POSTER PRESENTATIONS ...................................................... 1681
Our modern way of working and living has changed our experience and understanding of the work-life interface. Nowadays, technology enables people to be constantly occupied with work or leisure activities through their smartphone, creating challenges for recovery activities and experiences. Individuals are triggered to engage in and proactively arrange for themselves worthwhile and meaningful activities that may promote their sense of flourishing, but simultaneously they need to be goal-oriented and perform adequately in different life domains, including work and personal life. Therefore, the work-life interface seems to evolve into a work-life integration process, in which characteristics of and performance in work, family, and personal lives are closely related. In this presentation, I will give an overview of recent research highlighting the link between the work-life interface on the hand and issues like recovery, proactivity, performance, personal time, and technology use on the other hand. The main message is that we need to see work and other life domains more in relation to each other, rather than separated. Moreover, I will show that individuals are proactive agents who strive for meaningful experiences, well-being, and goal achievement in all life domains and that they do this by using key strategies and resources.
Work-Team Climate: a Three-Property Perspective

Prof. Vicente González-Romá

University of Valencia

Institute for Research in Psychology of Human Resources

Organizational Development and Quality of Working Life (IDOCAL)

Valencia, Spain

Work-team climate is a relevant construct to understand how work-teams function. Previous research has shown that work-team climate has influences on key work-team processes (e.g., communication) and outcomes (e.g., performance). In this talk, I will propose that in order to describe and characterize a work-team’s climate in a more complete and detailed way, we should consider three different properties: climate uniformity (the pattern of climate perceptions within the team), climate strength (the agreement of the existing coherent subgroupings of climate perceptions within the team), and climate level (operationalized as the aggregated climate score for the aforementioned subgroupings). I will review recent research about these three properties, and present new findings about the antecedents and consequences of climate uniformity. Finally, I will suggest a number of questions and research lines that can contribute to improving our understanding of work-team climate.
Job redesign interventions: insights from a practice-based theory of job design

Prof. David Holman
Professor of Organisational Psychology
Alliance Manchester Business School
University of Manchester – UK

My talk will focus on job redesign interventions (JDIs), which are important tools for organisational and employee development that seek to modify job characteristics as a means of enhancing employee outcomes. I will start by providing an overview of the strengths and limitations of our current understanding of JDIs. From this, I will then suggest that our understanding of JDIs can be advanced by using what I term a “practice-based theory of job design” that details the key practices (enacting, crafting and embedding) that organisational actors use to create, sustain and alter the content and characteristics of a job, and which highlights individual, organisational and institutional factors that shape the practice of job design. My talk will then show how a practice-based theory of job design can be used to provide a better understanding of, for example, the nature of JDIs (e.g., are they more enacting or crafting-focused) and the processes through which JDIs modify job characteristics, and how it can be used to point to the ways in which the design and implementation of JDIs could be developed to enhance the sustainability of their effects on employee practice and outcomes.
How Subtle Biases Can Profoundly Influence our Workplaces

Prof. Michelle “Mikki” Hebl

Martha and Henry Malcolm Lovett Professor of Psychology, Professor of Management
Rice University - Department of Psychology
Houston, TX – United States of America

In this talk, Dr. Hebl will provide an overview of her 20 year research career examining issues related to diversity and discrimination in the workplace. She will discuss the ways in which powerful people “gatekeep” or prevent others from reaching their full workplace potential. Her work specifically focuses on subtle (as opposed to more overt) forms of discrimination, and her talk will focus on many gender- and race-related research findings. She will close with suggestions for how we can individually and organizationally remediate biases and enhance our diversity-related efforts.
The importance of designing work to mitigate against psychosocial risks and to enhance performance has been of considerable interest for a long time. But with digitalization, new organisational forms, an ageing workforce, increases in mental ill health in the population, as well as other changes, the topic of work design is arguably more important than ever. In this presentation, I will recap on what we know about work design already, and introduce the SMART work design model as a way to summarize key work characteristics. I will then identify several emerging research agendas and provide illustrative studies, including the need to adapt theory to meet contemporary challenges; the neglected long-term effects of work quality; and the antecedents of work design. Finally, I conclude with an introduction to the Centre for Transformative Work Design (transformativeworkdesign.com).
Work and organizational psychology is an empirical science and evidence-based practice that has been in existence for over a century. Work and organizational psychology is well-established in the developed world and has made rapid advances in the developing world over the last couple of decades. The field has developed a substantial empirical foundation and a wide range of well-developed applications that are routinely used to enhance organizational effectiveness. Yet, with few exceptions, work and organizational psychology has had relatively limited direct impact on government policies relevant to workforce well-being and effectiveness. My presentation will discuss the many challenges that have to be surmounted to change this state of affairs, ongoing efforts for work and organizational psychology to have a more tangible policy impact, and things that each of us can do to more directly shape workforce policies.
Enhancing Scientific Impact: Publishing Psychology Research in Top Management Journals

Prof. Jason Shaw

Special EAWOP President's keynote

Most Work and Organizational Psychologists (WOPs) are trained to publish their research in the leading disciplinary journals (e.g., JAP, PPsych, JOOP, EJWOP). However, increasingly, WOPs are also seeking to publish their work in broader management and business journals (AMJ, Org Science, JOM). These journals often have a broader audience and allow WOPs to communicate their findings and perspectives beyond their own discipline to other scholars in the organizational sciences, thus potentially increasing the scientific impact of Work and Organizational Psychology. However, publishing in management journals often requires a different emphasis in terms of theory, methods and focus. Professor Jason Shaw, Editor of Academy of Management Journal, will share his experiences with publishing psychology research in AMJ and will provide tips for WOPs seeking to do so.
Management and leadership: essential factors for employee health and well-being

Emma Donaldson-Feilder

*Occupational psychologist, Affinity Health at Work*

*United Kingdom*

There is now a large literature showing that the way people are managed and led has an impact on their health and wellbeing. Emma will share insights into her colleagues’ and her research looking at how managers can prevent and reduce stress in their team. Funded by the UK Health and Safety Executive, Chartered Institute of Personnel and Development, and others, this research: created a behavioural framework to help managers and employers understand what competencies managers need in order to prevent and reduce employee stress at work; tested a training intervention that aimed to support managers to develop their skills; and explored how employer organisations implemented the framework and intervention in practice. While this work showed that managers were able to change their behaviour, particularly when given upward feedback, it also found that behaviour change is hard and is influenced by the organisational environment. Emma and her colleagues’ further research has therefore looked both at potential mechanisms for manager/leadership behaviour change, and at how to create an organisational context that is conducive to management/leadership development for enhancing employee wellbeing. Emma will share their latest findings in these areas, including the potential for interpersonal mindfulness as a leadership development methodology.
The psychology of the internet @ work: current insights and future research opportunities

Guido Hertel

Professor of Organizational and business psychology

University of Münster, Germany

The Internet as global interconnection of computer systems is causing fundamental changes in the way we work, and how work is organized. Online-recruiting, virtual teamwork, e-leadership, and e-learning are by now established as the new normal, and innovative technologies such as virtual and augmented reality, machine learning, and interconnected objects (Internet of Things) are already at the doorstep. However, psychological research only slowly embraces these developments, and often focuses on discrete technologies instead of work dimensions that might be better connected with existing theories of work and organizational psychology. Based on a conceptual framework to structure the various psychological implications of Internet-based work (including new developments), this presentation reviews potential opportunities and risks of Internet-based work from the perspectives of the individual worker, the work organization, and the social society. Internet-based tools (e.g., Management Information Systems, Virtual Reality) and work environments (e.g., virtual teams, flexible offices) are discussed both as single interventions (main effect) and as context conditions (moderator) that might qualify workers’ experiences and behavior. Moreover, research opportunities are derived within psychology and beyond, as well as strategies to disseminate the findings outside the academic field. In addition to reacting to current technological trends, psychology can provide conceptual guidance for the development of technologies, designing jobs and work environments for a more sustainable and inclusive society.
When you can’t be who you are: career transitions of migrants and refugees

Jelena Zikic

Professor of Human Resources

York University, Toronto, Canada

Many migrant receiving countries are increasingly more concerned about integrating migrants and refugees into the local workplace but also into their societies and culture overall. In our literature, migrants and refugees are often discussed as the ‘new form of diversity’ who experience many challenging forms of career and life transitions. Their experiences require us to reflect on our current understanding of coping with transitions, diversity of their experiences in and out of organizations and the meaning of successful integration. This State-of-the-Art presentation will introduce the audience to what we currently know about the challenges as well as facilitators of skilled migrant and refugee career transitions and integration. Specifically, by focusing on over 10 years of qualitative and quantitative studies in the area, I will describe my work on the individual, relational as well as organizational level perspective based on research conducted both in Europe and North America. The Individual perspective will focus on professional identity struggles, as well as coping with foreign career capital translation in and out of organizations. The Relational perspective will focus on mentoring relationships between migrants and local professionals as well as the value of local vs. foreign social capital in local job search. Finally, the organizational perspective will capture the ongoing debate on integration challenges vs. diversity facilitators, and propose an overarching model focusing on the value of high-quality connections between local and migrant workforce. The presentation will conclude with avenues for future research and some of the critical questions still facing researchers in this area.
Current research and practice on fairness and discrimination in personnel selection

Dragos Iliescu
Professor of Work and organizational psychology
University of Bucharest, Romania

Fairness in personnel selection is an important category of research drawing both from fundamental assessment literature, and from labor relations and personnel psychology. When drawing from assessment literature, research and practice tends to follow the precepts of the AERA-APA-NCME Standards for Educational and Psychological Assessment, focusing on the quality of measures (reliability, validity, equivalence etc.) and of the assessment process. When drawing from personnel psychology and labor relations, research and practice tends to focus rather on the legal implications and protection against liability in the selection process. These two lines of research will be discussed, as well as a number of outcomes related to fairness in the personnel selection process, such as test-taker mood and future attitudes, with an impact on longer-term phenomena such as employer branding, population attitude towards testing and more generally towards employment selection.
The concepts of burnout and work engagement have sparked a lot of research in occupational health psychology and beyond. From the outset I have been actively involved in this endeavor. Meanwhile, since the late 1980s tens of thousands scholarly publications have appeared on the subject. This has resulted in an impressive body of knowledge, which not only significantly advanced our understanding of employee health and wellbeing but is also successfully applied in organizations, particularly in Europe. Nevertheless, there are also personal annoyances about failures, flaws and lapses that obstruct the accumulation of valuable and relevant knowledge on employee health and wellbeing. In this state-of-the-art lecture, these advances as well as annoyances are discussed.
PANEL DISCUSSIONS

48 - [ALLIANCE SESSION] MEET THE EDITORS: EVERYTHING YOU’VE ALWAYS WANTED TO KNOW ABOUT PUBLISHING AND REVIEWING

Co-Chairs:
Alicia Grandey (Penn State University, USA) and Janine Bosak (Dublin City University, Ireland)

Many wonder how to get their work published in the top outlets in the field and may struggle with which journals best fit their work. The purpose of this roundtable is for participants to meet the editors of top-tier journals in the field of Work and Organizational Psychology and learn more about the journal submission and review process. Issues addressed will include the following:

Submission “flow” issues. How many papers are submitted and accepted annually?

Types of papers. Does the journal focus on empirical papers or theory pieces? Development of measures?

Characteristics of an “ideal” paper. Methods, including laboratory versus field methodology, theoretical and practical contributions

Review process. How many reviewers? How long is the typical review process? When a paper is accepted, how long to be published?

What can reviewers do? What characterizes a helpful review to editor and author?

Editors will present a 3 to 5-minute summary of their journals. After question-and-answer, we will have breakout groups to ask more specific questions, time permitting. This is a session where everyone will feel comfortable and “safe” to ask what they’ve always wanted to know about the journal submission process.

The session will be chaired and facilitated by Janine Bosak, Consulting Editor of the Journal of Occupational and Organizational Psychology (JOOP), and Alicia Grandey, Associate Editor for Journal of Occupational Health Psychology (JOHP) and editorial board member for JAP and AMJ.

Editor Panel Participants:

Eden King, Rice University, USA

Senior Associate Editor: Journal of Management

David G. Allen, Texas Christian University, USA

Editor: Journal of Management

Paul Bliese – University of South Carolina, USA

Editor (incoming): Organizational Research Methods

Gilad Chen – University of Maryland, USA

Editor: Journal of Applied Psychology

Sharon Clarke - University of Manchester, UK
Editor: Journal of Occupational and Organizational Psychology
Kevin Daniels, University of East Anglia, UK
Outgoing Editor, European Journal of Work and Organizational Psychology
William Gardner, Texas Tech University
Leadership Quarterly
Eric Kearney, University of Potsdam, Germany
Co-Editor, Organizational Psychology Review
Maria Kramer, Rutgers University, US
Editor, Personnel Psychology
Ioannis Nikolaou
Editor of International Journal of Selection and Assessment
Steven Rogelberg, University of North Carolina-Charlotte, USA
Editor, Journal of Business and Psychology
Jason Shaw, Hong Kong Polytechnic University, Hong Kong
Editor, Academy of Management Journal
Sabine Sonnentag, University of Mannheim, Germany
Associate Editor: Journal of Organizational Behavior
167 - ALLIANCE SPECIAL SESSION: SEXUAL HARASSMENT SCIENCE AND PRACTICE AROUND THE GLOBE

ROSALIND SEARLE (1) - Alicia Grandey (2) - Sandy Hershcovis (3) - Jessica Jenkins (4)

University of Glasgow, Adam Smith Business School, Glasgow, United Kingdom (1) - Pennsylvania State University, Psychology, State College, PA 16801, United States (2) - University of Calgary, Haskayne School of Business, Calgary, Canada (3) - ICF, Washington D.C., United States (4)

This panel will discuss I/O research and human resource practices for sexual harassment, representing different national contexts (USA, Canada and the UK), and perspectives as both scientists (from business and psychology contexts) and practitioners (from military and consulting contexts). They will briefly describe their background, compare their experiences, and then have a question and answer session.

In this era of #MeToo and #TimesUp, there is finally recognition that sexual harassment is a frequent experience for women in the workplace, no matter what their job status or where they work. Scholars and practitioners in I/O have been studying sexual harassment, why it occurs, its consequences, and how to address it, for decades. This panel will discuss I/O research and human resource practices for sexual harassment, representing different national contexts (USA, Canada and the UK), and perspectives as both scientists (from business and psychology contexts) and practitioners (from military and consulting contexts). They will briefly describe their background, compare their perspectives, and have a question and answer session.

The recent #MeToo movement raised awareness of the issue of sexual harassment, with 12 million online mentions within the first 24 hours of the trend and users throughout the United States and across the globe sharing their stories of sexual harassment (Johnson & Hawbaker, 2018). This movement has raised societal consciousness about the prevalence of this issue and other gender inequities in the workplace (e.g., Calfas, 2018). As such, the time is right to revisit what is known about sexual harassment in terms of the scientific developments across the past few decades (O’Leary-Kelly et al., 2009), how organizations and practitioners around the globe have tried to address this issue with human resource practices, and what should do moving forward.

To fit the Alliance in Organizational Psychology block, the panelists for this Alliance session were selected to maximize the diversity of their expertise (business, psychology, consulting, military) and national context (US, Canada, and UK) while also keeping the group small enough to have ample time for each to contribute to the discussion and to answer audience questions. All have extensive experience with sexual harassment research and/or practice.

Format: Panelists will be asked the following types of questions by the chair to start the conversation.

Introduce yourself - What is your background and expertise around sexual harassment in the workplace?

The #MeToo movement shows broad awareness now of this issue. What would/do you tell reporters about how I/O psychology helps to address sexual harassment?
Sexual harassment is a worldwide phenomenon. How do you think that studying or addressing sexual harassment varies by national context? What does science/practice from other countries tell us about this phenomenon?

What do you think must occur in the future, in terms of needed research and/or policy changes, in order to capitalize on this movement and make change happen around the world?

Chair Alicia Grandey will facilitate discussion among presenters and also ask the audience for their questions and own experiences.

Panelists and Affiliation:

Alicia Grandey

Panelist

Rosalind Searle
HRM & Organisational Psychology; University of Glasgow, United Kingdom
Panelist
Emotional labor was defined by Arlie Hochschild (1983) as “the management of feeling to create a publicly observable facial and bodily display” (p. 4) within a paid work role. Since that time, citations in published research has grown from about 50 in 1985 to over 4,500 in 2005 (Grandey, Diefendorff, & Rupp, 2013), with three meta-analyses and integrated reviews showing that emotional labor is linked to both employee well-being and job performance.

In the past decade or so, the construct of emotional labor has shifted. Originally, emotional labor was specific to lower-status service contexts, including call centers, restaurants, airlines/hotels, and cashiers. Scholars now examine the emotional labor performed with team members (Ozcelik, 2013), leaders/subordinates (Humphrey, 2012), and at home (MacDermid, Seery, & Weiss, 2002). More broadly, online media also is referring to emotional labor as “the unpaid job men still don’t understand” including gift-giving, household management, and discussing feelings in a relationship (Hartley, 2017).

How does broadening the topic help or harm the science of it? The purpose of this panel is to discuss and debate these definitional shifts and how researchers can contribute to the conversation and emerging construct. The panel is international scholars of emotional labor from different generational stages that have distinct views on the following topics for our discussion:

How the definition and study of emotional labor has changed
Whether expanding vs narrowing the concept is beneficial
How future research can help clarify the concept

Facilitator: Alicia Grandey

353 - ALLIANCE SESSION: SUPPORTING YOUR INTERNATIONAL RESEARCH VISIT THROUGH EXTERNAL GRANTS AND FELLOWSHIPS

Purpose: A number of funding sources are available to academics to support their extended visits to institutions overseas. However, the process for obtaining this financial support may seem complicated or mysterious to those considering these opportunities. In this session, awardees of Fulbright, Marie Curie, and other grants – awarded at different career stages – describe their experiences in applying for them, tips for a successful application, and specific challenges they encountered during the application process. Panelists also describe the support needed from host faculty and the critical role played by academic institutions for obtaining these grants and for ensuring the success of extended overseas visits.

Controversial Perspectives: Although international mobility periods provide invaluable experience to researchers, obtaining support for this travel can be competitive, and navigating the financial, family, interpersonal, administrative, and logistical issues can seem daunting.

Implications for Research/Practice: Supporting longer-term cross-cultural and international travel for faculty is crucial for the dissemination of research findings, research and teaching methodologies, and scholarly viewpoints; for curriculum development; and for supporting a deeper understanding across cultures. These issues are particularly important to the viability of work and organizational psychology research and practice because of the field’s embeddedness in larger social, political, and cultural systems.

Names of the Panelists:

Fraccaroli, Franco, University of Trento

Kozusznik, Gosia, University of Leuven

Truxillo, Donald, University of Limerick (Chair)

van Dick, Rolf, Goethe University Frankfurt
EXPLORING THE SPACE FOR CRITICAL WORK AND ORGANIZATIONAL PSYCHOLOGY

Matthijs Bal (1)
University of Lincoln, LIBS, Lincoln, United Kingdom (1)

Facilitator: Prof.dr. P. Matthijs Bal, University of Lincoln, United Kingdom

Purpose: While critical perspectives have emerged and been established in various disciplines related to Work and Organizational Psychology (WOP), such as social psychology (Gough, 2017), management studies (Butler & Spoelstra, 2014), and the general field of psychology (Teo, 2015), thus far, they have been neglected in our field. However, for each scientific discipline it is important to generate critical perspectives in order to sustain scientific progress, but also to remain relevant for both in- and outsiders (such as society; Gerard, 2016). Without a firmly established critical field, pluralism within WOP is stifled and discussion of normative underpinnings is absent (e.g., Bal & Dóci, 2018; Islam & Zyphur, 2009). The aim of this panel discussion, therefore, is to explore the possible avenues for Critical WOP, focusing on 1) theoretical avenues for Critical WOP, and 2) setting an agenda for the future of Critical WOP, including possibilities for special issues, handbooks, streams within EAWOP and separate meetings (e.g., SGMs, Summer Schools).

Controversial Perspectives: One could argue that Critical WOP in itself encapsulates a controversial perspective within WOP, which is a scientific discipline which has not yet fully embraced critical perspectives. During the debate, various panel members will make brief statements on their perspectives for the possibility of the establishment of Critical WOP, and introducing their theoretical perspectives on the advancement of Critical WOP. Subsequently, we will interactively discuss with the audience possible ways forward to advance a critical agenda for WOP.

Implications for Research/Practice: The aims of the panel debate are the following: establishing a ‘formal’ Critical WOP stream within EAWOP, focused on organizing various initiatives such as special issues, handbooks, white papers on how to conduct critical research in WOP, symposia and meetings. Special attention will be paid to the how Critical WOP may influence the practice of WOP, and how WOP-practitioners (including students!) may benefit from a more critical stance.

Name of the Panelists (Surname, Name, Affiliation):

Prof.dr. Wolfgang Weber, University of Innsbruck, Austria (topic: Radical Humanism)
Prof.dr. Gazi Islam, Grenoble Ecole de Management, France (topic: Dark sides of Positive Psychology)
Dr. Severin Hornung, Carnegie Mellon University, USA (topic: Dialectics of Neoliberal Ideology)
Dr. Edina Dóci, VU University Amsterdam, the Netherlands (topic: Feminist Perspectives)
Dr. Nathan Gerard, California State University Long Beach, USA (topic: Rekindling the Endogenous Critical Tradition in WOP).

GENDER AND SEXUAL DIVERSITY IN WOP, A MORE INCLUSIVE SCIENCE AND PRACTICE

Purpose

In keeping with the theme of the Congress, “Working for the greater good: Inspiring people, designing jobs and leading organizations for a more inclusive society”, we would like to hold a panel that initiates the discussion in EAWOP about gender and sexual diversity in WOP academia and practice.

Controversial Perspectives

In a recent poll, it was found that the main issues from the Workplace Trends survey (SIOP, 2018) are: Sexual Harassment, Diversity, Inclusion, and Equity, and Work-life Balance Interventions & Employee Wellness. For members and attendees of EAWOP these are real issues that we experience in academia and practice (e.g., all-male panels of teaching staff or executive committees, office housework, bias awareness). This session is proposed in order to facilitate a physical and temporal space for the exchange of ideas and establishment of networks of support for gender and sexual minorities in the workplace and work spaces. The panelists, selected to represent different stages and roles in the EAWOP community, will discuss issues from everyday life to long-term careers as students, researchers, practitioners and members of EAWOP.

Implications for Research/Practice

There are two online communities, based on North American networks (twitter.com/siopwin and /WomenofOB) in which female WOP/IO/OB academics and practitioners are involved in active discussions about different topics such as: dealing with discrimination and biases, gender, diversity and inclusion research, parental leaves, increasing visibility of researchers and practitioners in our community and the media, to name a few. We hope that this panel will start these conversations within EAWOP.

Panelists:

O’Shea, Deirdre. Kemmy Business School of University of Limerick, Ireland (Senior Lecturer)

Michel, Alexandra. BAuA, Federal Institute for Occupational Safety and Health, Germany (Scientific Director)

Zak, Tony. WellBiz brands, USA (Junior Practitioner)

Kampf, Pia. Universitat de Valencia, Spain (Doctoral Candidate)

Kozusznik, Malgorzata. Katholieke Universiteit Leuven, Belgium (Post-doctoral researcher)
960 - HOW TO BE A GOOD REVIEWER

Purpose

A research reviewer competency framework will be introduced and discussed by a panel consisting of experienced reviewers, editors, and editorial board members. Content will include practical recommendations and interactive discussions around ethical and practical dilemmas.

Controversial Perspectives

Serving as a reviewer for academic journals and conferences has many benefits. For early-career academics, though, it is not always clear how to become a competent and responsible reviewer. The proposed session will raise awareness of (1) reviewer competencies and (2) practical and ethical challenges of reviewing. Following the panel discussion, the audience will engage in a series of interactive exercises designed to facilitate further discussion and learning. The panel session proposed here is part of a large-scale joint effort initiated by the Alliance for Organizational Psychology (MOU on Fostering Ethical, Relevant and Rigorous Research) and followed by actions of signing scholars of the MOU to involve the Society for Industrial and Organizational Psychology (SIOP) and the Consortium for the Advancement of Research Methods and Analysis (CARMA) to build a more robust and reliable science by developing and training on reviewer competencies.

Implications for Research/Practice

The benefits of reviewer training and mentoring are many (e.g., clarifying for new reviewers what editors and authors find useful and helpful, delivering comprehensive reviews in the most efficient way), and include the development of early career researchers’ competences as authors (e.g., how to craft their own papers, how to deal with reviews).

Facilitator:

Gonzalez-Morales, M. Gloria. University of Guelph. Associate editor of Work & Stress, member of the editorial board of JOHP, Occupational Health Science, Anxiety, Stress & Coping and Stress & Health, and member of SIOP’s subcommittee for responsible, reliable, and rigorous reviewer training

Panelists:

Grote, Gudela. ETH Zürich. President of AOP, past president of EAWOP, Associate editor of the journal Safety Science and member of the editorial board of Journal of Business and Psychology and Applied Ergonomics.

Arnold, John. Loughborough University. Past editor of Journal of Occupational and Organizational Psychology (JOOP) and member of the editorial board of JOOP, JVB, HR and OPR.

Daniels, Kevin. University of East Anglia. Editor-in-Chief of the European Journal of Work and Organizational Psychology, associate editor of the British Journal of Management, past associate editor of Human Relations (HR) and JOOP, and member of the editorial board of HR, JOM and JOOP.

Koehler, Tine. University of Melbourne. Associate Editor of Organizational Research Methods and past associate editor of Academy of Management Learning and Education and member of the editorial board of JMS, SGR, ORM, AMLE, & JME, chair of SIOP’s subcommittee for responsible, reliable, and rigorous reviewer training and member of CARMA’s Advanced Reviewer Development Advisory Board.
Allen, Joe. University of Nebraska Omaha. Member of the editorial board of the Journal of Business and Psychology and managing editor for a Handbook on Organizational Community Engagement and Outreach for Cambridge University Press, and affiliate of SIOP’s subcommittee for responsible, reliable, and rigorous reviewer training.
**1071 - ROBOTIZATION AT WORK: A CURSE OR A BLESSING?**

Hannah Berkers (1) - Sonja Rispens (1) - Pascale Le Blanc (1)

Eindhoven University of Technology, Human Performance Management, Eindhoven, Netherlands (1)

*Purpose:* According to the World Economic Forum, the amount of work executed by robots is expected to almost double the coming decades, which will change many jobs. The impact of robotization on the experience, well-being, and performance of employees, however, has received surprisingly little attention in research. Our aim to set a research agenda and discuss what the potential role of work and organizational psychologists is in the robotization of work.

*Controversial perspectives:* Work executed by robots could be seen as an opportunity to deal with strenuous or unenjoyable tasks and create more meaningful jobs and better outcomes. However, robotization could also be seen as a threat, because it potentially destroys and polarizes work. Specifically, the social aspects of work may be threatened, because to what extent can robots be good colleagues? Currently, the implementation of robots at work is mainly driven by technology, leaving out valuable insights about work design and job insecurity.

*Implications:* A research agenda can initiate the needed insights about the impact of working with robots, which could ensure that organizations and employees benefit from this change.

*Audience:* 30-60 persons.

*Panelists:* prof. dr. Kevin Daniels, Employment Systems and Institutions group of the Norwich Business School at the University of East Anglia, prof. dr. Christian Korunka, Department of Applied Psychology at the University of Vienna, prof. dr. Magnus Sverke, Department of Psychology at the Stockholm University, Hannah Berkers, dr. Sonja Rispens, and dr. Pascale Le Blanc (facilitator), Human Performance Management Group at the Eindhoven University of Technology.
THE DIGITAL TRANSFORMATION OF WORK IS HERE – HOW SCIENTISTS AND PRACTITIONERS CAN WORK TOGETHER TO MANAGE NEEDED WORKPLACE CHANGES

Chair and facilitator: Colin Roth, BlackBox/Open, Germany

Panelists:
Oliver Kohnke; SAP, Germany
Diana Rus, Creative Peas, the Netherlands,
Hartwig Fuhrmann, t-velopment, Germany
Katarzyna Więcek-Jakubek, University of Silesia, Katowice
John Arnold, School of Business and Economics, Loughborough University

Organizations across Europe are reinventing their structures and processes in the quest to become more “agile”. To facilitate these changes methods like “Design Thinking”, “Bar Camps” or “Working Out Loud” are becoming mainstream, no longer only used in hip start-ups and communication agencies. Traditional working environments, typically associated with rules, routines, and regulations are now transformed into open (co-working) spaces. Something big is going on.

In this panel discussion we would like to invite scientists and practitioners to engage in a conversation about future directions of WOP with the aim of keeping education, research and practice relevant to contemporary work. We want to look into the current state of co-operation and co-creation within WOP and examine what needs to change and how this will be achieved. Together, we would like to figure out how research can support practitioners in their work with organizations and how to manage the digital transformation. As part of the scientist – practitioner collaborative stream this panel discussion compliments the conference theme of working for the greater good by looking into future directions of organizational development and how to use evidence based practices to help individuals to adapt to change.

The aim of this session is to have an active debate between panelists and the audience generating ideas and activities to improve co-operation. We propose to use an innovative process method called “BarCamp” to encourage presentation and review. This interactive panel discussion will end with a plenary session and would be best placed in a 120-minute slot. We would expect an audience of 30-60 people.
2027 - THE MOVE TO THE BUSINESS SCHOOLS: CHALLENGES AND OPPORTUNITIES FOR THE FUTURE OF WORK AND ORGANIZATIONAL PSYCHOLOGY

Participants: Frederik Anseel (Chair), Gilad Chen, Filip Lievens, Nicholas Roulin, Ute Stephan

Purpose: There has been a trend of work & organizational psychologists (WOPs) moving from psychology departments to business schools. While this move has been most notable in the US, similar trends have been observed in Europe. As European business schools have gained prominence in international rankings, an increasing number of WOPs are finding a good research and teaching home in business schools. The aim of this session is to discuss WOPs move to the business schools and the implications of this trend for the future of WOP. Four panel members have moved from a psychology department to a business school, while one panel member has moved in the opposite direction.

Perspectives: Drawing on the experiences of the panel members, a first aim is to gain more insight into the reasons why WOPs move. A second aim is to inform early career researchers about what differences there may be and what to expect when moving from a psychology department to a business school.

Implications for Research/Practice: The implications of the move to the business schools have been extensively debated (e.g., Aguinis, Bradley, & Brodersen, 2014). While some have warned that such a move may threaten the future sustainability and even survival of our field, others have advanced more optimistic views. We aim to offer a balanced and inclusive discussion of positive and negative consequences. We will seek to identify opportunities and strategies to capitalize on these opportunities for WOP to prosper in business schools in the future.

Panelist                    Affiliation
Gilad Chen                  Robert H. Smith School of Business
                            University of Maryland (US)
                            Editor of Journal of Applied Psychology
                            Fellow of APA, APS, IAAP and SIOP
Filip Lievens               Lee Kong Chiang School of Business
                            Singapore Management University (Singapore)

King's College London (UK)

President EAWOP and fellow IAAP
Purpose:
A diverse panel of both academic and applied organizational psychologists will discuss the challenges of and most effective strategies for conveying research findings to the wider working public.

Controversial Perspectives:
In the field of work and organizational psychology, research and practice are inextricably linked. The line between academics and practitioners is often blurred, and many in the field shift seamlessly between the two approaches. However, the relationship is not without tension. Organizations often eschew research-backed advice in favor of traditional or less costly approaches. Research is generally released behind paywalls and inaccessible to those outside the academic system. Even when it is shared publicly, it’s often jargon-filled and hopelessly complex for a non-scientist.

Should researchers accept more responsibility for conveying their findings to a broader audience? Can researchers embellish the significance of findings to encourage their adoption in the workplace? How can practitioners convince results-driven executives to use research-backed methods? Does simplifying research findings risk losing the nuance and depth of the studies? How can academics do more to develop research that is relevant to a broader audience?

Implications for Research/Practice:
This panel will offer a valuable discussion of best practices for organizational psychologists in academia and industry alike who want to convey research findings to a broader audience and encourage their implementation in organizations. It will also bring together six accomplished professionals with experience in just this to debate the more controversial aspects of the scientist/practitioner relationship.

Facilitator:
Marcinko, Andrew - Teaching Fellow, Durham University

Panel Members:
Galli, Lorenzo - Founder and Managing Director, ScienceForWork
Bauer, Talya - President, SIOP
Cioca, Iulia A. - Writer, ScienceForWork
Wietrak, Emilia - Researcher and Lecturer, Universitat de Barcelona
Marenco, Pietro - People Analyst, Deloitte
When top news outlets such as the Wall Street Journal and Forbes publish articles about how artificial intelligence and gamification can revolutionize the hiring processes, you can be sure that business executives and researchers take note. Yet news articles based on hype rather than research can lead to extreme ideas such as humans being excluded from the hiring process or that AI is inherently biased. To compound this problem, gamification and AI are so new to employee selection that substantial peer-reviewed research is often not published yet.

This interactive session brings together a diverse panel of researchers and practitioners actively involved revolutionizing hiring to discuss the reality of these new methods in our field. Specifically, three main topics will be covered. First, artificial intelligence and gamification in the employee selection context are defined and then contrasted to traditional selection methods. Second, application reactions to the use of AI or games in the hiring/staffing decisions are discussed (e.g. would candidates be ok with their next interview being conducted by a computer)? Lastly, the question is proposed, is there hope that these new methods can be used to create a more fair and inclusive hiring practice rather than perpetuate bias?

Panel Participants
Thompson, Isaac
Principal Data Scientist at Shaker

Delany, Tanya
Director, Selection, Onboarding and Metrics and Analytics at IBM

Nikolaou, Ioannis
Associate Professor of Organizational Behaviour, Work & Organizational Psychologist at Athens University of Economics and Business

Montefiori, Lara
Chief Scientist at Arctic Shores
Beyond Greenleaf’s seminal essays, empirical research using psychometrically sound measures has profoundly advanced our view on servant leadership (SL). Current empirical evidence suggests its beneficial effects on follower performance and OCB, beyond transformational leadership and LMX, across different jobs and cultures.

Contributions

The symposium highlights empirical research and theoretical reasoning in three major domains related to the research agenda proposed by Liden et al. (2014). We determine antecedents of SL, expand its criterion domain, and investigate the psychological mechanisms underlying its impact on followers.

Brouns presents main and interactive effects of leader agreeableness, conscientiousness, and ethical climate as antecedents of SL. Bildat and Martin discuss a curriculum for student leadership development including SL, motivation to lead, and psychometric measures of evaluation. Sülzenbrück and Strehl provide evidence for the beneficial effects on followers’ work engagement via strengthening their psychological resources (PsyCap). Rivikin et al. report findings from a diary study, showing that basic needs satisfaction mediates the effects of SL on followers’ subjective vitality. Diestel presents a three-way interaction of SL as buffering the deleterious effects of self-control demands, only if followers’ role clarity is high. Externbrink shows that SL increases followers’ innovative work behavior and examines if this relationship is amplified by their emotional intelligence.

Implications

SL is instrumental for contemporary issues in organizations such as employee health or innovation. The identified processes allow future theory building and differentiation from other leadership models. Knowledge about personal and situational antecedents can stimulate leadership and organization development.

Presentations of the Symposium

Big Five Personality Traits and Ethical Climate as Antecedents of Servant Leadership

Tim Brouns (UCAM, Catholic Univ. of Murcia, ES)

Purpose

Evidence on the relationship between leader traits and the tendency to act as a servant leader is currently scarce. Taking on an interactionist perspective, organizational climate should be considered as a moderator.

Method
The sample consisted of $N = 99$ employees who rated the big five, ethical climate and servant leadership of their immediate supervisor. A 2-wave panel design was chosen to reduce common method bias. The questionnaire included SL-7 for servant leadership, BFI-K for leader’s personality and Corporate Ethical Values for ethical climate.

Results

Data analysis was done with a multiple linear regression model. All five personality dimensions of the leader have been included in the model. A best-fit model has been determined with a stepwise-backward-search algorithm. Agreeableness and conscientiousness turned out to be the two remaining personality dimensions in the model. As the Theory of Purposeful Work Behavior suggests, agreeableness has the strongest effects on servant leadership, because of its strong alignment to the communion striving. Ethical climate had a significant moderating effect on the correlation between agreeableness and servant leadership.

Limitations

The sample mainly consisted of employees in the ICT-sector in Germany. Leader self-assessment of big five traits can increase the validity of the results.

Practical Implications

Findings could be used for the selection of leadership personnel in companies which would like to cultivate a servant leadership style in their organization.

Originality/Value

Findings advance knowledge about antecedents of servant leadership and show contrasting results to studies regarding personality and other leadership styles, like transformational leadership.

Why and how we should develop transformational and Servant Leadership in higher education. Propositions on Student Leadership Development (SLD) in Germany.

Lothar Bildat (NORDAKADEMIE, Univ. of Appl. Sc., DE); Lisa Martin (EBC Hochschule Hamburg, Univ. of Appl. Sc., DE)

State of the art

A preparation of our future leaders to exert positive outcomes in different leadership and team contexts seems necessary in a dynamic and change-oriented world. Many studies show correlates of transformational and Servant Leadership with positive organizational outcomes. Recent metaanalysis show devastating medium to strong effects of destructive behaviors on employee health. Research regarding E-Leadership clearly shows for the positive role of mutual trust. In contrast, narcissism shows negative correlations with Servant Leadership but positive with leadership self-efficacy. In Germany there’s a lack of scientifically sound and sustainable development programs focusing leadership competencies. We therefore offer an evidence-based curriculum for higher education including evaluation aspects and newly developed evaluation scales.

New Perspectives/Contributions
How Servant Leadership Affects Employee Work Engagement: The Mediating Role of Psychological Capital

Sandra Sülzenbrück (FOM, Univ. of Appl. Sc., DE); Timo Strehl (VKPB Dortmund, DE)

Purpose
In search for an overarching framework for the beneficial effects of servant leadership, we build on the Job Demands-Resources Model and conceptualize servant leadership as a job resource that increases follower work engagement via strengthening their personal resources (i.e. their psychological capital, PsyCap). We thereby extend current evidence on Servant Leadership as a job resource that buffers adverse effects of job demands on employee exhaustion.

Method
We conducted a cross-sectional survey study with $N = 406$ employees from a broad range of industries using self-reports (SLS, PCQ, and UWES).

Results
Indeed, PsyCap partially mediated the positive effect of servant leadership on work engagement. While meaningful indirect effects were found for PsyCap-dimensions hope and optimism, no substantial mediating effects occurred for resilience and self-efficacy. A full mediation was found for the servant leadership dimension accountability and partial mediation effects for empowerment, standing back and courage. No mediating effects were found for authenticity and forgiveness as well as for humility and stewardship.

Limitations
As the study is cross-sectional, no strict causal conclusions can be drawn. All variables were measured as self-reports and therefore common-method-bias could limit the findings.

Practical Implications
Creating an organizational culture where servant leaders can flourish is a sustainable investment in employees’ work engagement and wellbeing.

Originality/Value
Our results advance the understanding of the organizational antecedents of PsyCap by showing its responsiveness to servant leadership. We further explore the psychological mechanisms through which particular dimensions of servant leadership exert influence on followers.

**How Servant Leaders Facilitate Employees’ Subjective Vitality; Disentangling the Within-Person Mediating Effects of Basic Needs Satisfaction and Autonomous Regulation**

_Wladislaw Rivkin (Aston Business School, Aston Univ., UK); Stefan Diestel (Univ. of Wuppertal, DE); Klaus-Helmut Schmidt (Leibniz Research Centre for Working Environment and Human Factors at the Technical Univ. of Dortmund, DE)_

**Purpose**

*In the present study, we integrate literature on servant leadership, self-determination theory and spillover to propose that day-specific needs satisfaction for autonomy, competence, and relatedness and associated flow experiences - a form of autonomous regulation - at work restore employees’ energy or resources and thus sequentially mediate the relationship between servant leadership and day-specific subjective vitality at home. Moreover, we suggest trait self-control as a moderator of this mediation model. Our proposition draws on the theoretical notion that individuals with high levels of trait self-control handle demands at work in a less effortful way. Therefore, for these individuals the resource generating effect of flow experiences at work is more likely to spillover from the work to the home domain.*

**Method**

*We examine our hypotheses in a daily diary study across 10 days with 51 employees from different occupational fields.*

**Results**

*Our results support the proposed mediating effects for autonomy and competence needs satisfaction and associated flow experience. Moreover, trait self-control moderates this mediation model.*

**Limitations**

*A limitation of our study is common method variance since all variables were measured as self-reports.*

**Practical Implications**

*To facilitate employees’ vitality at home, servant leaders should focus on satisfying their followers’ daily needs for autonomy and competence.*

**Originality/Value**

*Servant leadership is a leadership style that focusses on putting subordinates’ interests before the self-interest of the leader. Even though previous research has demonstrated the positive impact of servant leadership on employees’ health and well-being, the within-person mechanisms underlying this relation remain largely unexplored.*
When does Servant Leadership moderate the deleterious effects of self-control demands on well-being: The role of role clarity

Stefan Diestel (Univ. of Wuppertal, DE)

Purpose

I analyze the interplay between role clarity and servant leadership in moderating the negative relationship between self-control demands and psychological well-being. Servant leadership (as conceptualized as a kind ethical leadership with a strong focus on growth of individual employees) has been found to foster well-being. According to self-determination theory, employees who experience high servant leadership, should be better able to cope with demands than when servant leadership is low. However, and in line with models of action regulation, such a buffering effect will only emerge, if employees also perceive high certainty about how to perform their job. Consequently, servant leadership and role clarity should jointly moderate (attenuate) the deleterious effects of demands on well-being. In cases of high role clarity the buffering effect of servant leadership is stronger as compared to low clarity.

Design

The hypothesized three-way interaction was tested in two studies: Study 1 (cross-sectional study: N=1105) consisted of employees of a banking institution, whereas study 2 was a daily diary study (N=66).

Results

The results show that servant leadership and role clarity jointly moderate the negative relations of self-control demands and emotional dissonance to indicators of well-being (low exhaustion and work engagement).

Limitations

Correlational designs do not allow for strong causal conclusions.

Research/Practical Implications

The beneficial effects of servant leadership is contingent upon boundary conditions, which facilitate regulatory processes and provide information about how to cope with task-related demands.

Value

The present study provides new insights into how leadership and other job resources interact in facilitating well-being.

Does Servant Leadership Enhance Employees’ Innovative Work Behavior? Examining the Amplifying Role of Emotional Intelligence.

Kai Externbrink (FOM, Univ. of Appl. Sc., DE)

Purpose

Innovative work behavior (IWB) is widely claimed to contribute to organizational effectiveness. Building on broaden-and-build theory, I propose that servant leadership (SL) as precursor of positive emotions can broaden followers’ thought-action repertoires and build
enduring personal resources that in turn positively influence IWB. Further the theory implies that there are individual differences in the ability to “intelligently” use positive emotions to guide and understand one's behavior and experience; which is why followers’ emotional intelligence (EI) should enhance the positive association between SL and IWB.

Method
In a cross-sectional study with $N = 120$ employees from a broad range of organizations and job types, self-reports of all constructs were gathered via a questionnaire with a time lag of one week. IWB was additionally assessed through peer ratings.

Results
Regression Analysis revealed significant main effects for SL and EI on self-ratings ($R^2 = .35$) and peer ratings ($R^2 = .10$) of IWB but did not support the supposed interactive effects.

Limitations
The study is only cross-sectional, and the measures may fuel discussions on the differences between trait vs. ability measures of EI and subjective vs. objective measures of IWB. Further, the theorized psychological mechanisms (mediators such as gratitude, interest, hope, pride, or inspiration) are not measured explicitly.

Practical Implications
Findings can stimulate leadership development and personnel selection practices.

Originality/ Value
The present study broadens the criterion domain of SL and is one of the currently still relatively rare examinations of the role of follower personality in the SL-process.
PROFESSIONAL DEVELOPMENT AT WORK AND THE EFFECTS OF EMPLOYEES’ CHARACTERISTICS, AND STRUCTURAL AND CULTURAL WORK CHARACTERISTICS

Submitted by:
Regina H. Mulder, Institute of Educational Science, University of Regensburg, Germany

State of the art
In order to adapt to economic and technological transformations in the world of work, employees must engage in professional development (PD), which to a large degree takes place on the job and depends on the characteristics of the work context. Professional development of employees encompasses various components and is defined and operationalized in different ways, such as informal learning at work, self-regulated learning, reflection, learning activities after triggers. Various motivation and learning theories are used to increase insight into processes of professional development as well as into what the individual and contextual antecedents are.

New perspectives
In this symposium a wide variety of theories, such as self-determination theory, deliberate practice, job-demand-control-support model, is in most contributions used in a unique combination. The contributions focus on the mentioned different aspects of professional development, and on different context variables as antecedents, such as job characteristics, strengths in work teams, feedback culture and broader organizational support for professional development activities taking into account employees’ characteristics. In addition, a wide variety of research designs and instruments are used. The limitations of self-reports is addressed in the fifth contribution by using multiple data sources.

Research / practical implications
This symposium increases insight into professional development in different work domains, what gaps need to be bridged in future research, such as the demand for more longitudinal studies, and delivers suggestions for fostering professional development in practice, through for instance leadership, organization of work and providing specific cultures for learning.

Presentation 1:

The impact of job characteristics on employees’ learning behaviour and well-being: A time variant and invariant analysis of the job-demand-control-support model
Eva Kynadt (presenting author)\textsuperscript{1} Tim Bednall\textsuperscript{2}, Nele De Cuyper\textsuperscript{1}, and Hans De Witte\textsuperscript{1}
\textsuperscript{1}KU Leuven – University of Leuven, Belgium
\textsuperscript{2}Swinburne University of Technology, Melbourne, Australia

Purpose
Despite the fact that the widely used job demand-control-support model (JDCS) proposes both a learning as well as strain hypothesis, the research on work-related learning and well-being is primarily disconnected. Few studies examine how (changes in) job characteristics influences work-related learning and well-being conjointly. Prior systematic reviews have highlighted the need for longitudinal research using more than two measurements, as empirical support for the longitudinal multiplicative effects proposed by the model is fairly limited.

Methodology
In total, 1484 unique individuals participated in this research project (response rate = 51.07%). Every potential participant was invited at each wave leading to respectively 1077 (T0), 1083 (T1), 911 (T2) and 870 (T3) participants each wave. A random intercept latent variable cross-lagged panel analyses including main effects and interactions allowed the investigation of time invariant and time variant relationships.

**Results**
The results of the analysis show that the time invariant relationships support the model; both main effects and significant interaction effects were identified. Time variant relationships are limited. Job characteristics and well-being are only predicted by their own measurement of the prior wave. Prior formal learning participation predicts future formal leaning. Remarkably, this does not apply to informal learning.

**Limitations**
The main limitation of this study is the reliance on self-report data.

**Value**
The current study examines the longitudinal multiplicative relations proposed by the JDCS and shows that while support for the time invariant relationships is ample, this is not the case for the time variant component of the model.

**Presentation 2:**

**The relationship between team strengths use and team learning**

*Marianne van Woerkom (presenting author) and Christina Meyers*

Department of Human Resource Studies, Tilburg University, the Netherlands

**Purpose**
Based on positive psychology theories, previous studies have indicated that strengths use of individuals is positively associated with developmental processes. The aim of this study was to investigate how strengths use in teams is associated with team learning. We investigated the impact of the diversity of strengths that are represented in the team (strengths diversity), the trust that team members have in the strengths of other team members (strengths credibility), and whether tasks and roles are allocated based on team member strengths (strengths coordination).

**Methodology**
We conducted a cross-sectional survey study amongst 454 employees who worked in 79 different teams. We aggregated the data to the team level.

**Results**
We found that strengths diversity was not related to team learning, whereas strengths credibility and strengths coordination were both positively associated with team learning. Moreover, strengths coordination moderated the effect of strengths diversity on team learning. At low levels of strengths coordination, the effect of strengths diversity on team learning was negative, whereas this effect was non-significant at moderate levels, and positive at high levels of strengths coordination.

**Limitations**
The study was based on cross-sectional self-report data of employees.

**Research/practical implications**
Previous studies have indicated that strengths use of individuals is positively associated with developmental processes. This study suggests that strengths use in teams is also associated with collective forms of learning.
Originality
Research on strengths use in organizations has so far focused exclusively on the individual level. This study addresses strengths use in the context of work teams.

Presentation 3:

Effects of perceived feedback culture in organizations on professional learning activities after errors and feedback
Regina H. Mulder (presenting author), Veronika Anselmann, and Gerhard Messmann

Purpose
Building on self-determination theory, theories of experiential learning and Piaget’s theory on cognitive conflicts, this contribution investigates whether professional learning activities after errors or feedback incidents are enhanced if the perceived feedback culture (PFC) within an organization is characterized by high quality feedback and an integration of feedback into work practice.

Methodology
Two quantitative, cross-sectional questionnaire studies were carried out. Study 1 focused on professional learning activities after errors (PLA-E) and was conducted among N=206 employees in the insurance industry. Study 2 focused on professional learning activities after feedback (PLA-F) and was conducted among N=244 employees in production and service companies. In both studies, structural equation modelling was employed to test assumptions concerning direct and mediated effects of PFC on PLA-E/PLA-F.

Results
PFC had a positive effect on PLA-E, which was fully mediated by a corresponding safer team climate and, through this, a decreased tendency to cover up errors (Study 1). PFC had a positive effect on PLA-F, which was partly mediated by an increase in extrinsic and intrinsic self-determined motivation (Study 2).

Limitations
As the current evidence is based on cross-sectional, self-report data, the mediated relationship between PFC and PLA-E/PLA-F should be further explored longitudinally and with multiple data sources.

Implications and Value
Our results imply that a healthy PFC provides an essential basis for boosting employees’ self-determination, for strengthening the work climate and, thus, for facilitating professional learning activities. Accordingly, supervisors and employees alike should value and give high quality feedback, and provide support for using feedback.

Presentation 4:

Self-regulation and organizational support in university teachers’ professional learning
Margje van de Wiel (presenting author), Fleurie Nievelstein, Simon Beusaert, and Kathleen Schlusmans

1Department of Work & Social Psychology, Maastricht University, the Netherlands
Purpose
To ensure high quality education, teachers need to learn from their experiences and be supported in their continuous development. At university, where, besides teaching, most staff is highly involved in research, only few studies have been done. Based on theories of deliberate practice and self-regulated learning, the present study examined the learning activities university staff engaged in to improve their teaching practice and how they felt supported in doing so.

Methodology
Semi-structured interviews were conducted with 49 university teachers from two institutions.

Results
Most participants aimed to foster student learning and showed to self-regulate their performance. They monitored their teaching by seeking for feedback and used this information, student evaluations and peer discussions to reflect on their practice. They also reflected automatically while performing teaching tasks to improve their course or skills. They did not make plans to improve their own performance, although most participants wanted to further develop as teachers and all kept up to date on their topic. They felt supported by the organization through workshops, discussion meetings, collaboration and a positive learning climate, but they experienced time constraints and many said they would appreciate more developmental guidance and recognition for teaching.

Limitations
More motivated teaching staff might have participated. Data were obtained from retrospective self-reports.

Implications
Support can be further organized, e.g. by peer coaching and reflection. Intervention studies are needed to monitor and optimize support.

Value
This study showed how universities can build upon self-regulatory practices by promoting quality culture and professional development.

Presentation 5:
Self-regulation of professional learning in everyday medical practice
Katrien Cuyvers (presenting author), Piet Van den Bossche, and Vincent Donche
Faculty of Social Sciences, Department of Training and Education Sciences, University of Antwerp, Belgium

Purpose
Notwithstanding a growing interest in self-regulation of professional learning (SRpL), empirical research is still scarce. If studied, offline cross-sectional self-report techniques are used to measure SRpL retrospectively. This study aims to explore through a new, innovative methodology which overt and metacognitive self-regulation strategies are undertaken in everyday medical practice.

Methodology
A longitudinal multiple case-study design was used, including 13 physicians of different medical specialties. Ethical approval was obtained. A multi-method approach was applied combining long-term observations offering evidence on overt self-regulatory strategies. Observable behaviors were used as cues for in-loco stimulated recall interviews, asking about metacognitive strategies and the content of thoughts regarding a situation at hand. Fieldnotes and audiotaped interviews were transcribed verbatim and integrated in a longitudinal database. The transcripts were analyzed with Nvivo 12 applying principles of content analysis and grounded theory.

Results and limitations
Results show that SRpL is strongly intertwined with self-regulation of performance. Also, metacognitive strategies not included in contemporary frameworks on self-regulated learning are indicated. Exemplary, awareness of learning needs is reported. Overt and metacognitive strategies for learning often originate in performance-goals. Overt learning strategies used to tackle difficulties during job-performance are for example consulting colleagues and guidelines. Metacognitive awareness is difficult to extract and medical specialists often report not to know how to monitor their learning. Reflection and evaluation can hardly be deduced from the data.

Originality
The study forwards a situated methodological perspective which goes beyond the path of retrospective self-report questionnaire-use and contributes to the understanding of SRpL in everyday practice.
State of the Art. In this symposium, we address aspects of leader personality and behaviours, notably combining positive and negative leadership aspects (Gatti et al., Felfe et al.) as well as factors mitigating the effects of negative personality (Genau et al., Kranefeld and Blickle). Finally, an exploratory study addresses an underexplored aspect of personality, namely, vulnerable narcissism.

New Perspectives/Contributions. This symposium addresses previous gaps in the literature, namely the lack of studies combining positive and negative aspects of leadership as well as exploring deeper the dark personality of leaders. Since the contributions of this symposium are theoretically and practically aligned, we included a discussant who focuses on what we can learn from each others’ research. For example, what happens if a vulnerable narcissist also shows transformational leadership. Can Machiavellians be trained to contribute more positively to the organisation?

Research/Practical Implications. The contributions to this symposium have theoretical and practical implication. First, leaders are often not exclusively “bad” or exclusively “good”. However, combinations of behaviour exist in daily organisational life and this symposium acknowledges this reality and explores the consequences of such behaviours or trait combinations. Looking into leader personality also helps organisations and followers to better understand their leaders and device coping mechanisms.

Chair: Barbara Wisse

Discussant: Jan Schilling

Title
Leader Machiavellianism, apparent insincerity, and low leader performance: A multisource moderated mediation analysis

Authors
Hanna A. Genau, University of Bonn, Germany
Gerhard Blickle, University of Bonn, Germany
Nora Schütte, University of Bonn, Germany
Purpose. It is important to understand leaders with high levels of Machiavellianism as their behavior toward team members can form a multiplier of toxic consequences. Machiavellian managers tend to instill distrust and thereby reduce their team’s performance. However, if these managers are socially aware and possess the capacity to form accurate perceptions of their own and others’ behaviors, i.e., if they have social astuteness, they can act as true Machiavellians, i.e., avoid the suspicion of dishonesty although they are manipulative.

Design. We used a multisource design with 153 managers, whose apparent insincerity was rated by 282 subordinates, and leader effectiveness by 153 superiors. We additionally controlled for outer extraneous effects.

Results. We found in a moderated mediation analysis that Machiavellian managers have a negative reputation for sincerity (mediator) and show poor leadership effectiveness (consequence). However, when managers’ social astuteness (moderator) is high, Machiavellianism is not associated with leadership effectiveness.

Limitations. In this study we used a cross-sectionally design. Future studies should address longitudinal effects and investigate additional leadership outcomes.

Research/Practical Implications. We explore the question how Machiavellian leaders can persist and integrate previous findings into a complex model of Machiavellian functioning with recommendations for human resources and leadership research.

Originality/Value. We contribute to the sparse empirical evidence regarding Machiavellians’ actual leadership effectiveness.

Title
The role of social astuteness in counterbalancing leader psychopathic disinhibition: A multisource field study on counterproductive work behavior

Authors
Iris Kranefeld, University of Bonn, Germany
Gerhard Blickle, University of Bonn, Germany

Purpose. This study examined the relation of a core facet of psychopathic personality (i.e., disinhibition) with counterproductive work behavior (CWB) of leaders. We suggested that disinhibition (a facet of the triarchic model of psychopathy characterized by impulsiveness, weak restraint, and difficulties in emotion regulation) would be positively related to CWB. However, underpinned by the concept of successful psychopathy, we further suggested that disinhibition would not be associated with CWB if individuals indicated high levels of social astuteness.
Design. We used a multisource design with 119 leaders, whose CWB was rated by one to four subordinate(s). A moderated regression analysis was used for hypothesis testing.

Results. Results of the moderated hierarchical regression analyses provided strong support for the role of social astuteness in counterbalancing the effects of leader disinhibition with CWB.

Limitations. This study focuses on cross-sectional data and only one leader outcome. Future research should address longitudinal effects and investigate other leadership behaviors.

Research/Practical Implications. Our research contributes to understanding whether and when workers with dark traits really live up to their problematic disposition. Our results indicate first recommendations for personnel selection and development.

Originality/Value. Disinhibition has been deemed the most “toxic” dimension of psychopathy. To our knowledge, we are the first to investigate moderating effects on this trait in the prediction of leader work outcomes.

Title
The behaviour of vulnerable narcissistic leaders

Authors
Birgit Schyns – Neoma Business School, Campus Reims, France
Sarah Gilmore – University of Exeter Business School, Exeter, UK
Iris-Katharina Koch – University of Bamberg, Bamberg, Germany

Purpose. Research into narcissism and leadership research has mainly focused on grandiose or overt narcissism. However, clinical research differentiates a second facet of narcissism, namely vulnerable or covert narcissism. This type of narcissism is harmful to others but difficult to detect. We aim to uncover behaviours of vulnerable narcissistic leaders.

Design/Methodology. We conducted qualitative interviews with followers of vulnerable narcissists. We coded the interviews and used the material to create a questionnaire on vulnerable narcissistic leader behaviour. We followed up with a quantitative study to examine the new questionnaire.

Results. In addition to the categories based on existing instruments (e.g., the HSNS), we found eight new categories in our qualitative study, such as Opacity Of Behaviour/Secrecy, Desire For Control, and Competition And Self-Judgement Avoidance. The strongest emerging theme was micro-management and the exercise of control. The quantitative research is ongoing. Results of factor analyses and correlations to related instruments will be reported.
Limitations. Due to the nature of the phenomenon, the number of interviews we conducted was low. However, we supplemented the information from the interviews with other sources such as case studies and clinical evidence, leading to rich material.

Implications. We found additional dimensions of vulnerable narcissistic leader behaviour adding to those available from personality instrument. This information will help followers and organisations to identify vulnerable narcissistic leaders and create interventions.

Originality/Value. Research on narcissism and leadership is limited to grandiose narcissism. We add to this discussion by conducting in depth research into vulnerable narcissism of leaders.

Title
Investigating constructive and destructive leadership styles together: A pattern approach

Authors
Paola Gatti – Università degli Studi di Torino, Turin, Italy
Birgit Schyns – NEOMA Business School, Reims, France
Claudio G. Cortese – Università degli Studi di Torino, Turin, Italy
Rosalie J. Hall – Durham University Business School, Durham, UK

Purpose. Studies on constructive and destructive forms of leadership have largely progressed separately even though social interactions – such as that between leader and follower – often mix aspects of these forms (Skogstad, et al., 2014) and leadership styles can overlap to some degree (Yan, et al., 2014). It thus is important to bridge this gap by investigating positive and negative leadership styles together.

Design/Methodology. Pattern-oriented methods – which identify meaningful clusters based on a pattern of dimensions (Foti & McCusker, 2017) – can be fruitfully used to understand how leadership styles combine. Two studies testing this idea are presented: the first on a sample of Italian nurses (N=718), and the second on a varied sample of UK workers (N=741). In both cases, respondents reported on their direct supervisors’ leadership styles. Patterns combining positive and negative styles were identified through latent profile analysis of the resulting data.

Results. Profiles in the two studies show some common points and relate to followers’ outcomes (e.g., perceived organisational support, job satisfaction, emotional exhaustion, and a few more).

Limitations. Because leaders’ profiles were based on followers’ perceptions, the perceptions could reflect the followers’ characteristics in addition to leaders’ actual behavior.
Implications. Our findings contribute to the discussion of how constructive and destructive leadership naturally occur in combination, and how they affect follower outcomes, thus providing a more realistic picture of leaders’ behaviour and follower experiences.

Originality/Value. This is the first study which uses latent-profile analysis combining multiple leadership styles ranging from destructive to constructive.

Title
How does leaders’ narcissism change the impact of positive and negative leadership from a follower perspective

Authors
Felfe, J., Helmut-Schmidt-Universität, UniBw Hamburg, Germany
Klebe, L., Helmut-Schmidt-Universität, UniBw Hamburg, Germany
Klug, K., Helmut-Schmidt-Universität, UniBw Hamburg, Germany
Bergner, S., Institut für Unternehmensführung und Entrepreneurship, Karl-Franzens Universität Graz, Austria

Purpose: While research has examined direct relationships between leaders’ abusive behavior and dark personality and outcome criteria, it is unknown how the perception of narcissism may influence the relationship between leadership behavior and outcome criteria in terms of allowing exerting influence. Examining the interplay of personality and leadership behavior may deepen the understanding of the influence of leadership on commitment, OCB, resources and strain. For example, we postulate that the perception of narcissism may neutralize the positive effect of TfL on commitment, because the underlying motives of positive surface behavior are considered as selfish and non-credible.

Method: Hypotheses were tested in two cross-sectional studies with N = 695 and N = 247.

Results: As expected, abusive LS and TfL are highly negatively related in study 1. As postulated the relationships between TfL and commitment, OCB and resources are lower if leaders are perceived as narcissistic. Relationships between TfL, abusive LS and narcissism were similar in study two. However, narcissism only moderated the relationship between LS and strain when leaders were supposed to experience high stress.

Limitations: Cross sectional designs are limited in terms of causality.

Implications: Besides leader behavior, followers’ information processing also integrates leaders’ personality and contextual factors when it comes to allow influence. This study can be seen as a starting point to better understand what happens in the mind of perceivers of narcissism.
**Originality:** To our knowledge this is the first study to examine the interplay of personality, behavior and context from a followers’ perspective.
155 - SYMPOSIUM DESTRUCTIVE LEADERSHIP (1): LEADER BEHAVIOUR AND STYLES

Proponent:

Birgit Schyns, Neoma Business School, France

State of the Art. In this symposium, we address aspects of leader destructive behaviour and style, thereby spanning a wide range of leader behaviour and leadership styles, such as (un-)ethical leadership, self-serving leadership, and inconsistent leadership, as well as problematic outcomes of independence at work and humour. In some cases, the leader might be aware of the issues they are creating, in other cases, they might do so without realising the effect of their behaviour on others.

New Perspectives/Contributions. Contributions to the symposium used innovative approaches such as actor-partner models, experimental studies, and mixed methods approaches. Context differ between the contributions including samples taking into account the context of the leader behaviour (e.g., organizational change, strong competition, and the military context), thus highlighting the breadth of leadership and its connection to context as a boundary condition. The connection between the contributions will stimulate an in depth discussion led by our discussant, fostering links between the presented approaches and avenues for future research.

Research/Practical Implications. In this symposium, we focus on negative aspects of leadership, highlighting issues that can arise out of such negative aspects. This is (still) an underdeveloped area of research, on the one hand, and, on the other hand, has been shown to be highly relevant in the organisational practice. In our symposium, we will jointly developed future areas of research as well as recommendations for organisational approaches to the prevention of negative leadership.

Discussant: Joerg Felfe

Presentations

Title

Don’t humor me: Leader negative humor styles, employee trust and outcomes

Authors

Pedro Neves, Nova School of Business and Economics

Gokhan Karagonlar, Dokuz Eylül University, School of Business

Purpose. Most research on leader humor has focused on its positive effects on employee outcomes. Nonetheless, its detrimental consequences, if misplaced or used poorly, have also
been documented, albeit more rarely. Moreover, research has provided inconsistent findings for the humor-performance relationship. Our study examines a) whether negative humor styles are related to performance and deviance; b) its underlying mechanisms; and c) who might suffer the most from the use of negative humor.

**Design/Methodology/Approach/Intervention.** Our final sample was composed by 428 employees and their 151 supervisors from 19 services organizations. Employees rated leader humor and trust in the supervisor and the organization; supervisors rated each employee’s performance and deviance.

**Results.** Negative leader humor styles (aggressive and self-defeating) reduced performance and heightened deviance via decreased trust in the supervisor. Both humor styles were also related to trust in the organization. None of these relationships was shaped by employees’ core self-evaluations.

**Limitations.** Cross-sectional design. The limited number of mechanisms examined.

**Research/Practical Implications.** Our study is part of an emerging literature that shows that leader humor does not always entail positive consequences and examines the underlying process. Organizations should train leaders on the use of humor, particularly on the distinction between positive and negative humor. They should also develop a culture where aggressive and self-defeating humor is not tolerated.

**Originality/Value.** One of the few studies to examine the effects of leader negative humor and extends our knowledge of the humor-performance relationship, which has yielded inconsistent findings, namely its mechanisms.

**Title**

When a leader resource can be ambivalent or even destructive: Independence at work as a double-edged sword

**Authors**

Paola Gatti – Department of Psychology, Università degli Studi di Torino, Turin, Italy

Michelle C. Bligh – Division of Behavioral & Organizational Sciences, Claremont Graduate University, Claremont, CA, US

Claudio G. Cortese – Department of Psychology, Università degli Studi di Torino, Turin, Italy

**Purpose.** Independence at work (IaW), or job autonomy, is commonly seen as a job resource fostering well-being at work (Bakker & Demerouti, 2007). Paradoxically, autonomy is embedded in a relationship (Baxter & Montgomery, 1996), and employees’ independence hinges on leaders’ willingness to grant it. However, leader’s independence may not always be appreciated by employees: it can share some points with certain destructive leadership styles,
and can make the exchange with the follower too weak. Analyzing this resource in the framework of the leader-follower relationship can thus be useful.

**Design/Methodology.** We present two Actor-Partner Interdependence Models (APIMs, Kenny, Kashy & Cook, 2006) with leaders’ and followers’ IaW as antecedents, and work engagement and emotional exhaustion as outcomes. Our primary focus is on the partner effects between leaders’ IaW and followers’ outcomes.

**Results.** Using a paired sample of 112 workers in the UK, we found significant actor effects and a positive partner effect between leaders’ IaW and followers’ exhaustion.

**Limitations.** Limitations include our use of cross-sectional data and the lack of measures of leadership styles permitting a better interpretation of our findings.

**Implications.** Findings emphasize the utility of a dyadic perspective for investigating work well-being, show a shortcoming of IaW that behaves as an “egotistic job resource”, and suggest improvements for leadership training and measures fostering well-being.

**Originality/Value.** Investigating job resources (and demands) which have a relational basis (such as IaW) in the framework of the leader-follower relationship sheds new light on well-being at work.

**Title**

“This way today and totally different tomorrow” – An interview study on the practitioner’s view of inconsistent leadership

**Authors**

Jan Schilling, University of Applied Administrative Sciences Hannover, Germany

Daniel May, Freie Universität Berlin, Germany

Birgit Schyns, Neoma Business School, Campus Reims, France

**Purpose:** Perceived consistency, and even more so inconsistency (e.g., in terms of behavioural variation across similar situations), is an important factor in the evaluation of other people, especially leaders, whose behaviour is typically closely monitored and interpreted by their followers. The paper presents first empirical evidence concerning the newly introduced concept of inconsistent leadership (IL) to compare scientific conceptions and everyday beliefs of the phenomenon.

**Design/Methodology /Approach/Intervention:** A qualitative study on the content and structure of practitioners’ (managers and personnel experts) conceptions of inconsistent leadership is presented. Using semi-structured interviews, thirty practitioners were asked about their conceptions of inconsistent leadership, its antecedents and consequences.
Results: Results show that the concept of inconsistent leadership is associated with a wide array of aspects: especially discrepancies between goals, decisions, statements and behaviours of the leader over time, but also unequal treatment of followers. Inconsistent leadership was causally attributed to both the environment of the leader and his personality. The main consequences included negative follower feelings and attitudes, and destructive follower behaviour.

Limitations: Possible limitations of the study with regard to biases due to the specific sample and social desirability effects are discussed.

Research/Practical Implications: The comparison between everyday concepts of practitioners and the theoretical concept of IL provides a promising foundation for future research and starting points for leader- and follower-focused interventions.

Originality/Value: We offer first empirical evidence concerning a new leadership concept that addresses a largely overlooked aspect of leader-follower interactions.

Title

Self-serving Leadership as a Consequence of Leader Fear of Losing Power and Competitive Climate

Authors

Barbara Wisse, University of Groningen, The Netherlands, Durham University, UK

Diana Rus, University of Groningen, Creative Peas, The Netherlands

Anita C. Keller, University of Groningen, The Netherlands

Purpose: The purpose of the study is to further our understanding of the negative downstream consequences of leader fear of power loss. Having power offers access to numerous tangible and intangible benefits. The fear of losing this control over valued resources may, so we argue, fuel leader self-serving tendencies. Moreover, we expect that such effects may be particularly strong in environments that are characterized by a strong focus on competition and rivalry, because such environments further facilitate low concern for others’ outcomes.

Methodology: Three studies were conducted: (1) one two-wave study among students active in boards of student associations; (2) one multi-source study with a sample of leaders and followers in Dutch organizations; (3) one online experimental study.

Results: Leader fear of losing power seems indeed positively related to their self-serving behavior. Moreover, this relationship appears to be stronger in organizational climates that are more competitive.
Limitations: Power loss has rarely been studied. We need much more information on the phenomenon and future research may incorporate potential mediators and distinguish different sources of fear of power loss.

Implications: A threat of power loss is a reality for many leaders, therefore insights into its potential downstream effects are crucial. Our research suggests that interventions geared at fostering leaders’ sense of safety regarding their positions, ideally, combined with interventions focused on curbing a competitive climate might be particularly fruitful.

Value: Our study suggests that the potential effects of (anticipated) power loss may deserve more attention than previously awarded in the literature.

Title
Reporting Unethical Behavior: Moderating Role of Leader’s Gender and Behavior

Authors
Paul J. Hanges, University of Maryland, USA
Jordan J. Epistola, University of Maryland, USA
Jeffrey W. Lucas, University of Maryland, USA
Col. Todd D. Woodruff, United States Military Academy, USA
Kelly A. Beavan, University of Maryland, USA

Purpose. Ongoing scandals in private/public institutions has eroded trust of these institutions. Almost daily, we hear about business/government officials who have embezzled, perjured, or sexually harassed someone. Whistleblowing plays an important role in reducing such behaviors. Unfortunately, negative consequences reduce willingness to report such behaviors. This study examines factors that affect perceptions of the offender and behavior immorality and the appropriateness of whistleblowing.

Methodology. We collected data from 298 US Military cadets. In a policy capturing study, cadets evaluated four vignettes in which the gender and leadership status (i.e., leader/peer) of the offender as well as the type (drunk/sexual harassment) and severity (affects victim/entire unit) of unethical behavior varied.

Results. Severity and type of behavior had main effects on perceptions. Cadets viewed the offender and behavior more negatively and whistleblowing as more appropriate when sexual harassment was involved and the entire unit was affected. Several two-way interactions were found (e.g., offender gender moderated the behavior type-perception relationship). Also, cadets’ conformity to masculine norms, social dominance, and liberal/conservative attitudes regarding both social/economic matters affected perceptions.
Implications/Limitations. Reporting unethical behavior is affected by both offender and observer characteristics. Organizational climate/culture that enhances reporting depends on understanding how these characteristics affect perceptions. The use of vignettes as opposed to experimentation is a limitation of this work.

Originality/Value. The cadet sample is a major strength of this study. The US Military Academy already has a formal culture intolerant of unethical behavior. Despite this culture, cadets still meaningfully differed in their perceptions of the behavior, the offender, and reporting appropriateness.

Title

Change-related Unethical Leadership and Follower Resistance to Change: A Conceptual Model

Authors

Daniel May, Freie Universität Berlin, Berlin, Germany
Olga Moutousi, NEOMA Business School, Reims, France

State of the Art. As an important asset for successful organizational change, theory and research emphasize the significance of change recipients’ attitudes and reactions to the change initiative. From an organizational perspective, resistance is the most critical reaction, as it has the potential to cause costs and delays and may eventually even stall the change process.

New Perspectives/Contributions. We develop a theoretical model that delineates how change-related unethical leadership can trigger follower resistance to change and how ethics-related follower characteristics influence followers’ perceptions of change-related unethical leadership as well as their specific resistance reactions. Change-related unethical leadership is introduced as a perceptual phenomenon, depending not on leader behavior alone, but also on followers’ normative framework and leadership expectations. We further discuss how follower rationalization strategies for their involvement in unethical acts as well as their expectations regarding fair interpersonal treatment impact their cognitive, affective and intentional resistance reactions.

Research/Practical Implications. Our model offers testable propositions to inspire empirical research, for example through field studies during change processes in organizations. Additional lab studies could help to specifically test the moderation assumptions we make, for example with regard to follower perceptions of change-related unethical leadership.

Originality/Value. Our model extends the literature on resistance to change by illustrating the influence process of change-related unethical leadership. Moreover, it highlights a specific form of ethical followership, based on the notion that through resisting change-
related unethical leadership, followers do not only protect their own ethical position, but ultimately also support their organization as a whole.
RESPONDING TO THE UNFORESEEABLE: THE EFFECTS OF BEHAVIOURAL AND ENVIRONMENTAL FACTORS ON TEAM ADAPTATION AND PERFORMANCE

Proponents:

Eleni Georganta¹, Surabhi Pasarakonda²

¹Ludwig-Maximilians-Universitaet Muenchen, Munich, Germany
²ETH Zurich, Department of Management, Technology and Economics, Zurich, Switzerland

Discussant:

Travis Maynard

Department of Management, Colorado State University, Fort Collins, CO, USA

State of the Art. Research on teams operating in intense, unpredictable and high risk environments such as firefighting and medical teams is growing. However, evidence on the underlying mechanisms of how teams respond to critical situations remains scarce. Studies investigating these mechanisms are needed because failing to adapt to unpredictable events has detrimental effects on teams and their surroundings.

New Perspectives/Contributions. Consequently, this symposium aims at providing insight into the underlying behavioral and environmental factors that impact team adaptation during critical situations. Santos et al. conduct experiments to investigate how a concept mapping intervention influences shared cognition and reacquisition adaptation after a task change using emergency simulation. Schmutz explores the effect of team reflexivity before and during a crisis on coordination and shared mental model using computer simulation. Georganta et al. focus on two types of adaptive demands (internal/external) in rescue teams and investigate their impact on coordination, trust, performance, and cohesion during critical situations. Pasarakonda et al. provide insight into the relationship between task complexity, unexpected events and performance of surgical teams and highlight the benefits of coordination centrality of specific role holders. Finally, Marques-Quinteiro et al. investigate firefighters extrication courses to understand how the accumulation of multiple unpredictable events affects shared cognitions, coordination and emotional reactions and thus team adaptation.

Research/Practical Implications. Addressing the impact of various factors on team behaviour during critical situations with unique samples, varied methodologies and research designs, this symposium offers implications for research and team training to promote successful team adaptation under critical circumstances.

Getting Teams to Recover after a Change in a Task: The Effect of a Concept Mapping Intervention on Shared Cognition, Team Performance and Adaptation

Catarina Marques Santos

Maastricht University, School of Business & Economics
Purpose: This study analyzes the effect of a concept mapping intervention on shared cognition (task mental model and transactive memory system) development; and on the drop in performance immediately following a task change (transition adaptation) and the subsequent reuptake of performance (reacquisition adaptation). This study also analyzes the mediating effects of shared cognition between the intervention and team adaptation.

Methodology: We conducted two laboratory experiments in two European Universities (30 teams and 44 teams, respectively). Teams worked on an emergency management simulation by performing six tasks. We collected survey data to measure shared cognition. We used the costs of each task to operationalize team performance and adaptation. We conducted discontinuous growth modelling to analyze data.

Results: Findings suggest that: concept mapping promotes the development of shared cognition; concept mapping promotes reacquisition adaptation; and task mental models mediate the effect of concept mapping on reacquisition adaptation.

Limitations: The generalization of the results to “real” world teams has to be make with caution, as we used two experimental studies.

Research/Practical Implications: This research provides insight into the way shared cognition develop over time, and into the way teams relearn changed tasks. This research presents concept mapping as a practical intervention to be used by organizational and business teams.

Originality/Value: We introduce concept mapping as a promising practical intervention that promotes the development of task mental models and transactive memory system, and that increases the team’s ability to recover after a change in a task.

Don’t Crack Under Pressure: Team Reflexivity as a Means to Enhance Team Functioning in Crisis Situations

Jan B. Schmutz
Department of Communication Studies, Northwestern University, Evanston, Illinois,

Purpose: Teams in crisis situations (CS) need to adapt to changing circumstances and process emergent information during task performance. Team reflexivity (TR)—the extent to which group
members overtly reflect upon and communicate about the group’s objectives, strategies and processes—represents a powerful team process to foster team functioning in CS. Teams can either reflect before (pre-action TR), during (in-action TR) and after (post-action TR) the performance event. However, the implications of pre-action and in-action TR on team functioning and performance in CS are not well understood.

**Methodology:** We manipulated pre-action TR and in-action TR in a control-group design using the crisis simulation C²Fire. Besides demographic variables coordination, shared mental model and team performance is assessed. Subjects are university students.

**Results:** Data assessment is ongoing. Preliminary results show that pre-action TR as well as in-action TR is positively related with coordination and shared mental models within a team.

**Limitations:** The study is conducted with students only, using a computer simulation. Future studies need to investigate if the results can be generalized to crisis teams in field settings.

**Research/Practical Implications:** Our results will advance the understanding of reflection during various stages of teams and uncover the effects that reflection has on team functioning and performance therefore informing future trainings of crisis teams.

**Originality/Value:** To date no study investigated the effect of pre-action TR or in-action TR on coordination or emergent states in CS. Our results will advance understanding how and under what conditions reflection has performance implications in crisis teams.

**Rescue Forces in Action:**

**The Impact of Contextual Demands on Team Performance and Team Cohesion**

Eleni Georganta
Clara Köhler
Jasmin Niess
Felix Brodbeck
Ludwig-Maximilians-Universitaet Muenchen

**Purpose:** The goal of our study is to explore the contextual and psychological mechanisms affecting team cohesion in rescue forces. We investigate the positive influence of team coordination and mutual trust (during operation) on team cohesion (after operation) and analyze the mediating role of team performance. We further explore the moderating effect of the operation’s contextual demands (origin of operation, origin of adaptive demands) on the relationship between mutual trust/coordination, team performance, and team cohesion.

**Methodology:** Seventy-two members of different rescue teams completed an online questionnaire. Participants described one routine and one crisis operation and then selected the categories reflecting the origin of each operation (man-made or natural disaster) and the type of the facing demands (internal or external). Team coordination, mutual trust, team performance, and team cohesion were also assessed.
Results: Team performance mediated the positive relationship between mutual trust/team coordination and team cohesion. Findings demonstrated that the positive mediating relationship between team coordination, team performance, and team cohesion was weaker in the face of internal than of external adaptive demands. In crisis compared to routine operations, team coordination was lower.

Limitations: Common-source bias; retrospective assessment of operations; individual-level data.

Research/Practical Implications: We reflect the importance of contextual demands on crisis operations and suggest integrating them in training to enhance the team’s adaptive capacity and performance.

Originality/Value: We incorporated contextual demands when investigating crisis operations and extended recent findings by showing the negative impact of internal adaptive demands on team functioning not only during, but also after operation completion.

Variabilities in the Operating Room: The Importance of Core Team Members’ Coordination Centrality for Surgical Performance

Surabhi Pasarakonda
ETH Zurich, Department of Management, Technology and Economics, Zurich, Switzerland

Jan B. Schmutz
Department of Communication Studies, Northwestern University, Evanston, Illinois

Gudela Grote
ETH Zurich, Department of Management, Technology and Economics, Zurich, Switzerland

Jasmina Bogdanovic
Institute of Nursing Science, University of Basel, Basel, Switzerland

Merlin Guggenheim
Swissparc, Zurich, Switzerland

Tanja Manser
University of Applied Science and Arts Northwestern Switzerland, Olten, Switzerland

Purpose: In line with the theory of strategic core role holders (SCRH) this study investigates the importance of having a SCRH who is central to the team’s coordination in surgical teams. We point out how the coordination centrality of a SCRH can mitigate the negative effects of variabilities (e.g.: task complexity or unexpected events) during various operation phases on surgical performance.

Methodology: We conducted 30 live observations at a major Swiss University Hospital to observe coordination behaviour in surgical teams. Using Lag-sequential-analysis and network analysis we investigated the coordination centrality of specific role holders. Additionally, the main surgeon assessed the complexity of the operation, the occurrence of unexpected events as well as the surgical performance.
Results: We found that teams benefit from having a SCRH who is central on team coordination. Coordination centrality of the SCRH buffered the negative effects of variabilities during various operation phases on surgical performance.

Limitations: Since we only observed one type of operation generalizations of our results to other medical and non-medical teams need to be made with caution.

Research/Practical Implications: Studies with live observations of “real” teams especially in medicine are scarce. Therefore, our results can help improve teamwork in health care which in turn has practical relevance in terms of increasing patient safety.

Originality/Value: This study links the strategic core role theory with team coordination and performance and thereby highlights the importance of having a SCRH. Our results help to improve coordination behaviour of teams when it comes to responding to unforeseen situations.

Team Adaption to Multiple Unpredicted Events During the Extrication of Road Accident Victims

Pedro Marques-Quinteiro
William James Center for Research, ISPA- Instituto Universitário

Ramón Rico
UWA Business School, The University of Western Australia

João Marôco
William James Center for Research, ISPA- Instituto Universitário

Purpose: We test how extrication teams adapt to the accumulation of multiple unpredictable events happening during a single extrication episode. We expect that team adaptation is slower when teams confront a set of accumulating unpredictable events that are incompatible (adapting to one event prevents the team from adapting to the other) rather than compatible (teams can adapt simultaneously to both events). We also expect that shared cognitions, coordination, and emotional reactions relate to team adaptation.

Methodology: This study follows a quasi-experimental design with multiple unpredicted events as a between-subjects factor. We analyse at least five extrication courses for professional urban firefighters. Data collection is done using a temporal, multi-method (i.e., questionnaire; audio; video), and multi-source (i.e., team leader; team members) approach.

Results: Data collection ends in December 2018.

Limitations: Small number of teams (≤ 30).

Research/Practical Implications: This research extends previous knowledge by examining team adaptation to multiple unpredictable events. The research findings will be helpful for developing training programs aimed at improving teamwork capacity in extrication teams, as well as other teams performing under extreme conditions presenting either compatible or incompatible series of events.

Originality/Value: The added value of this work is showing that teams do not adapt exclusively to a single change, but mainly to a cascade of changes which present different degrees of compatibility.
This fact has not been addressed in extant research; thus, our work testing how urban firefighter extrication teams adapt to the accumulation of multiple unpredictable events is new.
State of the Art. In the past two decades, work engagement has established itself as an important construct with significant implications for employees and organizations at large. Engaged employees are full with energy and dedicated to their work; as a consequence, they are creative, productive, and prosocial. Now that research has revealed the most important predictors and outcomes of work engagement, it is time to explore what’s next.

New Perspectives/Contributions. This symposium brings together five empirical contributions from four countries, namely Germany, Greece, Australia, and The Netherlands. All contributors use sophisticated research designs to study work engagement, and show that proactive employee behaviors (e.g., job crafting, personal initiative) are crucial for work engagement and performance. However, the symposium expands previous literature by showing that certain types of proactive behavior (a) may lead to abrupt changes in work engagement, and (b) are most effective when aligned with supervisor behaviors and employee strengths use. Moreover, the contributions show that work engagement fluctuates not only at the day, but also at the task level, and will show whether improvements in the quality of social encounters at work lead to greater engagement with work.

Research/Practical Implications. The studies presented in this symposium clearly suggest that work engagement fluctuates from day to day and from task to task, and thus is malleable. Organizations may want to improve work engagement and performance by using top-down interventions, or by facilitating daily bottom-up proactive employee behaviors – for example through daily transformational leadership.

Work Engagement: Let’s Take Tasks More Seriously
Sabine Sonnentag
University of Mannheim, Germany

Purpose. This presentation discusses work engagement from a task perspective. Recently, it has been suggested that work engagement does not only differ between persons and does not only fluctuate within persons (e.g., from day to day), but that it varies from task to task as well (Sonnentag, 2017; cf. also Oerlemans & Bakker, in press). The present study empirically examines the degree to which work engagement differs from task to task and whether task characteristics are related to work engagement at the task level.
Design/Methodology/Approach/Intervention. In an online survey, 259 persons identified three of their core work tasks. For each task, participants reported task-specific work engagement (Schaufeli & Bakker, 2004) and task characteristics, using five dimensions of the Job Characteristics Model (Hackman & Oldham, 1976).

Results. ICC for task-specific work engagement was .22, suggesting that more than 70% of the variance in work engagement resides at the task level. Multi-level analysis further showed that task characteristics predicted work engagement at the task level.

Limitations. The study design does not allow any conclusions about the potential influence of objective versus perceived job characteristics.

Research/Practical implications. Future studies should examine for whom and when task characteristics are particular powerful predictors of work engagement. The study emphasizes the importance of task design in order to foster work engagement.

Originality/Value. This study demonstrates that capturing work engagement only at the person or day level may fall short in fully understanding the engagement phenomenon.

Job crafting and work engagement:
Probing nonlinear effects with catastrophe theory models

Despoina Xanthopoulou (presenting author)
School of Psychology, Aristotle University of Thessaloniki, AUTH Campus, GR-54124, Thessaloniki, Greece.

Dimitrios Stamovlasis
School of Philosophy and Education, Aristotle University of Thessaloniki

Purpose. To shed light on previous findings suggesting that not all job crafting strategies are (equally) favorable for employee motivation, we applied catastrophe theory to explore the possibility that nonlinear changes occurring in job crafting may explain changes in work engagement. We hypothesize that increasing social and structural job resources will have a positive, linear relationship with engagement, while increasing challenging job demands and decreasing hindering job demands will act as bifurcation factors inducing abrupt changes in engagement.

Design/Methodology/Approach/Intervention. Cross-sectional data from a heterogeneous sample of 193 employees were analyzed using the probability density function and a maximum likelihood method performed in R.

Results. Cusp models proved superior to linear alternatives. Increasing social resources functioned as an asymmetry factor for vigor and dedication. Increasing structural resources was the asymmetry factor
for absorption. The bifurcation factors were decreasing hindering demands for vigor and increasing challenges for dedication and absorption, respectively. The latter suggests that threshold values exist, beyond which sudden changes in work engagement occur.

**Limitations.** The cross-sectional nature of the study and its exploratory character are main limitations.

**Research/Practical implications.** Enhancing work engagement requires increasing job resources and controlling the threshold values of decreasing hindering demands and increasing challenges at work.

**Originality/Value.** This is the first study applying catastrophe theory in work engagement research. The supported nonlinear models help explain the inconsistencies of previous studies regarding the (un)favorable effects of job crafting and have epistemological implications by suggesting that the underlying processes are better viewed as a complex dynamical system.

**Testing a Workgroup-Based Approach (SCORE) to Improving Workplace Civility and Work Engagement**

Michael P. Leiter, PhD
Professor of Organisational Psychology, Deakin University, Geelong, VIC Australia

**Purpose.** SCORE (Strengthening a Culture of Respect and Engagement) addresses workplace civility through five facilitated sessions. The process begins with increasing participants’ awareness of both the blatant and the subtle forms of social encounters. It proceeds to coaching participants in actions that increase the frequency of explicitly civil encounters and in effective responses to incivility. In light of established positive relationships of civility with work engagement, it is hypothesized that improvements in workplace civility will mediate improvements in work engagement.

**Design/Methodology/Approach/Intervention.** This presentation reviews a pilot of SCORE with an Australian health district comprising hospitals and outpatient facilities in 2018. A baseline survey included 235 respondents from 9 organisational units. SCORE was implemented in five units between May and November 2018. The survey was repeated after Wave 1 (September) and after Wave 2 (December).

**Results.** The Baseline survey confirmed work units varied on measures of both civility and incivility indicating a need for improvement in collegial relationships. Work engagement measured with the UWES was relatively low.
Limitations. The post-test surveys have not occurred at this time but will be available for the conference.

Research/Practical Implications. The research examines the impact of a facilitated group process for improving workplace relationships. It examines the extent to which improvements in the quality of social encounters at work lead to greater engagement with work.

Originality. Despite considerable attention to the sources and consequences of workplace incivility, few studies have tested interventions with contrasts with control groups. Changing something for the better deepens understanding.

Employee work engagement and supervisor-rated performance:
Uncovering the role of employee and supervisor crafting

Evangelia Demerouti
Eindhoven University of Technology, the Netherlands

Purpose. The aim is to uncover which factors strengthen the link between employee work engagement and supervisor-rated task, adaptive, and contextual performance. The focus was on employee and supervisor job crafting as it represents attempts to make work more meaningful and increase person-job fit. We hypothesize that the positive link between employee work engagement and supervisor-rated performance will be stronger, when both employee and supervisor job crafting are high as this signals that employee crafting is accepted and even stimulated by the supervisor.

Design/Methodology/Approach/Intervention. Data from 188 employees and their supervisors were collected. Employees reported their work engagement and job crafting, whereas supervisors rated their own job crafting and employee task, adaptive, and contextual performance.

Results. Regression analysis supported the expected three-way interaction effects for three of the nine possible interactions. Specifically, the relationship between work engagement and adaptive and contextual performance was positive and stronger when both employee and supervisor were high on seeking challenges compared to low (which was the second strongest) or non-matching. The relationship between work engagement and task performance was positive and stronger when both employee and supervisor reducing demands were high or low.

Limitations. The study is cross-sectional, allowing no causal inferences.
Implications. Findings suggest the importance of job crafting as a way to improve employee functioning and the role of the supervisor in creating a context in which such behaviors are accepted.

Originality. Suggesting the fit between employee and supervisor job crafting behavior as determinant of effective employee functioning is original.

Transformational Leadership and Work engagement:
Exploring the Daily Process

Arnold B. Bakker (Presenting author)
Erasmus University Rotterdam, The Netherlands

Jorn Hetland, Olav Kjellevold-Olsen & Roar Espevik
University of Bergen, Norway

Purpose. Transformational leadership may have important consequences for employee work engagement, because on the days leaders use individual consideration and inspirational motivation employees have access to important job and personal resources. In the present research, we propose that transformational leadership may be related to employee work engagement and performance through (a) employee strengths use and (b) employee personal initiative.

Design/Methodology/Approach/Intervention. A total of 57 naval cadets (mean age 23 years; 90% males) who travelled with a sail ship from Northern Europe to North America filled out a diary questionnaire for 30 days – resulting in 1533 data points (response rate is 68%). The questionnaire included scales for transformational leadership, personal initiative, strengths use, and work engagement. In addition, two colleagues rated the focal cadet’s job performance on each day. We used Mplus to test indirect effects.

Results. As hypothesized, results showed that transformational leadership was indirectly related to next-day work engagement through strengths use and personal initiative. The indirect effect of transformational leadership on next-day performance was significant through first strengths use and then work engagement, but this sequential indirect effect was not significant through personal initiative.

Limitations. The study clearly indicates that leaders may facilitate employee work engagement and performance by facilitating strengths use and personal initiative, but the indirect effects were small.

Research/Practical implications. The findings suggest that leadership interventions could follow a daily approach.
Originality/Value. This study answers the call for research on the processes through which transformational leadership has an influence on follower work engagement and performance.
Chair: Rolf van Dick (Goethe University Frankfurt, Germany),

Discussant: Steffen Gießner (Erasmus University, Rotterdam, The Netherlands)

Abstract: This symposium comprises four presentations on new research on Identity Leadership. In the first presentation, Nik Steffens et al. present results from a recent meta-analysis of 117 independent samples on leader group prototypicality. As in previous research and social identity-based theorizing, they found a moderate-sized effect on multiple indicators of leadership effectiveness. However, recent work from a social identity perspective claims that identity leadership goes beyond prototypicality and suggested three additional dimensions, namely identity advancement, entrepreneurship and impresarioship. All four dimensions have been included in the Identity Leadership Inventory (ILI). In the second presentation, Rolf van Dick et al. will show that the ILI is a reliable and valid instrument in more than 20 countries and that it explains variation in follower attitudes and (self-reported) behaviors above and beyond established leadership constructs. Using the same data set of almost 6,000 participants, Jérémy Lemoine et al. will then go into the details of the four dimensions of the ILI and present analyses on the interplay between them (profiles). In the fourth presentation, Sut I Wong and colleagues show specific analyses focusing on two countries (Norway and North America) and on one ILI dimension, namely identity entrepreneurship and they show that identity entrepreneurship relates to LMX which in turn relates to innovative behavior – but that this mediation was only reliable in the North American sample. Finally, Steffen Gießner will serve as discussant, comment on the studies and get the audience involved.

Individual presentations

1. Title

A meta-analytic review of leader group prototypicality and leadership effectiveness

Authors and Affiliations

Nik Steffens (The University of Queensland), Katie Munt (The University of Queensland), Daan van Knippenberg (Drexel University), Michael Platow (Australian National University), Alex Haslam (The University of Queensland)

Purpose

The social identity theory of leadership asserts that leadership effectiveness is impacted by leaders’ group prototypicality (the extent to which a leader is perceived to embody shared social identity). Evidence supports this proposition, but the theory is limited in specifying core characteristics of group prototypicality. Here, we advance the theory by addressing these issues.

Design
We conducted a systematic review and meta-analysis of leader group prototypicality effects comprising 117 independent samples (234 effect sizes; N=29,739 individuals globally).

**Results**

This analysis reveals a moderate-sized effect of leader group prototypicality on indicators of leadership effectiveness ($r = .39, 95\%\text{CIs} [.34, .43]$). Results hold not only for evaluative but also for behavioral outcomes. In addition, they show that this effect is stronger when prototypicality is operationalized as the leader being an ideal rather than a typical group member, stronger for group members in formal rather than informal leadership roles, and for strong as compared to weak group prototypes. Finally, meta-analytic results consolidate effects for moderators that have been examined in primary research: follower group identification and leader group-oriented behavior.

**Limitations**

There are other alternative pathways to manage group identity and the present work provides little insight into how group prototypicality combines and interacts with other aspects of identity leadership.

**Implications**

This work underscores the value of understanding, examining, and practicing leadership as a group-based process that is shaped by shared social identity and leader group prototypicality.

**Originality/Value**

Results shed new light on several key features that characterize the nature and impact of leader group prototypicality.

2. **Title**

Identity Going Global: A validation study across cultures

**Authors and Affiliations**

University, United Kingdom), Juan Antonio Moriano (UNED, Spain), Pedro Neves (Nova School of Business & Economics, Portugal), Gábor Orosz (Stanford University, USA and Hungarian Academy of Science, Budapest, Hungary), Diwakar Pandey (Tribhuvan University, Kathmandu, Nepal), Christine Roland-Lévy (University of Rheims Champagne-Ardenne, France), Sebastian Schuh (China Europe International Business School, Shanghai, China), Tomoki Sekiguchi (Kyoto University, Japan), Lynda Jiwen Song (Renmin University of China, Beijing, China), Jeroen Stouten (KULeuven, Belgium), Srinivasan Tatachari (Indian Institute of Management Udaipur, India), Daniel Valdenegro (Pontificial Catholic University of Chile, Santiago, Chile), Lisanne van Bunderen (Erasmus University, Rotterdam, The Netherlands), Viktor Vörös (Hungarian Academy of Science, Budapest, Hungary), Sut I Wong (BI Norwegian Business School, Oslo, Norway), Xin-an Zhang (Jiao Tong University, Shanghai, China), & S. Alexander Haslam (University of Queensland, Australia)

Purpose

Many studies have shown that more prototypical leaders are more effective. Haslam et al. (2011) identified three further dimensions of identity leadership, namely identity advancement, identity entrepreneurship, and identity impressarioship. All four dimensions have been operationalized with the Identity Leadership Inventory (ILI; Steffens et al., 2014). The purpose of the – ongoing – ILI-Global project was to apply and validate the ILI scales across countries and cultures.

Methods

The present presentation presents results of the ILI-Global, which applies and validates the ILI scales by gathering data from all six continents and more than 20 countries with almost 6000 participants. The ILI was translated (using back-translation methods) and used in online surveys along with other measures of leadership (LMX, transformational and authentic leadership) and employee attitudes and (self-reported) behaviors (e.g., satisfaction, identification, citizenship behaviors) in 15 different languages.

Results

We show that the four dimensions of the ILI are distinguishable and that they contribute to the prediction of work-related attitudes and behaviors above and beyond other influential leadership constructs.

Limitations

The study design was cross-sectional and used self-report data.

Implications

The results show that identity management is an important aspect of effective leadership across cultural boundaries. Future research is needed to establish links to objective outcomes and look into the causality of the dynamics between leaders’ identity leadership and follower responses.

Originality
The results of ILI-Global confirm the validity of the ILI for the first time across a variety of cultures.

3. Title
Should I be a perfect identity leader to be a good leader?

Authors and affiliations
Jérémy E. Lemoine (University of East London, United Kingdom; ESCP Europe Business School, United Kingdom), Nik Steffens (University of Queensland, Australia), Rolf van Dick (Goethe University Frankfurt, Germany), Serap Arslan Akfirat (Dokuz Eylul University, Izmir, Turkey), Belen Alvarez (Pontifical Catholic University of Chile, Santiago, Chile), Lorenzo Avanzi (Trento University, Italy), Kitty Dumont (University of South Africa, Johannesburg, South Africa), Olga Epitropaki (ALBA Graduate Business School, Athens, Greece), Katrien Fransen (KULeuven, Belgium), Steffen Gießner (Erasmus University, Rotterdam, The Netherlands), Roberto González (Pontifical Catholic University of Chile, Santiago, Chile), Ronit Kark (Bar-Ilan University, Ramat-Gan, Israel), Rudolf Kerschreiter (Freie Universität Berlin, Germany), Ana Laguia Gonzales (UNED, Spain), Yannis Markovits (Ministry of Finance, Thessaloniki, Greece), Fernando Molero Alonso (UNED, Spain), Lucas Monzani (Plymouth University, United Kingdom), Juan Antonio Moriano (UNED, Spain), Pedro Neves (Nova School of Business & Economics, Portugal), Gábor Orosz (Stanford University, USA and Hungarian Academy of Science, Budapest, Hungary), Diwakar Pandey (Tribhuvan University, Kathmandu, Nepal), Christine Roland-Lévy (University of Rheims Champagne-Ardenne, France), Sebastian Schuh (China Europe International Business School, Shanghai, China), Tomoki Sekiguchi (Kyoto University, Japan), Lynda Jiwen Song (Renmin University of China, Beijing, China), Jeroen Stouten (KULeuven, Belgium), Srinivasan Tatachari (Indian Institute of Management Udaipur, India), Daniel Valdenegro (Pontifical Catholic University of Chile, Santiago, Chile), Lisanne van Bunderen (Erasmus University, Rotterdam, The Netherlands), Viktor Vörös (Hungarian Academy of Science, Budapest, Hungary), Sut I Wong (BI Norwegian Business School, Oslo, Norway), Xin-an Zhang (Jiao Tong University, Shanghai, China), & S. Alexander Haslam (University of Queensland, Australia)

Purpose
Since 2000, a new model of leadership has emerged, based on the social identity theorising (after Tajfel & Turner, 1979). This social identity approach to leadership argues that the effectiveness of a leader will depend upon his/her capacity to represent a given group and this has been confirmed in numerous studies (Van Knippenberg & Hogg, 2003). Moreover, three other dimensions of the leader identity have been identified (Haslam, Reicher, & Platow, 2011): identity entrepreneurship (creating a group identity), identity advancement (acting for the group) and identity impresarioship (embedding group identity). The goal of this paper is to test the influence of identity leadership profiles on various outcomes among his/her followers.

Methods
Over 5,000 participants from more than 20 countries answered a questionnaire composed of the Identity Leadership Inventory (ILI, Steffens et al., 2014), along with measures of team identity, innovation and burnout. The ILI is a 15-item scale which measures the four dimensions of identity leadership.

Results
The results indicated variations in the outcomes (e.g., burnout) based on the identity leadership profiles. Four-way interactions and simple slopes difference tests showed how the different identity leadership profiles impact team identification, innovation and burnout. Whilst identity entrepreneurship is the main predictor of team identification, identity advancement is the main predictor of burnout.

Limitations
The cross-sectional design of the study limits the inference of causality.

Implications
This paper helps to understand which aspect of identity leadership is essential regarding various outcomes.

Originality
This is the first study investigating the identity leadership profiles.

4. Title: Identity Entrepreneurship and Innovative Behavior: A Comparison between Scandinavian and Anglo-Saxon Contexts

Authors and Affiliations: Sut I Wong (BI Norwegian Business School), Gillian Warner-Søderholm (BI Norwegian Business School), Lucas Monzani (Ivey Business School at Western University, Canada), Rolf van Dick (Goethe University Frankfurt, Germany)

Purpose
How leaders facilitate team work is an important driver for team innovation. In this study, we argue that by creating a stronger shared norms and identity, i.e., identity entrepreneurship, leaders may foster a stronger leader-member exchange relationship (LMX) and in turn leading to members’ higher engagement in innovative behaviors. However, we also argue that the effectiveness of such ‘crafting a sense of us’ identity leadership influence is contextual and may particularly not translate well in the Scandinavian context where charismatic leadership is not highly emphasized.

Design/Methodology
We tested the posited moderated mediated model using PROCESS based on a cross-country data set between Norway (N = 329) and North America (N = 302).

Limitations
The cross-sectional design limits causal inferences.

Research/Practical Implications
The results, as expected, suggested that identity entrepreneurship was only significantly related to LMX in the North American sample, but not in the Norwegian sample. Furthermore, the mediating relationship was also only significant for the North American sample.

Originality/Value
The results support that identity entrepreneurship may be less effective in fostering innovative behaviors in Scandinavian context. Our study sheds light on the theoretical and practical implications for Scandinavia versus Anglo-Saxon identity leadership model.
**State of the art.** This symposium addresses two often uttered critiques on employability research. First, there is no consensus on the conceptualization and measurement of employability, which leaves the field disparate. Second, employability research is overly agentic and largely ignores context. Accordingly, our aim is (1) to integrate different views on employability, and (2) to probe antecedents and consequences of employability that are overlooked in the agentic view.

**Contributions.** Contributions are threefold. First, we *deepen* the conceptual employability debate. In particular, Van Harten et al. (paper 1) present a systematic literature review which shows that the different conceptualizations are related. Second, we *broaden* employability research by a focus upon antecedents (e.g., gender identity in paper 2 by Sanchez-Cardona et al.) and consequences (e.g., retention practices in paper 3 by Coetzee) that are less common in the dominant agentic view. The paper by Butler et al. (paper 4) connects the two aims by probing also contextual antecedents in relation to different indicators of employability. Third, we bring together scholars from across the world, with authors and co-authors from Belgium, Ecuador, The Netherlands, the UK, Puerto Rico, South-Africa, and Spain.

**Implications.** Prof. John Arnold will critically reflect upon the two aims and highlight routes for future research and implications for practice.

**A systematic literature review and research agenda on employability**

Jasmijn Van Harten\(^1\), Nele De Cuyper\(^2\), Eva Knies\(^1\) and Anneleen Forrier\(^2\)

\(^1\) Utrecht University, The Netherlands
\(^2\) KU Leuven, Belgium

**Purpose.** Employability research is quickly developing and this has led to a proliferation of conceptualizations. Recent studies have attempted to bring this back to a manageable set, with three different strands: personal strengths (e.g. employability competencies), individual appraisal of employment chances (self-perceived employability) and job transitions. This sets the floor for integration: interrelationships, both within and across the different strands, are often assumed yet not probed in much detail. In response, our aim is to systematically review empirical research on the relationships among and between the different strands.

**Design.** We performed a systematic literature review using different databases (excluding studies not in English or with student samples). Final sample size was 47 articles.
Results. Twenty-three studies investigated relationships within a specific strand, mostly personal strengths: relationships are all positive, though with variation in strength. Twenty-four studies probed relationships across strands. Most but not all studies reported a positive relationship between specific personal strengths and individual’s appraisal of employment opportunities, yet those relationships are generally weak. The few studies including job transitions show a positive relationship with both personal strengths and individual’s appraisal of employment opportunities.

Implications and value. Insights in the connection among and across the different strands may help to arrive at a more integrated notion of employability.

Gender Identity, Sex and Employability: An examination among Spanish employed and unemployed youngsters

1Israel Sánchez-Cardona, 2María Vera, & 3Eva Cifre

1Carlos Albizu University, Puerto Rico; 2Universidad Especialidades Espíritu Santo, Ecuador; 3Universitat Jaume I, Spain

Purpose. Perceived employability has not been approached from a gender perspective. In this study we aimed to explore differences by sex and gender identity on perceived employability (PE) among young employed and unemployed samples.

Methodology. We used two cross-sectional samples collected in Spain. Sample 1 consisted 181 employed individuals (47% male and 53% female) younger than 30 with at least 2 years of work experience. Sample 2 consisted of 246 unemployed individuals (52% male and 48% female). We measured sex (male/female), gender identity, and the perceived employability. Multivariate analysis of variance were conducted to examine sex, gender and their interaction effect on PE.

Results. Sample 1 (employed): MANOVA showed no sex differences in PE dimensions; yet effect size was noticeable. ANOVA showed men differed in quantitative and qualitative internal employability. Gender identity effect was not statistically significant. However, ANOVA showed that for qualitative external employability androgynous profile scored significantly higher than the undifferentiated profile. Sample 2 (unemployed): Showed that women perceived themselves as more employable than men both in quantitative and qualitative external employability. Gender effect on PE was non significant. Sex and gender interaction is significant for perceived external qualitative.

Limitations. Although this study considered employment status using two different samples, data was cross-sectional, with small sample size and collected uniquely in one country (Spain).

Research/Practical implications. Findings highlight the role of sex, gender identity and their interaction in shaping PE across employed and unemployed young samples. Though the pattern of results is far from straightforward, it is clear that employability is dependent upon these variables.

Employability Attributes as Predictors of Employees’ Satisfaction with Human Resource Retention Practices

Melinde Coetzee
Department of Industrial and Organisational Psychology, University of South Africa

South Africa

**Purpose.** The objective of the present paper is to explore the extent to which individuals’ employability attributes predict their satisfaction with key organisational retention practices (i.e. compensation, job characteristics, training and development, and career development opportunities, work-life balance, supervisor support and organisational commitment). Individuals’ employability attributes (career self-management, cultural competence, self-efficacy, career resilience, sociability, entrepreneurial orientation, pro-activity and emotional literacy) imply the ability to sustain one’s employability amidst organisational and career changes and conditions. Employees’ employability attributes are valuable resources that function as a precursor for both employee results (i.e. performance and positive career outcomes) and organisational outcomes (i.e. sustainable performance). The retention practices denote organisational conditions that may either support or impede individuals’ drive to sustain their employability.

**Research design.** A cross-sectional survey design was utilised to collect primary data through questionnaires from a sample of N = 321 permanently employed employees in a South African automotive manufacturing company. Employability Attributes Scale (EAS: Bezuidenhout & Coetzee, 2010) and Retention Factor Scale (RFS: Döckel, 2003) were applied. Multiple regression analysis was performed. Control variables included age, gender, and race.

**Results.** The results highlighted proactivity, career self-management and sociability as important employability attributes in explaining employees’ satisfaction with retention practices: job characteristics, training and development/career opportunities, work-life balance, and organisational commitment.

**Practical/managerial implications.** Interventions that develop employees’ career self-management, proactivity and sociability skills may contribute to retention practices satisfaction.

**Contribution.** This study highlighted the role of employability attributes in enhancing positive perceptions of retention practices.

---

**Exploring key antecedents of self-perceived employability and employability competencies: The role of openness to experience, new career orientations and skill utilization**

Christina Butler¹, David Guest², Ricardo Rodrigues², & Beatrice Van der Heijden³

¹Kingston University London, UK; ²King’s Business School, UK; ³Radboud University Nijmegen, Open University, The Netherlands

**Purpose.** Two of the most prominent approaches to employability focus on self-perceptions of employability and employability competencies. While both perspectives are useful, little is known about whether they have shared antecedents and correlates. We will consider the influence of personality (openness), career preferences (protean – PCO - and boundaryless career orientations - BCO) and organizational resources (skill utilization) as possible antecedents.
Design. We have tested our model using a sample of graduates surveyed over three years.

Results. Both measures of employability have significantly different antecedents. Skill utilization is positively associated with self-perceived employability while openness to experience is a more significant predictor of the development of employability competences. Openness to experience is important in the development of self-perceived employability employability, via its positive effect on both PCO and BCO. In contrast, the BCO is not significantly associated with the development of employability competences.

Limitations. We focused on participants at an early career stage. Three years might not be enough time to develop career orientations and employability competences.

Research/Practical Implications. To develop employability competencies, it seems important that management stimulates skill utilization, for instance by facilitating ‘on-the-job learning’ and by protecting the learning value of the employee’s job, from the very start of a graduate’ career.

Originality/Value. Our findings indicate that self-perceived employability and employability competences have quite distinct antecedents and correlates. They also show that PCO and BCO are quite distinct and distinctly different features of the ‘new career’.
State of the Art

In light of workforce aging, researchers and organizational practitioners have highlighted the importance of older workers’ ability to mobilize their resources to meet work and career demands while maintaining their well-being. This symposium illustrates how a wide array of internal and external demands and resources might be affected by aging and can contribute to successful aging at work.

New Perspectives/Contributions

By combining different methodologies (i.e., longitudinal studies, qualitative interview studies, meta-analyses) and examining diverse work samples, the five papers investigate various personal and job resources and its relationship with age. At the beginning, Friederike Doerwald and colleagues will present meta-analytical evidence suggesting that generativity (the motive to establish and guide the next generation) is a relevant resource at work, not only for older workers. Friedrich Kröner and Andreas Müller will present a two-wave study indicating that colleagues’ social support is an important resource for successful ageing at work. Karen Pak and colleagues will present an interview study that offers insights into the organizational resources that can help older workers to deal with career shocks. Cândiz and colleagues will present longitudinal evidence suggesting that work ability mediates relationships between resources, including an age supportive climate at work, and various important work and individual outcomes. Finally, in a meta-analytical study, Cornelia Wieck and colleagues tested the idea whether and when age-related differences in different facets of empathy play a role for a set of work outcomes. Lastly, Antje Schmitt will provide a synthesis of the five research presentations, identify common themes, and highlight directions for future research.

Research/Practical implications

The papers showcase how various personal and job-related resources are associated to age and can help older workers to maintain their performance and well-being at work.

The Generativity Motive at Work: A Resource of Older Workers?

Friederike Doerwald\(^1\), Hannes Zacher\(^2\), Nico W. Van Yperen\(^1\), & Susanne Scheibe\(^1\)

\(^1\)University of Groningen, The Netherlands
\(^2\)University of Leipzig

**Purpose:** Generativity is a concept from the lifespan literature that refers to the motivation to establish and guide future generations. Lifespan theory and research has suggested that...
generativity motives are particularly salient at middle age (i.e., 40-60 years), comprising the age span of older workers. As research has indicated that generativity is associated with positive work outcomes such as work motivation and mentoring, generativity might be a resource of older workers. However, research on generativity at work is scattered. Our aim was to synthesize and integrate findings on antecedents (including age) and outcomes of generativity at work.

**Design/Methodology:** We conducted a meta-analysis with $k = 39$ independent samples on antecedents and outcomes of generativity.

**Results:** With regard to antecedents, results show that age, tenure, personality traits, work centrality, and job autonomy are positively related to generativity. Gender, health, and future time perspective were unrelated to generativity. With regard to outcomes, results reveal that generativity is positively related job satisfaction, work motivation, positive affect at work, occupational self-efficacy, leadership relationship quality, and mentoring; and negatively related to negative affect at work. Generativity is unrelated to motivation to continue working after retirement.

**Limitations:** Most studies included in the meta-analysis employed a cross-sectional design. Some meta-analytical estimates were based on a small number of studies.

**Research/practical implications:** Generativity is a desirable resource for employees of all ages and organizations and might be a strength of older workers.

**Originality/Value:** This research sheds light on the magnitude and consistency of relationships between generativity and its antecedents and outcomes.

---

**Those Who Need it the Most get it the Least: Age Specific Reciprocal Effects Between Social Support and Mental Strain.**

Friedrich Kröner and Andreas Müller
Institute of Psychology, Work & Organizational Psychology, University of Duisburg-Essen, Germany

**Purpose:** Socioemotional selectivity theory and models of lifespan development of resources suggest that older workers may particularly benefit from social resources in order to maintain well-being across the work lifespan. However, the age-differential effects of social support at work have been rarely investigated. We hypothesised that age moderates the effects of colleagues’ and supervisors’ social support on mental strain, with strongest effects for older workers.

**Method:** A two-wave complete panel design (six month time lag) was used. Self-reports from $N = 334$ nurses (age: 21 – 63 years) were gathered with established questionnaires.
Results: As expected, older nurses (≥ 45 years) benefited the most from colleagues’ social support. However, mental strain in older nurses was associated with reduced social support from colleagues. Surprisingly, with middle-aged nurses (35 – 44 years) an increase in colleagues’ social support resulted in higher mental strain. No effects for supervisor support were observed.

Limitations: The generalizability of results can not be assumed for other occupations. Neither can the absence of common-method bias, since data were collected from self-reports.

Implications: Results indicate that social support by colleagues is an important resource for older workers, but older workers are less likely to experience support when mental strain is present. Moreover, the timing of social support across the work lifespan seems to be critical, as it might have detrimental effects in middle-aged workers.

Originality: Our findings add to studies on the lifespan perspectives of job design by pointing to the critical role of colleagues’ social support for successful ageing at work.

The Perceived Influence of Career Shocks on Ones’ Career: a Qualitative Study Among Older Workers

Pak, K.\textsuperscript{1,2}, Kooij, T.A.M.\textsuperscript{2}, de Lange, A.H.\textsuperscript{2}, Meyers, M.C.\textsuperscript{1} & van Veldhoven, M.J.P.M.\textsuperscript{1}

\textsuperscript{1} = Tilburg University, The Netherlands
\textsuperscript{2} = HAN University of Applied Sciences, The Netherlands

Purpose: Due to societal trends individuals are challenged to work until a later age by ensuring that their careers are sustainable (Kanfer & Ackerman, 2004). Schaufeli (2011) suggests that people will have sustainable careers when they experience a fit with their work. However, over the span of their careers employees are likely to experience several career shocks which might disrupt this fit (Akkermans, Seibert, & Mol, 2018). Examples of career shocks are getting a chronic illness or being fired. No study to date has examined how career shocks influence careers on the long run. This study aims to fill this gap by examining how individuals perceive the influence of career shocks on their career development and which organizational resources helped them deal with this.

Methodology: 33 in-depth interviews with participants of 50 years and older have been conducted.

Results: Preliminary results suggest that participants experience fluctuations in the sustainability of their career due to career shocks. Participants indicate that they often experience very little support from their organization and rarely receive HR practices after such a career shock occurred.

Limitations: A limitation of this study is the retrospective nature of the interviews, which could have resulted in recollection bias.
Research/practical implications: This study gives some initial ideas about how career shocks can influence the sustainability of careers. Furthermore, it gives HRM practitioners insight in the HR practices that employees perceive as useful after having experienced a career shock.

Originality/Value: This is one of the first studies that addresses career shocks in relation to sustainable career development.

Work Ability as a Mechanism Between Resources and Performance, Absence, and Attitudes Toward Aging

David M. Cadiz¹, Grant Brady¹, Donald M. Truxillo², & Jennifer R. Rineer³
¹Portland State University, ²Kemmy Business School, ³RTI International

Purpose: We investigated the mediating role of perceived work ability (WA) between individual (core self-evaluations [CSEs]) and organizational resources (age supportive climate) and the important outcomes of organizational citizenship behaviors (OCBs), days absent, and attitudes toward aging (morale age).

Design/Methodology/Approach/Intervention: We utilized a longitudinal survey-based design collecting data three times over nine months in a matched sample of 98 US registered nurses. Antecedents (CSE, age supportive climate) were collected at T1, the mediator (WA) was collected at T2, and outcomes (OCBs, work days absent, and morale age) at T3.

Results: WA fully mediated the relationship between age-supportive climate and all outcomes, partially mediated the relationship between CSE and OCBs, and fully mediated the relationship between CSE and days absent and morale age.

Limitations: Limitations include self-report data and small sample. However, data were collected at multiple time points. Also, participants were nurses, which could limit generalizability.

Research/Practical Implications: Perceived WA served a mechanism between resources (CSE and age supportive climates) and important work and individual outcomes. Results support the importance of creating an age-supportive work climate and considering both individual and organizational resources together.

Originality/Value: Current research investigating the mediating role of work ability is limited. Moreover, we examined two outcomes of WA that have seen limited or no research with regard to OCBs and morale age (i.e., work-related attitudes towards aging). Thus, we expanded the nomological network of WA with regard to resources that can positively influence it and key outcomes.

When It Hurts, and When It Helps: A Meta-Analysis on Age and Empathy in the Workplace
Purpose: Both cognitive empathy (the capacity to correctly infer others’ emotions) and affective empathy (the ability to share another’s emotions and to feel compassion) have been proposed as fundamental to social relationships at work, especially in occupational sectors with high emotional demands (e.g., healthcare, education). Due to the aging workforce, such types of jobs are increasingly performed by older workers. Research on emotional aging has provided evidence of multidirectional age differences in empathy, suggesting that the cognitive facet decreases with age, while affective facets remain stable or increase. However, whether and when age-related differences in empathy affect work outcomes (e.g., performance, career success, relationship quality, occupational well-being) is poorly understood.

Method: We meta-analytically examined independent worker samples to uncover compound and unique effects of age, and cognitive and affective facets of empathy on a broad set of work outcomes.

Results: Preliminary analyses revealed cognitive and affective facets to have both positive and negative effects on work outcomes.

Limitations: Due to the cross-sectional nature of relationships between empathy and work outcomes, conclusions about causality cannot be drawn.

Research / Practical Implication: Previous research predominantly investigated the relationship between cognitive empathy and job performance. Understanding the link between employees’ age, different facets of empathy, and work outcomes beyond performance enables managers to create conditions that positively affect the organization and its employees.

Originality/Value: It is important to consider empathy in its multidimensionality in order to uncover strengths and vulnerabilities of young vs. older workers, and differential effects for different work outcomes.
DEALING WITH JOB SEARCH AND CAREER CRISSES: ADJUSTING AND DEVELOPING ONE'S CAREER

Katja Wehrle and Ulrike Fasbender

Justus-Liebig-University Giessen

State of the Art

Due to the changing nature of contemporary careers, workers have to deal with complex, unpredictable, and uncertain career trajectories. Facing setbacks, involuntary transitions, or job loss, individuals’ self-definitions or sense of job security may be threatened.

New Perspectives/Contributions

This symposium seeks to understand how job seekers experience and cope with job search and career crises. We focus on the struggles that people face on the labor market, the job insecurity they encounter, and how the related job search processes unfold over time.

By combining conceptual, qualitative, and quantitative research, and by sharing practical insights, we pave the way from identifying how uncertainty during job search and career crises is experienced, to subsequent coping, and how interventions can aid job seekers to re-enter work. Specifically, the first study offers a theoretical framework exploring uncertainty management strategies during diverse career transitions, followed by the second study that unravels how meaningful work may be crafted despite an involuntary nature of such transitions. The third and fourth study then illustrate resources and strategies that aid job seekers to reduce insecurities and self-regulate their job search. The fifth and sixth study add practical insights into the effects of self-compassion and networking interventions on job seekers’ coping.

Implications
We extend research on coping with career uncertainty and job search by providing implications for scholars, career counselors, and organizations to manage workers’ career transitions and successfully re-integrate them to work. Also, we show available resources for job seekers to further their job search.

Presentation 1:
Managing Career Shifts: A Theoretical Framework of Dealing with Career Transition Uncertainty
by Serge da Motta Veiga\textsuperscript{a,}\textsuperscript{*}, Jos Akkermans\textsuperscript{b}, & Andreas Hirschi\textsuperscript{c}

\textsuperscript{a} American University, USA
\textsuperscript{b} VU Amsterdam, The Netherlands
\textsuperscript{c} University of Bern, Switzerland

State of the Art
Irrespective of their type, career transitions tend to involve high levels of uncertainty. Indeed, whether individuals change jobs within an organization, from one organization to another, become unemployed, self-employed, and so forth, they go through uncertainty regarding the transition between their current and future situation.

New Perspectives/Contributions
We integrate various theoretical frameworks (e.g., career construction theory, uncertainty reduction theory, conservation of resources theory, self-regulation theory), and propose an integrative theoretical framework to study uncertainty management strategies during career transitions. We review relevant theories that relate directly or indirectly to uncertainty management during career transitions. As part of this review, we develop a typology of uncertainty management strategies during career transitions. We then propose
an integrative theoretical framework to investigate uncertainty management strategies during different types of career transitions.

**Implications**

This integrative theoretical framework should help both scholars and career counselors further investigate and better understand whether and how individuals manage uncertainty during career transitions.

**Originality/Value**

Prior research has not conceptualized whether and how different career transitions involve different uncertainty management strategies depending on the type of career transition. Furthermore, uncertainty in career transitions has received attention from various literatures (e.g., career psychology, communications, health psychology, management), but there has not been an overarching theoretical framework to study uncertainty management during career transitions.

**Presentation 2:**

**Seeing a Silver Lining: Refugees’ Experience of Meaningful Work**

*by Katja Wehrle*, Ute-Christine Klehe, & Mari Kira

*Justus-Liebig-University Giessen, Germany*

*University of Michigan, United States*

**Purpose**

People experience their work as meaningful when it aligns with their self-definitions and when they can see their work having value to others. This study aims at unraveling the sources of meaningful work among refugees and capturing the processes through which
Refugees craft their self-definitions and careers to experience meaningfulness after an involuntary resettlement. We seek to distinguish and describe conditions and processes that enable individuals to overcome adversity and that pave way to re-infuse meaning into work after experiencing radical breaks in one’s career path.

Design/Methodology/Approach/Intervention

Following the inductive grounded theory approach, we present longitudinal findings of 21 semi-structured interviews. We track how refugees infuse their work with purpose and meaning to generate a theoretical model for a more profound understanding of meaningful work in times of adversity.

Preliminary Results

Having to re-settle into an alien context with institutionalized norms and expectations, participants reported a lost sense of who they were, struggling to envision their futures. Yet, they were aware of how to not define themselves, aiding many to set themselves apart from externally imposed self-definitions and instead, e.g., pursue their genuine values, interests, and capabilities and act on the environment’s opportunities when crafting their daily work and career trajectories.

Limitations

The sample may differ in certain demographic characteristics and personality traits from the overall refugee population.

Implications

Insights allow an understanding into future practices that may foster positive adaptations to foreign work contexts.

Originality/Value
We extend research on identity work, meaningful work, and adversarial growth theories.

**Presentation 3:**

**Negative Career Shock and Job Insecurity: The Moderating Role of Environmental Career Resources**

by Annabelle Hofer*, Daniel Spurk, & Andreas Hirschi

University of Bern, Switzerland

**Purpose**

Negative career shocks could have a major impact on careers. Many employees have to deal with negative career shocks and job insecurity nowadays. The purpose of the study was to test a) the relationship between a negative career shock (objective threat) and job insecurity (subjective threat), and b) the moderating role of environmental career resources (i.e., career support).

**Design/Methodology/Approach/Intervention**

A total of 989 employees from Switzerland participated in a time-lagged survey design. Negative career shock (T1), organizational and social career support (T1), and quantitative job insecurity (T2) were measured.

**Results**

The results of the study showed that organizational career support moderates, i.e. buffers, the positive relationship between a negative career shock and quantitative job insecurity. However, the moderation effect of social career support was non-significant.

**Limitations**
Based on the study design with a short time-lag between waves (four months), no long-term effects for career development were investigated.

**Implications**

The results are highlighting the role of career support in times of insecurities. Future research should investigate quality and quantity of negative and positive career shocks. Moreover, follow-up studies with more time points are needed to overcome interpretations of short-term effects and to achieve a broader generalizability.

**Originality/Value**

To our knowledge this is the first time that the moderating role of environmental career resources for the relationship between a negative career shock and job insecurity has been analyzed.

**Presentation 4:**

**Improving the Self-Regulated Job Search of Older Job Seekers: The Use of Selection, Optimization and Compensation Strategies**

*by Ulrike Fasbender, Henriette Schönhage*, & Ute-Christine Klehe

*Justus-Liebig-University Giessen, Germany*

**Purpose**

Job search is a highly demanding and often demotivating process for older job seekers, challenging their self-regulation. The purpose of this study was therefore to explore to whether the use of selection, optimization, and compensation (SOC) strategies can support older job seekers in the self-regulated job search process, as in their goal establishment and goal pursuit.

**Design/Methodology/Approach/Intervention**
We collected data from 659 older job seekers based in three countries (Germany, Great Britain, and the United States) at four different times over four months.

Results

Results of multi-level modeling supported most of our hypotheses, suggesting that SOC strategies are beneficial for older job seekers’ goal establishment and goal pursuit.

Limitations

Attrition reduced the sample size and led to selective drop-out in a way that some participants found a job during the course of the study.

Implications

Future research may capture the daily dynamics of the job search process, and explore potential antecedents of older job seekers’ use of SOC strategies. With regard to practice, the present study suggests that SOC strategies should be encouraged and points to the development of interventions targeted toward older job seekers.

Originality/Value

We add to the understanding of job search from a lifespan development perspective by focusing on older job seekers’ SOC as beneficial coping strategies to their job search. Moving beyond quantitative job search indicators, our findings shed light on the qualitative indicators, namely older job seekers’ goal establishment and goal pursuit as the two central phases of their job search process.

Presentation 5:
Testing a Self-Compassion Intervention Among Job Seekers:
Self-Compassion Beneficially Impacted Affect Through Reduced Self-Criticism

by Loes Kreemers*, Edwin A. J. van Hooft, & Annelies E. M. van Vianen
Purpose

Being self-compassionate in the face of negative job search experiences can be beneficial to job seekers’ emotional responses. In the current field experiment ($N=180$) we test whether writing exercises in which job seekers are instructed to reflect on their experiences with self-compassion (in comparison to reflecting freely) promote state self-compassion and consequently positively influence their affect, and whether this is mediated by self-criticism.

Design/Methodology/Approach/Intervention

A between-participants field experiment with two conditions (i.e., self-compassion vs. control) and three measurement times one week apart: a baseline questionnaire, the intervention and a second questionnaire, and a follow-up questionnaire.

Results

The self-compassion writing exercise increased job seekers state self-compassion which in turn related to job seekers’ affective responses to job search: their negative deactivating affect (e.g., sadness) was higher and their positive deactivating affect (e.g., calmness) was lower immediately after the self-compassion writing exercise than after reflecting freely. Changes in affect were mediated by reduced self-criticism.

Limitations

The effects on affect were matched by the control condition one week after the intervention.

Implications

The experimental design of the current study allows us to draw causal conclusions regarding the effect of self-compassion on job seekers’ affect. Our study provides a stringent
test of self-compassion theory and increases our understanding of how self-compassion improves emotional wellbeing through reducing self-criticism.

**Originality/Value**

The insights gained by this study contribute to the development of interventions that facilitate job seekers to take a self-compassioned perspective on their difficulties to retain or increase positive emotions, which benefits their job search.

**Presentation 6:**

**Enhancing Job Seeker Networking Self-Efficacy, Use, and Benefits: Effects of an Online Training Program**

Connie R. Wanberg\(^a\), Edwin A.J. van Hooft\(^b\),*, Songqi Liu\(^c\), & Bori Csillag\(^a\)

\(^a\) University of Minnesota, USA

\(^b\) University of Amsterdam, The Netherlands

\(^c\) Georgia State University, USA

**Acknowledgements:** This work was supported by a grant from the National Science Foundation

**Purpose**

Networking is a highly encouraged behavior for job seekers. Yet, many are uncomfortable using networking, or do not know how to network effectively. We identified three aspects of networking (self-efficacy, use, and benefits) that job seekers may need assistance with. We developed a theory-based intervention (BRIo; Building Relationships and Improving Opportunities) and examined whether this intervention increases networking self-
efficacy, use, and utility. Additionally, we examined whether BRIO impacts reemployment quality, and whether BRIO is differentially effective depending on job seekers’ self-efficacy.

**Design/Methodology/Approach/Intervention**

We designed the BRIO-program around the premises of social cognitive theory, focusing on improving individuals’ skills and motivation to network. See Table 1 for the informational content. In an experimental field study, we compared networking outcomes of recently unemployed job seekers who participated in the intervention (n=209) with a pre-test-post-test (n=178) and a post-test only control group (n=158).

**Results**

Results demonstrate that (1) the intervention group had higher levels of networking self-efficacy, use, and benefits as compared to the control groups; (2) the intervention resulted in higher reemployment quality through its positive effects on networking self-efficacy; and (3) the intervention was more effective for improving networking self-efficacy and reemployment quality for individuals lower on baseline networking self-efficacy.

**Limitations**

Future research is needed to explore distal career outcomes, beyond reemployment.

**Implications**

Practically, our study provides tools and insights on how to help job seekers improving their networking during job search.

**Originality/Value**

This study contributes to the theoretical understanding of the intermediate processes by which networking produces positive outcomes.
State of the Art
Inclusive HRM is conceived as HRM to realise that (potentially) vulnerable workers such as older workers, chronically ill workers, or workers with reduced work capacities find work and stay happy, healthy and productive at work. Research on Inclusive HRM is growing, but more knowledge is needed, both on integrating viewpoints from different fields, specific target groups of vulnerable workers, as well as on practices and interventions to realise Inclusive HRM.

New Perspectives/Contributions
In this symposium, we aim at a better understanding of how inclusive HRM can be realised in general and for different target groups of workers more specifically. It includes five presentations and an interactive discussion. First a possible model for inclusive HRM is presented integrating viewpoints from Strategic HRM and Social Policy (1). The second contribution explores what inclusive HRM should entail when including older people (2). Next a study about factors that improve the workability of employees with disabilities like chronical diseases is presented (3). Further, a multiple case study examines how inclusive HRM deals with paradoxes and how these are actually dealt with in practice (4). Finally, an intervention study is presented aimed at the inclusion of persons with a distance to the labour market by using the company turnover growth (5).

Research and Practical Implications
During this symposium we will share our research and professional experiences about this topic. We challenge HRM and HRM studies to contribute to the inclusion of persons with a distance to the labor market.

Proposal for five oral presentations as part of the Inclusive HRM Symposium

(1)

Inclusive HRM: a tango between employers and institutions

Charissa Freese & Irmgard Borghouts (Tilburg University, The Netherlands)

Purpose
The purpose is to explore perceived tensions and synergies between the inclusive employers’ desires to hire people with reduced work capacity and the institutional context. Laws and regulations may restrict or facilitate the possibilities to hire people from a large pool of inactives or regions. Our goal is to identify possible solutions that may solve these tensions and ultimately results in Inclusive HRM and participation of more people in society.

Methodology
This is a qualitative study. Forty employers and their representatives (HR directors) are interviewed, as well as ten employment services from different municipalities, to inquire about their inclusive HRM practices and the way employers are supported or hindered by rules and regulations. The results are analyzed within the Strategic Contextual Inclusive HRM model to display the relevant factors.

**Results**

*Data collection is ongoing.*

**Limitations**

The qualitative design of the study limits conclusions about generalizability and causality.

**Practical implications**

The wicked problem of the inclusion of people with reduced work capacity in regular jobs can only be solved by a multi-disciplinary approach in which the parties involved understand the relevant factors that need to be taken into account. The results of this study contribute to this understanding.

**Originality**

The multi-disciplinary study provides understanding of inclusive HRM by integrating viewpoints from Strategic HRM literature and Social Policy to understand a highly relevant topic for modern society. How can we jointly overcome the divide between inactives and workers, by recognizing the role of the government as well as employers?

(2)

**One size does not fit all: a case for tailoring jobs to retain older workers in different roles**

*Hiske den Boer (Maven7, Budapest, Hungary) & Tinka van Vuuren (Open University of the Netherlands/Loyalis)*

**Purpose**

Inclusive HRM can focus on more age-driven policies to allow older employees to continue working. This study investigates relationships between job design characteristics and older employees' willingness to continue working, for different job roles (operational, expert, and managerial).

**Methodology**

A survey was completed by government employees, age 55+. Questions represented three job design categories: work content, work relationships, and work context. Hierarchical regression analyses showed which job characteristics are positively related to employees' willingness to continue working, as well as a possible moderation of job roles.
Results
The results indicate that co-worker support, task variety, challenges, and client contact were positively related to willingness to continue working. Work content appears most important for older workers in managerial jobs, work context for experts, and work relationships for operational staff.

Limitations
The current sample of participants does not closely represent work sectors of the larger economy and therefore limits possibilities to draw generalizable conclusions.

Practical implications
The majority of older employees are happy to continue working as long as adjustments are made to their specific work situation. Organizations might need to replace the “one for all solutions” by differentiated job redesign based on various job roles.

Originality
Jobs are currently redesigned for a general population of older workers. Although this one-size-fits-all approach might be appropriate in certain companies, it cannot address the unique needs of individuals who hold different jobs. This study is aimed at describing work characteristics that can create tailored jobs to retain older workers.

Retention of employees with disabilities
Ingrid G. Boelhouwer (Department of Applied Psychology, Amsterdam University of Applied Sciences, Amsterdam, The Netherlands), Willemijn Vermeer (Department of Applied Psychology, Amsterdam University of Applied Sciences, Amsterdam, The Netherlands) & Tinka van Vuuren (Open University of the Netherlands/Loyalis)

Purpose
The aim of the study was to determine if disabilities among employees are predictive for lower work ability, higher burnout and lower work engagement, as job demands might be experienced as heavier. In line with the job demands-resources (JD-R) model we also hypothesized that the job resources autonomy and social support by colleagues, would moderate the relation between disabilities and respectively burnout and work engagement.

Methodology
This secondary data analyses (n=2930) was performed on data from a cross-sectional Dutch survey among employees in educational and (semi) governmental organizations. Separate univariate regression analyses were used, controlling for age.
Disabilities were: 1) physical (chronical) health problems without comorbidities, 2) mental diseases without comorbidities, 3) tumour diagnosis with or without comorbidities, and 4) comorbidity of physical (chronical) health problems and mental diseases.

**Results**
In general the disabilities predicted lower work ability, higher burnout and lower work engagement. Furthermore, the results indicated that autonomy seems to buffer burnout, and to enhance work ability and work engagement. However, social support by colleagues did not have a moderating effect.

**Limitations**
The number of employees with a tumour diagnosis was small.

**Practical implications**
Interventions focussing on autonomy offer opportunities to enhance work ability and work engagement and reduce burnout among employees with disabilities, as part of an employee retention strategy for this population.

**Originality**
The study introduces a combination of the JD-R model and the concept of work ability, and introduces a former tumour diagnosis as a possible cause for disability.

(4)

**Paradoxes and practices of inclusive HRM; a multiple case study into perceived challenges, preconditions and success factors to employ workers with reduced work capacity in the Netherlands**

*Judith Semeijn (Open University of the Netherlands/Maastricht University), Tinka van Vuuren (Open University of the Netherlands/ Loyalis) & Christine Parkin Hughes, University of Exeter, Business School, United Kingdom*)

**Purpose**
The purpose is to explore perceived paradoxes for organisations, induced by the Dutch legal obligation to employ workers with reduced work capacity. Dutch employers need to create 125,000 additional jobs for these workers. Our goal is to identify paradoxes for HRM as a consequence of this legal obligation and to investigate which factors must be met (preconditions) or that help (success factors) to realize inclusive HRM.

**Methodology**
The study takes an explorative qualitative approach. HRM professionals, management/supervisors, colleagues and workers with reduced work capacity themselves
from several organizations in the Netherlands are interviewed with a semi-structured guideline. A paradox perspective for inclusive HRM is used for its theoretical founding.

**Results**

Based on paradox literature, three types of paradoxes were indeed perceived and recognized by HRM professionals of different organisations regarding inclusive HRM. In a further multi-stakeholder exploration within schools, it appeared that schools can deal with these paradoxes by implementing preconditions for inclusive practices and by commitment to realising several success factors.

**Limitations**

The explorative qualitative design of the study limits its possibilities to draw conclusions about generalisability and causality.

**Practical implications**

In spite of existing paradoxes in employing workers with reduced work capacity, deployment of these employees can be of added value for organisations, by implementing some preconditions and taking explicit care of success factors.

**Originality**

The study provides understanding of inclusive HRM by recognizing paradoxes and examples of dealing with tensions regarding the employment of workers with reduced work capacity for a more inclusive society.

(5)

**Connecting company turnover growth to the inclusion of persons with a distance to the labor market: The development and evaluation of a new intervention**

*Goedele Geuskens, (TNO, The Netherlands) Roland Blonk (TNO, Tilburg University, The Netherlands), Anneke Goudswaard (TNO, Windesheim Flevoland, The Netherlands)*

**Purpose**

To develop and evaluate an intervention aimed at increasing inclusive company growth, i.e. the Inclusive Turnover Growth Intervention.

**Methods**

In Lelystad, a living lab was set up in which employers, unemployed persons, work coaches, and researchers jointly developed the intervention during work sessions, company visits and
experiments. Reflexive monitoring was used to support the work process and adjust the process when needed. The effect of the intervention is studied using questionnaires (employer, unemployed person, work coach), registration data, and (group) interviews.

Results
Four different routes connecting company turnover growth to the inclusion of persons with a distance to the labor market were identified. In these routes, (1) the job, and not the person, is the starting point and employers define which vacancies they expect within 1 to 2 years due to turnover growth, and (2) unemployed persons obtain the required skills and knowledge before the vacancy arises. During the presentation, factors influencing the social lab, and first results of the effect evaluation will be presented.

Limitations
The intervention was developed in Lelystad (The Netherlands) during a period of economic growth. We do not know yet whether the intervention needs to be adjusted to other regions and economic situations.

Practical implications
Tailored training may take place at the employer where the vacancy will arise or in different work organizations, and obtaining certificates may be part of this.

Originality
The Inclusive Turnover Growth Intervention may add an approach, in which the job is the starting point, to the existing re-integration interventions.
Integrated summary

State of the Art: Since its introduction into the work and organisational psychological lexicon in 2002, positive psychology at work has received a significant amount of attention. The past two decades of scientific advancements in the field have shown the potential positive impact of adopting a positive psychological approach towards designing, managing and understanding “work”. Research shows that adopting a positive psychological approach at work has numerous benefits for the individual, team, organisation and community. Although the paradigm has become popular within the discipline of work and organisational psychology, the spill over into the profession is largely lagging. As such, the purpose of this symposium is to provide a science-based, practitioner focused symposium on contemporary developments in the field of Positive Psychology @ Work.

New perspectives/Contributions: We use several approaches, including theoretical presentations and scenario studies to explore different concepts of Positive Psychology at work. Olckers and colleagues start with a more theoretical approach and examine the management of territorial behaviours within organisational contexts. Based on their research about evidence-based positive psychological intervention strategies, they provide important practical suggestions for practitioners and organisations. Kaluza and colleagues use an experimental approach and investigate how the stress mindsets of leaders – that means their general assessment of whether stress is beneficial or detrimental – influences their dealing with employees’ well-being. Dreisörner and colleagues examine self-compassion at work. They show that self-compassion predicts better well-being (e.g., more job satisfaction, less burnout) and underline the relevance of self-compassion in the work context. Further, in the Inceoglu paper, the effect of leader empowering behaviours on wellbeing and deep rooted counterproductive psychological processes are examined. They found that empowering leaders play an important role in the emotional wellbeing of employees and can actively contribute to the management of ruminating thoughts. Building on this positive approach, Machteld van den Heuvel presents an innovative view on burnout, through looking at the positive outcomes of these experiences. She argues that burnout and its recovery process has numerous positive benefits psychological benefits such as personal growth, self-management and enhancing the capacity to learn. Finally, Rothmann will present a model on the psychological ingredients needed to build thriving academic institutions.

Research/Practical Implications: The contributions shows the importance of adopting a positive psychological approach towards developing people and structuring work, and highlights the benefits thereof to practitioners.
Positive psychological interventions aimed at managing territorial behaviours within the organisational context

Chantal Olckers (University of Pretoria, South Africa)
Llewellyn E van Zyl (Eindhoven University of Technology, The Netherlands and Optentia Research Programme, North-West University, South Africa)
Corné Booysen (University of Pretoria, South Africa)

State of the Art: Psychological ownership, a psychological state where individuals perceive an object as theirs, has proven to result in positive outcomes and behaviours within the organisational context. However, feelings of ownership may result in increased territorial behaviour at work. Territoriality, a social behavioural construct, has been defined as behaviours or actions emanating from psychological ownership for the purpose of claiming, maintaining or protecting an individual's target of ownership. Very limited research exists regarding evidence-based positive psychological intervention strategies aimed at the management of territorial behaviours within organisational contexts.

New perspective/contribution: Literature indicates an increasing need for the development, implementation and validation of interventions aimed at cultivating the promotive and managing the preventative mechanics (territoriality) of psychological ownership at work. Research has shown that cultivating a culture where psychological ownership is optimised and territoriality is effectively managed, remains a structural and systemic challenge.

Practical implications: The study aimed to provide practitioners and organisations with practical suggestions for interventions, from a positive psychology perspective, which could be implemented towards managing territorial behaviours within the organisational context. Some of the general positive psychological interventions aimed at managing territorial behaviours include the measuring of territoriality, appreciative discussions to manage conflict as well as creating a trust environment. More specific positive psychological interventions aimed at managing claiming behaviours as well as managing anticipatory defending are also suggested.

Originality/Value: This study not only contributed to the literature on territorial behaviour in organisations, but provided practitioners and organisations with practical suggestions for interventions which could be implemented to manage territorial behaviours at work.
The influence of leaders’ stress mindsets on health-promoting leadership behaviour

Antonia J. Kaluza (Goethe University Frankfurt am Main)
Sebastian C. Schuh (China Europe International Business School)
Nina M. Junker (Goethe University Frankfurt am Main)
Rolf van Dick (Goethe University Frankfurt am Main)

Purpose: Individuals differ in their stress perception, their stress response and in their general assessment of whether stress is beneficial or detrimental, with the latter being referred to as “stress mindset” (e.g., Crum et al., 2013). Even though a “stress-is-enhancing” mindset (as compared to a “stress-is-debilitating” mindset) has positive effects on one’s own health and performance, it reduces the perception of stress symptoms of others (Ben-Avi et al., 2018). At work, this bears the risk that leaders with a “stress-is-enhancing” mindset less easily recognize employees’ stress symptoms and provide less health-promoting support. Additionally, we predict that this process is moderated by leaders’ identification with the team as the perceived similarity with other ingroup members influences the projection of one's own inner states onto others (e.g., Ames, 2004).

Design: We conducted two scenario studies in which we experimentally manipulated participants’ stress mindsets and either assessed or manipulated team identification.

Results: Our analyses revealed mixed results in both samples. We found that participants’ stress mindsets influence the judgment of others’ stress symptoms to some degree and that this association is partly moderated by identification.

Implications: Previous research on leaders’ health-promoting behaviour has focused primarily on the effects of such leadership behaviour or on organisational conditions and less on leaders’ personal characteristics. Our results revealed that leaders’ stress mindsets can be an important starting point to enhance health-promotion in organisations.

Value: To our knowledge, this study is among the first to focus on leaders’ stress mindsets and its implications for dealing with employees.

Self-compassion at work: A cross-sectional study of self-compassion, burnout, job satisfaction and GRIT in organisations

Aljoscha Dreisörner (Goethe University Frankfurt am Main)
Nina M. Junker (Goethe University Frankfurt am Main)
Rolf van Dick (Goethe University Frankfurt am Main)

Purpose: In the last decade, self-compassion has become a popular research topic. Yet, almost all studies about this topic have been done with student samples. This article examines the importance of self-compassion in organisations. Self-compassion is a kind and understanding rather than critical way
to refer one’s shortcomings, failures or moments of suffering. The work place provides many sources of potential suffering including stress, poor working conditions or hostile work environments. Self-compassion may work as an antidote to these threats.

**Design:** 217 participants from organisations completed a battery of questions including scales for self-compassion, job demands, GRIT, burnout, intrinsic motivation and job satisfaction.

**Results:** Results from regression analysis indicate that self-compassion positively predicts job satisfaction, GRIT, and intrinsic motivation as well negatively predicts burnout. It was assumed that job demands moderated these relationships, but this was not the case.

**Implications:** The findings indicate that high correlations of self-compassion with important constructs like motivation or burnout not only exist in student samples but also occur in organisational samples. Employees may benefit from interventions targeted at increasing self-compassion. Future research should explore the direction of causality of these effects.

**Value:** This article provides initial evidence for the importance of self-compassion in the work context.

---

**Empowerment leadership, affective well-being and rumination**

Ilke Inceoglu (Exeter University Business School, University of Exeter)
Geoff Thomas (University of Surrey)
Chris Chu (University of Surrey)
David Plans (Exeter University Business School, University of Exeter)
Mark Cropley (University of Surrey)
Jon Heron (University of Bristol)

**Purpose:** Psychological empowerment (Spreitzer, 1995) is associated with positive affective and behavioural outcomes for individuals. Recent research shows, however, that when leaders empower their employees by, for example, involving them in decision-making processes and assigning demanding tasks, both positive and negative effects on followers are observed (for example, higher self-efficacy but also higher job tension: Cheong et al., 2016). This study examines the effect of empowerment leadership on their followers’ affective well-being and levels of rumination in by considering job ambiguity and follower trust.

**Methodology:** We measured daily affect and rumination using a diary study design in a sample of 150 employees from a financial organisation over the course of two weeks. At the beginning of the study employees were asked to assess levels of job ambiguity and trust in their leader and the extent to which their leaders displayed empowering behaviours (Ahearne et al., 2005) towards them. Data analysis is still in progress. We will examine whether different levels of empowerment leadership are related to different trajectories in followers’ well-being. We will also investigate whether under conditions of low trust and high job ambiguity the effect of empowering leadership behaviour on follower well-being (overall trajectories) is diminished and might even be negative.

**Limitations:** Participant drop-out over the course of the data collection.
Research Implications and Originality: We examine the effect of empowerment leadership behaviour on employee well-being by considering within and between-person differences/fluctuations in affect and rumination in employees over two weeks. Second, we consider moderating job conditions.

The Bright Side of Burn-out: Exploring Learning and Growth in Post-burnout Employees

Machteld van den Heuvel (Department of Work and Organizational Psychology, University of Amsterdam, The Netherlands)

Purpose The underlying assumption of positive psychology as a field is often that positive and negative are distinct and mutually exclusive. Few studies have focused on how the two co-occur or complement each other. In this study, I will explore potential positive sides of burnout and the recovery process. Burnout, its predictors and outcomes have been studied extensively from positivistic perspectives such as the job-demands resources theory. However, the potential positive outcomes of burnout in terms of learning, personal growth or self-management skills is an understudied area. Since burnout rates are still high, especially amongst younger employees, we need further knowledge on how to prevent burnout. Existing knowledge can be enriched by focusing on learning and growth experiences during burnout recovery. Hence, the purpose of this study is to explore the positive experiences in employees that have overcome burnout and to apply this knowledge.

Approach Combining a humanistic-existential perspective with theories on meaning-focused coping, benefit finding and job crafting, I will review burnout as a process that may hold potential for growth.

Results Based on literature reviews and experiences from working with burnout employees, I will propose a number of ‘positives’ (learning and strategies) to the burnout phenomenon, a research design and how we may use outcomes to avoid burnout and foster well-being.

Implications Combined positive themes from the burnout recovery process, can be translated to interventions at the organizational, team and individual level.

Originality This is a novel approach to the study of burnout and its potential benefits.

Thriving of Academics in Higher Education Institutions in South Africa

Fatima Mahomed (Optentia Research Focus Area, North-West University, Vanderbijlpark, South Africa)

Sebastiaan Rothmann (Optentia Research Focus Area, North-West University, Vanderbijlpark, South Africa)

Purpose: Research regarding the thriving of academics in higher education institutions is necessary given the effects of thereof on individual and organizational outcomes. This presentation reports on a study that aimed to investigate the relationships between among strengths use and deficit correction,
job crafting, high-performance human resource management practices, psychological need satisfaction, thriving, and outcomes (performance and intention to leave) of academics in higher education institutions.

**Methods:** A cross-sectional survey design was used. A convenience sample of 276 academic employees from three universities of technology in South Africa participated in the study. The participants completed the Strengths Use and Deficit Correction Scale, Job Crafting Questionnaire, the High-Performance Human Resource Practices Questionnaire, the Basic Psychological Need Satisfaction and Frustration Scale, the Thriving at Work Scale, Turnover Intention Scale, and a scale that measured perceptions of performance-related pay, and measures of task and contextual performance.

**Results:** As hypothesised, thriving, job crafting, high-performance human resource practices, psychological need satisfaction were positively correlated. A significant interaction between job crafting and high-performance human resource practices was found. The relationship between job crafting and thriving was found to differ to the extent to which individuals perceived high-performance human resource practices. Strength use had direct effects on autonomy, competence, and relatedness satisfaction of employees. Staff development had a direct effect on autonomy satisfaction. Furthermore, autonomy satisfaction, strength use, and staff development had direct effects on thriving, while low autonomy satisfaction and poor staff development had direct negative effects on intention to leave. Strength use, as well as staff development, had indirect effects on thriving and intention to leave via autonomy satisfaction. Perceived organisational support for strengths use, as well as individual strengths use and deficit correction, predicted thriving at work. Thriving predicted task and contextual performance. A significant interaction was found between thriving and perceptions of performance-related pay.

**Value:** This study provides an innovative approach towards understanding the dynamics of the positive psychological assets needed to build thriving academic institutions.
INTEGRATED SUMMARY:

- Title and name of the proponent(s) of the symposium
Dr. Bart Wille (Chair)
Ghent University, Belgium
Department of Personnel Management, Work and Organizational Psychology

Dr. Samuel T. McAbee (Co-Chair)
Bowling Green State University, USA
College of Arts and Sciences

- State of the art
Data are being collected and stored in organizations at ever increasing rates using new methods and technologies, and obtained from diverse sources. There is increasing awareness within the fields of Work and Organizational Psychology and Human Resources Management that this abundance of data—variables, measurements, and observations—can be used to inform a vast number of topics in research and practice. This is the era of ‘big data’, and beyond opportunities, this new era also presents challenges and potential hazards.

- New perspectives / contributions
This symposium brings together five presentations that illustrate the promises and perils of this methodological frontier. The presentations cover new ways of collecting data (e.g., using game-based assessment, ‘scraping’, or applicant tracking systems), methods to analyze or combine data sources (e.g., powered by artificial intelligence), as well as more strategic considerations on how to use and integrate these techniques in organizational decision making.

- Research / practical implications
Although big and online data are trending topics, many researchers and practitioners in this field remain uncertain about their value and potential pitfalls. This symposium provides an introduction to and critical evaluation of these developments for a mixed audience of researchers and practitioners.

- Title, name and affiliation of the authors
Scoring game-based assessments with artificial intelligence and trace data

Dr. Richard N. Landers
University of Minnesota, USA

- State of the art
Game-based assessment (GBA) offers the ability to assess human knowledge, skills, abilities, and other characteristics (KSAOs) with high scalability and a much more positive candidate
experience than assessment with traditional measures, such as surveys. As GBA grows in popularity, it has become increasingly critical to understand how to build and score them to achieve adequate reliability and validity. Because GBAs are constructed as a complex set of inter-related and nested computing systems, achieving sound psychometric properties is much more complex than in traditional survey development and is often outside the traditional skillset of work and organizational psychologists, requiring intense collaborations with computer or data scientists.

- **New perspectives/Contributions**
  In this presentation, I will explain how artificial intelligence (AI) can be used by I-O psychologists to make KSAO measurements using one type of data stream commonly outputted by GBAs: trace data. Specifically, GBAs produce log files containing a click-by-click record of all candidate behaviors. By utilizing AI, these behaviors can be used to improve upon existing measurement or measure new KSAOs unrealized by the original GBA development process.

- **Research/Practical implications**
  AI opens many new avenues for KSAO measurement both inside GBAs and outside of GBAs. For research, this is the first step toward developing true behavioral models of KSAOs. For practice, this represents an entirely new measurement method.

- **Originality/Value**
  Using AI as a scoring approach in I-O psychology is quite uncommon, and even less of this work is typically shared in a public forum.

- **Title, name and affiliation of the authors**
  Developing and Validating User-Friendly Innovative Assessments for Hiring

  Sonia Codreanu
  Hirevue / University College London

- **State of the art**
  Innovative assessment formats are gaining ground in hiring practices, and early research has identified these as offering improved candidate experience compared to traditional assessments. Nevertheless, research on the validity and fairness of these innovative assessments is lagging. In particular, it is of paramount importance to understand how highly predictive assessments previously thought to be fraught with adverse impact, such as interviews and cognitive assessments, can be made fairer.

  **New perspectives / contributions**
  In this presentation, I will outline how psychometrically informed design of innovative assessments (focusing on video interviews and game-based assessments) can result in the development of user-friendly and valid assessments. I will also touch upon machine learning scoring approaches as a promising methodology for reducing and/or mitigating adverse impact.

*Originality / Value*

I will share some insights and best practices for designing user-friendly innovative assessments and suggest ways in which machine learning scoring approaches can contribute to creating more valid and fair assessments.

---

*Title, name and affiliation of the authors*

Predicting hiring decisions using applicant tracking system data

Dr. Colin I.S.G. Lee  
University of Amsterdam, Amsterdam, The Netherlands

Dr. Will Felps  
University of New South Wales, Sydney, Australia

Dr. Piers Steel  
University of Calgary, Calgary, Canada

*Purpose*

On what basis do hiring professionals decide whom to invite for a job interview? In order to address this fundamental but understudied question we draw on applicant tracking data from 48 companies ($N = 441,769$ applicants).

*Methodology*

We use synthetic validity and dominance analysis to identify the relative importance across occupations and industries of 18 factors including demographics (i.e., age, gender, nationality, distance from hiring company), biodata (i.e., experience, level of education), the application (i.e., internal or external candidate, applied before deadline) and the applicant pool (i.e., applicant count, average percentage invited, occupation vacancy rate).

*Results*

We correctly predict invitation outcomes on a holdout sample for 2,539 of the 3,656 applicants that got invited (sensitivity of 69.45%) and 27,876 of the 40,531 that did not get invited (specificity of 68.78%). Age and experience emerged as the most relevant in applicant prescreening, across occupations.

*Limitations*

There is considerable variance across occupations. Further research would be required to study the relationships between the predictors and the job characteristics.

*Originality*

The study demonstrates that interoperable database structures containing applicant trace data can be useful in studying the application process. At the same time, we show that methods from IO Psychology, such as synthetic validity, can be highly useful and informative when applied on such “Big Data” databases.
People analytics to make informed HR decisions: A practitioner point of view

Dr. Britt De Soete  
HR Consultant  
Cubiks, Belgium

Jouko Van Aggelen  
Executive Director, Head of People Analytics  
Cubiks, Belgium

State of the art

Many HR-related decisions are still made intuitively, and potential identification has been no exception. Most companies solely rely on unstandardized managerial input to make decisions about their employees’ potential. However, this process has repeatedly proven to be skewed or biased, resulting in unfair decision-making and failed high-potential programs.

New perspectives/Contributions

Instead, Cubiks has taken it to heart to encourage and assist clients in using data as the basis for high-stakes HR-related decisions. We have therefore implemented a more objective and data-driven approach to identifying potential in a large international consultancy organization. More specifically, by using upward mobility ratings as a proxy variable for potential, Cubiks has developed an algorithm which combined personality data and self/other competency ratings to assess individual potential. This information was subsequently combined with performance data to position individuals in a 9-box grid.

Research/Practical implications

As this improved version of the organization’s 9-box grid relied on multiple internal as well as external data sources and a validated algorithm of potential, it could reliably be embedded in the organization’s performance management system to make informed decisions with regards to career progression.

Originality/Value

We will share some insights and learning with regard to this methodology. In addition, we will discuss and address some common challenges practitioners may face when embarking on a people analytics journey, such as data quality, data privacy (GDPR) and mindset shifts.

Structural integration of people data within organizational decision making: Considerations from a strategic and an operational perspective

Dr. Bernd Carette  
Manager Human Capital Consulting  
Deloitte, Belgium

State of the art

Although the interest in people analytics has grown dramatically, in many organizations
people analytics activities remain limited to a number of “one off” HR projects in which people data is used to better understand isolated people issues.

- New perspectives/Contributions
The aim of my presentation twofold. First, I will explain that in order to fully leverage the power of people analytics, organizations need to step away from the “one off” people analytics approach and structurally embed people and business data within organizational decision making. My second goal is to explain how this structural integration of data within decision making can be achieved. I will do so by presenting a framework Deloitte developed containing multiple hurdles organizations need to take when embarking on their people analytics journey.

- Research/Practical implications
I will illustrate this framework through a number of projects across industries (financial services, insurance, life sciences, public sector), and will share lessons learned and points of attention.

- Originality/Value
On the most strategic level it needs to be clear why the organization is investing in people analytics. The simple fact that more data is available in today’s (business) environment is not sufficient to get started with analytics. It needs to be clear from the very beginning how data will add value to address key talent challenges. On more operational levels, decisions need to be made regarding the data that is required, and how this translates to organizational processes, people, and technology.
417 - INVITED SYMPOSIUM - LEADERSHIP AND IDENTITY

Robert Lord (1)
Durham University Business School, Durham, United Kingdom (1)

State of the Art. The topic of leadership identity development has generated lots of contemporary interest and research, reflecting the practical importance of having individuals pursue and fulfill leadership roles in all walks of life. Identities are viewed as contextualized, in-the-moment self construals that are grounded in more stable schemas (self-concepts) that individuals use to describe themselves. Each of the four presentations approaches leadership identity development from a different perspective—an evolution of a personal trajectory over time (Day), a construct that “trickles up” over time from a leader’s team or followers (Johnson), a construct that at time is invented from fragments that populate a distant future (Braun, Zheng, & Lord) or as a consequence of role transitions (Epitropaki, Hall, & Gatti). All of these views essentially reflect a process view of identity development which characterizes contemporary state-of-the-art thinking about identity.

New Perspectives. In his opening remarks, Robert Lord will comment on why identity is so important for understanding developmental processes. He will emphasize the role of identity in brain functioning, characterizing identity as being the “golden thread” that binds information together in forming episodic memories using the hippocampal memory (indexing) system, and over time leads to a more consolidated, long-term memory based on neocortical structures. Both processes afford representations of the self that are dynamic and can foster development over time or contexts. In this respect, both focusing on followers (Johnson) or quantum theories of time (Braun et al.) reflect new perspectives in the leadership identity field.

Research/Practical Implications. Each presentation will be limited to 15 minutes, which will allow time for a brief introduction and for a collective discussion of theoretical/practical implications of this symposium.

Charting and Understanding Personal Trajectories of Leader Identity Development

David V. Day, Professor, Kravis Leadership Institute

State of the Art. A robust finding from developmental psychology is that people start from different places and change in different ways over time, regardless of the attributes under study. This also applies to how individuals take on and internalize an identity as a leader.

New Perspectives. This presentation will review findings from various research studies that have adopted a personal trajectory approach to the study of leader identity development among emerging leaders (i.e., students) as well as those who are more experienced (i.e., high-potential executives).

Research/Practical Implications. Implications will be discussed in terms of the role that a leader identity plays in motivating more general leader development over extended time periods (e.g., months and years).
Leader Identity and Behavior as Outcomes Rather Than Predictors: The influence of Followers and Team Members

Russell E. Johnson, Professor, Michigan State University, College of Business

State of The Art. Research on leadership and teams has primarily focused on how a leader’s actions shape the motivation, coordination, and behavior of their followers. This process of influence, however, runs both ways.

New Perspectives. By adopting a followership perspective, I will present empirical results showing how subordinates and team members can shape the identity and behavior of their leaders. In one study, we examine how follower self-construal (individual, relational, and collective) ‘trickles up’ to shape leaders’ self-construal. In a second study, we examine how workgroup OCB shapes leaders’ moral identity, which then gives rise to either moral licensing or consistency behaviors depending on the leader’s self-construal.

Research/Practical Implications. The theoretical and practical implications of this perspective also will be discussed.

Who will I be if I’m betwixt and between? A review and extension of the literature on identity dynamics

Susanne Braun, Professor, Durham University Business School, Durham, UK
Xiaotong Zheng, Post-Doctoral Research Associate, Durham University Business School, Durham, UK
Robert G. Lord, Professor, Durham University Business School, Durham, UK

State of the Art. We reviewed 163 articles published in 26 peer-reviewed journals that addressed identity dynamics based on 18 key words in a literature search. Our final sample of 91 articles for review was selected by reading the abstract of each article to determine its relatedness to various themes concerning identity development.

New Perspectives. We then categorised the literature in terms of five themes, i.e., stable identities, multiple identity development, continuous identity development, discontinuous identity shift, and being betwixt and between. These themes, particularly being betwixt and between, provide a novel theoretical lens for our theory development. Being betwixt and between as a part of identity invention emphasizes serendipity and creative mental processes emerging from a state of disruption, uncertainty, and conflict. In quantum theory, this state has also been described as a superposition state in which components of multiple identities exist but no particular identity has been fully developed. It is argued that this superposition state describes mental time travel to the distant future, where identities are not fully developed. Thus, this approach represents a trajectory over time of potentials from which identities can be developed.
Research/Practical Implications. Our work contributes to the identity literature by (a) integrating identity theory with issues of how individuals think about and use time, (b) incorporating contextual effects on identity development, (c) providing a formalized way to consider the state of being betwixt and between, and (d) considering leadership identity invention in terms of leadership and followership identity dynamics.

The Impact of Early Career Experiences on Leadership/Followership Identity and Motivation to Lead

Olga Epitropaki and Rosalie J. Hall – Professors, Durham University Business School, Durham, UK
Paola Gatti – Research Fellow, Università degli Studi di Torino, Turin, Italy

Purpose. We describe theoretical development and initial results from a research programme designed to advance our understanding of the influence of early career experiences on leader identity development. Prior literature emphasizes the fundamental role that early life experiences play for leadership development (e.g., Murphy & Johnson, 2011), but empirical research on this topic is still limited. We focus on employment directly after university graduation to capture processes of leader and follower identity development during those formative years. Early career experiences with leaders and leadership schemas are proposed to shape individuals’ leader identity and motivation to lead.

Design/Methodology. The study utilises a multi-wave design, with data collection from a sample of undergraduate and postgraduate students a few months before graduation and then again during the first months of their first job after graduation.

Results. The preliminary findings support the role of leadership schemas for identity outcomes and motivation to lead but data collection is still ongoing.

Limitations. At this stage, results are only based on the cross-sectional data of the first wave and thus causality claims must be tempered. Common method variance issues must also be acknowledged.

Research/Practical Implications. Our study addresses the call for more empirical work on the early influences of leadership development and contributes to the wider literature on the socio-cognitive foundations of leadership and leadership identity.

Originality/Value. It is one of the first studies to test existing theoretical propositions for the importance of formative early career years for leader identity development.
Emotions are at the core of nursing work. Therefore, a nurse may feel, express or repress his emotions according to the emotional display rules (Diefendorff, Erickson, Grandey, & Dahling, 2011). Emotional dissonance emerges when the felt emotions diverge from the display rules one must follow (Brotheridge & Grandey, 2002). Emotional dissonance is a well-documented work stressor contributing to negative well-being outcomes, signifying that we urgently need more information on factors that might buffer against emotional dissonance. This aim of this symposium is to better understand the impact of emotional dissonance on work outcomes in three cultural contexts: French, Italian, and Algerian. More specifically, the role of supervisor support and team reflexivity was examined.

Nursing students’ positive and negative emotions in providing personal care to the patient: the role of emotional labor

Letizia Dal Santo*, Maura Galletta**

*University of Verona, Department of Nursing Studies**University of Cagliari, Department of Public Health and Molecular Medicine.

**Purpose**: Literature highlights that nurses experience ambiguous attitudes in dealing with patients’ body. Providing personal care is considered as a privileged element that makes nurses feel satisfied and useful. Nevertheless, it is also viewed as a source of negative feelings. A clarification of this ambiguity is not been adequately provided and the role played by human emotions remains relatively elusive. This study aims to test the role of the different emotional labor components (emotional dissonance, cognitive reevaluation, emotional amplification, emotional suppression and attentional deployment) on students’ emotions when providing personal care to patients.

**Methodology**: A multidimensional questionnaire was administrated to 208 nursing students of the University of Verona. Linear multiple regression analyses were performed to test our hypotheses.

**Results**: The results showed that attentional deployment and emotional dissonance had a main contribution as predictors of negative emotions ($\beta=.33$, $p<.001$; $\beta=.31$, $p<.001$, respectively), whereas emotional amplification was significantly and positively related to positive emotions ($\beta=.46$, $p<.001$) with a main contribution to the explanation of the
dependent variable. Emotional dissonance had a negative association with positive emotions ($\beta=-.15, p<.01$).

**Limitations**

As a cross-sectional design was used, causal direction of the relationships cannot be confirmed.

**Research/Practical Implications**

These results highlight the importance of capturing the roles played by each different component of emotional labor when nursing students provide personal care to the patient. Practical implications include the importance to insert emotional training in the nursing education.

**Emotional dissonance and caregiver burnout: the moderating role of colleagues and supervisor support**

Marie Andela¹ & Didier Truchot²

¹ University of Bordeaux
² University of Bourgogne-Franche-Comté

**Purpose:** The aim of the present study was to better understand caregiver burnout in nursing homes by considering job stressors (workload and emotional demands), job resources (colleagues and team supervisor support) and emotional dissonance as essential determinants. Moreover, based on the Job-Demand-Resources model, we suggested that the job resources represent key factors to moderate the effects of emotional dissonance and job stressors on burnout.

**Methodology:** 481 caregivers working in French nursing homes filled out a survey evaluating:

- **Burnout** (MBI-HSS, Dion & Tessier, 1994)
- **Specific nursing home job stressors and job resources** (Huguenotte, Andela, & Truchot, 2016)
- **Emotional dissonance** (Andela, Truchot, & Borteyrou, 2015)

**Results:** First, correlation and regression analyses indicated that both job demands (workload and emotional demands) were positively associated with burnout, while both organizational resources (colleagues and team supervisor support) were negatively related to burnout. Secondly, the present study highlights the strong relationship between emotional dissonance and burnout. Thirdly, results indicated that colleagues and team supervisor support buffered the impact of emotional demands and emotional dissonance on burnout.

**Limitations**

As a cross-sectional design was used, causal direction of the relationships cannot be confirmed. However the idea that job demands, organizational resources and emotional dissonance lead to work-related outcomes is based on established sources.

**Practical implications/ Originality**
Organizations would benefit from promoting team and supervisor support in order to reduce the impact of emotional dissonance. This could be encouraged by recommending formal teamwork training and the development of strategies that facilitate effective collaboration between health care professionals.

**Professional stressors, emotional dissonance and burnout among nurse managers: the moderating effect of team reflexivity**

Didier Truchot¹, Marie Andela² & Ivanne Bestagne³

¹ University of Bourgogne-Franche-Comté
² University of Bordeaux

**Purpose:** To investigate the effects of job stressors, emotional dissonance, and team reflexivity on job burnout in nurse managers. In particular, we hypothesized that emotional dissonance mediates the association between stressors and burnout, while reflexivity would moderate the effects of emotional dissonance. Indeed, in reference to Rimé’s theoretical model (2009), we suggested that team reflexivity responds to both psychological necessities induced by dissonance (cognitive clarification and socio-affective necessities).

**Methodology:** 782 French nurse managers filled out a survey evaluating:
- **Burnout:** French version (Dion & Tessier, 1994) of the MBI-HSS (Maslach & Jackson, 1981).
- **Stressors:** based on the existing literature and interviews with nurse managers, we designed a scale containing 58 items that was included in the questionnaire. Factor analysis EFA and CFA revealed 4 factors: role conflict and role ambiguity; workload; conflicts with patients; lack of support.
- **Team reflexivity:** French version of the team reflexivity scale (Carter & West, 1998).
- **Emotional dissonance** (Andela, Truchot, & Borteyrou, 2015).

**Results:**
Regression analyses indicated that:
- Three of the stressors (role conflict, workload and lack of support) were significantly associated to burnout.
- Emotional dissonance mediated the association between the stressors and burnout.
- Team reflexivity buffered the link between stressors, emotional dissonance and burnout.

**Limitations**
Our transversal design cannot permit to infer causality.

**Practical implications/ Originality**
First research studying emotional dissonance and team reflexivity among nurse managers. This finding indicates the relevance of recommending formal teamwork training and the
development of strategies that facilitate effective collaboration between health care professionals.

**Emotional dissonance and work outcomes: The role of supervisor emotional support**

Sabine Pohl,1 Abdelhamid Djediat & Adalgisa Battistelli2

1 Université Libre de Bruxelles, Belgium
2 University of Bordeaux, France

**Purpose**: This longitudinal study examined how emotional dissonance, emotional supervisor support, emotional exhaustion, job satisfaction and work engagement are associated over time. We hypothesised mediating effects of emotional supervisor support in the chain of relationships among emotional dissonance and work outcomes.

**Methodology**: The sample consisted of nurses working in two Algerian hospitals, in total 552 at time 1 and 188 six months later at time 2.

Nurses filled out a survey evaluating:
- Emotional Dissonance: FEWS (Zapf and al. 1999)
- Emotional supervisor support: (Pohl and Galletta, 2017)
- Emotional Exhaustion: MBI-HSS (Maslach, Jackson and Leiter, 1996)
- Job satisfaction: Michigan Organizational Assessment Questionnaire (Cammann, Fichman, & Klesh, 1983)
- Work engagement: « UWES-9 » (Schaufeli & Bakker, 2003)

**Results**: Structural equation modelling showed that, over time, emotional dissonance change work engagement. We also showed that emotional dissonance is related to emotional supervisor support which, in turn, is associated with work outcomes.

**Limitations**
Data was merely based on self-reports, which might have overstated the relationships between variables. Future research could integrate additional objectives, especially regarding job outcomes

**Research/Practical Implications**: This study provides valuable intuitions for hospital health managers who should consider emotional supervisor support as an important aspect able to effectively enhance nurses’ well-being.
426 - THE ROLE OF TIME IN INTENSIVE LONGITUDINAL DESIGNS: TRENDS AND APPROACHES

Chairs:
Alfredo Rodríguez-Muñoz and Mirko Antino
Universidad Complutense de Madrid, Spain

State of the art: Intensive longitudinal data provide the opportunity to better understand psychological processes over time. As such type of designs has become increasingly common, several scholars have suggested that the adoption of a temporal approach is needed for the advancement of our field (e.g. Shipp, & Cole, 2015). In this symposium, we address this call by including four studies where time is considered in their models.

New perspectives/Contributions: In the first contribution, Dormann illustrates how SEM models could allow for more valid causal conclusions than HLM models when analyzing diary data. In the second contribution, Keller and Meier focus on how the stressor – strain relationship evolves over time. In four diary studies they find positive concurrent effects from time pressure on fatigue, but not support for short-term accumulation effects of time pressure on the previous day. In the third contribution, Baethge explores differences between short- and long-term effects, and analyzes how to incorporate time perspective into diary designs. Using two different studies, she shows differential effects on the same outcomes depending on the time of exposure. Finally, Hülsheger and colleagues explore the weekly rhythms in affect in relation to incivility at work. They demonstrate that incivility declined systematically over the workweek and that these change patterns could be influenced by trait mindfulness.

Research/Practical implications: This symposium offers theoretical and methodological insights that offer new directions and perspectives for integrating time in psychological and organizational research.

Why Continuous Time Modeling Should Replace Multi-Level Analyses of Intensive Longitudinal Data

Christian Dormann
Johannes Gutenberg-University Mainz, Germany & University of South Australia, Australia
**State of the Art:** This presentation calls for a paradigm shift in the analysis of intensive longitudinal data (ILD). ILD are frequently collected using diary designs, in which individuals provide data at multiple time points. Data are then usually analyzed using hierarchical lineal models (HLM), and person-mean centering is applied to eliminate stable differences between persons. However, information about the time ordering of variables is usually not used, and possible reciprocal relations cannot be estimated. Panel designs are very similar, except there are usually more individuals and fewer time points. Panel data are frequently analyzed using cross-lagged panel structural equation models (SEM), allowing estimation of reciprocal effects and change across time. Stable personality differences are usually not accounted for, even though such methods exist, too.

**New Perspectives/Contributions:** SEM models could allow for more valid causal conclusions than HLM models, but applying SEM models to diary data has its problems. For example, when time lags vary within and between individuals, this is irrelevant for HLM but not for SEM, in particular if time lags are short. Varying time lags, however, could be handled with continuous time SEM (ctSEM). Random effect ctSEM using Bayesian procedures are also available.

**Research/Practical Implications:** It is recommended to replace HLM with ctSEM for analyzing diary data.

**Originality/Value:** The before mentioned problems and solutions are conceptually elaborated further, examples are provided, and solutions are presented.

**Does it matter what happened yesterday? Testing accumulation effects of time pressure on fatigue**

Anita C. Keller (University of Groningen, Netherlands)
Laurenz L. Meier (University of Neuchâtel, Switzerland)

**Purpose:** Studies investigating the stressor – strain relationship using diary designs are usually interested in within-person deviations predicting well-being outcomes on the same day. These models typically do not account for short-term accumulation of stressors such as time pressure. In this study, we test the theoretical assumption of Meijman and Mulder (1998) that insufficient time to recover from high time pressure may increase the intensity of subsequent load reactions.

**Design/methodology/approach:** We used data from four diary studies (ten working days, mean observations = 1,406, mean N = 166) assessing time pressure (3 items) and fatigue (1-3 items).

**Results:** In all studies, positive concurrent effects from time pressure on fatigue were observed. Within one day, in three out of four studies a positive lagged effect from time pressure on fatigue was observed as well. We found no support for short-term accumulation
effects in all four studies implying that higher levels of time pressure on the previous day did not intensify the effect of time pressure on fatigue within one day.

**Limitations:** The studies rely on self-report only and we only investigate short-term accumulation.

**Research/practical implications:** Our findings tend to support initial impact and recovery models over accumulation models.

**Originality/value:** To the best of our knowledge, there is no other paper systematically investigating different conceptualizations of how the stressor – strain relationship evolves over time.

---

**Stay away from me on Mondays: Weekly rhythms in enacted incivility and the role of mindfulness**

Ute R. Hülsheger, Suzanne van Gils, and Alicia Walkowiak

Maastricht University

**Purpose:** Incivility at work, a form of deviant behavior that is low in intensity, is widespread in the world of work. The vast majority of research on incivility at work has focused on targets of incivility and has provided ample evidence that incivility harms employee well-being. In contrast, less is known about the personal and situational factors that drive enacted incivility. In the present study we built upon research on weekly rhythms in affect, link it to the incivility literature and propose that enacted incivility is highest on Mondays and decreases systematically over the course of the week. Furthermore, we propose that trait mindfulness functions as a boundary condition.

**Methodology:** To test hypotheses, we used an experience-sampling study involving 3 daily measurement occasions over 5 work days (N = 152 participants, 564 observations).

**Results:** Growth curve analyses revealed that (a) on average, enacted incivility declined systematically over the course of the workweek and that (b) interindividual differences in these change patterns could be explained by trait mindfulness.

**Limitations:** Future research may extend this research with peer-ratings of enacted incivility.

**Practical Implications:** Knowledge about weekly rhythms in enacted incivility may inform civility trainings.

**Originality/Value:** So far, little attention has been paid to the role of time in the incivility literature. This study addresses this gap by studying the role of the day of the week in enacted incivility.
Symposium Chairs: Denise J. Fortuin & Heleen van Mierlo
Erasmus University Rotterdam, The Netherlands

State of the Art: Work engagement has been well-established as a positive, fulfilling state of mind with marked benefits for individual employees and their organizations. Recently, scholars have begun to argue and demonstrate that work engagement also has meaning as a collective positive state that emerges from the actions and interactions among group and/or organizational members (Costa, Passos, & Bakker, 2014).

New Perspectives/Contributions: With this symposium, we aim to extend current knowledge on collective work engagement. To this end, we present a coherent ensemble of studies, based on state-of-the-art methodology (growth-curve modelling, longitudinal designs, multi-source data, and multi-level analysis). First, Urien and colleagues present a team-level job demands-resources perspective that offers a solid multilevel framework for studying collective work engagement. Next, four empirical studies offer new insights on individual and team-level antecedents and outcomes of collective work engagement. Together, these studies identify shared justice perceptions (Costa), individual team boosting behaviors (Fortuin), and charismatic leadership (Hernández) as predictors of collective work engagement. In terms of outcomes, they link collective work engagement to employee turnover (Dawson), individual preferences for flexible work-life boundaries (Costa), team motivation and performance (Fortuin), and team creativity (Hernández).

Research/Practical Implications: Based on these contributions, it is evident that a collective perspective on work engagement offers a valuable extension to the current, mostly individual-level, approaches. Theoretically, this offers intriguing new avenues for future research. Practically, the symposium indicates it may pay-off to invest in collective engagement, and showcases several factors that could be targeted in workplace intervention strategies.

ABSTRACT 1

Title: The Team Job Demands and Resources (tJD-R) Model: Team Engagement Path and Crossover Relationships

Authors
Begoña Urien¹, Ramón Rico², Evangelia Demerouti³, & Arnold B. Bakker⁴

¹Universidad de Navarra, Spain
²University of Western Australia, Australia
State of the art: Extant research on team engagement does not fully integrate job engagement, their antecedents and outcomes at the individual and team levels, let alone their relationships with team and individual burnout (e.g., Bakker, van Emmerik & Euwema, 2006; Costa, Passos, & Bakker, 2014).

New Perspectives/Contributions: The tJD-R fills this gap through integrating knowledge and research from different fields (well-being, job design, team efficacy, social influence, motivation, multilevel theory). For example, it explains how individual engagement will be more salient to predict individual performance when team engagement is low, or how the lack of individual resources will increase the shared experience of insufficient team resources to activate team engagement.

Research/Practical Implications: Fifteen sets of propositions are ready to be tested. Sociometric technology is suggested to record actual team members’ interactions to uncover when team level states emerged and how specifically both states and levels interact (Olguin et al., 2009). As practical implications, we highlight the possibility to generalize the analysis of strategic data to anticipate how industry trends impose new demands on teams, and input for developing in-team resources to activate collective engagement.

Originality/Value: Contributes to a better understanding of the mechanisms that regulate the relationships between antecedents, burned-out and engaged states, and outputs at the individual and team levels, pushing forward research on well-being and productivity.

ABSTRACT 2

Title: Organisational Engagement and Employee Turnover in the Health Sector

Author: Jeremy F. Dawson

Institute of Work Psychology, Sheffield University Management School, UK

Purpose: Many studies have demonstrated negative links between work engagement and turnover intentions (e.g. Bakker et al., 2014; Keyko et al., 2016). Studies examining actual turnover are rarer, mostly at the organisational/unit level, and give inconsistent results (e.g. Collini et al., 2015; Powell et al., 2014). This may reflect the complexity nature of turnover. To examine this further, I analyse longitudinal data from the English National Health Service (NHS).

Methodology: Data from 238 organisations across five years were used. Engagement (a version of the Utrecht Work Engagement Scale) came from the annual NHS staff survey. Staff
retention was measured by the NHS Electronic Staff Record. Regression analysis examined one-year lagged effects. Growth curve analysis was used to examine longer-term trends. Analysis controlled for organisation type, size, region, and prior retention.

**Results:** Regression analysis revealed an unexpected negative relationship between engagement and retention ($B = -3.12, p < .05$). However, the growth curve model revealed that improvements in engagement are associated with increased retention ($B = 5.01, p < .01$).

**Limitations:** Despite longitudinal analysis, causality cannot be assumed.

**Research/Practical Implications:** Although it initially appears that organisations with more engaged workforces tend to have higher turnover, the growth curve analysis suggests that other factors may explain this. When considered over a five-year period, organisations that show improvements in engagement also show reductions in turnover (an average of 5% reduction per unit engagement).

**Originality/Value:** The use of growth curve analysis reveals a different relationship with clearer implications than the cross-sectional or lagged analysis.

**References**

**ABSTRACT 3**

**Title:** Injustice anywhere is a threat to engagement everywhere

**Authors:** Patrícia L. Costa¹, David L. Patient¹, & Tatiana Marques¹

¹Católica Lisbon, Universidade Católica Portuguesa, Lisbon, Portugal

**Purpose:** This study explores the relationships between shared distributive justice perceptions and TWE. Furthermore, it explores the multilevel process linking those team variables and individuals’ preferences for more flexible boundaries between work and private life.

**Methodology:** Data was collected from 40 teams ($N = 133$ individuals) from several occupations via an online survey and analyzed on MPlus (Preacher, Zyphur & Zhang, 2010).

**Results:** In line with our predictions, distributive justice has a significant and positive influence on TWE. Multilevel analysis’ results support the claim that the individual preferences for
integrating their work and personal life are explained by an indirect effect from distributive justice, via the level of TWE.

**Limitations:** This study was cross-sectional. We have included one dimension of justice, leaving procedural and interactional justice aside.

**Practical Implications:** In a context where technology allows for more opportunities to work virtually away from the office, the boundaries between work and family/personal life become less rigid. In this sense, and to promote the optimization of these possibilities, employees and organizations may benefit from a more integrative approach to both life domains. What is more, with teamwork as a prevalent reality in many sectors, understanding which team variables can foster a positive attitude towards integration becomes relevant for managerial practices.

**Originality:** To our knowledge, this is one of the first studies to focus on the relationship between fairness and engagement at the team level, as well as to explore team-level influences of the individual preference for segmenting/integrating work and personal life.

ABSTRACT 4

**Title:** Team boosting behavior and team performance: Uncovering the role of team work engagement

**Authors:** Denise J. Fortuin¹, Heleen van Mierlo¹, Paraskevas Petrou¹, Arnold B. Bakker¹, and Evangelia Demerouti²

¹Erasmus University Rotterdam, the Netherlands
²Eindhoven University of Technology, the Netherlands

**Purpose:** With this contribution we aim to uncover the link of team boosting behavior with team emergent states and outcomes. Team boosting behavior is defined as activating, mood-enhancing, and jellifying behaviors directed at fellow team members. We propose that team boosting behavior is positively related to positive and fulfilling motivational states such as team work engagement (TWE; Costa, Passos, & Bakker, 2014), and that this link is translated into elevated levels of team sustained effort and team performance. Moreover, we examine whether team boosting particularly helps under conditions in which teams do not function well, i.e. when easily distracted or focused on fun.

**Design/Methodology/Approach/Intervention:** We conducted an empirical study among 61 work teams (246 members) and their team leaders. We obtained multi-source ratings, i.e. members and leaders, and used team-level structural equation modeling to test our hypotheses.
Results: Results support our hypothesis that TWE mediates the relationship between team boosting behavior and team performance and sustained effort. Furthermore, we found that team boosting behavior was more strongly related to TWE for teams that were highly fun-focused and easily distracted.

Limitations: The study is cross-sectional, allowing no causal inferences.

Research/Practical Implications: Our findings provide new insights into the concept of team boosting behavior and its linkages with TWE as a positive, energetic emergent state and behavioral as well as output-oriented team performance indicators.

Originality/Value: Team boosting behavior reflects a novel and promising concept, as is evidenced by the links with TWE and performance uncovered in the current study.

ABSTRACT 5

Title: Fostering creativity of work units over time through charismatic leadership: The mediating role of work-unit engagement

Authors: Ana Hernández1, Vicente González-Romá1, Gea Eman1 & Verónica Melián 2

1Idocal, University of Valencia, Spain
2Universidad de la República, Uruguay

Purpose: Based on the Job-Demands-Resources we hypothesize that when work-unit perceptions of leader’s charisma increase over time, the levels of engagement of the work unit will also increase, which in turn will relate to an increase in an important aspect of organizational success: work-unit creativity.

Methodology: Hypotheses were tested by means of hierarchical multiple regression in a sample of 103 bank branches at two time points separated by 2 years. We controlled for team size and tenure and whether managers changed work units over time or not.

Results: The results showed that, a change in perceptions of leaders’ charisma was positively related to a change in work-unit engagement (a = .28, p < .01) which was positively related with a change in work-unit creativity (b = .28, p < .01). The “indirect effect” Δ work-unit engagement → Δ work-unit engagement → Δ work-unit creativity, was also positive and significant (ab=.08; P = Za Zb = 13.30, p < .01). After partiailing out the effects of work-unit engagement, the increase in perceptions of leaders’ charisma was related with an increase in creativity (B=.26, p<.01)

Limitations: Data were collected from the same source, which might have inflated the relationships.
**Implications:** The study shows that work-unit engagement is one of the mechanisms that links perceptions of leaders’ charisma with a key factor of performance: creativity. Thus, work-unit engagement and creativity can be fostered by training leaders’ charismatic behaviors.

**Originality/Value:** The dynamic and aggregated approach taken adds value to the field of engagement.
Integrated Summary

State of the Art: Person-centered analyses, such as latent profile analysis and latent trajectories analysis are being increasingly used in the field of work psychology. We present five empirical demonstrations of their utility in answering important work psychology research questions by applying these techniques to operationalize different constructs in work psychology, including individual differences, work contexts, motivational mechanisms, dynamically changing constructs, and collective constructs.

Contributions: The first study examined the replicability of HEXACO personality profiles across different samples, while the second study examined how work characteristics combine in affecting performance and well-being outcomes. The next two studies examined work motivation profiles and trajectories showing that motivation changes in early career stages to become more stable thereafter, and that changes in motivation trajectories are predicted by leadership and predicted the development of professional and organizational commitment and turnover intentions. Finally, the last presentation demonstrates the use of latent profile analyses to examine team processes and emergent states.

Research/Practical Implications: Through these applications, we will discuss the pertinence, advantages, and challenges in using person-centered analyses.

Profiles of Personality: Evidence for a Stable Profile Structure of the HEXACO Trait Dimensions

Kabir N. Daljeet\(^a\), Jose A. Espinoza\(^a\), & John P. Meyer\(^{ab}\)

\(^a\) Department of Psychology, Western University, London, Ontario, Canada
\(^b\) School of Management, Curtin Business School, Curtin University, Perth, Australia

Purpose: Failures to reproduce a consistent profile structure for the BIG5 and HEXACO
personality dimensions across studies raises questions about their meaningfulness. Our objectives were to determine (a) whether there is a stable profile structure for the HEXACO dimensions, (b) how large a sample is required to reproduce this structure, and (c) whether the structure can be recovered in small samples by imposing parameters identified in a very large sample.

**Methodology:** Using data from 90,000 international respondents to the HEXACO-100, we extracted 3 to 10 profiles using latent profile analysis. We conducted similar analyses on subsamples of 10,000 and used replicability as a criterion in identifying the optimal solution. We further evaluated replicability using increasingly small groups from a holdout sample. Finally, we examined the fit of an imposed structure using parameters from the large sample.

**Results:** A five-profile structure fit the data well and was reproduced in each of the subsamples of 10,000. The structure could not be reproduced consistently with samples below 500, but the imposed structure fit well in these cases.

**Practical Implications:** Demonstrating a reproducible personality profile structure attests to its meaningfulness. The fact that this structure can be imposed on even small samples will allow researchers to compare findings across studies. These findings create the opportunity to take a holistic approach to personality research by examining trait dimensions in combination.

**Originality:** Ours is the first study to identify a stable HEXACO profile structure and to demonstrate how the structure can be imposed with small samples.

---

**The Work Design Profiles of Employees in the Australian Not-For-Profit Sector: A Person-Centered Perspective**

Caroline Knight\(^a\), Sharon K. Parker\(^a\), Matthew McLarnon\(^b\), & Ramon Wenzel\(^c\)

\(^a\) Future of Work Institute, Curtin University, Perth, Australia  
\(^b\) Department of Psychology, Oakland University, Rochester, USA  
\(^c\) Centre for Social Impact, University of Western Australia, Perth, Australia

**Purpose:** Work design is the content, responsibilities and relationships involved in work. Research suggests work characteristics co-occur, with important effects on work outcomes. We investigate the structure and function of different work design profiles of Australian Not-
For-Profit (NFP) employees and identify predictors and outcomes to inform theory and future interventions.

Methodology: Latent Profile Analysis (LPA) explored the dataset (N=2434). Established measures of autonomy, social support, relational characteristics (e.g. task significance, social impact) and job demands were used. Recommended fit indices tested for increasing numbers of profiles and explanatory and predictive validity.

Results: Four distinct profiles emerged: 1) ‘High strain’ (low autonomy, support, relational characteristics); 2) ‘Low autonomy’ (low autonomy, average support and relational characteristics, higher demands); 3) ‘Average’; and 4) ‘Active’ (autonomy, support, relational characteristics above average, demands moderate). Managers were more likely to have ‘active’ jobs and experience better health and performance. Those with ‘low autonomy’ jobs outperformed those with ‘high strain’ jobs.

Limitations: The dataset is cross-sectional. Longitudinal data is being collected to improve predictive and explanatory validity.

Research / Practical implications: Relational characteristics may buffer the negative effects of low autonomy and high demands. Our results inform the development of person-centered work design theory and help target employees who would benefit most from improved work design.

Value: Few studies have investigated the work design profiles of employees, with mixed results. None have included relational characteristics, yet research suggests these are particularly important for positive work outcomes in service industries.

Motivation Trajectories at Career Start:
Antecedents and Effects on Commitment and Turnover Intentions
Claude Fernet\(^a\), Alexandre J. S. Morin\(^b\), Stephanie Austin\(^a\), David Litalien\(^c\), Mélanie Lavoie-Tremblay\(^d\), & Jacques Forest\(^a\)

\(^a\) Département des Sciences de la Gestion, Université du Québec à Trois-Rivières, Trois-Rivières, Canada
\(^b\) Department of Psychology, Concordia University, Montréal, Canada
\(^c\) Faculté des Sciences de l’Education, Université Laval, Québec, Canada
\(^d\) Ingram School of Nursing, McGill University, Montréal, Canada
Purpose: Despite decades of theoretical and empirical research on work motivation, the dynamics of its development remain unclear. To enrich this understanding, we examined profiles of employees’ characterized by different trajectories of self-determination at career start, and assessed how these profiles differentially related to a variety of predictors and outcomes.

Design: Data (at 0, 6, 12, and 24 months over a 24-month period) were gathered from a sample of 660 newly registered nurses working in public health care.

Results: Longitudinal growth mixture analyses (GMA) revealed three distinct trajectory profiles, characterized by Increasing, Moderate, and Decreasing global levels of self-determination at work. Of particular interest, more positive perceptions of supervisors’ transformational leadership practices and task-level socialization were associated with a greater likelihood of membership in the Increasing profile. This profile was also associated with higher affective commitment to the occupation and organization, as well as lower intentions to leave the occupation and organization.

Limitations: Self-reported measures were used. Future studies could include data from other sources (e.g., peer perceptions of leadership) and outcomes (e.g., actual turnover) to widen the scope of the findings.

Research implications: The identification of predictors of these trajectories points to valuable avenues, involving transformational leadership and task-level socialization, for fostering self-determination, and in turn, commitment and intentions to stay, early in a career.

Originality: In combining a longitudinal and person-centered approach, the findings not only support the idea that self-determined motivation is a dynamic process, but also that this process can vary meaningfully across subpopulations of employees.

A Longitudinal Analysis of Motivation Profiles at Work
Josh L. Howard, Alexandre J. S. Morin, & Marylène Gagné

a Department of Management, Monash University, Melbourne, Australia
b Department of Psychology, Concordia University, Montréal, Canada
c Future of Work Institute, Curtin University, Perth, Australia
**Purpose:** This paper examines the multidimensional nature of workplace motivation and the importance of a continuum structure in self-determination theory (SDT) through application of complementary variable- and person-centered approaches, and additionally tests the stability of these results over time. Specifically, the study demonstrates the usefulness of combining comprehensive measurement modelling (bifactor-exploratory structural equation modelling), prior to estimation of latent motivation profiles in order to model the complexity of motivation. This study represents the first test of the temporal stability of work motivation profiles.

**Methodology:** Bifactor-ESEM and LPA are applied to a sample of 510 full-time employees from a range of occupations over two time points four months apart. Latent transition analyses demonstrate profile temporal stability in a sample of established employees.

**Results:** Results support the central importance of a general factor representing self-determination as the most influential factor in employee’s motivation profiles, but indicates further effects associated with the motivation subscales after controlling for general motivation. Motivation profiles were found to be highly stable over time.

**Limitations:** Participants represent a highly heterogeneous sample and therefore may not be representative of more specific contexts. Additional measurement points would allow for growth mixture modelling capable of tracking motivation trajectories.

**Research/Practical Implications:** Results demonstrate the importance of correctly modelling motivation prior to profile analysis. Additionally, the practical importance of self-determined motivation is demonstrated.

**Value:** Results lend support to the theoretical position that while general self-determination is an essential component of motivation, it alone does not fully describe employee motivation.

**Capturing Complexity across Levels: A Team-Centered Approach to Profiles**

William S. Kramer\textsuperscript{a}, Thomas A. O’Neill\textsuperscript{b}, Marissa L. Shuffler\textsuperscript{c}, & Matthew J. W. McLarnon\textsuperscript{d}

\textsuperscript{a} Department of Psychology, University of Nebraska Omaha, Omaha, USA
\textsuperscript{b} Department of Psychology, University of Calgary, Calgary, Canada
\textsuperscript{c} College of Behavioral, Social and Health Sciences, Clemson University, Clemson, USA
Purpose: To identify meaningful patterns of team-level variables, a shift in focus on variable-centered to team-centered approaches (TCAs) has been suggested. We discuss how latent profile analysis (LPA) provides a holistic view of the complexities exhibited by teamwork processes and emergent states.

Methodology: We review the theoretical and methodological considerations necessary for adopting a TCA.

Results: Applying TCA is a complex process that influences all steps from theoretical development to research design. In addition to identifying patterns of variables, it can be used to develop theories, including those that propose complex relations between constructs. However, researchers must consider several important issues: correlations between constructs, distributions of data, sample size, aggregation, etc. From these considerations, a clear case is made for when TCAs may be useful and when variable-centered approaches might be more practical.

Limitations: Our considerations are drawn from a relatively scarce literature. However, there is theoretical and methodological support for both the use of profiles to examine complex interactions and TCA in recent literature, as well as recommendations that can be adapted from the individual-level.

Implications: Using a TCA provides the opportunity to develop and test complex new theories, simplify our understanding of existing theories and overlapping constructs, and understand how teams change over time.

Originality: Our research provides an integration of: (1) whether TCA should be used, (2) what the data should look like, and (3) the challenges of applying TCA.
WORKING FOR THE GREATER GOOD

Symposium submitted by Fred Zijlstra, Maastricht University

In line with this year’s conference theme ‘Working for the greater good: Inspiring people, designing jobs and leading organizations for a more inclusive society’ this symposium focuses on projects, studies or approaches that indeed aim at making this world a better place. These projects do not focus on optimizing performance, or effectiveness of employees and/or organizations, but are demonstrations of projects addressing a societal goal.

The aim of this symposium is to inspire the debate among the W&O psychological community on the issue that resonated loudly in the 1970’s and 1980’s: “For whom are we working?” In the neo-liberal period we also see that science is following the money (grants, funding). However, the question is whether this will indeed make our world a better place.

The projects presented in this symposium will focus on ‘decent work’, ‘sustainable employment’, and ‘inclusiveness of organizations’, and represent initiatives from 3 European countries: Portugal, Spain and The Netherlands. With the following presentations we hope to inspire the debate concerning ‘quality of work’.

Contribution 1

Decent Work for the common good

Leonor Pais*, and Nuno Rebelo dos Santos**,

*University of Coimbra, and **Escola de Ciências Sociais, Universidade de Évora

State of the art: Decent work (DW) is a concept proposed by the International Labour Organization (ILO), intending to express the aspirations of people worldwide concerning their working lives. Regarding DW measuring researchers and policy makers have been focused mainly on statistical indicators. Recently, Work, Organizational and Personnel Psychology began to study DW (see also EAWOP conference 2011). A psychological measure was developed by Ferraro, Pais, dos Santos and Moreira (2018) showing that the subjective perception of the concept is configured through seven dimensions: 1) Fundamental principles and values at work; 2) Adequate working time and workload; 3) Fulfilling and productive work; 4) Meaningful remuneration for the exercise of citizenship; 5) Social protection; 6) Opportunities; 7) Health and safety. Furthermore, the overall DW concept was previously analyzed and characterized in six aspects which originate several insights on DW: a) evolves over time; b) has components that are universal and other culturally specific; c) depends on the actions of several stakeholders; d) is the result of strong interdependence among social agents; e) depends on the developmental stage of people; f) depends on the time length of specific external conditions and indicators of decent work deficit (Ferraro, Pais, & dos Santos, 2015; Dos Santos, Pais, & Ferraro, 2016).

New perspectives/contributions: These six aspects of the concept are analyzed considering each DW dimension and corresponding theoretical propositions are made.
Research/practical implications: A research agenda and practical implications are proposed, based on the systematic analysis and reflection undertaken. Each DW dimension originate theoretical propositions that are suggested for further empirical research.

Originality/value: The systematic reflection undertaken is new and highlights the contribution of the concept for common good.

Contribution 2

For the Sustainable good:

A practical approach to promoting sustainable employability in organizations

Rosine Rutten & Bram Fleuren

Work and Social Psychology, Faculty of Psychology and Neuroscience, Maastricht University, The Netherlands (4Limburg project)

Purpose: In light of aging and labor shortages, organizations become increasingly willing to invest in sustainable employability (SE). However, organizations frequently struggle to handle the complexity of SE effectively. Based on previous work that conceptualizes SE as a multifaceted longitudinal construct, this project provides an approach to facilitate organizations in addressing SE.

Approach: The approach helps organizations in identifying their employees’ needs regarding SE and to intervene accordingly. The approach starts by interviewing HR-managers about the most crucial issues regarding SE. These issues are then translated into instruments that, with a core set of SE indicators, form an organization-tailored SE-survey. This survey allows for quantifying the most SE-relevant issues in terms of individual, work, and contextual factors. Consequently, facilitated focus groups of stakeholders within the organization design appropriate interventions. Such interventions typically target work and work-contextual factors, given their potential changeability.

Results: At the time of writing, seventeen organizations have participated in this project and results from four organizations are available. Moreover, two organizations find themselves in the focus-group stage. As the participating organizations are diverse, the presentation in the symposium zooms in on inclusiveness as determinant of SE within a subset of the participating organizations. A comparison between a large higher education and research institution and three commercial organizations shows that inclusiveness contributes significantly to some indicators of SE.

Practical Implications: Substantial variance exists in perceptions of inclusiveness, suggesting that inclusiveness oriented interventions can be fruitful. Ongoing focus-groups yield several potential prevention and intervention strategies.

Originality: This is a new approach for intervening in organizations to facilitate inclusiveness of the organization and at the same time the sustainable employability of personnel. The
project is an example of how regional government works together with university to solve problems in the labor market.

Contribution 3

**Organizational practices that facilitates the integration of employees with disability: Socialization and insiders’ affective climate.**

Francisco J. Medina, Nuria Gamero, Francisco J. Sanclemente & Rocío López-Cabrera,

*University of Seville (Spain)*

**Purpose:** The integration of employees with disabilities is a challenge for current organizations (Colella & Bruyre, 2011). It is well known that for integration to be effective, organizations must adapt their organizational processes to this aim, because this integration can be hindered due to some psychosocial processes such as social exclusion, stigma, stereotypes or dehumanization (McGonagle & Barnes-Farrell, 2013; Medina & Gamero, 2017). The HRM literature about the integration of this collective has a theoretical approach, whereas data that support main propositions are almost inexistent. This line of research aims to work in this gap, showing evidence from four studies, using a quantitative and a qualitative methodology.

**Methodology and results:** In the first study participated 463 workers of 24 different companies (52.1% without disability and 47.9% with disability). A mean comparison analysis indicates no significant mean differences in socialization tactics, but significant mean differences between workers with disability and co-workers in learning of organizational culture aspects. More specifically, the main differences revolved around three information domains: background, language and policies. The ignorance of these domains is the first warning sign of a poor integration process (Benzinger 2016).

In the second study we analyse mechanisms that explain how socialisation process facilitate learning about main organizational aspects, introducing the performance of workers with disability, evaluated by the superior. 66 work group with one worker with disability per group, participates in this study, from the companies described in study 1. Our findings indicated that social support and organizational learning are full mediators in the relationship of socialization tactics with performance of workers with disability.

In the third study we analyse the role of insiders in the process of integration (considering their share psychological safety, share stigma and affective climate), analysing 60 work groups from the companies described in study 1. Results indicate that high levels of organizational learning of workers with disabilities are achieved through maintain high levels of socialization tactics in these workers and at the same time, maintain high levels of affective climate and shared psychological safety and low level of shared stigma in coworkers without disabilities.

In the last study we developed six focus groups with 70 participants in an industrial organization dedicated to the integration of employees with schizophrenia, analyzing some
HRM aspects that facilitate integration such as leadership, team climate, socialization processes and psychological safety.

**Conclusions:** Finding supported the relevance of socialization processes in the integration of employees with disability and social support as a main mechanism that facilitates integration. In the same direction, it has been shown that the role of the insiders is essential to predict integration, rather than the disability itself, being very relevant the affective climate of the team, the low level of stigma and an appropriate leadership.

This line of research is innovative when analyzing work teams composed of people with disabilities, to deepen the role of insiders, and to provide data from an organization whose workers are mostly people with mental illness.

**Added Value:** From an applied point of view allows providing tools to human resources departments to improve their socialization practices and prepare the organization to receive this collective of employees.

Contribution 4:

**Monitoring the Work Capability of People with Limited Work Capacity (LWC)**

Gemma M. C. van Ruitenbeek · Fred R. H. Zijlstra · Ute R. Hülsheger

*Department of Work and Social Psychology, Faculty of Psychology and Neuroscience, Maastricht University, P. O. Box 616, 6200 MD Maastricht, The Netherlands; Centre for Inclusive Organizations*

**Purpose:** Participation in work positively affects mental health especially for people with limited work capacities (LWC). Notwithstanding their limitations, people with LWC are capable to provide a productive contribution dependent on adequate support and a suitable job. How can the individual support enhanced in daily practice?

**Approach:** A certain level of self-understanding is crucial for professional and personal development. This can be enhanced with the help of tailored measures that enables people with LWC to reflect on their strengths and weaknesses. For that reason we developed self-report and observer measures. We adjusted measures of mental ability, conscientiousness, self-efficacy, and coping by simplifying the language level. In order to validate these measures tested dimensionality, internal consistency, test-retest reliability, and conducted confirmatory factor analysis (CFA).

**Results:** Our studies assured that the adapted scales possess factorial validity, content validity and internal consistency reliability, which means that they are reliable for people with LWC.

**Limitations:** These studies don’t cover criterion related validity.

---

1 people that are limited in their work capacity as a consequence of chronic mental illness, psychological or developmental disorder
**Practical Implications:** The measures form the basis of an instrument that monitors the development of people with LWC over time. The instrument is already implemented in several organizations. Participants (N=180) received via their personal coach an individual report of their scores, the meaning, the differences between the self-report and observer scores after each measurement. Professionals report that in their opinion the measures do help people with LWC to reflect on their strengths and weaknesses and that this enables personal development.

**Added value:** WOP can benefit from these tailored and reliable measures to study more accurately relationships between personality traits and work performance in this specific population.

**Discussants:**

Henny Mulders, Consultant, UWV (Social Security Fund), The Netherlands

Fred Zijlstra, Maastricht University.
475 - THE WORK-FAMILY INTERFACE: NEW PERSPECTIVES ON HOW PARENTAL EXPERIENCES SHAPE WORK BEHAVIOR AND ATTRIBUTIONS AND HOW WORK EXPERIENCES SHAPE BEHAVIOR AT HOME

Chair: Nina M. Junker & Alina S. Hernandez Bark (both Goethe University Frankfurt)

State of the Art: Most employees face the challenge to combine work and family roles and experience demands from both of these roles. The five contributions in this symposium provide new evidence on how parental experiences affect workplace behavior and attributions and vice versa.

New Perspectives/Contributions: In this symposium, we combine experimental and longitudinal approaches to study the work-family interface. The first two contributions focus on employees, who have just transitioned into parenthood. Pundt and colleagues provide longitudinal evidence to show how parenthood changes workplace behavior. Hernandez Bark and colleagues then demonstrate in an experimental study how parental leave decisions and employees’ gender affect decision makers’ perceptions. The third contribution by Toker and Junker similarly focuses on decision makers, namely supervisors. They experimentally investigate how differences in supervisors’ work-family mindset affects how they perceive a female vs. male employee. The last two presentations focus on spillover processes from one domain into the other. Junker and colleagues demonstrate how incongruence between employees’ segmentation preferences and organizational supplies predict work-family conflict and enrichment six weeks later and how self-control moderates this relationship. Finally, Nilsen and colleagues propose and test a cross-lagged crossover model to understand how own and partner work-family conflict predicts the parent-child relationship two years later and vice versa.

Research/Practical Implications: Together, the results of the five contributions in this symposium add to the complexity of managing the work-family interface and provide both theoretical as well as practical implications how to support employees in doing to successfully.

Does a change of parental status predict changes in employee well-being?

Franziska Pundt (Federal Institute for Occupational Safety and Health, Dortmund, Germany)
Alexander Pundt (MSB Medical School Berlin, Germany)
**Purpose:** The change of a person’s parental status is among the critical life events and associated with stress. One explanation is that such change causes new demands with respect to child care that have to be brought together with demands from other life domains such as work. We investigated the relationship between the change of parental status of working adults and several aspects of well-being.

**Design/Methodology/Approach/Intervention:** The study is based on the matched surveys of two waves of the Working Time Survey – a German representative survey of employees with a time lag of two years. The longitudinal sample consists of more than 5800 employees. We compared employees who became parents within the time lag of the survey with those whose parental status did not change with respect to well-being.

**Results:** We found change of parental status to be associated with an increase in fatigue and lack of sleep, but also an increase in subjective health status. Moreover, new parents showed an increase in cognitive interference of the home domain (rumination, planning) with their working tasks and were contacted more frequently during working time by a person from the home domain.

**Limitations:** The survey is based on self-report data.

**Research/Practical Implications:** Our findings underline the importance of research on the consequences of parenthood for work-related experiences and open up a discussion about how to support newly become parents in organizations.

**Originality/Value:** Our study is among the first to investigate the consequences of parenthood in a representative longitudinal sample of working adults.

I will be back! Effects of taking parental leave for women and men

Alina S. Hernandez Bark, Nina M. Junker (both Goethe University Frankfurt, Germany) & Thekla Morgenroth (Exeter University, UK)

**Purpose:** Previous research shows that mothers taking maternity leave face negative evaluations in work-related domains like job commitment and working mothers receive negative evaluations in family-related domains like family commitment. In our research, we extend the scope and include fathers, who take parental leave. Thereby, we assume detrimental effects of taking parental leave for both women and men regarding work-related
variables. We further expect a boost effect of parental leave on family-related variables only for men but not for women (as they just fulfill social expectations when taking parental leave).

**Methods:** We conducted two online experiments with a 2 (gender of the person in the scenario: female vs male) x 3 (parental leave condition: control with no information vs. parental leave vs. no parental leave) between subject design using vignettes (Study 1: $N=222$; Study 2: $N=189$).

**Results:** Both studies provided support for our hypotheses and possible mechanisms driving these effects.

**Limitations and Implications:** The majority of participants had no children and we used an experimental design. Ideally, future research should use a longitudinal and multi-source design and follow parents before and after parental leave. Further, potential moderators like lengths of parental leave, social norms, etc. should be included.

**Originality/Value:** Previous research has predominantly focused on the effects of parental leave for women, especially in countries where maternity leave is not protected by law (like the USA). With our research, we highlight the effects of parental leave for both gender and contribute to a deeper understanding of the underlying mechanisms.

---

**My conflict- your conflict? An experimental study of work-family mindset and perceptions of others’ work-family conflict and enrichment**

Sharon Toker (Tel Aviv University, Israel) & Nina M. Junker (Goethe University Frankfurt, Germany)

**Purpose:** We aimed to investigate how individuals perceive others’ work-family conflict and enrichment and what the outcomes of such perceptions are. We build on the mindset literature and introduce the work-family-mindset construct, namely whether the work-family interface is perceived as leading mainly to conflict or to enrichment. Integrating social-projection and mindset literatures, we investigate the effect of holding such conflict or enrichment mindsets on social judgments of female or male employees' burnout and promotability, and on the intention to provide them with work-family supportive supervision.

**Design/Methodology/Approach/Intervention:** We conducted a randomized controlled experimental study among 224 German working parents. We first manipulated participants' work-family-mindset and then gave them a social judgment task.
**Results:** We predicted and found that participants holding a work-family-enrichment mindset versus a work-family-conflict mindset were more likely to judge another working-parent as suffering from less burnout and as more worthy of promotion, independent of the perceiver's mood and personality. In addition, the target's gender interacted with the mindset manipulation, such that perceivers with an enrichment mindset were more likely to help male but not female targets.

**Limitations:** The study is restricted to a German sample.

**Research/Practical Implications:** As conflict and enrichment mindsets can be induced, managers and HR practitioners should be aware of the degree to which their own perceptions, irrespective of employees' work-family experiences, shape their judgments and behaviors towards these employees.

**Originality/Value:** We introduce the new construct of work-family-mindset and show, for the first time, how such mindsets can be induced and what the consequences are.

**Help me (not) to forget what happened at work – How self-control moderates the relation between segmentation preferences-organizational supplies (in)congruence and work-to-family conflict and -enrichment**

Nina M. Junker (Goethe University Frankfurt, Germany), Roy F. Baumeister (University of Queensland, Brisbane), & Jeffrey H. Greenhaus (Drexel University, Philadelphia)

**Purpose:** Individuals differ in their preferences to integrate work into family with some aiming more at segmenting these roles (i.e. work should stay at work) and others aiming more at integrating these roles (i.e. work can come home). Organizational supplies determine whether employees can enact these preferences or not. In the present research, we use the job demands-resources theory to argue that incongruence between employees’ preferences and organizational supplies represents a demand, which may increase work-to-family conflict and decrease work-to-family enrichment. We further assume that self-control – individuals’ ability to self-regulate themselves – serves as an individual resource which buffers the negative and accentuates the positive relationships.

**Design/Methodology/Approach/Intervention:** We conducted a longitudinal study with a six-week interval between measurement points among 208 working parents in Germany to test our assumptions.
**Results**: Overall, we found mixed support for our hypotheses. Most importantly, (in)congruence differentially affected work-to-family conflict and enrichment and these effects were differentially moderated by self-control, thus adding to the conceptual distinctiveness of conflict and enrichment.

**Limitations**: Experiences of work-to-family conflict were very stable across the six-week time interval while work-to-family enrichment was less stable. Replications using shorter or longer time frames are, therefore, warranted.

**Research/Practical Implications**: Self-control can be trained and organizations may support their employees in doing so.

**Originality/Value**: We propose self-control as a relevant and promising intraindividual factor contributing to experiences in the work-family interface.

---

**Cross-lagged associations between work-family conflict and parent-child relationship in a longitudinal study of mothers, fathers and adolescents**

Wendy Nilsen (Work Research Institute, OsloMet – Oslo Metropolitan University, Norway), Nina M. Junker (Goethe University Frankfurt, Germany), Amanda Cooklin (La Trobe University, Melbourne), & Anne Kjeldsen (Bjorknes University College, Norway)

**Purpose**: To examine the longitudinal interplay between work-family conflict (WFC) and parent-child relationship (PCR) in dual-earner couples.

**Design**: Self-rated WFC and PCR (i.e. closeness and conflict) were measured twice across three years, in 139 Norwegian couples with adolescent offspring from the longitudinal “Tracking Opportunities and Problems” (TOPP)-study. We examined within-person cross-lagged, and crossover processes (from mothers to fathers, and vice versa), with structural equation modelling.

**Results**: Unadjusted findings support former cross-sectional studies. The fully adjusted model taking into account bidirectionality, support reversed causality (i.e., PCR precedes WFC), but does not support direct causality (i.e., WFC precedes PCR). Cross-sectional, but not longitudinal, crossover links were found from mothers to fathers.

**Limitations**: The sample can be generalized to middle-class families in Northern-European setting, but due to attrition issues, we warrant caution when generalizing to couples with
lower socio-economical status, or other cultural settings. While PCR was measured with a valid measurement, WFC was measured with one item, and we did not measure the potential positive effects of work-family interface.

**Research/Practical implications:** The findings suggest parental WFC is important for PCR with adolescent offspring, mimicking findings of younger offspring. Finding that PCR precedes WFC, but not vice versa, is important for planning prevention efforts. Future studies should examine positive implications of the work-family interface, shorter time lags, and robust measurements of WFC.

**Originality/Value:** Despite increasing interesting in WFC and child outcomes, this is the first study examining cross-lagged crossover links between WFC and PCR.
State of the art: Decades of leadership research have focused predominantly on the leader’s behavior and characteristics. But with changing conditions in the working world, the requirements of and the perspective on leadership are similarly changing. This symposium reflects this change and shows the relevance of (social) context in leadership.

New Perspectives/Contributions: This symposium covers a variety of research methods (qualitative and quantitative) and designs (cross-sectional; longitudinal; multi-level). First, Pundt and Thompson address the relevance of context. They show that the hierarchical level of the leader matters and needs to be considered when examining leadership. Second, van Gils et al. find in two studies that meaningfulness mediates the effect of ethical leadership on employee wellbeing. Third, Richter and Volmer demonstrate in a diary study the relevance of time. They find that the time leaders spend with their employees acts as a boundary condition for leaders’ engagement in LMX and leaders’ thriving. Empowering leadership styles seem to address the needs of the digital age, but are they enough? Fourth, Bracht et al. present the new concept of self-leadership-culture and demonstrate its relevance for organizational success. Fifth, Nieberle et al. examine the co-creation of leadership in teams, and highlight that leadership is a dynamic, relational phenomenon.

Research/Practical Implications: This symposium shows that leadership needs to consider the context to be effective and that it should be seen as a social process, not as a one person’s (leader) behavior/characteristics. Together the five contributions provide valuable theoretical and practical implications for leadership.

Hierarchy matters: Leaders’ hierarchical level, their working conditions and health

Purpose: The hierarchical level is mostly examined in relation to leadership behavior or subordinates’ working conditions. We assume that it also characterizes the leaders’ working situation. We investigate whether leaders at top, middle, and low hierarchical levels differ with respect to their working conditions and health outcomes.
Design/Methodology/Approach/Intervention: The study is based on data of the BIBB/BAuA Employment Survey 2018 – a representative survey of employees in Germany. Of those participants having a leadership position, 710 work at top, 2465 at middle, and 1589 at low hierarchical levels. We compare leaders at these levels with respect to various demands, resources, and health outcomes.

Results: Leaders at the top level reported more non-routines (new tasks, improving processes), disturbances, and multitasking. Whereas decision latitude increases significantly at higher hierarchical level, especially information access, supervisory support, and appreciation were decreased at the low level compared to middle and top management. Moreover, we found more job satisfaction and a better health status and less health complaints and absenteeism in top managers compared to subordinate hierarchical levels.

Limitations: The survey is based on self-report, cross-sectional data.

Research/Practical Implications: Our findings underline the importance of structural conditions for the working conditions and health of leaders. In practice, organizations should be aware of the health-relevant working situations of their top managers, middle and low managers.

Originality/Value: This study is among the first to investigate the hierarchical level with regard to several demands, resources, and health outcomes of a diverse leader sample.

Ethical leaders, stress-free employees: the mediating role of meaningful work

Suzanne van Gils (Maastricht University, The Netherlands)

Purpose: I investigated how ethical leadership can reduce employee stress through meaningful work and identification. I build on earlier work that discusses how ethical leadership fosters identification (van Gils, van Quaquebeke, & van Knippenberg, 2010; Zhu, He, Treviño, Chao, & Wang, 2015), and how meaningful work promotes identification (Meyer, Becker, & van Dick, 2006) in order to provide an integrated view into how ethical leaders can improve stress of employees by providing a meaningful context.

Design: I conducted a cross-sectional survey (N=115), as well as a replication study with Mturk participants (N=198)

Results: The hypothesis that meaningful work mediates the negative relationship between ethical leadership and stress was confirmed in the cross-sectional study. The Mturk study
replicated these findings, and extended them to the domain of physical symptoms (e.g. headaches, backaches, bloodpressure).

Limitations: Both studies employ a cross-sectional design, future research should focus on establishing causality and longitudinal patterns.

Research/Practical Implications These studies contribute to the understanding of how ethical leaders can positively influence both the mental and the physical well-being of employees.

Originality/Value: This research focuses on the scarcely researched area of ethical leadership and employee health. Moreover, this study is the first to relate ethical leadership to employee physical well-being.

The benefits of leader-member exchange for leaders’ work-related well-being:

A matter of time

Stefanie Richter & Judith Volmer (University of Bamberg, Germany)

Purpose: The positive impact of high-quality leader-follower interactions has been repeatedly shown with regard to a wide range of employee outcomes. Yet, leaders’ own perceptions of the leader-member exchange relationship quality (LMX) and related consequences have only received scarce attention. Applying a positive psychological perspective, we propose leaders’ engagement in LMX as a means of building relational resources at work which may promote leaders to thrive at work. Moreover, we suggest that the time that leaders spend with their followers may act as a boundary condition in this relationship.

Methodology: We conducted an online-based daily diary study over the course of five consecutive work days (N = 85 leaders).

Results: Results of multilevel analyses confirmed a significant positive association between leaders’ engagement in LMX and leaders’ thriving between- and within-persons. Moreover, the positive daily relationship between LMX and thriving was moderated by the extent of time that leaders had spent together with their followers on the respective day.

Limitations: All constructs were measured using self-reports.

Research/Practical Implications: Organizations should act as enablers of high quality relationship amongst their members and provide their leaders with a work environment that allows them to implement sufficient positive interactions with their followers on a daily basis. Future research may also address leaders’ perception of followers’ contribution to the exchange relationship to better capture the dynamic nature of leader-follower interactions.
**Originality/Value:** Our findings demonstrate that high-quality leader-follower interactions bear the potential to elicit a resource-building process in favour of leaders’ own well-being and personal growth.

**Leadership for grown-ups: About the usefulness of a self-leadership-culture in the digital age**

Eva Bracht, Nina M. Junker, & Rolf van Dick (all Goethe University Frankfurt, Germany)

**Purpose:** Empowering forms of leadership are on the rise, as they may help organizations dealing with challenges of the digital age. Self-leadership-culture (SLC) is such an empowering concept, which provides the opportunity to analyze self-leadership in its social and organizational context. We present a valid scale to operationalize SLC, and empirically show its relevance for organizational success.

**Design/Methodology:** We conducted a series of four studies. In the first two studies, we developed of a scale to measure SLC. With Studies 3 and 4, we explored causal effects of SLC on organizational success, using an experimental and a longitudinal design.

**Results:** In Studies 1 \((N=169)\) and 2 \((N=167)\), we created a set of 23 items, and found the theoretically assumed factor structure. Studies 3 and 4 demonstrate the expected causal effects of SLC on organizational success. Thereby some dimensions of SLC elicited stronger effects on the outcomes than others.

**Limitations:** A large proportion of participants from Study 3 were students, which limits the generalization of results.

**Research/Practical Implications:** As SLC influences organizational success positively, practitioners should consider developing their culture accordingly. Future research could analyze why certain aspects of SLC have a stronger influence on organizational success than others.
Originality/Value: It is the first series of studies, which empirically investigated self-leadership as an organization-wide solution, and showed its contribution to organizational success in the digital age.

Co-creating leadership? A qualitative study of the dynamic relational processes in teams
Karolina Nieberle (LMU Munich, Center for Leadership and People Management, Germany)
Susanne Braun (Durham University, Durham University Business School, United Kingdom)
Dieter Frey (LMU Munich, Center for Leadership and People Management, Germany)

Purpose: We seek to contribute to the current understanding of how multiple individuals in teams co-create leadership. We follow a qualitative-constructivist approach focusing closely on how leadership emerges through micro-level processes that take place between team members and in interaction with the team’s manager.

Design/Methodology/Approach/Intervention: Our methodology builds on Organizational Discourse Analysis and Grounded Theory. We collected data from 11 teams with 42 team members primarily based in a large city in the south of Germany (analysed to date: 25 interviews, 6 team exercises).

Results: Individual level processes that facilitated the co-creation of leadership include gaining awareness of relevant personal strengths, developing interest/motivation, and role taking. At the team level, we identified realizing similarities/positive relationships, trusting/feeling safe, developing team mental models, empowering each other, and solving problems/developing ideas. Managers affected leadership co-creation through initiating and enabling, providing teams with strategic advantages, and the approach to decision-making.

Limitations: The study utilizes qualitative methodology with data collection at one point in time and in a selective sample.

Research/Practical Implications: Findings suggest that leadership research must take multiple actors and levels within the team into account. Leadership as a dynamic, relational phenomenon requires the alignment of leadership actors in the space between formal managerial structures and emergent processes.

Originality/Value: Our research considers team members as knowledgeable agents who co-create leadership. We specifically focus on team members’ use of language as means of communication, and seek to reveal what lies in the ‘space between’, in which leadership is co-created at multiple levels within teams.
532 - DRIVING POSITIVE EXPERIENCES IN THE WORKPLACE: THEORY AND PRACTICE

Olga Tararuhkina, Ph.D., Saint Petersburg State University, Saint Petersburg, Russia
Catherine T. Kwantes, Ph.D., University of Windsor, Windsor, ON, Canada
Cheryl A. Boglarsky, Ph.D., Director, R&D, Human Synergistics
Amirreza Talaei, Ph.D., University of Windsor, ON, Canada

State of the Art
Organizational culture, societal culture, as well as trust, individual needs, and interpersonal relationships in the workplace have received attention to study them directly and indirectly, however to a limit. For executives they represent a lever for engagement and effectiveness, and therefore productivity and bottom line. A growing amount of research on loneliness, stress, and lack of meaning describe a decrease in employee wellbeing. Can positive workplace experiences (culture, trust, meeting individual needs in their priority order, and satisfying interpersonal relationships) deliver positive outcomes for both employees and organizations?

New Perspectives/Contributions
Four points of view on culture, trust, individual needs and interpersonal relationships in the workplace, from the practitioner and scholar points of view, from both empirical and theoretical perspectives explore those less examined aspects looking to find those drivers.

Thus, only one of the three types of cultures (Constructive type) leads to effectiveness and sustainability in the organization. Only one of the four kinds of workplace relationships leads to relationship development and growth. While all SCARF needs lead to organizational citizenship behaviours, the need for Status is more important to be met. Studying trust in people and trust in institutions in context of societal cultural values can help understand variances and invariances of trust among different cultures.

Research/Practical Implications
Workplace relationships at dyadic level, constructive organizational culture, more trust, and paying more attention to individual needs can help improve both employee wellbeing and performance as well as decrease turnover.

Positive Interpersonal Relationships In the Workplace and Organizational Culture
by Olga Tararuhkina, Ph.D.,
Saint Petersburg State University
Saint Petersburg, Russia

State of the Art
Researchers typically study individual, team/group, or organizations when researching behavior, dynamics, development, or effectiveness in the workplace. Advances in organizational network analysis as well as engagement studies suggest that dyadic level is the most potent in saving cost, change adoption, productivity increase.
New Perspectives/Contributions
Both professional and personal, defined by the norms of societal cultures and influenced by the roles of relationship partners, the interpersonal side of relationships develop spirally, not linearly as researchers typically suggest: the focal point of every one spiral of the relationship is a point of interpersonal tension (including but not limited to conflict), and how relationship partners deal with it in the workplace with agendas, office politics, and turf wars. There are four kinds of relationships and corresponding approaches to handling tension, one of them creating the most positive outcomes: most satisfaction to both partners, moving the relationship forward.

Research/Practical Implications
Workplace relationships at the dyadic level can be a solution to the increasing demand for collaboration, increasing problem of loneliness, as well as saving time on getting things done, and therefore can be used as a lever for productivity, meaning, and connection. Positive workplace relationships boost organizational culture, individual and team performance.

Originality/Value
Focusing on the dyadic level of organizational behavior has not received enough attention. This theoretical approach for developing deeper and stronger workplace relationships can be used in trainings, coaching, consulting, mentoring, as well as organization development and design.

Trust, Societal Culture, and Role Relationships in the Workplace

Dr. Catherine T. Kwantes, University of Windsor, Windsor, ON, Canada

State of the Art
Trust in the workplace has been examined as both interpersonal and impersonal trust – that is, trust in people and trust in institutions. It is clear that trust in the workplace has positive results for both employees and organizations. Research examining interpersonal trust in the workplace has primarily focussed on antecedents to trust and the bases upon which trustworthiness determinations are made.

New Perspectives/Contributions
An understanding of role relationship expectations within societal cultures can be extended to organizations in order to address the question of how interpersonal trust develops as well as the question of what coworkers would be trusted for. Drawing on interpersonal relationship theories and explicitly including both cultural values and their resulting relationship norms can move toward an understanding of how societal culture affects expectations of behaviour within role relationships in the workplace as well as the resulting effect on trust based on the degree to which behaviour within those role relationships conform to expectations.

Research/Practical Implications
Bringing cultural values and relationship norms into research on workplace trust can aid in identifying the extent to which current knowledge is generalizable to multiple cultural contexts. Further, this has the potential to inform the development of workplace cultures where trust can enhance organizational and employee well-being.
In Pursuit of the Positive Organizational Workplace: The Role of Constructive Organizational Norms
Cheryl A. Boglarsky, PHD, Director, R&D, Human Synergistics

✓ Purpose
Organizational culture, or the behavioral norms and expectations of organizational members, has become the top priority of top executives because culture exists and affects everything that matters most to the organization and its stakeholders. Because of its impact, culture is the primary driver for positive organizational member experiences at the individual, team, and organizational levels.

✓ Design/Methodology/Approach/Intervention
Responses to the Organizational Culture Inventory® (OCI®) from over 250 organizations engaged in cultural initiatives were examined for cultural predictors of positive outcomes. The OCI measures the strength of 12 cultural norms and behavioral expectations associated with three types of cultures: 1) Constructive type (leads to effectiveness and sustainability), 2) Passive/Defensive type (leads to ineffectiveness and vulnerability), and 3) Aggressive/Defensive type (leads to mixed performance and volatility).

✓ Results
Results shows that, in general, Constructive styles are related to organizational profitability and adaptability, reports of enhanced teamwork and quality, and decreased turnover and stress. The Defensive styles (both Passive and Aggressive) lead to increased ineffectiveness in most outcome variables. Additionally, management and individual contributors who behave and endorse Constructive styles are associated with personal, as well organizational, effectiveness.

✓ Limitations
While it’s useful to focus solely on the norms and behavioral expectations that lead to positive workplace outcomes, it’s also necessary to measure those that may lead to undesirable outcomes. That is, because in practice Defensive cultural norms occur alongside Constructive cultural styles, it’s instructive to determine which patterns of norms lead to desirable outcomes.

✓ Research/Practical Implications and ✓ Originality/Value

Originality/Value
Understanding how trust develops and is maintained in social context or in multicultural workplaces has not received much attention. This theoretical approach suggests an approach for understanding culture’s effect on trust in interpersonal relationships via role relationship expectations.
Knowing the patterns will assist management and organizational change agents in their cultural initiatives.

**SCARF theory: Meeting employee needs**

Amirreza Talaei, University of Windsor, Canada

**Purpose:** The SCARF theory (Rock, 2008) draws on neuroscientific research and posits that satisfaction of the needs for Status, Certainty, Autonomy, Relatedness, and Fairness (SCARF) is crucial for positive functioning of individuals in the workplace. This study aimed to test the utility of SCARF as a new workplace need theory in predicting positive work outcomes, over and above what Self-Determination Theory (SDT) as a leading and widely established need theory in the workplace could offer. In so doing, Organizational Citizenship Behaviours (OCB) was chosen as the positive outcome.

**Methodology:** Data were gathered from 296 participants working in full time jobs across several industries. Self-report measures were employed.

**Results:** Although all the SCARF needs were significantly correlated with OCB, addition of the SCARF needs to the SDT needs did not improve the power of SDT significantly in predicting OCB. However, the need for Status emerged as a significant contributor in the final model along with Competence and Relatedness.

**Limitations:** Self-report measures and cross-sectional data were used in this study.

**Implications:** This study gives scholars and practitioners deeper insights on the relative importance of different psychological needs in the workplace. Particularly, the need for Status which is one of the least studied needs in the workplace showed up as more important than some other more extensively investigated needs such as Fairness and Autonomy in this study.

**Originality/Value:** This is the first study to empirically test the incremental validity of SCARF in relation to a positive work outcome.
533 - BE PREPARED! FACILITATING TRANSITIONS FROM EDUCATION TO WORK

Symposium chair: Annabelle Hofer\textsuperscript{a}

Discussant: Jos Akkermans\textsuperscript{b}

\textsuperscript{a} University of Bern, Switzerland

\textsuperscript{b} VU Amsterdam, The Netherlands

State of the Art

Past research shows how important a successful transition from education to work is for a future career development. However, less is known about opportunities to facilitate such a transition.

New Perspectives/Contributions

This symposium brings together scholars from different disciplines and countries. It consists of five distinct empirical studies that examine new and exciting topics within the transition from education to work realm. The first study presents the Career Resources Questionnaire – Adolescent Version, which assesses career preparedness in adolescents. In the second study, the effects of internships on students’ goal orientation are examined. The third study presents an online developmental network diagnostic tool and the fourth study investigates the effects of a training for university students to foster self-efficacy and minimize job anxiety. The fifth study investigates the relationship between education-job fit and work-related learning of recent graduates. The symposium highlights the importance of the transition from education to work, and starting points to foster such a transition. Finally, our discussant, a leading researcher on projects related to career transitions, comments on
the presentations and highlights the role of the transition from education to work, which can be seen as the foundation of sustainable careers.

**Research/Practical Implications**

Effective tools and trainings are available to support the transition from education to work. Schools, universities, career counsellors, and individuals in the transition phase could profit from these new tools and research findings. Future research should investigate long-term effects of facilitating possibilities on career development and career success.

**Presentation 1:**

**Development of the Career Resources Questionnaire – Adolescent Version (CRQ-A)**

*by Julian Marciniak⁷, Claire S. Johnston⁶, Madeleine Hänggli⁷, & Andreas Hirschi⁷*

⁷University of Bern, Switzerland

**Purpose**

In order to measure career preparedness in adolescents holistically and economically, we adapted the Career Resources Questionnaire (Hirschi et al., 2018) for adolescents.

**Design/Methodology**

We collected a sample of Swiss-German eighth grade students (N=186) and conducted confirmatory factor analyses to select items and verify the structure of the questionnaire. Additionally, we checked reliability, and convergent validity with previously existing scales.

**Results**
The results show that the CRQ-A provides acceptable model fit statistics for 12 distinct factor solution. Furthermore, the CRQ-A factors show high correlations with existing scales that measure closely related constructs.

Limitations

Although the CRQ-A captures many important dimensions of career preparedness, it is by no means exhaustive. Furthermore, the CRQ-A has yet to be tested for long-term predictive utility (e.g. transition from school to VET). Lastly, the CRQ-A is a self-report measure and it has yet to be researched, whether career counsellors would rate adolescents similarly to their self-indicated responses.

Research/Practical Implications

The developed measure can provide researchers and practitioners with a reliable, concise, and comprehensive measure to assess career preparedness in adolescents. This measure provides the opportunity to specifically tailor career interventions for an individual adolescent.

Originality/Value

The CRQ-A measures many important factors of career preparedness allows researchers and practitioners to assess said preparedness in adolescents reliably and economically.

Presentation 2:

School-to-work transition: Examining the effect of internships on students’ goal orientation
Purpose

One of the main purposes of secondary vocational education is to prepare students for their school-to-work transition. It is believed that internships play a central role in this preparation. They provide students with a first opportunity to transfer personal resources from school to a work setting. It is assumed that goal orientation (GO) is important for success in both settings, but the transferability of GO remains uncharted. This study will investigate the transferability of students’ GO and the persistence of changes in GO over time.

Design/Methodology

A three-wave longitudinal study with final year secondary vocational students (N = 681) was conducted to test the transferability of and change in students’ GO. Paired sample T-tests were executed to analyse differences between measurements before (January), the first day back at school (March – April), and six weeks after the internship (May).

Results

Findings show that students’ performance-avoidance, learning-approach, and learning-avoidance GO is higher immediately after the internship. This difference drops within six weeks but remains significantly higher compared to the level before the internship. Students’ performance-approach GO is higher immediately after the internship, but drops to the level before the internship.

Limitations
This study could be prone to the common-method bias as results rely on self-report questionnaires.

**Research/Practical Implications**

Results indicate that internships are vital for preparing students for the school-to-work transition. The sustained effect on students’ GO is of great value for achieving a successful school-to-work transition.

**Originality/Value**

In this study, students’ GO is investigated longitudinally across two settings.

**Presentation 3:**

The use of an online developmental network diagnostic tool in facilitating students’ transition from university to work

*by Myrtle Emmanuel*®

*® University of Greenwich, England*

**Purpose**

The aim of the session is to share key findings on undergraduates’ developmental network (DN) dynamics. DN is a subset of an individual’s entire social network providing developmental assistance including career and/or psychosocial support (See Higgins and Kram, 2011). The presentation will also showcase an online developmental network diagnostic tool used in the context of teaching for undergraduates in the transitory period from university to work.
Design/Methodology

The innovative diagnostic developmental network tool was developed as part of a longitudinal study that examines multiple developmental relationship influences on the early career management and outcomes of (N= 793) second-year undergraduates.

Results

Findings include a significant positive influence of undergraduates’ developmental network on their academic outcomes. In particular, formal DN were a major antecedent of subjective career success for undergraduates in terms of their perceived employability and clarity of professional identity over time.

Research/Practical implications

Key implications for Higher Education institutions include the role of formal workplace and educational developers in enhancing subjective career and academic success of undergraduates. Implications also include the use of the DN diagnostic tools in understanding the level of engagement or disengagement of undergraduates’ career management.

Limitations

Data collected through self-reports.

Originality/Value

The study embodies a ‘relatedness’ approach to early career management including making important distinctions between formal and informal DN relationships.
Presentation 4:

Trainings for psychology students - fostering self-efficacy and job anxiety

Henrike Peiffera,*, Thomas Ellwarta, & Franzis Preckela

a University of Trier, Germany

Purpose

Self-efficacy (SE) of psychology students describes the confidence to be able to successfully master psychological tasks (Peiffer, Preckel & Ellwart, 2018). There is evidence for the relevance of SE in higher education for e.g., academic performance and successful career choice decisions (Richardson, Abraham, & Bond, 2012). However, many students show a lack of confidence to be able to fulfill the required demands at the desired level (Freund & Kasten, 2012), and experience job anxiety (Ortenburger, 2013). To support psychology students to become aware of the competences they already have (Pajares, 1996) and to minimize their job anxiety, we developed two different types of training.

Design/Methodology

Students could either participate in a (1) single application training (45 min; n=27) or in a (2) group training (2h; n=63). We assessed SE and job anxiety by questionnaire within a pre-post-design with four measurement points.

Results

In both trainings, students SE increased ($F(3,83) = 13.24, p < .001$) and their job anxiety decreased ($F(3,84) = 17.09, p < .001$).
Limitations

Students volunteered to participate in a training, thus, the sample was self-selected. Moreover, we only used a pre-post design with an internal referencing strategy, but not long-term outcomes (e.g., career success).

Research/Practical Implications

Instructors should integrate practical exercises in their seminars, which allow students to reflect their competences so that students feel more self-efficacious and less anxious when thinking about future challenging tasks.

Originality/Value

In higher education, trainings fostering SE and lowering job anxiety support the professionalization of students thereby increasing their job opportunities.

Presentation 5:

The relationship between education-job fit and work-related learning of recent graduates:

Capitalising on a head start or filling a gap?

Ilke Grosemans\textsuperscript{a},* Katrien Vangrieken\textsuperscript{a}, Liesje Coertjens\textsuperscript{b}, & Eva Kyndt\textsuperscript{a}

\textsuperscript{a} KU Leuven – University of Leuven, Belgium

\textsuperscript{b} Université Catholique de Louvain, Belgium

Purpose

The alignment of the first job and graduates’ education appears to be of key influence on graduates’ career paths. As such, it is argued that fit affects work-related learning, which
is important for starting employees to be able to cope with the demands of their new job.
Theoretically, two (contradicting) processes have been put forward describing the relationship between education-job fit and work-related learning: Whereas the *complementing* hypothesis argues that work-related learning builds on an existing and appropriate set of competences, the *substituting* hypothesis assumes that work-related learning can compensate in case of misalignment.

**Design/Methodology**

This study identified latent profiles of recent graduates (N = 779) and compared differences regarding work-related learning across the profiles. Furthermore, it was assessed whether differences remained to exist six months later by means of latent change score models (N = 398).

**Results**

Four distinct profiles were identified: full fit, horizontal fit, vertical fit, and full misfit. The results provided support for the complementing hypothesis, arguing that continued learning at work complements what was learned during higher education. Differences were found regarding formal and informal learning. Moreover, the relationship was sustained six months later.

**Limitations**

The study took a single focus on higher education graduates.

**Research/Practical Implications**

The study demonstrated that graduates with an optimal alignment take a head start regarding work-related learning.
Originality/Value

This study adopted a nuanced view by including multiple types and measures of fit. It refined existing theory by demonstrating how the fit profiles differently influence formal and informal learning.
State of the Art: When studying the role of personality at work, researchers have typically focused on predicting work-related outcomes from personality traits—or stable individual differences in the habitual patterns of behavior, thought and emotion. Despite the simplicity of this approach, an exclusive focus on how one behaves, feels and thinks on average disregards the fact that the variation in behaviors, feelings and cognitions within an individual is as large as the variation between individuals (Fleeson, 2001). Because of this reason, researchers have realized that to fully understand personality, how personality is affected by work and how it affects work, both between-person and within-person variation should be equally considered. This realization has led to a recent rise of studies focusing on triggers (e.g., Huang & Ryan, 2011) and consequences (e.g., Debusscher et al., 2017) of within-person fluctuations in personality states.

New Perspectives/Contributions: By bringing together four studies on within-person fluctuations in personality states, this symposium aims to further our understanding of the relevance of personality variability in a work context. As a set, these studies look at both work-related triggers and outcomes of personality variability, employing a variety of methods (i.e., experience sampling, intervention research and meta-analytic research).

Research/Practical Implications: Investigating triggers and consequences of short-term fluctuations in personality states will help us to better understand the role of personality dynamics at the most basic level. Moreover, by complementing the dispositional perspective of personnel selection, such knowledge might offer suggestions for selection and organizational interventions (e.g., training, job design).

Predicting Personality States from Personality Traits – The Role of Situations

Kai T. Horstmann¹, John F. Rauthmann², & Matthias Ziegler¹

¹Humboldt-Universität zu Berlin, Germany
²Universität zu Lübeck, Germany

Purpose: Employing personality measures in an occupational setting requires that those measures predict future personality states (i.e., behavior) in an occupational context. We therefore examine how self-reported personality traits are related to personality states in experience sampling studies and which situational characters allow explaining interindividual differences in states.

Design: In our first study, we meta-analytically (k = 15, N = 1,937 with about 80,000 measurement occasions) explored how average personality states are linked to personality traits, and which methodological considerations in study design influence the trait-state-correlation. In our second pre-registered experience sampling study (N = 273, with about 7000 measurement occasions), we
examined how personality states can be predicted by momentary aspects of the person and the situation, above and beyond stable personality traits.

Results: Our results indicate that personality states are associated with self-reported personality traits. Further, explaining interindividual differences in personality states requires considering the psychological situation as well as momentary affect.

Limitations: All studies relied on self-reports. The role of actual behavior in specific contexts must be further examined.

Research/practical implications: Personality traits can predict future behavior, yet for a complete understanding of the person in a situation (such as an occupational context), the situational features must be considered as well. Research on the psychological situation will thus enhance the understanding of behavior in real-life settings.

Originality/value: Based on several data sets and a large sample of daily behaviors, the study systematically examines the expression of personality traits in specific situations in daily life.

The effects of counter-dispositional behavior at the workplace

Jennifer Pickett 1,2, Filip De Fruyt 3, & Joeri Hofmans 1

1 Work and Organizational Psychology, Vrije Universiteit Brussel, Belgium
2 Department of Psychology, University of Jyväskylä, Finland
3 Department of Psychology, Gent Universiteit, Belgium

Purpose: Despite rich literature on the correlates of personality traits, studies on the momentary expressions of these traits—referred to as personality states—are less frequent. We present three studies that examine the dynamic interplay of states and traits by studying what happens when people behave in a way that is counter to their traits. Drawing on the behavioral concordance model (BCM; Moskowitz & Coté, 1995), which hypothesizes that trait-concordant behavior leads to positive outcomes, we expect counter-dispositional behaviour to result in decreased levels of wellbeing (Study1), approach goal orientation (Study2) and vitality (Study3).

Design: Data were collected using experience sampling from (Study1) 82 employees reporting on their level of state conscientiousness and affect for 10 consecutive work days (N=734), (Study2) 48 employees reporting on daily levels of extraversion and approach goal orientation for 10 consecutive work days (N=384), and (Study3) 67 employees reporting six times a day for five consecutive work days on state extraversion and vitality (N=1664).

Results: Multilevel polynomial regression analysis offered mixed support for the BCM, suggesting that deviations from one’s trait level matter (studies 1, 2, and 3), that the effects thereof might differ depending on whether one behaves below/above one’s trait (Study1), and that the effects of counter-dispositional behavior might not show immediately, but rather in a delayed fashion (Study3).

Limitations: All data are self-reported.
Practical Implications: By cultivating trait congruence at work, increased psychological functioning and employee wellbeing is also cultivated.

Originality/Value: We demonstrate the usefulness of adopting an integrative approach to personality.

Revisiting the personality-performance link: A dynamic approach to neuroticism and conscientiousness

Joanna Sosnowska 1, Joeri Hofmans1, Yannick Griep2, & Filip Lievens3

1 Vrije Universiteit Brussel, Belgium
2 University of Calgary, Canada
3 Singapore Management University, Singapore

Purpose: Responding to calls for the integration of personality traits and states, we study the relationship between conscientiousness, neuroticism and work performance using a novel dynamic model of personality, the Personality Dynamics (PersDyn) model. The PersDyn model represents personality using three sources of individual differences: (1) one’s average state level [baseline], (2) the extent to which one experiences different state levels across time and situations [variability], and (3) the swiftness with which one returns to his/her baseline once (s)he deviated from it [attractor strength].

Design: 105 employees participated in a 20-day experience sampling study, reporting their daily levels of state neuroticism and conscientiousness. Objective performance was measured by sales volumes after three and six months.

Results: Individual differences in variability were negatively related to performance, for both neuroticism and conscientiousness, while conscientiousness attractor strength related positively to performance. Looking at the interactions between baseline, variability and attractor strength, we found that for conscientiousness (but not for neuroticism) the consistency of the behavioral patterns (in terms of variability and attractor strength) moderated the relationship between baseline and job performance.

Limitations: Our findings reveal that relationships are likely to be trait-specific.

Research/practical implications: To fully understand the link between personality and performance, it is essential to consider not only the average trait level, but also more dynamic components of personality.

Originality/value: Acknowledging stability and change in personality can move forward research on the consequences of personality in a work setting.
Who are you today? The effect of a mindfulness intervention on Big Five personality states

Annika Nübold & Ute R. Hülsheger
Maastricht University

**Purpose:** Research on personality states at work has to date mainly focused on outcomes of and situational antecedents of personality state change. In this study, we draw on social cognitive theory of self-regulation and the social investment principle to test if a structured intervention can bring about changes in employees’ personality states at work.

**Design/Methodology:** We investigate the effect of a 4-week low-dose mindfulness intervention delivered via a mobile application on employees’ personality state change in a multi-group experiment with a passive and an active control group. Employees (N = 167), either practicing mindfulness, doing brain training exercises, or not receiving any treatment were tracked in a diary study across a period of four weeks.

**Results:** Results of growth curve analyses showed that the mindfulness intervention led to linear increases in employees’ daily expressions of mindfulness, emotional stability and agreeableness across the 4-week period. No changes were found in daily openness, conscientiousness, and extraversion.

**Limitations:** We are not able to say whether personality state change will pertain and potentially lead to a shift on the trait level.

**Research/Practical Implications:** Our findings illustrate the value of mindfulness interventions to alter employees’ personality states, which have been linked to important work outcomes like performance in previous studies.

**Originality/Value:** To date, knowledge about the predictors of personality state change at work is limited. Our study sheds further light on how to deliberately influence personality states in a planned and systematic way, thereby enabling employees to act in a more functional way at work.
Zvonimir Galić, Department of psychology, University of Zagreb, Croatia

State of the Art

In the field of work and organizational psychology (W/O psychology), personality is dominantly assessed with questionnaires that ask respondents to describe themselves on a set of items about their typical attitudes, feelings and/or behaviors. The reliance on self-reports has two major limitations: first, personality questionnaires capture only the aspects of personality that are available to respondents’ introspection, and second, respondents are able to adjust their self-reports in order to present themselves in a more positive light.

Recent developments in implicit personality theory and measurement have brought new methods that should circumvent the problems of personality questionnaires and, thus, enhance personality assessment in organizational purposes. Recently, Sackett et al (2017) have identified the measures that rely on the Implicit Association Test (IAT) and the conditional reasoning (CR) paradigm as the most prominent among them.

New Perspectives/Contributions

Within this symposium we will present six papers describing studies that explored the usefulness of IAT and/or CR paradigms in W/O psychology realm. The papers range from those extending the two paradigms to new constructs important for understanding and predicting workplace behaviors (i.e., core-self evaluations, self-control and the Dark Triad traits), over psychometric models behind the CR paradigm and importance of congruence between explicit and implicit personality for entrepreneurship, to comparison of the IAT and CR paradigms in predicting organizational leadership criteria.

Research/practical implications

We will try to demonstrate that contemporary implicit personality measures might be both psychometrically valid and practically convenient tools for W/O psychology researchers and practitioners.

Implicit, Explicit Core Self-Evaluations and their Relation with Job Performance and Income

Erik Dietl\textsuperscript{1} & James A. Meurs\textsuperscript{2}

\textsuperscript{1}Loughborough University, UK
\textsuperscript{2}Kennesaw State University, USA

Purpose

Core self-evaluations (CSE) represents the fundamental appraisals individuals make about their self-worth and capabilities. Although scholars characterize CSE as subconscious evaluations, the implicit aspect of CSE has not yet been examined. Drawing on models of dual
information processing, we investigate how explicit, implicit, and acquaintance-rated CSE relate to task performance, organizational citizenship behaviours (OCB), and income. We argue that implicit CSE incrementally predicts these three outcomes beyond explicit and acquaintance-rated CSE.

**Design/Methodology**
We developed a CSE Implicit Association Test (IAT) – a reaction time based measure – in a pilot study. In the main study, we collected data from a matched triad of 153 employees, 153 co-workers and 153 personal acquaintances using a multi-source design. Employees assessed their explicit self-reported CSE, implicit CSE (measured via IAT), and income. Personal acquaintances rated target employee CSE; co-workers rated task performance and OCB.

**Results**
We found that implicit CSE incrementally predicted OCB and income above and beyond explicit CSE. The effects for implicit CSE held even when controlling for acquaintance ratings of CSE. Also, acquaintance ratings revealed some incremental validity for predicting income and OCB beyond explicit CSE.

**Limitations**
The field study design does not allow conclusions about causality.

**Research/Practical Implications**
In evaluative situations, such as personnel selection, self-reported CSE is susceptible to impression management. Organizations should measure self-rated, implicit, and other-rated CSE to predict job performance and income more accurately.

**Originality/Value**
We extend organizational research on implicit measures by focussing on an important, but, so far, overlooked aspect of implicit personality: implicit CSE.

---

**The road to growth: Implicit and explicit motives as predictors of happiness and company performance expectation.**

Hendrik Slabbinck¹, Arjen Van Witteloostuijn²,³, Johanna Vanderstraeten⁴, Wim Coreynen⁴, Joeri van Hugten².

¹Department of Marketing, Innovation and Entrepreneurship, Faculty of Economics and Business Administration, Ghent University, Belgium

²School of Business and Economics, Free University Amsterdam, The Netherlands

³Antwerp Management School, University of Antwerp, Belgium

⁴Department of Management, Faculty of Applied Economics, University of Antwerp, Belgium

⁵Jheronimus Academy of Data Science, Tilburg University, The Netherlands.
Purpose
This study investigates the congruency between the entrepreneurs’ implicit and explicit motives and their effects on both the entrepreneur’s well-being and the expected growth of their ventures.

Design/Methodology/Approach/Intervention.
Data was collected with a sample of 193 Belgian entrepreneurs. Self-reported questions were used to assess explicit motives and the Brief Implicit Association Test to assess implicit motives. Also self-reported measures were used to measure well-being and expectations towards future growth.

Results
Congruency between implicit and explicit motives yields higher levels of well-being, which on its turn results in higher expectations towards company growth. However, we could only confirm the congruency hypothesis for the power motive, but not for affiliation and achievement motives. Polynomial regression analysis further shows that high implicit need for power is imperative to reach high levels of well-being and that well-being further increases when it coincides with a high explicit need for power.

Limitations
The results are based on a limited sample in one small country. We relied on self-reported measures for the assessment of growth expectations.

Research/Practical Implications
Our study shows that the entrepreneurs’ personal motives are important determinants of venture growth. We further demonstrate that it is worthwhile to assess both implicit and explicit motives and that a venture’s future is (partially) determined by the entrepreneur’s well-being.

Originality/Value
The combination of both implicit and explicit motive measures is a novel and promising approach to predict business performance measures.

Using Thurstonian IRT to Model the Response Process in Conditional Reasoning Tests
Jonas W. B. Lang\textsuperscript{1}, Ingo Zettler\textsuperscript{2}, J. Malte Runge\textsuperscript{1}, & Julia Haubrich\textsuperscript{3}
\textsuperscript{1}Ghent University
\textsuperscript{2}University of Copenhagen
\textsuperscript{3}University of Hagen

Purpose
Conditional reasoning tests (CRTs) measure personality characteristics indirectly from choice behavior in reasoning problems. For each reasoning item, respondents choose one option out of three incorrect answers, one logically correct answer that simultaneously indicates a high,
and one correct answer indicating a low level of the implicit personality characteristic. Although CRTs have become popular, a recent IRT study (DeSimone & James, 2015) has concluded that CRTs have insufficient reliability using standard IRT models. Another problem is that the development of CRT items has proven to be challenging because of the need to avoid a systematic impact of cognitive ability.

Methodology
The model is a Thurstonian choice model (TCM) that (a) jointly models cognitive ability and the personality characteristic, and (b) adopts a dynamic systems perspective (Lang, 2014) to account for the fact that respondents' implicit personality tendency may decline over time. We apply the model to data from a power CRT with 25 items (N = 937 employees who were part-time students).

Results
Results show that the TCM improves the detection of the underlying traits in CRT choices in comparison to traditional IRT analyses using 1PL models and successfully separates cognitive ability and implicit personality in the item responses.

Limitations
Respondents did not fill out the CRT in a high-stakes context.

Implications
The present findings are likely helpful in the future development of CRTs and also allow I-O psychologists to use them to simultaneously measure cognitive ability.

Value
We improve theoretical and practical understanding of the CRT response process.

Initial Evidence for the Conditional Reasoning Test of Workplace Psychopathy

Nicolas Roulin & Ryan Cook
Saint Mary’s University, Canada

Purpose
Workplace psychopaths are more likely to engage in unethical decision making or risky behaviors, cause conflict and bully colleagues, and be abusive supervisors (Boddy, 2011; Mathieu & Babiak, 2015; Stevens et al., 2012). It would be beneficial for organizations to avoid hiring or promoting workplace psychopaths. But existing measures either require a clinical assessment (which can be costly or illegal) or rely on easily-fakable self-reports. Our research describes the development and validation or a conditional reasoning test to assess workplace psychopathic tendencies (CRT-WP).

Design/Methods
We initially developed 60 CRT items associated with 6 justification mechanisms derived from existing models of psychopathy. We then conducted four studies, involving a SME-based construct validation process (Study 1), an initial EFA with data from a sample of MTurk respondents (Study 2), CFA, test-retest reliability, and convergent validity testing with another sample or MTurk respondents (Study 3), and examination of relationships with personality and cheating behaviors with a student sample (Study 4).

**Results**
Taken together, our studies identify a reliable and valid 27-item CRT-WP, with a clear factor structure.

**Limitations**
All our studies are based on online or student sample, and the CRT-WP needs to be further validated with an employee sample, and in high-stakes contexts (e.g., in selection).

**Research/Practical Implications**
Our research demonstrates that CRTs can be used to assess dark personalities like workplace psychopathy.

**Value**
Although still in development, the CRT-WP offers a promising approach for assessing psychopathic tendencies with a short self-report measure that is theoretically less prone to faking.

A comparison of two paradigms for implicit power motive measurement in predicting organizational leadership criteria

Zvonimir Galić¹, Natasa Trojak², & Mitja Ružočić¹

¹Department of psychology, Faculty of humanities and social sciences, University of Zagreb, Croatia
²University College Algebra, Zagreb

**Purpose**
The purpose of this study was to compare the validity of the Conditional Reasoning Test for Power motive (CRT-P), and an implicit power motive test based on the Implicit Association Test paradigm (IAT-P) in explaining organizational leadership criteria.

**Design/Methodology/Approach/Intervention.**
We conducted a study on a sample of Croatian managers of small businesses (N = 66) and their subordinates (N = 194). Managers’ implicit power motive was captured with the CRT-P and IAT-P, and their explicit power motive was assessed with a self-report questionnaire. We also collected managers’ self-reports and subordinates’ reports about the managers’
effectiveness (ME). Also, subordinates self-reported about perceived organizational support (POS), and their task performance (TP) and counterproductive work behaviors (CWBs).

Results

Multi-level analyses showed that CRT-P scores correlated positively with subordinates’ ME ratings and POS, and negatively with subordinates’ CWBs. At the same time, IAT-P scores were significantly related only to ME self-ratings. All relations held when self-reported power motive was controlled for.

Limitations

Both studies were conducted on a relatively small sample of managers, and the effects were generally small in size.

Research/Practical Implications

Our findings indicate an added value of implicit power motive measures in the organizational leadership field, both for scientific and practical purposes (e.g., leadership selection).

Originality/Value

Our study is among rare that compared the two most prominent methods for implicit personality measurement (Sackett et al., 2017) on the same sample of participants.

Measuring Honesty-Humility Using a Partially Structured Attitude Measure

Dan Asfar\textsuperscript{1,2}, Marise Ph. Born\textsuperscript{1,3}, Janneke K. Oostrom\textsuperscript{1}, & Mark van Vugt\textsuperscript{1}

\textsuperscript{1} Vrije Universiteit Amsterdam, Amsterdam, The Netherlands
\textsuperscript{2} NOA B.V., Amsterdam, The Netherlands
\textsuperscript{3} Erasmus University Rotterdam, Rotterdam, The Netherlands

Purpose

In recent years, organizational scholars have started to adopt implicit measures of personality and attitudes. One of these implicit instruments is the partially structured attitude measure (PSAM; Vargas, von Hippel, & Petty, 2004). In the current study, we developed a PSAM to measure personality trait Honesty-Humility (H-H), and examined the usefulness of this instrument for predicting behaviour at work.

Methodology

We assessed 12 self-developed PSAM H-H items among a sample of employees ($N = 230$). Participants also completed the HEXACO personality inventory, a self-reported counterproductive work behaviour (CWB) and organizational citizenship behaviour (OCB) scale, and responded to a hypothetical dictator game scenario that measures altruism.
Results

The H-H PSAM ($\alpha = .69$) correlated significantly with CWB ($r = -.32$), OCB ($r = .21$), and altruism ($r = .19$). Low or nonsignificant correlations were observed between PSAM H-H and the six personality domains. The PSAM H-H explained unique variance in CWB and OCB above and beyond the six dimensions of personality.

Limitations

In this study, we relied on self-report measures. Future research could also further investigate the relation between the PSAM and other implicit measures such as the IAT.

Research/Practical Implications

The PSAM has a significant contribution to predicting behaviour at work.

Originality/Value

The present study integrates insights from social and cognitive psychology for the purpose of personnel selection.
557 - SYMPOSIUM TITLE: SUSTAINABLE LATE CAREERS AND RETIREMENT TRANSITIONS FOR OLDER WORKERS IN THE 21ST CENTURY

Chairs: Sara Zaniboni and Donald Truxillo

1 University of Bologna, Italy; 2 University of Limerick, Ireland

Discussant: Franco Fraccaroli

3 University of Trento, Italy

Integrated Summary

State of the Art. The lengthening of the lifespan requires identifying ways to sustain late careers and to cope with retirement transitions. This symposium aims to contribute in the understanding in how to help older workers to successfully work longer and to adjust to future retirement.

New Perspectives/Contributions. This symposium combines research contributions from Switzerland, Germany, Ireland, USA, Portugal, and Spain/Italy, developed to address new challenges that older workers and their employers have to face. The first two presentations focus on study factors that can improve older employee work attitudes, well-being, and workability: Pfrombeck and Grote identify work characteristics (i.e., task significance and job autonomy) in affecting older employees’ satisfaction and emotional exhaustion. Weber, Angerer, Borchart, Hasselhorn, and Müller assess changes in job demands and job resources in influencing workability in older employees with health problems. The next two presentations focus on entrepreneurship in late career: Shee, McCarthy, Costin, Hynes, and Heraty explore motivational aspects affecting the decision to pursue self-employment in later life. Alterman and Wang identify work passion as a key factor in determining late career trajectories and retirement transitions for older entrepreneurs. The last two presentations focus on factors influencing retirement timing and adjustment. Sousa, Ramos, and Carvalho assess age-diversity practices in motivating workers to retire later. Zaniboni and Topa show the key role of core self-evaluations in affecting retirement-related outcomes.

Research/Practical Implications. The symposium expands knowledge and suggests fruitful strategies for supporting older employees’ work attitudes, well-being, workability, entrepreneurship, and retirement-related aspects.
How to design jobs in sustainable careers? The combined effects of task significance and job autonomy for employees in their late career

Julian Pfrombeck and Gudela Grote
ETH Zurich, Switzerland

**Purpose.** To promote employee health and workability in sustainable careers, age-related differences must be considered in job design. In particular, task significance and job autonomy gain importance in late careers based on socioemotional selectivity theory and selective optimization and compensation theory. Therefore, we hypothesized in a three-way moderated mediation model with job satisfaction as mediator that the joint effects of task significance and job autonomy reduce emotional exhaustion of older employees.

**Design/Methodology/Approach/Intervention.** The three-way moderated mediation model was tested with a representative sample of 766 employees in Switzerland using a time-lagged design.

**Results.** Under high levels of job autonomy, task significance was positively related to job satisfaction for older workers, which in turn was negatively related to emotional exhaustion. The indirect effect of the three-way moderated mediation model was slightly negative.

**Limitations.** The main limitations lie in the study design with only two points of measurement. The findings should be replicated in a study with at least three measurement time points for independent, mediator, and outcome variables.

**Research/Practical Implications.** The study highlights the relevance of job design for sustainable career management and contributes to lifespan aging theories by emphasizing the interdependent effects of task significance and job autonomy for older workers. Employers are advised to consider task significance and job autonomy simultaneously for the effective design of sustainable careers and transitions to retirement.

**Originality/Value.** This study revealed that the beneficial effects of high task significance seem to vanish if older employees experience low levels of job autonomy.
Maintaining the work ability in older employees with health problems: The impact of the adaptation of job demands and job resources

Jeannette Weber, Peter Angerer, Daniela Borchart, Hans Martin Hasselhorn, and Andreas Müller

1 University of Düsseldorf, Germany; 2 University of Wuppertal, Germany; 3 University Duisburg-Essen, Germany

Purpose. Taking the perspective of lifespan development of resources, we investigated whether changes in job demands and job resources affected work ability in older employees with health problems.

Methodology. Two waves (three year time-lag) of the German lidA cohort study with 3,573 participants born in 1959 or 1965 were analyzed. Baseline data of psychosocial and physical working conditions, musculoskeletal and depressive symptoms as well as changes in working conditions from wave one to two was used. We used multiple regression to analyze differential effects of working conditions on work ability depending on individual health status.

Results. Especially decreases in quantitative demands as well as increases in development opportunities and leadership quality were associated with improved work ability in older employees. Those effects were mainly independent of musculoskeletal and depressive symptoms.

Limitations. As all information was obtained by computer-assisted personal interviews a common method bias might be possible. Furthermore, reliability could not be achieved for all measures of working conditions.

Implications. Results suggest that an increase in job demands negatively affects and increase in job resources positively affects, the work ability of older employees. Overall effects were similar for employees with musculoskeletal, depressive or employees with none of those symptoms.

Originality/Value. Due to their potential of being modifiable on the employer side, knowledge of which working conditions may be most sensible to adapt in regard to different health conditions should be essential to maintain work ability of aging employees in order to ensure sustainable careers across the work life span.

Opportunity or necessity? Motivations of “third age” entrepreneurs

Brian Shee, Jean McCarthy, Yvonne Costin, Briga Hynes, and Noreen Heraty

University of Limerick, Ireland

Purpose. We explore why older adults decide to pursue self-employment in later life, the so-called “third age entrepreneurs”. In doing so, we consider the extent to which nascent and early-
stage entrepreneurial activity is selected as a postretirement path through opportunity or necessity among those over the age of 50 in Ireland.

**Design/Methodology/Approach/Intervention.** Drawing on Irish data from the Global Entrepreneurship Monitor (GEM) survey, we explore: (1) the prevalence of nascent and early-stage entrepreneurship among those over the age of 50, and (2) the motivations to start a new business among this group.

**Results.** We draw on responses from \( N=2,002 \) participants. We find some level of entrepreneurial activity amongst those over the age of 50 in Ireland. More importantly, we find that these individuals are motivated by opportunistic factors, rather than by necessity. These individuals are more likely to establish growth-oriented and sustainable firms.

**Limitations.** GEM comprises cross-sectional data. Longitudinal research would allow a detailed exploration of “third age entrepreneurs” over time.

**Research/Practical Implications.** Policy-level interventions must be developed to encourage opportunistic entrepreneurial activity among older age cohorts.

**Originality/Value.** Policy makers have recognised that the promotion of entrepreneurship in “older” age cohorts is important as a means of prolonging the working lives of older people, and reducing older-age unemployment, yet little research exists on the prevalence and motivations of “third age entrepreneurs”. We attempt to close this gap.

---

**The impact of work passion on retirement and succession planning of older entrepreneurs**

Valeria Alterman and Mo Wang

University of Florida, USA

**Purpose.** In the retirement literature, scholars have examined how various individual attributes and organizational factors affect employees’ retirement processes. Nevertheless, the unique characteristics that might be important for entrepreneur’s retirement process are not sufficiently understood. The purpose of our study was to incorporate work passion as a unique factor for older entrepreneurs who are motivated by their own excitement for their organizations (i.e., high entrepreneurial passion) and determine whether their late career trajectories and retirement transitions differ from those of older entrepreneurs who are less passionate about their careers.

**Design/Methodology.** We are in the process of collecting multiple-wave longitudinal data from University of Florida alumni who are entrepreneurs.

**Results.** The preliminary data we collected showed that entrepreneurial passion was negatively related to retirement planning and positively related to succession planning. This finding pattern is interesting, as it highlights entrepreneurs’ dual focuses in preparing for retirement. While entrepreneurs with higher levels of entrepreneurial passion resisted retirement by not engaging in retirement planning, they also invested more effort in succession planning to make sure that their business would be sustainable in the event of their retirement.
**Research/Practical Implications.** From a theoretical standpoint, our findings emphasize the unique nature of entrepreneurs’ retirement decision-making, which includes a component of considering business continuity. From a practice standpoint, our findings suggest that entrepreneurs’ personal characteristics (e.g., entrepreneurial passion) not only has the potential to influence their preparation for retirement, but also has the potential to influence the continuing success of the business.

**Organizations can have a word to say in older workers’ retirement preferences: The role of age-diversity practices, work centrality and work engagement**

Inês C. Sousa, Sara Ramos, and Helena Carvalho

Instituto Universitário de Lisboa (ISCTE-IUL), Portugal

**Purpose.** Whilst the population continues to age, the European Union defined key policies to increase labor market participation among older workers. Previous research investigated innumerable factors that can influence workers’ retirement timing (Fisher, Chaffee, & Sonnega, 2016; Wang & Shultz, 2010). However, the role of the organizational context has not been fully explored. Therefore, this study examines the influence of perceived age-diversity practices on work engagement that, in turn, impact on the preference for early or late retirement. We also investigate the moderator role of work centrality in the relationship between age-diversity practices and work engagement.

**Methodology.** A sample of 263 Portuguese workers, aged between 50 and 80 years ($M = 55.17$, $SD = 4.70$), completed a questionnaire with an on-line and a paper version. The moderated mediation hypothesis was tested by Multiple Linear Regression and conditional process modeling using the PROCESS macro for SPSS (Hayes, 2018).

**Results.** The results supported the hypothesis, suggesting that age-diversity practices were linked with increased work engagement, which in turn was linked with the preference to retire later. The relationship between age-diversity practices and work engagement was moderated by work centrality: as work centrality decreased, this relationship became more important. Also, the positive indirect effect of age-diversity practices on the preference for retire later is greater the less the work centrality.

**Limitations.** This cross-sectional study focuses on organizational-related variables, not considering other variables that can influence workers’ retirement preferences.

**Research/Practical Implications.** Age-diversity practices are an important strategy to motivate workers to retire later.

**Originality/Value.** This study focuses on the organization’s potential role in extending older workers’ careers, by highlighting the relevance of age-diversity practices.

**Core self-evaluations, older workers, and retirement-related outcomes**

Sara Zaniboni and Gabriela Topa
**Purpose.** Core self-evaluations (Judge, Erez, Bono, & Thoresen, 2003) have been shown to be a key characteristic in affecting work outcomes, such as task performance, job engagement, occupational well-being, and career satisfaction (e.g., Hannes & Rudolph, 2018). However, only few studies have examined its effects on retirement-related outcomes (e.g., Muratore & Earl, 2009). The goal of the present study is to assess the role of core self-evaluations as a predictor of retirement-related outcomes (i.e., expected social adjustment, retirement goals and expectations), over and above important demographic, financial, health and work predictors. Specifically, our work is based on the core self-evaluations theory (e.g., Judge, Locke, & Durham, 1997) and the resource-based dynamic model for retirement adjustment (e.g., Wang, Henkens, & van Solinge, 2011).

**Design/Methodology.** A study was conducted in Spain using a time-lagged design (N=190). At Time 1 participants provided information on core self-evaluations and other variables (age, gender, health, financial situation, job centrality, and expected retirement age); at Time 2 (2-3 weeks later) participants provided information on retirement-related outcomes (e.g., expected social adjustment, retirement expectations and goals).

**Results.** Core self-evaluations significantly and positively affected social adjustment expected in retirement, retirement expectations, and goals over and above demographic, financial, health, and work predictors.

**Limitations.** The major limitation is the use of self-report data.

**Research/Practical Implications.** Core self-evaluations are valuable and supportive to workers across the work lifespan and for dealing with retirement.

**Originality/Value.** Our work shows the key role of core self-evaluations in affecting important retirement-related outcomes.
**State of the Art:** Research on the work—nonwork interface has constantly been growing over the past decades. Yet, although the experience of this interface is clearly linked to individual careers, there are few empirical studies addressing the interplay of nonwork factors with career-related attitudes, behaviors, and outcomes.

**New Perspectives/Contributions:** This symposium aims at providing insights into the interplay between nonwork factors and career-related variables, thus contributing to linking work—home and career research. In a sample of parent—adolescent dyads, Steiner, and Hirschi examine how parents’ experience of work—home conflict and enrichment crosses over to their children’s work centrality. Focusing on women who re-entered their organization after maternity leave, Debus, Philipp, and Palffy investigate negative consequences of mothers’ overqualification on performance, satisfaction, and recovery. Adding to that, Stertz and Wiese examine the effect of parental leaves on fathers’ experienced workplace discrimination after organizational re-entry. In a sample of German politicians, Kornblum, Unger, and Grote address the question how close others can facilitate career goal attainment. Finally, Potočnik and Unger investigate how goal-setting shapes retiree well-being and what role the romantic partner plays in this relationship. Our discussant will be Andreas Hirschi from the University of Bern. In discussing the papers, he will provide take-away messages from the presentations as well as highlight future research directions.

**Research/Practical Implications:** The studies included in this symposium show that nonwork factors are interrelated with individual careers in a variety of samples across different age groups, and yield various practical implications.

**Parental work-to-family conflict and enrichment and youths’ work centrality: The mediating role of parental job satisfaction and job insecurity**

Rebekka S. Steiner & Andreas Hirschi
University of Bern

**Purpose:** Based on crossover research illustrating that work-to-nonwork conflict and enrichment not only have important consequences for the focal person but also for family members, we examined whether and how parental work-to-nonwork conflict and enrichment relate to adolescents’ work centrality. Moreover, based on a source-attribution perspective, suggesting that the sending domain (i.e., work in our study) is perceived as responsible for the conflict or enrichment, we investigated parental job satisfaction and job insecurity as perceived by the children as potential mediating mechanisms, linking parental work-to-nonwork conflict and enrichment to adolescents’ work centrality.

**Methodology:** We investigated our research questions based on 276 parent-adolescent dyads from Switzerland with a structural equation modeling approach.

**Results:** Results indicate that parental work-to-nonwork conflict, but not enrichment, related to decreased adolescent work centrality. Moreover, this effect was mediated through parental job satisfaction, but not insecurity. More specifically, parental work-to-nonwork conflict related to decreased parental job satisfaction, as perceived by the adolescents, which in turn related to decreased adolescents’ work centrality.

**Limitations:** Although based on multi-source data, the results are based on cross-sectional data.

**Research and Practical Implications:** Our findings contribute to work-nonwork research and practice, highlighting the importance of parents’ experiences in the work-nonwork interface for the development of work attitudes in their children.

**Originality:** We go beyond past research that mostly investigated crossover within couples, and investigate crossover at the work-nonwork interface from parents to children.

**Overqualification among Returning Mothers: The Impact of Maternal Role Adaptation**

Maike Debus, Stefanie Philipp, and Patricia Palffy

University of Zurich

**Purpose:** Overqualification occurs when a person has a surplus of skills, experiences and/or education for his or her current job. In the present study, we focused on women who re-entered their previous organization after maternity leave. Based on Relative Deprivation Theory, we postulated that overqualification may induce feelings of deprivation, which may then trigger a multitude of negative outcomes (i.e., reduced job, life, and maternal satisfaction, as well as reduced job performance and higher need for recovery). Drawing from Conservation of Resources Theory, we further postulated that mothers’ adaptation to their new role might function as a resource that buffers the respective indirect effects.
**Design:** We surveyed 270 mothers at three time points with a lag of three weeks each. Mothers had re-entered their previous organization up to 12 months ago.

**Results:** In line with our predictions, overqualification was indirectly related to decreased job, life, and maternal satisfaction, decreased job performance, and an increased level of need for recovery (via increased levels of relative deprivation). Maternal role adaptation buffered the respective indirect effects, such that the negative effects of overqualification via relative deprivation were less pronounced among mothers who were well-adjusted to their new role of being a mother.

**Limitations:** Analyses are solely based on self-report data.

**Research/Practical Implications:** This research demonstrates how maternal role adaptation as a resource from the home domain can affect women’s reactions to perceived overqualification.

**Originality/Value:** This study extends the overqualification literature by adopting a spillover perspective.

---

**Are you really welcome back? Fathers’ experiences of workplace discrimination after taking parental leave**

Anna M. Stertz & Bettina S. Wiese
RWTH Aachen University

**Purpose:** Parental leave is intended to support new parents. But leave taking may have adverse consequences, too. Building on social role theory, we examined the role of fathers’ family-supportive organizational perceptions on their subjective experience of workplace discrimination after their return to work.

**Design/Methodology:** Fathers (N = 85) were surveyed twice (online questionnaires). Their family-supportive organizational perceptions were assessed during parental leave; their experiences of workplace discrimination were assessed after having returned to work.

**Results:** Fathers perceiving their organization as family-supportive during parental leave reported fewer experiences of workplace discrimination at the time of their return to work than fathers who perceived their organization as family-unsupportive. Moreover, experiences of discrimination were more pronounced among those fathers who were the first males taking leave in their work unit.

**Limitations:** The data of the second survey were not assessed immediately after fathers’ individual return to work but some time later. Thus, fathers reported retrospectively about their perceived workplace discrimination.

**Research/Practical Implications:** Organizations should support leave-taking fathers so that these they feel respected and valued. Particularly fathers who are pioneers in male leave taking subjectively experienced that they are punished for doing so. Consequently, more
supervisors should point to (or be) male role models who are actively caring fathers. In addition, more organizational attention should be payed to the functioning of teams with leave-taking fathers.

**Originality/Value:** A major strength is the specific group studied, namely, fathers during and after their parental leave.

---

**Career goal attainment in close relationships: How significant others facilitate politicians’ election success**

Angelika Kornblum, ETH Zurich
Dana Unger, University of East Anglia
Gudela Grote, ETH Zurich

**Purpose:** Career goal attainment is crucial for career success, yet research on its antecedents is scarce. We investigate whether significant others facilitate career goal attainment. Based on transactive goal dynamics theory, we assume that goal attainment is higher if the most significant other shares one’s career goals, and that this relationship is mediated by available resources. Furthermore, a good goal coordination should strengthen the effect.

**Methodology:** Data collection is ongoing; we are conducting a three-wave online survey with German politicians who have the career goal to become a member of parliament. To measure goal attainment, we collect objective data about election results.

**Results:** Our preliminary analysis ($N = 83$) revealed no direct effect of shared goals on election success, yet a significant indirect effect through shared resources ($b = 0.17$, 95% CI [0.01; 0.52]). Against our assumptions, goal coordination did not moderate the relationship.

**Limitations:** The generalizability of our results might be limited, because our sample differs in various respects from employees working in organizations. Moreover, we cannot rule out common method bias, because our preliminary analysis is mostly based on self-report measures.

**Research/Practical Implications:** Our results imply that close others can facilitate goal attainment by providing resources if they share one’s career goals, thus providing first empirical support for transactive goal dynamics theory. These findings are especially relevant for dual-career couples that have to coordinate multiple career goals.

**Originality/Value:** We contribute to career research by providing first evidence regarding the influence of close others on career goal attainment.
Happily ever after? A study of retiree well-being in romantic couples

Kristina Potočnik, University of Edinburgh
Dana Unger, University of East Anglia

**Purpose:** Drawing on self-regulation theory, the main aim of this study is to explore how goal-setting shapes retiree well-being and how the romantic partner further enhances this relationship. We propose a mediation model that links adaptive goal-setting to goal pursuit which, in turn, is related to Jahoda’s latent benefits of work and goal attainment. Both the latent benefits of work and goal attainment should predict retiree well-being. We assume that romantic partner can exert a moderating influence on the assumed relationships.

**Design/Methodology:** Our sample so far is composed of 74 retirees and their romantic partners. Their average age was 69.88 years ($SD = 11.30$) and 71.16 years ($SD = 8.40$), respectively. On average, they have been in a romantic relationship for 42.56 years ($SD = 14.02$).

**Results:** We found initial evidence to support our assumption about the role of goal-setting in retiree well-being. As we get more data we will explore the proposed mediation model at the couple level.

**Limitations:** We have no objective data of retiree well-being which could contribute to common-method bias.

**Research/Practical Implications:** We inform the successful ageing intervention programs to encourage retirees to engage in setting and pursuing goals to improve their well-being. Future research could look into the role of other significant others and discern the effects of specific types of goals on retiree well-being.

**Originality/Value:** We extend the self-regulation theory to the study of goal-setting in romantic couples in retirement. The use of multi-source data adds rigor to our results.
610 - AGING IN ORGANIZATIONS

Andreas Hirschi

State of the Art
Organizations all over the world are facing a workforce that is becoming progressively older because of population aging. This symposium aims to advance our understanding on the aging process in the context of work and organization settings.

New Perspectives/Contributions
This symposium combines research contributions from Denmark, Ireland, Netherlands, and USA, developed to address organization and work settings’ roles in the employee aging process. In particular, Pak, Kooij, de Lange, and van Veldhoven examine how HR practices may help older workers to maintain their ability, motivation to continue working after experiencing major life events (e.g., death of a loved one). Rineer, Truxillo, Cadiz, and Brady examine how teamwork characteristics, especially team cohesion, may help older workers to maintain their workability in the face of poor health. Scheibe, Fluttert, Broekstra, and Keller test potential limits of older workers’ resilience to emotional demands and link them to important individual and organizational outcomes, such as health and absenteeism. Brady, Cadiz, Truxillo, and Rineer examine how leadership context in organizations may shape the beneficial effects of workers’ generativity motives (i.e., the motivation to guide future generations that can vary across one’s lifespan).

Research/Practical Implications
The symposium expands knowledge and offers beneficial implications for sustaining and improving older workers’ health, motivation, workability at workplace.

Abstract #1: Title, name and affiliation of the authors

We are only human after all: An examination of the influence of life events on the ability, motivation and opportunity to continue working and the moderating role of HR practices

Pak, K.1,2, Kooij, T.A.M.1, de Lange, A.H.2 & van Veldhoven, M.J.P.M.1

1= Tilburg University, the Netherlands
2= HAN University of Applied Sciences, the Netherlands

Purpose: As employees are stimulated to work until a later age organizations are challenged to ensure the extension of working lives (Phillips & Siu, 2012). Schaufeli (2011) suggests that people will work longer when they experience a fit with their work. However, this fit might be challenged when employees experience major life events, such as the death of a loved one or getting a promotion (Akkermans, Seibert, & Mol, 2018). In line with the conservation of resources theory we assume that HR practices could be particularly important for employees who are facing major life events. This study
aims to examine to what extent life events influence indicators of working until a later age and whether HR practices can buffer this effect.

Methodology: Two waves of data were collected at 26 healthcare institutions in the Netherlands (N = 1478). We conducted analyses in M-plus to test the hypotheses.

Results: Preliminary results suggest that life events have a negative effect on indicators of the extension of working lives and that HR practices can buffer this effect.

Limitations: A limitation of this study is the limited time between the two measurements.

Research/practical implications: This study gives some initial ideas about how life events can influence the extension of working lives. Furthermore, it gives practitioners insight in the HR practices that could be used to buffer the negative effects of life events.

Originality/Value: This is one of the first studies that addresses life events in relation to the extension of working lives.

Abstract #2: Title, name and affiliation of the authors

Team Cohesion Buffers against Negative Effects of Poor Health on Work Ability

Donald M. Truxillo¹, Jennifer R. Rineer², David M. Cadiz³, & Grant Brady³

¹University of Limerick, ²RTI International, ³Portland State University,

Purpose: Health is one of the strongest predictors of work ability (one’s ability to meet their mental and physical job demands) throughout the lifespan, and health tends to decline with age. Thus, there is a need to better understand how to maintain work ability for those who must continue to work despite health problems. This study examined the role of team cohesion in supporting the work ability of employees with poor health.

Design/Methodology/Approach/Intervention: Self-reported data on health, work ability, and perceptions of team cohesion were collected from 274 construction employees from 36 teams in two public works organizations. The mean age was 44.8 (SD = 9.7).

Results: The relationship between poor health and work ability was negative, but this negative relationship was significantly weaker under conditions of higher team cohesion, suggesting that perceptions of team cohesion buffered against the negative effect of poor health on work ability.

Limitations: Data were self-report and cross-sectional. Findings may not generalize across all industries and types of jobs.

Research/Practical Implications: Members of cohesive work teams are more likely to help one another. Organizations may be able to help their employees to successfully meet their
job demands in spite of health problems by developing and supporting cohesive teams. Future research should examine the effectiveness of team cohesion interventions on work ability.

**Originality/Value:** This study provides a more nuanced understanding of the relationship between health and work ability and has practical implications for organizations looking to support their employees’ work ability throughout the lifespan.

Abstract #3: Title, name and affiliation of the authors

**Limits of older workers’ resilience: Emotion regulation, health, and absenteeism in a forensic mental healthcare setting**

Susanne Scheibe\(^a\), Frans Fluttert\(^b\), Reinder Broekstra\(^a\), and Anita C. Keller\(^a\)

\(^a\) University of Groningen

\(^b\) University of Southern Denmark, Oslo University Hospital, and FPC Dr. S. van Mesdag

**Purpose**

Several studies suggest an advantage in well-being at higher worker age, which is explained by accumulated emotion-regulation expertise with aging. Yet, in contexts of chronic stress, otherwise effective emotion-regulation strategies lose effectiveness, which may enable age-related vulnerabilities in physiological systems to undermine older adults’ health. Testing potential limits of older workers’ resilience, we surveyed employees of a forensic mental healthcare center – a stressful work context where violent patient incidents occur regularly and therapeutic success is challenged – regarding their job demands, emotion-regulation strategies, and health.

**Methodology**

Participants (N=237; mean age 44 years, 44% female, 60 units) completed an online survey. Absence data were retrieved from organizational records. Accounting for unit clustering, we tested a path model predicting age differences in health and absenteeism by emotional demands transmitted through different emotion-regulatory responses.

**Results**

Emotional job demands predicted increased cognitive engagement (problem-solving, reappraisal) and avoidance strategies (behavioral disengagement, denial). Cognitive engagement, usually seen as adaptive, was unrelated to health but predicted higher absenteeism. Avoidance, a maladaptive strategy, predicted lower health and higher absenteeism. Age was associated with higher use of avoidance strategies and lower physical health, especially in presence of high emotional demands.

**Limitations**

We rely on global self-reports for some variables.
Research/Practical Implications
In occupational contexts with extreme emotional demands, usually adaptive emotion regulation strategies lose effectiveness, and typical older-age advantages in emotion regulation and well-being may reverse.

Originality/Value
Few studies measured age differences in work-related emotion regulation in highly demanding occupational settings. Results point to limits of older workers’ resilience.
WORKPLACE PROCRASTINATION: ANTECEDENT AND CONSEQUENCES OF SELF-REGULATION FAILURE AT WORK

Chairs: Roman Prem\textsuperscript{1,2} & Tabea Scheel\textsuperscript{3}
Discussant: Sandra Ohly\textsuperscript{4}
\textsuperscript{1}University of Vienna, Vienna, Austria
\textsuperscript{2}University of Applied Sciences Upper Austria, Hagenberg, Austria
\textsuperscript{3}Europa-Universität Flensburg, Flensburg, Germany
\textsuperscript{4}University of Kassel, Kassel, Germany

State of the Art
Procrastination can be described as a quintessential form of self-regulation failure that results in delays in the initiation or completion of intended activities. Despite the prevalence and relevance of procrastination in work settings, most of previous research on procrastination was conducted in academic settings. However, by traditionally taking a situational perspective, scholars in work and organizational psychology could help advance procrastination research. Moreover, work and organizational psychologists could benefit from a better understanding of self-regulation failure at work.

New Perspectives/Contributions
This symposium sheds light on the antecedents and consequences of workplace procrastination: Scheel et al. investigate the relationships of working conditions with workplace procrastination and also explore self-compassion as a moderator. Metin and Goncu Kose turn the focus to motivation as a potential additional antecedents of workplace procrastination and investigate indirect effects via organizational commitment. By use of two diary studies, Kühnel and Bledow investigate the interplay of time pressure and positive emotions in preventing day-level workplace procrastination. Using a diary study likewise, Prem et al. investigate potential vicious circles of workplace procrastination that link procrastination on one day to procrastination on the next day. In the last contribution van Eerde and Sirois investigate effects of procrastination on co-workers, both in a vignette experiment as well as a dyad survey. Finally, an interactive discussion will be kicked off with a short integrative summary by our discussant Sandra Ohly.

Research/Practical Implications
This symposium offers ideas for research and practical interventions that focus on self-regulation failure at work.

Effects of Job Characteristics and Social Support on Procrastination at Work:
Can Self-Compassion Buffer Missing Job Resources?
Tabea Scheel¹, Wieland Fraas², & Roman Prem³,⁴

¹Europa-Universität Flensburg, Flensburg, Germany
²FernUniversität in Hagen, Hagen, Germany
³University of Vienna, Vienna, Austria
⁴University of Applied Sciences Upper Austria, Hagenberg, Austria

Purpose
Procrastination at work is costly. Although working conditions are related to procrastination, their effects may vary between persons, as self-compassion might be a personal resource to compensate unfavorable working conditions. Specifically, we assume that job resources (JCM and social support) relate (negatively) to procrastination over time, and that self-compassion moderates these relationships such that it reduces procrastination when job resources are low or missing.

Design/Methodology/Approach/Intervention
A quantitative four-wave online study was designed (ongoing). We present results from two waves with \( n = 423 \) (T1) respectively \( n = 103 \) (T1-T2) employees. Validated scales were used for assessing job resources (WDQ), self-compassion (SCS), and procrastination (GPS, adapted). Hypotheses were tested in moderated regression analyses controlled for time pressure.

Results
Only social support correlated (negatively) with procrastination (T1). Self-criticism (a subfacet of self-compassion) correlated positively with procrastination (T1). Moderation effects were only found cross-sectionally: Task identity respectively task feedback were related with (lower) procrastination only in individuals with low self-criticism.

Limitations
Although the study is designed with four waves, data is single-source self-report. The T2 sample is rather small as of yet.

Research/Practical Implications
Future research should focus on the dynamics between personal resources, working conditions and procrastination, as lagged effects could not be established yet. Nevertheless, social support, task identity, task feedback, and self-criticism seem important foci for organizational interventions.

Originality/Value
This is the first study investigating self-compassion as a buffer in the working conditions–procrastination link. However, self-criticism seems to be a risk factor preventing job resources from reducing procrastination.
Can Motivation and Organizational Commitment Influence Workplace Procrastination?

A Mediation Study

Baran Metin¹, Asli Goncu Kose²

¹Utrecht University, Utrecht, The Netherlands
²Cankaya University, Ankara, Turkey

Purpose
Workplace procrastination is a prevalent subject which attracts more attention throughout the last decade from researchers. However, the number of empirical studies still appear insufficient. The present study examined the relationship between motivation, organizational commitment and workplace procrastination. More specifically, the indirect link of intrinsic motivation, extrinsic motivation and amotivation on workplace procrastination through affective commitment was tested on a heuristic model.

Design/Methodology/Approach/Intervention
Data was collected from 844 office employees using self-report questionnaires. Structural equation modeling was used in order to test the proposed model.

Results
The proposed model yielded acceptable goodness-of-fit. Amotivation was positively related to procrastination, whereas both intrinsic and extrinsic motivation showed negative links to procrastination at work. Moreover, these links were partly mediated by affective commitment.

Limitations
The main limitations to this study are cross-sectional design and self-report instruments.

Research/Practical Implications
Theoretically, this study displays how intrinsic motivation, extrinsic motivation and affective commitment can be functional to diminish workplace procrastination. Practically, managers may pay additional attention on motivation to prevent employees from engaging in idle behaviors.

Originality/Value
The present study is among the first to examine the link among motivation, organizational commitment and procrastination at work using self-determination theory as a conceptual framework. Its notion to provide empirical results can potentially enrich procrastination at work literature.
What Prevents Procrastination?

Time Pressure and Positive Emotions as Alternative Pathways to Action

Jana Kühnel\textsuperscript{1} & Ronald Bledow\textsuperscript{2}

\textsuperscript{1}Ulm University, Ulm, Germany
\textsuperscript{2}Singapore Management University, Singapore, Singapore

Purpose

With the current work, we examine factors that enable and support individuals to initiate action. That is, we examine what prevents procrastination, the dysfunctional delay of the initiation or completion of work activities. We focus on the joint influence of the personal characteristic positive affectivity and the environmental factor time pressure. Building on personality systems interactions (PSI) theory, people who frequently experience positive emotions should be less prone to procrastination, because the experience of positive emotions facilitates the enactment of intended behaviors. People who experience low levels of positive emotions, however, should be dependent on the environmental factor time pressure to support the enactment of their intentions.

Design/Methodology/Approach/Intervention

One-hundred-and-eight (Study 1) and 154 (Study 2) employees answered daily electronic questionnaires across one work week.

Results

In Study 1, results of multilevel analyses support our hypotheses. We replicate the main findings in the second dataset.

Limitations

In both studies, we relied on self-report measures of the variables of interest.

Research/Practical Implications

By revealing benefits of time pressure to prevent procrastination, the current work contributes to research on person-environment fit and personality systems interactions theory. Future research might want to investigate potential drawbacks of the enactment of intentions under time pressure such as performance decrements.

Originality/Value

The current research shows that time pressure and positive emotions are alternative pathways to action.
Vicious Circles of Procrastination?
How Workplace Procrastination Is Related from One Day to the next

Roman Prem¹,², Ivana Igic³, Christian Korunka¹, & Tabea Scheel⁴

¹University of Vienna, Vienna, Austria
²University of Applied Sciences Upper Austria, Hagenberg, Austria
³University of Bern, Bern, Switzerland
⁴Europa-Universität Flensburg, Flensburg, Germany

Purpose
The goal of the present paper is to investigate potential vicious circles of workplace procrastination. Previous research indicates that unfinished tasks have a detrimental effect on sleep quality and that sleep is related to procrastination. Thus, we assume that procrastination on a given workday might result in more unfinished tasks, impaired sleep quality, and subsequently higher risks for further procrastination on the following workday. Additionally, indirect effects via reduced self-efficacy and increased time pressure were tested as well.

Design/Methodology/Approach/Intervention
To investigate within-person processes, we conducted a two-week diary study with three measurement occasions per workday. Overall, a total of 549 day-level data sets from 89 participants were analysed in multilevel analyses.

Results
Contrary to our assumption, procrastination on a given workday was not directly related to procrastination on the following workday, neither were unfinished tasks related to sleep quality. However, as expected, procrastination predicted unfinished tasks, and sleep quality and time pressure (but not self-efficacy) predicted procrastination. Results further revealed a serial indirect effect: More procrastination on a given workday was significantly related to more procrastination on the following workday via more unfinished tasks and subsequently increased time pressure on the next workday.

Limitations
Variance decomposition (similar to person-mean centering) affects the interpretation of the results.

Research/Practical Implications
Future research should investigate how the vicious circle of procrastination via more unfinished tasks and increased time pressure on the next workday can be interrupted.

Originality/Value
Using a diary study design enabled us to investigate potential vicious circles of workplace procrastination.

Effects of Co-Worker Procrastination

Wendelien van Eerde\textsuperscript{1} \& Fuschia Sirois\textsuperscript{2}

\textsuperscript{1}University of Amsterdam, Amsterdam, The Netherlands
\textsuperscript{2}University of Sheffield, Sheffield, United Kingdom

Purpose
Departing from theory on self-regulation, social norms, and positive psychology, we tested the effects of co-worker procrastination.

Design/Methodology/Approach/Intervention
In Study 1, co-worker procrastination was systematically varied in three vignettes (high, medium, and low), rated by employed participants \((n = 99)\). Study 2 assessed procrastination in co-worker dyads \((n = 103)\) in work settings.

Results
An ANOVA in Study 1 revealed that dependability and the desire to cooperate with the co-worker were lower when procrastination was high or medium, as compared to low. Liking the co-worker was not affected, nor was there interactive effect on any of the outcomes with one’s own procrastination. Study 2 used multilevel regression analysis, within the framework of the actor-partner interdependence model (APIM). Co-worker procrastination - directly or in interaction with one’s own procrastination - was unrelated to co-worker exchange (CWX). CWX did not mediate the relation between co-worker procrastination and life satisfaction, but it did mediate the relation between one’s own procrastination and life satisfaction.

Limitations
Study 1 was limited to the attitudes towards a procrastinating co-worker only. Study 2 consisted of self-selected dyads, which may have restricted the range of possible values on our variables.

Research/Practical Implications
Even a moderate degree of co-worker procrastination was judged as unacceptable, although liking was not affected. The effect of co-worker procrastination on CWX in dyads appears to be limited.

Originality/Value
This research is one of the few studies that takes a social-normative approach to the procrastination of others rather than studying the effects of self-reported procrastination.
647 - SYMPOSIUM: LEADER-MEMBER EXCHANGE (LMX) DIFFERENTIATION

Symposium Chairs
Cécile Emery, University of Surrey, UK
Robin Martin, University of Manchester, UK
Geoff Thomas, University of Surrey, UK

Discussant
Berrin Erdogan, Portland State University, USA

State of the Art: The Leader-Member Exchange theory (hereafter LMX; Graen & Uhl-Bien, 1995) advocates that leaders aim to develop high quality relationships with their followers. Yet, given that leaders’ time, effort, and resources are limited (Hooper & Martin, 2008a), leaders differentiate among followers, developing high-quality relationships with certain employees and not with others; a process referred to as LMX differentiation (e.g., Henderson, Liden, Glibkowski, & Chaudhry, 2009). Although a central premise of LMX theory, LMX differentiation has only recently gained momentum in the literature (Epitropaki, Kapoutsis, Ellen, Ferris, Drivas, & Ntotsi, 2016) and recent reviews have called for further research in the field (Martin, Thomas, Legood, & Dello Russo, 2018).

New Perspectives/Contributions: The current symposium brings together five presentations investigating key issues related to LMX differentiation. Zheng et al.’s study suggests that LMX differentiation impacts the mood of not only followers but also customers. Kampf et al. examine whether team information elaboration acts as a buffering moderator in the relationship between LMX differentiation and team performance. Buch refines our conceptualization of LMX differentiation by distinguishing between social and economic differentiation. Lee et al. examine how LMX Social Comparison (LMXSC) influences followers’ work behaviour. Finally, Emery et al. discuss how LMX differentiation shape the formation of other social relationships, such as advice and friendship networks, within a work-group.

Research/Practical Implications: Taken together, the papers presented in this symposium refine our understanding of how LMX differentiation could be conceptualized, how it operates, and how it impacts different organizational members.

Examining the Role of Leader-Member Exchange Differentiation for Employee- & Customer-Mood in a Services Context

Yuyan Zheng, Durham University, UK
Olga Epitropaki, Durham University, UK
Les Graham, Durham University, UK
**Purpose:** Prior scholarly work has pointed to the absence of studies examining the effects of LMX differentiation on emotional work outcomes (Matta & Van Dyne, 2018). Several reviews have also previously acknowledged that the linkages between LMX processes and mood and emotions are underdeveloped (e.g., Gooty, Connelly, Griffith, & Gupta, 2010). Recent theoretical work has attempted to fill in this gap and cast light on the black-box of affective processes in leader-member exchanges. For example, Cropanzano, Dasborough and Weiss (2017) utilised affective events theory as an explanatory framework for LMX development and Matta and van Dyne (2018) focused on the role of social comparison emotions for LMX differentiation. Still empirical work is scant.

**Design/Methodology:** By using mainly social comparison (Festinger, 1954) and emotional contagion (Hatfield et al., 1992) theories, and utilising data of 1,666 hair salon employees nested in 179 groups, our study aims at addressing the empirical gap previously identified. We specifically test a multi-level of the effects of salon LMX differentiation on employee-rated salon positive mood as well as customer-rated mood.

**Results:** The results provide support for an indirect effect of LMX differentiation on salon client mood via employee positive mood. Theoretical and practical implications will be discussed.

**The moderating role of team information elaboration in the relationship between LMX differentiation and team performance**

Pia Helen Kampf, University of Valencia, Spain
Vicente González-Romá, University of Valencia, Spain
Ana Hernández, University of Valencia, Spain
Verónica Melián, Universidad de la República, Uruguay

**Purpose:** In this study, we focus on the boundary conditions for the relationship between LMX differentiation and team performance. Specifically, we hypothesize that team information elaboration acts as a buffering moderator in this relationship.

**Methodology:** We tested our hypothesis by means of multiple regression in a sample of 100 bank branches. Variables were measured at two time points separated by 2 years. We controlled for team size, initial performance, team LMX quality, and whether team leaders changed over time or not.

**Results:** Results showed that teams with higher LMX differentiation at time 1 tended to decline in performance over time (b = -5.92, p < .01). This relationship was moderated by team information elaboration at time 1 (b = 1.40, p < .01), with a significant conditional effect only for teams with low information elaboration (b = -1.16, p < .05).
Limitations: Data were collected from the same source, which might have inflated the relationships.

Implications: The study shows that LMX differentiation may hamper team performance and stresses the importance for leaders to foster high-quality relationships with different team members. Moreover, we found that information elaboration buffers the detrimental effects of LMX differentiation. Hence, organizations should foster this team process through specific interventions.

Originality/Value: The longitudinal, aggregated team-level approach adds value to the field of LMX. By incorporating a moderator variable, we show that the influence of LMX differentiation is conditional on team information elaboration. Further, the study highlights the relevance of team dispersion measures.

Exploring the Differential Effects of Social & Economic Leader-Member Exchange Differentiation

Robert Buch, Oslo Metropolitan University, Norway

State of the Art: There is a growing literature on the concept of LMX differentiation, and how LMX differentiation plays a crucial role in shaping team processes and outcomes. Recently, however, researchers have started distinguishing between social and economic LMX relationships on the basis of social exchange theory and on pioneering work on employee-organization exchange relationships by Shore, et al. (2006). This research suggests that social and economic LMX relationships are qualitatively different and should be examined separately, which may have implications for the notion of LMX differentiation.

New Perspectives/Contributions: Building on recent work distinguishing between the social and economic exchange dimensions of LMX, I discuss how different dimensions of LMX differentiation (social vs. economic) could have different impact on employee outcomes. Furthermore, I propose that economic LMX differentiation may not be negative, dependent on factors such as leader political skill and individualized consideration, since some followers may actually prefer these short-term oriented economic exchanges (often of tangible resources, and characterized by little personal involvement).

Research/Practical implications: Preliminary results suggests that different dimensions of LMX differentiation (social vs. economic) are barely correlated, and if future research also supports the proposed differential impact of different dimensions of LMX differentiation (social vs. economic) on employee outcomes, this may have important implications for both practice and research.
Leader-Member Exchange Social Comparisons and Follower Outcomes: The Roles of Felt Obligation and Psychological Entitlement

Allan Lee, University of Exeter, UK
Alexandra Gerbasi, University of Exeter, UK
Gary Schwarz, SOAS University of London, UK
Alexander Newman, Deakin University, Australia

Purpose: We aim to extend the understanding of how and when leader-member exchange social comparison (LMXSC) influences followers’ work behaviour. Based on social exchange theory, we argue that felt obligation to one’s leader is a mediator of the relationship between LMXSC and follower outcomes. We also investigate whether the effect of LMXSC is not consistent across employees but influenced by their level of psychological entitlement (PE).

Design & Results: We conducted two quantitative studies which both utilised survey data from employees and their managers. We found evidence that LMXSC was associated with followers’ organizational commitment in Study 1 and both organizational commitment and job performance in Study 2 via felt obligation toward the leader. In both studies, we found this relationship was significant while controlling for LMX quality. Moreover, high levels of PE reduced employees’ feelings of obligation to reciprocate positive treatment.

Limitations: Our outcome data relied on either self-report (organizational commitment) or leader ratings (job performance), both of which are subject to bias. Further, only randomized experiments are truly able to demonstrate the causality of any given relationship.

Research Implications: LMXSC seems to drive feelings of obligation to one’s leader as opposed to overall LMX quality. Furthermore, those high in PE expect to be treated better than their colleagues, and therefore do not feel as much of a strong obligation to repay preferential treatment from their leader.

Originality: A central theme within LMX theory is that leaders form differentiated relationships with followers, yet little is known about how followers’ LMX social comparisons influence their attitudes and behaviour at work. Our findings show that individual differences also play a significant role in determining the outcomes of exchange relationships.
Examining how Leader-Member Exchange Differentiation Shapes the Pattern of Social Networks

Cécile Emery, University of Surrey, UK
Alexandra Gerbasi, University of Exeter, UK
Kristin Cullen-Lester, University of Houston, USA

**Purpose:** LMX differentiation describes the extent to which a leader creates (or not) distinctive interpersonal relationships with different followers (Henderson, Liden, Glibkowski, & Chaudhry, 2008). From a social network perspective, differentiated LMX relationships can be understood as a hub-and-spoke network structure with ties of varying strength (Sparrowe & Emery, 2015) and hence can be analyzed using social network analysis. As LMX relationships do not occur in isolation – instead, they are embedded in a larger social context composed of other social relationships –, we launch, to our knowledge, the first investigation examining whether LMX differentiation impacts the formation of other social relationships, such as friendship and advice. For example, at the triadic level, if a leader has a high-LMX with employee A and a low-LMX with employee B, are A and B more likely to be friends and rely on each other for advice?

**Design/Methodology:** We collected multiplex social network data – that is, multiple social networks, such as LMX, friendship, and advice relationships, among employees – in several organizations. We used exponential random graph models (ERGMs), which assume that the presence of one relationship (e.g., LMX) might be influenced by the presence or absence of other relationships (e.g., friendship, advice) and/or individual attributes (Robins et al., 2007), to examine whether LMX Differentiation and other social relationships are structurally related.

**Originality/Value:** By integrating social network and LMX theories, we examine how LMX differentiation can have an effect on within-group social networks dynamics.
State of the Art. Recovery is a process encompassing the study of behaviours (what people do), psychological experiences and the actual outcome (the state of feeling recovered). So far, there is mixed evidence for the recovery potential of some off-job activities and experiences. One of the explanations for these inconclusive results could be related to cognitive mechanisms. For example, apart from motivational and affective attributes, people’s thoughts while pursuing leisure activities may determine the feeling of being recovered. Cognitive-related aspects have been generally neglected even though these could be the key to understand the success of the recovery process.

New Perspectives/Contributions. We present five contributions following a cognitive approach to the study of recovery. Wendsche and colleagues analyse the effects of rumination during short rest breaks at work on strain reactions in two experimental studies. Adiasto and colleagues investigate to what extent music promotes recovery and what cognitive-affective mechanisms play a role in the process. Xanthopoulou and Sanz-Vergel examine the role of thoughts as a boundary condition on the daily recovery process. Binnewies and colleagues present an intervention study on how boundary management tactics affect recovery experiences. Finally, Chelidoni and colleagues analyze the covariation between executive function and rumination across time.

Research/Practical Implications. We highlight the importance of cognitive mechanisms in the study of recovery that may shed light on why some people recover more easily than others. These findings can help design interventions on how to re-appraise events and focus attention to make the most of recovery opportunities.

Time pressure and task-related rumination during short rest breaks: Experimental evidence from two lab studies

Johannes Wendsche¹, Anika Schulz², Andrea Lohmann-Haislah³, Ina Schöllgen⁴, Jürgen Wegge⁵

¹ 3.6 Workplace Interventions and Transfer, Federal Institute for Occupational Safety and Health, Dresden, Germany
**Purpose.** Many correlational studies revealed that task-related rumination during off-job time is driven by high quantitative demands and is related to more adverse strain outcomes. However, data on such relationships for recovery at work is sparse and experimental evidence is missing. Therefore, we investigated time pressure as a driver of rumination during short rest breaks, which in turn should increase adverse strain reactions due to lower levels of recovery.

**Design/Methodology.** In two experimental lab studies with student samples we manipulated the time pressure (low vs. high) of paced tasks which differed in cognitive load (Study 1: n = 44, picking tasks; Study 2: n = 40, mental arithmetics). Tasks were interrupted by three five-minute rest breaks. In Study 2, we further manipulated participants’ rest break control (without vs. with). We assessed task-related rumination during breaks and multiple strain outcomes.

**Results.** Time pressure significantly increased rumination during breaks only in Study 2. Rumination negatively correlated with well-being in both studies and with task performance in Study 2. Rumination mediated the relationship between time pressure and fatigue in Study 2. Rest break control reduced rumination during breaks.

**Limitations.** The small and specific sample and the short time on task.

**Research/Practical Implications.** We found experimental evidence that under higher cognitive task load time pressure increased task-related rumination during short breaks, which in turn increased fatigue. Ensuring rest break control is important to counteract rumination and fatigue under such conditions.

**Originality/Value.** Experimental approach to study antecedents and outcomes of recovery at work.

**Music listening and physiological recovery from stress: The mediating role of ruminative thoughts and positive affect**

Krisna Adiasto, Debby Beckers, Madelon van Hooff, Sabine Geurts, & Karin Roelofs
Behavioural Science Institute, Radboud University, The Netherlands

**Purpose.** Music listening has been proposed as a promising tool to promote recovery following exposure to stressors. However, the psychological mechanisms by which music
influences physiological stress recovery remain relatively unexplored. We theorize that listening to music may divert an individual’s attention away from stressor-related ruminative thoughts, which are known to prolong the activation of stress systems during and after exposure to stressors. Additionally, positive affective states induced by music may help undo the unfavourable cardiovascular arousal induced by negative affect experienced during stress. The present study aims to investigate whether ruminative thoughts and positive affect mediate the relationship between music and physiological stress recovery.

**Design/Methodology.** An experimental lab study will be conducted in which participants either listen to music or silence during a recovery period following a validated stress task. Participants’ heart rate and blood pressure are continuously monitored throughout the experiment, while ruminative thoughts and affect are measured following the stress task and the recovery period. The study is planned for November 2018. Based on a priori power analyses, we aim to recruit 156 participants who will be randomly assigned to either condition. Data will be analyzed using a structural equation modelling approach.

**Results.** Results will be presented and discussed during the conference.

**Limitations.** Limitations will be discussed during the conference.

**Research/Practical Implications.** Results may be used as support for evidence-based interventions to promote recovery, particularly through music listening.

**Originality/Value.** To our knowledge, the current study is among the few investigating cognitive and affective mechanisms underlying the effects of music on physiological stress recovery.

**Off-job activities and recovery experiences:**

**Work-related and activity-related reflection as boundary conditions**

Despoina Xanthopoulou  
School of Psychology, Aristotle University of Thessaloniki, Greece  
&  
Ana Sanz-Vergel  
Norwich Business School, University of East Anglia, UK

**Purpose.** To understand further the cognitive mechanisms that are at play in the recovery process, we introduce the concept of activity-related reflection as complementary to the concept of work-related reflection during off-job time. We define activity reflection as employees’ positive or negative thoughts about the activities that they undertake after work. We hypothesize that time spent in off-job activities (i.e., work-related, family, household, physical) will facilitate psychological detachment and relaxation in conditions of 1) low (vs. high) negative work-related and activity-related reflection and 2) high (vs. low) positive work-related and activity-related reflection.
Design/Methodology. Employees \((N = 139)\) completed a diary study for three to five consecutive workdays, before going to sleep.

Results. Multilevel analyses provided some support for our hypotheses. Time spent in family-related activities associated positively to detachment only at low levels of negative activity-related reflection, while it associated negatively to relaxation only at high levels of negative activity-related reflection. Time spent in household activities related positively to detachment at low (vs. high) levels of negative work-related and activity-related reflection. Physical activities associated positively to detachment at high levels of positive activity reflection, and negatively at low levels of positive activity reflection.

Limitations. Activity-related reflection was measured with regard to all activities that employees undertook during leisure, and not for each specific activity separately.

Research/Practical Implications. Reflecting about work during leisure is generally unfavorable for recovery. Leisure-time activities promote recovery experiences particularly when people think positively about these activities.

Originality/Value. This study highlights the role of thoughts during leisure as a boundary condition in the recovery process.

Evaluation of an online-based training on boundary management for employees’ recovery and well-being

Carmen Binnewies\(^1\), Julia Törk, & Corinna Brauner\(^2\)

\(^1\)University of Muenster, Muenster, Germany
\(^2\)Federal Institute for Occupational Safety and Health (BAuA), Dortmund, Germany

Purpose. The aim of our study was to evaluate the effects of an online-based training on boundary management for employees’ recovery and well-being. The training was based on the boundary management tactics: temporal, spatial, communicative and behavioral proposed by Kreiner, Hollensbe, & Sheep (2009).

Design/Methodology. We conducted a randomized control group trial with a pre – post measurement design. All participants responded to the pre-survey on a Monday and participants in the intervention group participated in the online-based training immediately afterwards. One week later both groups responded to the post-survey and participants in the waitlist control group participated in the training afterwards. In total, 74 employees (35 in the intervention group, 39 in the control group) completed both surveys.

Results. Results of analyses of covariances (controlling for the outcome at \(t_1\)) showed that participants in the intervention group showed an increase in recovery experiences, specifically in psychological detachment, relaxation and control as well as an increase in positive affect and vigor and a decrease in negative affect, emotional exhaustion and work-family conflict.
Limitations. Long-term effects of the training (retention) could not be examined and the small sample limits generalizability.

Research/Practical Implications. Our training shows that applying boundary management tactics is an effective way to increase employees’ recovery and well-being. Thereby, our study sheds light on the cognitive and behavioral mechanisms of successful recovery.

Originality/Value. Our study is one of the few interventions on boundary management showing that short-term interventions are effective to increase employees’ recovery and well-being in the short run.

A longitudinal investigation of the role executive function plays in the recovery from work process

Olga Chelidoni¹, Mark Cropley¹, David Plans²

¹School of Psychology, University of Surrey, Guildford, UK
²Centre of Digital Economy, University of Exeter, UK

Purpose. The objective of this study was to examine the stability of executive function and emotion regulation skills across time and explore how these constructs impact the different ways workers switch off and unwind from work.

Design. This is a longitudinal design. Participants completed an online survey at two time points, initially at baseline (T1) and then three months later (T2) completing a variety of measures assessing executive function as reflected on daily life behaviour, emotion regulation difficulties, work related rumination, whilst controlling for job demands and negative affect.

Results. Executive Function at T1 were significantly positively correlated with affective rumination (r=.40, p=.001) and the same effect was observed for T2 scores (r=.40, p=.001) demonstrating that executive function and rumination covary across time. However multiple hierarchical regression indicated that executive functions at T1 did not predict affective rumination at T2. We further conducted repeated measures ANOVA in order to test mean level changes across time.

Practical Implications. The covariation between executive function and work-related rumination is interesting and suggests that interventions aimed at increasing executive function could aid individuals to switch off mentally post work. More and longer time lags between time points however, could offer further insight on the causal relationship between the constructs.

Originality. To date this is the first study exploring possible cognition-emotion associations within employees in order to predict real life behaviour. Understanding these associations
and their relationship with work functioning has implications not only for individual wellbeing outcomes but on organisation level as well.
State of the art: A rapidly growing research stream on entrepreneurship and well-being showcases the important role of well-being for entrepreneurs. ‘Happy’ entrepreneurs are more likely to identify opportunities and persist in their business, and they lead higher performing firms. Indeed entrepreneurs are willing to make decisions that are financially costly to them to protect their well-being (Stephan, 2018, Wiklund, Hatak, Shepherd & Patzelt, 2018). Thus considering well-being can help re-cast how we view entrepreneurship and offers opportunities for psychologists to make unique contributions.

Contributions: This symposium brings togethers new theoretical ideas and empirical findings (including diary, longitudinal and meta-analytic research) on entrepreneurship and well-being by five author teams from eight countries and Michael Frese as a discussant. The well-being benefits of being an entrepreneur are smaller than many would expect. The contributions in this symposium help to understand why. They point to ambivalent effects of the strong meaningfulness, deep engagement and passion that working for oneself entails, and highlight how precarious such work can be (e.g. for entrepreneurs’ mental health and their family).

Implications: The symposium advances research on entrepreneurship and well-being. Instead of asking whether entrepreneurs have higher or lower well-being than other groups, the studies in this symposium ask when, how, for whom and why this may be the case. They help to unpack the heterogeneity of such effects for different types of entrepreneurs, for different components of well-being and across varying contexts.

ABSTRACTS below

WORKING 24-7, SURVIVING OR THRIVING? A MULTI-LEVEL STUDY AMONG ENTREPRENEURS
Marjan Gorgievski, Erasmus University Rotterdam, The Netherlands
Jacqueline Jumelet, Applied University Rotterdam, The Netherlands

Purpose: Running a business often comes with a feeling of having to be available 24 hours a day, 7 days a week. Additionally, entrepreneurs often see themselves confronted with uncertainties, both on a daily basis and concerning the future of the business. Building on the Entrepreneurial Job Demands-Resources (EJD-R) model, this study investigates cross-level interactions between on the one hand weekly motivational and health impairment processes, and on the other hand characteristics of the entrepreneur, the company and the business environment.

Design: This is a quantitative weekly diary study covering three weeks in which a total of 108 entrepreneurs of small and medium sized businesses participated.

Results: Results of mixed models analyses showed partial evidence for predicted main effects and interaction effects between accumulative entrepreneurial demands, but not for interactions between job demands and resources. In general, 24/7 availability related to a
higher weekly work engagement; this relationship was enhanced by financial hardship and reversed in case of high task insecurity. Task insecurity, work pressure and financial hardship predicted more weekly mental health complaints. Financial hardship aggravated negative effects of high work pressure.

**Limitations:** The main limitations include reliance on self-report measures, a relatively small and quite diverse sample and only three measurement moments.

**Implications:** The results of this study underscore that the JD-R model may work differently for entrepreneurs as compared to employees, with accumulative job demands playing an important role in both the health impairment and the motivational process.

**Originality:** This study is one of few studies investigating the interactions between accumulative job demands.

---

**FLOURISH, FIGHT OR FLIGHT: HEALTH AND WELL-BEING IN SELF-EMPLOYMENT OVER TIME – ASSOCIATIONS WITH BUSINESS SUCCESS**

*Claudia Bernhard-Oettel, Stockholm University, Sweden*

*Louise Bergman, Stockholm University, Sweden*

*Constanze Leineweber, Stockholm University, Sweden*

*Susanna Toivanen, Stockholm University and Mälardalen University, Sweden*

**Purpose:** Around 9% of the working population in Sweden consists of self-employed business owners, but a considerable amount of them struggle to consolidate or expand their businesses. Among the factors predicting business success the decisive role of long-term health of business owners has been acknowledged only recently, but longitudinal studies testing this assumption are scarce. Based on the conservation of resources theory, good health can be seen as a resource that helps business owners to tackle high workloads and make business succeed.

**Design:** Data from the Swedish Longitudinal Occupational Health Survey is used. Starting in 2012, N=554 self-employed have answered three or more times in the biannual data collection. Latent growth curve modelling is employed to study general and mental health trajectories and their associations with business survival over time.

**Results:** Preliminary descriptive analyses on biannual changes suggest that roughly one in ten self-employed leaves self-employment at follow-up. Job demands and emotional exhaustion are higher among those who leave compared to those who remain in business. After integrating new data collected in 2018, growth curve analyses are run over the whole longitudinal sample, and associations of health trajectories to business survival will be tested.

**Limitations:** Data is collected with questionnaires, and business success is operationalized as business survival only.

**Research/Practical Implications:** Study results increase knowledge on the self-employed’s health developments, vulnerable groups with poor health and risk of business failure can be detected.

**Originality/Value:** This is one of few studies on longitudinal developments of health in self-employed business owners.
GOOD FOR THE VENTURE BUT NOT FOR ME? THE ROLE OF PASSION IN ENTREPRENEURS’ WORK-FAMILY CONFLICT

Annelore Huyghe, Cass Business School, United Kingdom
Mirjam Knockaert, Ghent University, Belgium
Frederik Anseel, King’s Business School, United Kingdom

Purpose: The growing literature on entrepreneurial passion has focused primarily on its positive outcomes. The potential downside of passion in entrepreneurship remains largely unexplored (Cardon et al., 2005; Ho & Pollack, 2014). This is surprising as scholars have demonstrated negative outcomes associated with passion in other contexts. Our study addresses this gap by investigating the detrimental consequences of passion for entrepreneurs’ work-family conflict, which is the extent to family involvement is made more difficult due to engagement in one’s work role (Greenhaus & Beutell, 1985).

Design: Our study is based upon survey data collected with 505 Belgian entrepreneurs. We measured respondents’ entrepreneurial passion with Cardon et al. (2012)’s scale and work-family conflict with Netemeyer et al. (1996)’s scale. For our mediating and moderating variables, we built upon the work by Ong et al. (2015) and Shipp et al. (2009).

Results: Data were analyzed using path analysis-based conditional process modeling (Preacher & Hayes, 2008). Entrepreneurial passion exerts both direct and indirect influences on work-family conflict. We find empirical support for the nonlinear relationship between entrepreneurs’ passion and conflict. Entrepreneurial passion also increases work-family conflict through reflection. Finally, our results indicate that temporal focus moderates the latter link such that less conflict occurs amongst reflective entrepreneurs that are future-oriented.

Limitations: The cross-sectional design.

Implications: Passion is desirable for venture progress but may be harmful for entrepreneurs.

Originality: We point to the dark side of entrepreneurial passion and disentangle when passion can have a cost for entrepreneurs in terms of work-family conflict.

ENTREPRENEURSHIP AND WELL-BEING: THE ROLE OF EXPERIENCED MEANINGFULNESS OF WORK AND SOCIETAL LEGITIMATION

Susana M. Tavares, Instituto Universitário de Lisboa (ISCTE-IUL), Lisbon, Portugal
Helena Carvalho, Instituto Universitário de Lisboa (ISCTE-IUL), Lisbon, Portugal
Susana C. Santos, Rowan University, Glassboro, USA
Marc van Veldhoven, Tilburg University, Tilburg, Netherlands

Purpose: This study investigates whether entrepreneurship (operationalized as self-employment) is associated with higher levels of meaningfulness at work and individual’s well-being, specifically subjective vitality, when compared to regular employment. We propose that the impact of self-employment status on meaningfulness at work would depend on countries’ societal legitimation of entrepreneurship.

Design: We analyzed data from the Global Entrepreneurship Monitor and the European Working Conditions Survey on 16 European countries and tested a cross-level moderated mediation model.
Results: Results showed that entrepreneurship is positively related to individual’s well-being through the mediating effect of meaningfulness at work. However, the effect of entrepreneurship on individuals’ meaningfulness at work and, ultimately, on their subjective vitality, is stronger for people living in countries where entrepreneurship is less frequently considered a desirable career choice.

Limitations: Due to the cross-sectional nature of the empirical design we cannot draw causal inferences from our results.

Research/Practical Implications: Our study points to the need of European policy makers to actively foster a positive image of entrepreneurial activity through the educational system and the media as a way of sponsoring the social desirability of this career path. This will be beneficial not only to the self-employed, but also to traditional wage employees.

Originality: These findings provide evidence for framing meaningfulness at work as being contingent on the interaction between self-employment status and national normative context and contribute to the literatures on entrepreneurship, meaningfulness, and well-being at work.

STRESSED BUT HAPPY? A META-ANALYSIS OF ENTREPRENEURSHIP AND WELLBEING

Ute Stephan, King’s College London, UK
Andreas Rauch, University of Sydney, Australia
Isabella Hatak, University of St. Gallen, Switzerland

Purpose: It is uncertain whether entrepreneurship is a career choice that results in higher well-being than paid employment with existing research reporting conflicting findings. We suggest the entrepreneurship-wellbeing relationship is contingent on how well-being is conceptualized. Building on arguments from dissonance theory, we propose self-justification processes lead to reappraising of life and work situations. As a consequence, we expect entrepreneurs to report higher well-being than non-entrepreneurs even though they have more stressful work conditions and more mental health issues.

Design: We conduct a meta-analysis of existing research and differentiate four components of well-being: cognitive (i.e., satisfaction) and affective components, the latter distinguished by their valence as well-being or ill-being (distress and mental health issues).

Results. Based on the coding of 78 samples from 42 papers, preliminary results find that entrepreneurs report higher satisfaction and affective well-being (sample size weighted mean correlations r=.059 and r=.035) than non-entrepreneurs but also more stressful working conditions (r=.094). There was no difference for indicators of ill-being.

Limitations. The underlying research aggregated in the meta-analyses is predominantly cross-sectional.

Practical Implication: The well-being benefits to entrepreneurship are small and stressors are high. This should be borne in mind when advocating entrepreneurship as a career choice.

Originality: Synthesizing empirical evidence we find that entrepreneurs experience higher satisfaction and affective well-being than non-entrepreneurs. The differential relationship of entrepreneurship with well-being and ill-being highlights the importance of adopting a
component view of well-being, which helps to explain the conflicting findings in past research on entrepreneurship and well-being.
660 - WOMEN'S CAREER JOURNEYS: THE IMPACT OF WORK AND LIFE EVENTS’

Symposium Proponents:

Lisa van der Werff¹, Yseult Freeney¹, Marion Fortin²

¹ Dublin City University Business School, Dublin, Ireland
² University of Toulouse

Discussant:

Prof. Michelle Ryan

Professor of Social Professor of Social and Organisational Psychology

University of Exeter

The authors of the below papers represent France, Germany, Ireland, the UK and the US.

Integrated Summary of Papers

State of the Art

While there is considerable attention paid to the underrepresentation of women at senior levels of organisations, little or no research examines in detail the impact of life events on work and career journeys. Our symposium recognises the importance of specific life events such as motherhood in shaping women’s career progression and comprises four papers on women’s work experiences and decisions in light of these events.

Contributions
The symposium commences with a theoretical paper that provides a broad overview of how women’s physiological and hormonal changes interact and challenge “ideal worker” expectations. It proceeds with three empirical papers, two qualitative and one mixed-method study which explore the impact of maternity leave and motherhood on decisions to go back to work as well as the experiences of return. Drawing on theories of self-determination, organizational justice and trust, we will examine how these life events influence career decision making, and elicit negative psycho-social implications. Together, these papers illustrate the significance of life transitions and unpack the many reasons why women’s careers evolve in a different way to their male counterparts.

Research and Practical Implications

Meaningful social progress in addressing gender imbalance at senior levels of organisations requires a more nuanced understanding of the unique experiences of women at work. Our symposium provides complementary theoretical lenses and mixed methods evidence for how life events, and in particular maternity leave, influence women’s career experiences and decisions and provides a rich research agenda to guide future research in this field.

1. "Women’s Work and the Three M’s: Menstruation, Maternity and Menopause"

Alicia Grandey\textsuperscript{1}, Allison Gabriel\textsuperscript{2}, and Eden King\textsuperscript{3}

\textsuperscript{1}Pennsylvania State University

\textsuperscript{2}University of Arizona

\textsuperscript{3}Rice University

State of the Art
Contemporary perspectives of *ideal workers* require “complete commitment to paid work through long work hours, around-the-clock availability...and prioritizing employers’ interests above personal ones” (Kmec, O’Connor, & Schieman, 2014; p. 64), a perspective intertwined with masculine ideals (Davies & Frink, 2014).

**New Perspectives/Contributions**

We present a framework for how women’s physiological and hormonal changes intersect with, and may contradict, “ideal worker” expectations. We review evidence on the “3 Ms” – menstruation (i.e., pre-menstrual hormonal changes and discharge), maternity (i.e., hormonal and physical changes from pregnancy & breastfeeding) and menopause (i.e., hormonal changes with loss of menstruation) – as they relate to work and careers.

We propose women’s natural experiences are a *borderland*, a complete blurring of work/non-work borders (Clark, 2000), in that women cannot choose whether to bring these aspects of self to work. Our review will show how women’s life phases affect how women see themselves, and how others see women during these phases, in ways incongruent with “ideal worker” expectations.

**Research/Practical Implications**

Given that women are a large segment of the workforce (46% in Europe and North America), the time is right to talk about how normal life transitions uniquely experienced by women affect career progression. Society is ready for this conversation and policies that accommodate women’s experience (Clinton, 2017; Jack et al., 2016).

**Originality/Value**
Our goal is to change the conversation so that it is not taboo to study these topics among researchers and practitioners, with the goal to identify the challenges to women’s career advancement and implications for research and policy.

2. "Making the decision to return to work post maternity leave: a self-determination perspective"

**Yseult Freeney, Lisa van der Werff, and Nicolas Jourdan**

Dublin City University Business School

**Purpose**

Research is only beginning to recognise the impact of maternity leave on women’s careers. This transition presents a significant juncture for a woman to navigate and commences with the woman’s decision making about her return to work. Drawing on self-determination theory, the aim of this study is to develop a deeper understanding of how motivational profiles shape career decisions post maternity leave.

**Design/Methodology**

We draw on data from 500 women who participated in a survey during their maternity leave. We triangulate these data with interviews with 16 mothers as they make the decision to return to work or not and whether they will return in the same capacity.

**Results**

Preliminary results indicate that women with autonomous work motivation are more likely to make a decision to return to work in the same capacity. Qualitative data enrichens our understanding of this finding by presenting evidence of struggles between work and home motives as well as highlighting the role of normative influences on career decisions.
Limitations

Participants are all working in Ireland and the UK and their experiences may not be generalizable to other countries.

Research/Practical Implications

The research findings highlight the need for a more nuanced understanding of the impact of motherhood on career progression. The research identifies a need to unpack the various facets of parenting which interact with work and career decisions, particularly during significant transitions.

Originality/Value

This research is the first to identify the role of motivational profiles in shaping career related decisions during significant life transitions, such as maternity leave.

3. "Fair Returns: The impact of pregnancy and maternity leave on women's careers"

Marion Fortin1, Camille Desjardins1, Hayley German2, Janine Bernhardt3

1University of Toulouse
2University of Huddersfield
3German Youth Institute (DJI)

Purpose

Maternity leave is a tipping point for gender equality in society, and a time when central career motives may change. It is also a crucial transition time that gives rise to numerous fairness evaluations in work organizations. In this research we examine within-person justice dynamics around the time of maternity leave and how these have an effect on career decisions and career outcomes.
Design/Methodology

We conduct a qualitative longitudinal study with a sample of 40 pregnant educated women. Beginning in summer 2018, participants are interviewed when they are between 5-7 months pregnant. The sample represents a range of workplace industry types and job roles. Semi-structured interviews are conducted prior (T1), during (T2) and upon returning (T3) to work after maternity leave, and followed up 6 months later (T4). The interviews are complemented by a pre-study questionnaire and biographic data. The data is coded and content analysed to systematically analyse the women’s subjective experience and reasoning.

Results

In this study we present the initial findings from Time 1 (including biographic data), with a focus on their experiences with sharing the news about pregnancy and making concrete work arrangements for maternity leave and return, as well as their expectations regarding maternity leave and return (career, work relationships, etc).

Limitations

Only Time 1 data is available for presentation at the conference. Our sample is limited to highly educated women, for whom the gender gap effects of maternity leave have been illustrated to be more pronounced.

Research/Practical Implications

This research extends our understanding of the experience of fairness and career dynamics in relation to the crucial transition period that maternity leave represents. In particular, we link specific events (for example, breaking the news of pregnancy) and contextual factors (including the ideal worker norm in the organization) with expectations and attitudes regarding maternity leave and return. Understanding these within-person dynamics is informative for improving organisational policies,
managerial practices and working conditions, which in turn can bring organisations a step closer to achieving gender equality.

Originality/Value

In focusing on this pivotal time in women’s careers we integrate gender equality, career and justice research, providing a person-centric understanding of the experience of working women.

4. “Don’t you know that it’s different for girls”: A exploration of the dynamics of trust, breach and violation for women’s employment journeys en route to the top”

Rosalind Searle¹, Ruth Sealy², and Beverley Hawkins²

¹Adam Smith Business School, University of Glasgow, Glasgow G12 8QQ
²University of Exeter Business School, Exeter Centre for Leadership, Exeter EX4 4PU.

Purpose

Despite over the last forty years a plethora of programmes and policy interventions, there has remained a dearth of women at the top of organisations. The low rates of women in senior roles shows stubbornly similar results across different sectors, different industries and different countries with increasing numbers of women at graduate intake, but strikingly little dent in both the comparative speed and volume of men’s progression into elite leadership positions. This paper explores the experience of women in a programme designed to enhance their progression within a multi-national consultancy organisation.

Design/Methodology/Approach/Intervention

Drawing from 48 interviews of mentor-mentee dyads, we systematically explore the experiences of mentees that shapes their psychological attachment to their employing organisation.
Results

We focus on salient events identified by mentees, and use events systems theory to map these events and through these understand the dynamics of these experiences with a particular focus on building and violation.

Research/Practical Implications

Our dyadic study identifies whether, and how, experiences are different for women, and based on these insights identify what mentors and organisations can do to better support and enable their progression up the organisation.

Originality/Value

This research represents the first dyadic perspective on factors influencing women’s attachment to their organisations.
State of the art. This symposium approaches entrepreneurship from a career perspective. Unpacking and understanding entrepreneurs’ choices and actions across different types of entrepreneurship and different stages of the entrepreneurial career is an area where psychologists in particular can make significant contributions (Gorgievski & Stephan, 2016). From an entrepreneurial career perspective, research has most commonly focused on early stages of entrepreneurship, in specific entrepreneurial intentions.

New perspectives/contributions. The presentations in this symposium will provide insights into choices and behaviors of different types of self-employed workers in different stages of their entrepreneurial career. For example, the studies included in this symposium take into account demographics, such as age and gender; compare solo-workers and business owners with personnel; and investigate variability in social entrepreneurship. As we approach entrepreneurship as a conscious career choice, we pay attention to entrepreneurs’ values, motives, and behaviors that play an important role in the way the entrepreneurial career unfolds.

Research/practical implications. More in depth research on entrepreneurs from a career perspective will enable scholars to better understand different types of entrepreneurs and advance knowledge on what happens after starting a business. From a practical point of view, this symposium contributes to more knowledge on factors that influence entrepreneurial career success and reduced failure rates to inform policy makers’ actions and thus benefit European societies. These actions will also promote the well-being and health of self-employed workers with different demographical characteristics, levels of vulnerability due to their demographics and motives, and in different stages of their entrepreneurial careers.
(1) Conflict and stress dynamics in startup top-teams

Gosia Kozusznik and Martin Euwema

KU Leuven, Belgium

Purpose. Startups development and growth is one of the Europe’s Priorities. However, about 50% of new European businesses fail during their first five years; conflicts between founders and effects of work stress being identified as two of the top reasons for this failure. The aim of this work is to elaborate on typologies of conflicts specifically characteristic for start-ups and to analyze their dynamic as related to stress, coping and health.

Design/Methodology/Approach/Intervention. This study has a mixed design: we conducted interviews with 18 startup founders/experts, followed by concept mapping, multidimensional scaling, and cluster analysis. Also, we carried out multilevel SEM on a diary data from 86 start-up founders.

Results. The results indicate four types of conflicts specific to the context of startups, regarding: money, norms, teamwork, and vision. These dimensions of conflicts in startups relate in time with stress, and different indicators of well-being.

Limitations. Self-report was used to measure conflicts and stress levels.

Research/Practical Implications. The results can contribute to create guidelines for startups on how to prevent and effectively deal with stress and conflicts, take early preventive actions to avoid startup’s failure, and to promote founders’ well-being and health and start-ups’ success.

Originality/Value. This work adds knowledge about conflicts and stress dynamics in start-ups that is practically inexistent. It addresses a timely issue of start-ups’ entrepreneurial success, making this work relevant for European economy.

(2) What Do Starting Motives Say About Solo Self-employed Workers?

Sjanne Marie van den Groenendaal, Silvia Rossetti, Mattis van den Bergh, and Dorien Kooij

Department of Human Resource Studies, Tilburg University
School of Governance, Utrecht University
Department of Methodology, Tilburg University
**Purpose.** The central aim of this paper is to increase our understanding of the different types of solo self-employed workers based upon their start-up motive(s) and to advance knowledge on the effects of entrepreneurial motivations on proactive behaviors related to their career. To achieve this aim, we identified subgroups and investigated whether they differed in terms of their engagement in proactive career self-management behaviors, such as skill and knowledge development, networking, hiring and collaborating with fellow entrepreneurs, and hybrid entrepreneurship.

**Results.** We identified six subgroups of solo self-employed workers based on their start-up motives and found that they differed in their levels of engagement in proactive career self-management behaviors. Especially solo self-employed workers pushed by necessity tend to be more vulnerable because of their desire for paid employment but not succeeding the attainment of actual hybrid entrepreneurship as a career self-management behavior, due to a lack of employment opportunities.

**Limitations.** Due to the cross-sectional design, we could not examine whether start-up motives and its relationship with career self-management behaviors are stable over time.

**Research/Practical Implications.** With the knowledge generated in this study, institutions may develop more effective tailor-made policy-interventions to enable solo self-employed workers to reduce failure and sustain their business.

**Originality/Value.** The results will advance knowledge on the heterogeneity among solo self-employed workers and their career self-management behaviors using a person-centered approach (i.e. Latent Class Analysis).

---

**Entrepreneurial Proactive Behavior: Scale Development and Validation**

Dewi Kanters, Marjan Gorgievski, Arnold Bakker, and Daantje Derks

1Erasmus University Rotterdam, the Netherlands

**Purpose.** The present study aimed to develop and validate an instrument that measures entrepreneurial crafting: a behavioral construct which is further conceptualized in this study.

**Design/Methodology.** The concept of entrepreneurial crafting was explored through in-depth interviews with ten Dutch entrepreneurs. Based on literature and the transcribed and coded qualitative data, 43 scale items were constructed. After discussing the initial items with
multiple experts in the field of entrepreneurship, several items were removed or modified and 20 items remained. Data on the factor structure, reliability, and validity of the scale were collected among a sample of 147 Dutch entrepreneurs.

**Results.** Preliminary results from exploratory factor analysis (EFA) using Maximum Likelihood with oblique rotation indicated that the newly developed 20-item measure follows a three-factorial structure. The interpretation of these three factors reflected the crafting behaviors focused on either the 1) personal environment, 2) organizational environment, or 3) person-environment fit. Reliability and validity of the novel scale are being analyzed at the moment, as well as how it is associated with theoretically related constructs.

**Limitations.** This study is limited by the sample size and by the use of self-report measures.

**Research/Practical Implications.** The resulting instrument could be used for both research and practice when examining the behavioral processes in entrepreneurship. Also, these insights can benefit the development of interventions for entrepreneurs and may help policy makers encourage beneficial entrepreneurial crafting behaviors.

**Originality/Value.** This study contributes to the measurement of entrepreneurial crafting and can help researchers in theory testing.

---

**(4) The Value of Values in Understanding the Distinctiveness and Heterogeneity of Social Enterprises**

Ute Stephan¹, Johanna Mair², and Marieke Huysentruyt³

¹King’s College London, UK
²Hertie School of Governance, Germany & Stanford University, USA
³HEC Paris, France

**Purpose.** Research on social enterprises focusses on organizational tensions arising from the need to simultaneously attend to social and commercial goals. In parallel, research from an individual perspective casts social entrepreneurs as driven by prosocial motivations. Both lines of research concentrate on social aspects and their tensions with economic aspects. We use Schwartz’ Value Theory to explore who are the individuals leading social enterprises.

**Methodology.** We collected survey data from 1,018 managers of social enterprises in China, Russia, Germany, Hungary, Portugal, Romania, Spain, Sweden, and UK. Comparison data come from the European Social Survey for 10,452 employees, 3,511 managers and 1,580 entrepreneurs on the Portrait Value Questionnaire.
Results. (1) Social enterprise directors endorse self-transcendence and openness-to-change more strongly, and value self-enhancement and conservation less as compared to employees, managers and entrepreneurs. (2) Using latent profile analysis, we identify five value profiles of social enterprise managers. In only two profiles self-transcendence is the dominating value. Two profiles show a balance between self and other concerns, but tensions between fitting-in and seeking to change society. (3) We establish correlates of value profiles.

Limitations. We use cross-sectional self-report data.

Implications. Our study calls for a broader view of social enterprises beyond the singular focus on prosocial motivation and social-economic tensions.

Originality. We reveal substantial heterogeneity in values among social enterprise managers. We complement and recast the dominant perspective of social enterprises as sites of conflict and tension and instead call for acknowledgement of ambivalence as an important concept to understand individuals leading hybrid organizations.

(5) Age-related decrease in entrepreneurial intentions in Spain: Lost opportunities for senior entrepreneurship?

Juan A. Moriano and Ana Laguía¹
¹Universidad Nacional de Educación a Distancia (UNED), Spain

Purpose. The ageing population is one of the biggest challenges in Europe. Different solutions are under consideration, and one of them is encouraging entrepreneurship as a form of bridge employment to delay retirement. Drawing on the theory of planned behaviour, this study analyses entrepreneurial intentions of older workers.

Design/Methodology. The Entrepreneurial Intention Questionnaire was administered to a sample of 2333 participants (54.7 % female, 18-64 years old) from Spain.

Results. Partial least squares technique showed that age correlated significantly and negatively with entrepreneurial intentions, which could be explained by less positive attitudes towards entrepreneurship (e.g., “facing new challenges”, “being creative and innovative” and “obtaining high incomes”) and less perceived support from reference groups to become an entrepreneur, particularly family and close friends.

Limitations. Main limitations of this study relate to cross-sectional design and self-report measures. In future studies we propose to include an additional measure on subjective age.
Research/Practical Implications. These findings may have practical implications for the design of entrepreneurship courses for adult people as well as other educational initiatives in order to foster entrepreneurship in the third age.

Originality/Value. This study explores the relationship between age and entrepreneurial intentions in a large sample. Interestingly, age did not correlate with entrepreneurial self-efficacy. Thus, entrepreneurship education programs in the adulthood should pay special attention to attitudes and subjective norms, particularly to social acceptance of entrepreneurship at any age. Last, age is not only a control variable but a main antecedent of entrepreneurial intentions, so it should be taken into account in future research.
State of the art. Employability research has flourished in recent years, leading to many new insights into its importance in the contemporary world of work. However, more in-depth research is needed to address several blind spots related to employability in different career stages, occupational groups and employment relations. In three interrelated symposia stemming from the 2018 EAWOP Small Group Meeting organized by Pascale Le Blanc and Beatrice Van der Heijden, these topics are addressed. Together, these symposia aim to contribute to academic progress in the field and to improve (HRM) policy and practices in business. This second symposium on Graduate Employability (GE) focuses on various types of career resources, development practices, and interventions aimed at enhancing GE.

New perspectives. This symposium brings together six papers that advance research on graduate employability in innovative ways. Pearson et al. present findings on the effectiveness of an employability intervention; Blokker et al. examine career resources and employability before labor market entry; Hernández et al. introduce a dynamic perspective to study graduate employability; Okay-Somerville et al. present results on graduates’ social media use and graduate employability; Mazzetti et al. investigate how career planning, personal resources, and interpersonal behaviors enhance graduates’ employability; and Rodrigues et al. examine the effects of career development practices on graduate employability.

Implications. The studies in this symposium show in various ways that career resources are a crucial element of successful graduate employability. At the same time, the interplay with contextual factors is key to smooth transition into the labor market.

“Mastering Your Employability”: The effectiveness of a career course intervention for postgraduate business students transitioning to the world of work

Jill Pearson*, Ailish Chawke1, Joy Schneer2
1University of Limerick, Ireland, 2Rider University, USA
Purpose – To maximize employment rates of graduates and support students in their transition to working life, many third-level institutions provide career services and interventions to their students. Drawing on behavioral learning theory, the theory of planned behavior, and social cognitive theory, this study evaluates the effectiveness of one such intervention on the job search behavior of postgraduate business students.

Design – The intervention, entitled “Mastering Your Employability” involved two courses that were incorporated into the core curriculum of several Master’s level business degree programs. Using a quasi-experimental design, 55 postgraduate business students completed a pre- and post-intervention survey; 50 students who had not completed the intervention served as a control group.

Results – Supporting the effectiveness of the intervention, paired sample t-tests, independent sample t-tests, and regression analyses showed that it had a positive effect on career exploration (both self and environmental), job search clarity, preparatory job search behavior, active job search behavior, and job search effort.

Limitations – While several attempts were made to maximize the response rate of both groups, the necessity to match pre- and post-intervention survey responses meant several participants who only completed one survey were excluded from the analysis.

Implications – This study has implications for research on graduate employability and more specifically on the role of personality and interventions. It also has practical implications for third-level institutions as it shows the importance of incorporating career interventions into the core curriculum.

Originality – There has been limited research on the effectiveness of core versus optional career services/interventions.

Examining the role of career competencies and perceived institutional support in enhancing academic performance and graduate employability

Rowena Blokker*1, Jos Akkermans1, Svetlana Khapova1, Paul Jansen1
1School of Business and Economics, Vrije Universiteit, Amsterdam, the Netherlands

Purpose – Graduate employability literature proposes that young adults should build their employability already during their studies. In this study, we apply Job-Demands Resources theory in an educational setting and examine whether career competencies and perceived institutional support impacts student academic performance and their employability before entering the labor market.

Design – Three-wave data were collected among Dutch university graduates at the start of the Master’s program (T1), six months into the Master’s program (T2), and at time of
graduation (T3). We measured career competencies and perceived institutional support (T1), and study engagement and employability (T2). Objective indicators of academic performance (i.e., GPA and ECTs) were obtained via university records (T3).

**Results** – Findings show that career competencies (i.e., career resource) and perceived institutional support (i.e., organizational resource) were positively related to employability and study engagement, and subsequently employability was positively related to GPA at time of graduation. Employability mediated the relationship between career competencies and GPA, such that those students who developed career competencies at the start of the Master’s program, were more employable six months later and obtained higher GPA’s.

**Limitations** – We focused only on graduate students from an economics and business faculty.

**Implications** – Our findings show that students’ academic performance can be enhanced by developing career competencies and employability during the study career.

**Originality** – This is one of the first studies to examine the role of employability during the school-to-work transition using longitudinal data including objective outcomes.

---

**In the pursuit of graduates’ employment and job-fit: Career planning as a mean of improving self-perceived employability and job search attitudes over time**

*Ana Hernández*¹, Vicente González-Romá¹, Victor Valls¹,², Inés Tomás¹ y Juan P. Gamboa³

¹IDOCAL, University of Valencia, Spain ²Valencian International University, Spain ³OPAL, University of Valencia, Spain

**Purpose** – We take a dynamic perspective to graduate employability and analyze the role that career planning while obtaining a university degree plays in the development of self-perceptions of employability over time. This increase in self-perceived employability should lead to improving job-search attitudes, ultimately fostering positive employment outcomes. The logic behind this is that career planning requires setting career goals and thinking of strategies to achieve them, which in turn should foster perceptions of employability. In addition, individuals who view themselves as employable should enact attitudes and behaviors consistent with their self-perceptions, which should subsequently enhance job-market outcomes.

**Design** – The model was tested in a Spanish sample of 510 Bachelor and Master students who were about to graduate. Career planning was measured at T1 (before graduation); perceived employability and job-search attitudes were collected both at T1 and six months after graduation (T2); and employment outcomes (status and job-fit) were measured at T2.
Results – Career planning was significantly related to an increase in self-perceived employability, which in turn was significantly related to a positive attitude change. However, this attitudinal change did not show the expected relations with employment outcomes.

Limitations – The sample coming from one university in Spain precludes generalization.

Implications – Our results suggest that fostering career planning in university students helps to develop graduates’ self-perceived employability and positive job-search attitudes when entering the job market.

Originality – The dynamic perspective of this study adds value to the field of employability development.

Social media-based impression management for improving graduate employability

Belgin Okay-Somerville\textsuperscript{1}, Dora Scholarios\textsuperscript{2}

\textsuperscript{1}University of Glasgow, Scotland \textsuperscript{2}University of Strathclyde, UK

Purpose – An emerging area of research is how social media contributes to recruitment and selection decisions. However, this research often focuses on employers’ rather than applicants’ use of social media. Drawing on determinants of graduate employability literature, the purpose of this research is to examine university leavers’ use of social media for honest and deceptive impression management for securing high-skilled jobs following graduation.

Methodology – The study uses two-wave survey data from a 2017 graduating cohort. Time 1 (semester 1) measures include perceived barriers to labor market entry, job search expectations, and job search anxiety. Time 2 (semester 2) measures honest and deceptive impression management via social media.

Results – Confirmatory factor analyses validate a two-factor structure for impression management via professional (e.g., LinkedIn) but not for personal social media (e.g., Facebook). Structural regression models show that only job search expectations (i.e., of securing ‘good’ jobs with skill use and development opportunities) and academic achievement were positively associated with honest impression management. None of the predictors, but gender (in favor of men), were associated with deceptive impression management.

Limitations – Future research could introduce more measurement points and draw from wider theoretical perspectives to impression management, for example image theory.

Implications – Findings show job search goals and human capital to be associated with creating a positive online professional, but not personal, presence for enhancing graduate employability.
Originality – The study extends graduate employability research by examining use of social media-based impression management during university-to-work transitions.

A wise man will make more opportunities than he finds.
The relationship between graduates’ resources and skills and job search outcomes

Greta Mazzetti¹, Dina Guglielmi¹, Rita Chiesa², Marco G. Mariani², Beatrice I.J.M. Van der Heijden³,⁴,⁵
¹ Department of Education Studies, University of Bologna, Italy, ² Department of Psychology, University of Bologna, Italy, ³ Radboud University Nijmegen, Institute for Management Research, the Netherlands, ⁴ Open University of the Netherlands, the Netherlands, ⁵ Kingston University, UK

Purpose – The aim of the current study was to provide a frame of critical factors that may contribute to graduate employability (i.e., perceived employability and job search outcomes expectations), with a specific focus on career planning variables (i.e., work role salience, career identity, and career adaptability), personal resources (i.e., job searching self-efficacy, internal locus of control), and interpersonal behaviors (i.e., job search networking intensity and political skills).

Design – The sample consisted of 5,191 graduates. Most of them were women (63.9%) and had previous work experience (78.7%). To test our hypotheses, structural equation modeling was employed with maximum likelihood estimation methods.

Results – Our analyses revealed that different individual (i.e., career identity and career adaptability) and interpersonal factors (i.e., political skills) are significantly associated to graduates’ perceived employability and job search outcomes expectations.

Limitations – This research was based on cross-sectional data. Furthermore, the current study assessed graduate employability as the participants’ expectation to find employment, thus a valuable avenue for future research would be the collection of longitudinal and objective measures of job search success.

Implications – Our findings contribute to the development of intervention strategies aimed at fostering graduates’ personal resources and interpersonal skills that may enhance their persistence in job search activities and, consequently, could impact their employment status.

Originality – This study represents a valid contribution to the current understanding of those specific aspects concerning graduates’ career planning, personal resources and interpersonal behaviors, that may foster the perceived level employability and positive job search outcomes expectations.
Effects of career development practices on employability, commitment, and intentions to quit: It depends on perceptions of fit

Ricardo A. Rodrigues*1, Christina L. Butler2, Serge P. da Motta Veiga3
1King’s College London, UK 2Kingston University, UK, 3American University, USA

Purpose – Career development practices regarding graduate employability can have important effects on subsequent employee behaviors. The purpose of this study is to test a) the relationship between career development practices and subsequent commitment and intentions to quit, mediated by perceptions of employability, and b) the moderating role of fit perceptions (i.e., both person-organization and person-job fit).

Design – A total of 402 young employees (2/3 years after graduation) in the UK participated in a time-lagged survey design. We measured career development practices (T1), person-job and person-organization fit (T1), employability (T2), commitment (T2), intentions to quit (T2), and job search behaviors (T2).

Results – Preliminary results provide support for the overall model, in that stronger career development practices are positively related to employability, which in turn is positively related to intentions to quit and job search behaviors, and negatively to commitment. Interestingly, these relationships are buffered by the extent to which employees perceive there is a good fit between them and the job and/or organization.

Implications – This study highlights the importance of making sure that career development practices are aligned with employees’ perceptions of fit with the job and/or organization. Indeed, our results suggest that career development practices can influence employees and organizations alike, and that there is a need to align both individual and organizational demands.

Originality – To the best of our knowledge, this is the first time that career development practices’ influence on graduate employability and subsequent outcomes is examined. Furthermore, we also explore the moderating role of fit perceptions.
STATE OF THE ART:
Research shows that many job applicants engage in impression management (IM) or faking, meaning that they misrepresent their fit, qualifications, or interest. Such behaviors are prevalent when submitting resumes, during interviews, or when completing personality tests. They can also be problematic for organizations, who risk hiring individuals who are less qualified, could perform more poorly on the job, do not align with the values of the company, and are more likely to engage in counter-productive behaviors. However, we still have limited knowledge about the antecedents and outcomes of IM and faking, especially when it comes to new selection methods.

NEW PERSPECTIVE/CONTRIBUTIONS:
This symposium includes a collection of six presentations with authors from six countries, which advances our understanding of how job applicants behave (e.g., manage their impressions or fake) in the selection process. The presentations discuss how video interviewing technology can facilitate or prevent IM/faking in interviews, how organizational culture triggers strategic faking in personality tests, the effectiveness of IM across cultures in video-resumes, how faking during an Assessment Center can negatively impact applicants’ reactions, how faking in an interview can be detrimental to fit and well-being on the job, and how faking can be potentially identified with text analyses.

RESEARCH/PRACTICAL IMPLICATIONS:
While most previous work has focused on individual differences or short-term outcomes of IM or faking, the presentations in this symposium highlight situational or cultural antecedents and long-term effects. It also identifies tools for organizations to potentially limit faking or identify fakers.

TITLE:
Researching asynchronous video interviews (AVIs): A model to guide the examination of AVIs as a selection assessment

AUTHORS:
Eden-Raye Lukacik, University of Calgary, Canada
Joshua S. Bourdage, University of Calgary, Canada
STATE OF THE ART:
Asynchronous video interviews (AVIs) are becoming more pervasive as a selection assessment. Organizations are adopting AVIs—a style of interview where the applicant completes an interview online by recording video responses to interview questions but does not interact directly with an interviewer—because of the potentially low cost, high speed, and increased flexibility. The rapid adoption of AVIs as a selection tool has surpassed research examining their utility. As a result, there are major gaps in our understanding of how AVIs can be used, how applicants behave in AVIs, and how AVIs impact organizational and applicant outcomes. For instance, many of the unique features of AVIs, such as time to prepare or the ability to re-record, could influence applicant faking opportunity.

NEW PERSPECTIVE/CONTRIBUTIONS:
Current research is spread across disciplines and no theoretical framework exists to guide the use of AVIs and ground future empirical research. A review of the video interview and selection literature was completed to develop a model that can help guide research and integrate findings, including predicting applicant IM behavior and faking.

PRACTICAL IMPLICATIONS:
This model will stimulate AVI research by highlighting knowledge gaps and providing a framework to organize existing and future research. It will also provide practical recommendations to organizations about the advantages and risks associated with choosing to rely on various AVI features.

ORIGINALITY/VALUE:
How AVI features (e.g., ability to re-record, choose physical location, training) influence outcomes (e.g., triggering more/less faking, applicant reactions, acceptance intentions, performance evaluation) will be discussed.

TITLE:
Faking to fit in: Organizational cultures trigger strategic faking

AUTHORS:
Nicolas Roulin, Saint Mary’s University, Canada
Franciska Krings, University of Lausanne, Switzerland
INTRODUCTION/PURPOSE:

Applicant faking can have detrimental effects for hiring organizations, but research examining antecedents of faking has focused on individual differences or test/assessment characteristics. Building on recent theoretical propositions (e.g., Roulin, Krings, & Binggeli, 2016), we propose to explore how organizational culture triggers faking.

DESIGN/METHOD:

We recruited 181 U.S. residents currently looking for a job using Mechanical Turk. Participants were in a selection scenario, chose an organization to apply at (among 8 large U.S. companies identified as having either a competitive or collaborative culture) and then read a series of real employee reviews from Glassdoor.com. They completed the HEAXCO-60 personality test in a selection situation. Two weeks later, they completed the test again honestly.

RESULTS:

Participants who applied at an organization with a competitive culture faked to decrease their score on Honesty-Humility and Agreeableness, whereas those applying at a collaborative organization increased their score on those two traits. Differences in faking behaviors between the two culture conditions were significant and medium in size (d = .60 for Honesty-Humility and .36 for Agreeableness).

LIMITATIONS:

Results are based on an hypothetical selection scenario and not real job applications.

PRACTICAL IMPLICATIONS:

The culture of an organization, and how it is depicted on their corporate website or on publicly-available review sites, can trigger faking from applicant who want to appear like they would fit in.

ORIGINALITY/VALUE:

Faking can be understood as an adaptive or strategic response to the specific situation that applicants face, and not only as a behavior shown by dishonest individuals.

TITLE:

Cross-cultural impression management in hiring: Overlooked but important?

AUTHORS:
INTRODUCTION/PURPOSE:
According to the Cross-Cultural Impression Management Discourse model (Bilbow, 1997) a person’s sociocultural background affects both the use and interpretation of impression management (IM) tactics. Only a limited number of studies, however, investigated cultural differences in applicants’ use of self-presentational tactics in hiring situations (Derous, 2017; König, Wong, & Cen, 2012; Sandal et al., 2014). This study investigated whether cultural differences in IM-tactics use (CCIM-tactics) affected ethnic minorities/majorities hiring outcomes.

DESIGN/METHOD:
In a first study, CCIM-tactics were investigated (Derous, 2017). The focus was on IM-tactics preferred by Arab/Moroccan applicants, a large and still growing ethnic minority group in Western-Europe (including Flanders/Belgium). In a follow-up study, 116 recruiters evaluated equally qualified ethnic minority/majority applicants’ job suitability (based on video-resumes) and the potential moderating role of CCIM-tactics using a 2 (Ethnicity: Maghreb/Arab vs. Flemish) by 2 (CCIM-tactics: Entitlements vs. No) between-subjects design.

RESULTS:
Entitlements were preferred by Arab/Moroccan but not by Flemish applicants. ANOVA showed and interaction (but no main) effect for Ethnicity with CCIM-tactics. For Arab/Moroccan applicants, using Entitlements was somewhat but not significantly more helpful than not using any CCIM-tactic at all. For ethnic majorities (Belgian/Flemish), using Entitlements was harmful when compared to not using any IM-tactic at all (significantly lower job suitability ratings).

LIMITATIONS:
Aside from the small sample, only Arab/Moroccan and Flemish preferences for IM-tactics, ethnic majority (not minority) raters, and ethnic-minority (not-majority) preferred IM-tactics were considered.

ORIGINALITY/VALUE:
Applicants use of CCIM-tactics might affect their hiring scores.
Faking and applicant reactions: A fit-perspective

Daniel Duerr, Giessen University, Germany
Ute-Christine Klehe, Giessen University, Germany

This study focuses on the link between applicants’ faking and their reactions to selection procedures. Drawing on research from person-environment fit, which suggests that a poor fit might impair job satisfaction, we propose a similar mechanism to be present during selection. More specifically, we argue that faking leads to the feeling of inauthenticity, which in turn mediates the negative relationship between faking and applicant reactions.

295 students participated in a mock selection procedure including a structured interview, a role play, and a group discussion. Participants were evaluated by trained observers and were treated like real job applicants throughout the procedure. After each exercise, we measured participants’ faking. Their applicant reactions to the procedure were assessed in the end.

Results confirmed the suggested mediation model: Faking had an indirect negative effect on applicant reactions via participants’ felt inauthenticity.

We used a mock selection setting and a student sample, which might compromise the external validity of the results. Yet, this setting allowed us to gather data that would be difficult to assess in the field.

The study shows that faking is related to the feeling of inauthenticity, which in turn triggers negative applicant reactions. Thus, research and practice need to think of measures to engage applicants to show their true self in selection.
The study reviews faking from an applicant perspective and thus contributes to existing literature by shedding light on an understudied topic.

TITLE:
The impact of interview deceptive impression management on new employees’ fit, stress, well-being and engagement

AUTHORS:
Brooke Charbonneau, University of Guelph, Canada
Deborah Powell, University of Guelph, Canada

INTRODUCTION/PURPOSE:
We investigated the relationship between job applicants’ use of deceptive impression management (IM) in the interview, and their perceived person-job and person-organization fit once they are on the job. Fit is known to be related to important job outcomes, such as well-being, stress, and job engagement.

DESIGN/METHOD:
In a two-phase study, 209 cooperative education students self-reported on their use of deceptive IM during their real job interviews (time 1; shortly after the interview) and the job outcomes of fit, well-being, stress and job engagement (time 2; two months after beginning the job).

RESULTS:
As hypothesized, deceptive IM was negatively correlated with perceived fit, \( r = -0.19, 95\% \text{ CI } [-0.32, -0.06] \). Additionally, the relationships between deceptive IM and job outcomes (well-being, job stress and job engagement) were all in the expected directions.

LIMITATIONS:
Participants in this study had temporary co-op job positions, rather than career-track jobs. Future research with varied samples should be conducted in this area.

PRACTICAL IMPLICATIONS:
The results indicate that deceptive IM is likely detrimental for candidates’ fit with their job, as well as their own well-being. Consequently, candidates hoping to obtain long-term jobs where they can grow and develop should avoid using this interview strategy.

ORIGINALITY/VALUE:
This is the first known study to examine the relationship between deceptive IM in the interview and personal outcomes on the job, thus investigating the impact of using deceptive IM as an interview strategy.

TITLE:
Predicting faking in interviews with automated text analysis and personality

AUTHORS:
Djurre Holtrop, The University of Western Australia, Australia
Ward van Breda, NeedForward Research, The Netherlands
Janneke K. Oostrom, VU University Amsterdam, The Netherlands
Reinout E. De Vries, VU University Amsterdam, The Netherlands

INTRODUCTION/PURPOSE:
Some assessment companies are already applying automated text-analysis to job interviews. We aimed to investigate if text-mining software can predict faking in job interviews. To our knowledge, we are the first to examine the predictive validity of text-mining software to detect faking.

DESIGN/METHOD:
140 students from the University of Western Australia were instructed to behave as an applicant. First, participants completed a personality questionnaire. Second, they were given 12 personality-based interview questions to read and prepare. Third, participants were interviewed for approximately 15-20 minutes. Finally, participants were asked to—honestly—indicate to what extent they had verbally (α=.93) and non-verbally (α=.77) faked during the interview. Subsequently, the interview text transcripts (M[words]=1,755) were automatically analysed with text-mining software in terms of personality-related words (using a program called Sentimentics) and 10 other hypothesised linguistic markers (using LIWC2015).

RESULTS:
Overall, the results showed very modest relations between verbal faking and the text-mining programs’ output. More specifically, verbal faking related to the linguistic categories ‘affect’ ($r=.21$) and ‘positive emotions’ ($r=.21$). Altogether, the personality-related words and linguistic markers predicted a small amount of variance in verbal faking ($R^2=.17$). Non-verbal faking was not related to any of the text-mining programs’ output. Finally, self-reported personality was not related to any of the faking behaviours.

LIMITATIONS/PRACTICAL IMPLICATIONS:

The present study shows that linguistic analyses with text-mining software is unlikely to detect fakers accurately. Interestingly, verbal faking was only related to positive affect markers.

ORIGINALITY/VALUE: This puts the use of text-analysis software on job interviews in question.
Dr. Silja Kotte
University of Kassel, Germany

State of the Art – Recent meta-analyses and reviews have established the effectiveness of workplace coaching. Far less is known regarding process factors impacting upon its effectiveness. Contextual factors of workplace coaching have received even less attention. As workplace coaching becomes an established learning and development tool, specializations (e.g. particular settings or client groups) emerge in practice but so far lack scientific backing.

New Perspectives/Contributions – The symposium addresses processes, contextual factors, and specific formats of workplace coaching both from an empirical and theoretical perspective. First, one study focuses on process factors by analyzing the effects of client and coach variables together with interaction patterns between coach and coachee. Second, two contributions take a closer look at contextual factors. For organizational context factors, social identity theory is suggested for fostering the triangulate coaching relationship of coach, coachee and organizational stakeholders. For cultural context, a theoretical framework is proposed that incorporates societal culture, coachee regulatory focus and coaching approach. Third, distinctive characteristics of special coaching formats are identified. One study addresses team coaching and how it differs from individual coaching and other team interventions. A second study focuses on distinctive characteristics of coaching entrepreneurs throughout the entrepreneurial process.

Research/Practical Implications – The symposium contributes to building coaching theory and thereby lays the foundation for future, more theoretically grounded empirical studies. For practitioners, the studies provide directions regarding the establishment of a sound working alliance and the choice of effective coaching approaches in line with individual and contextual characteristics.

Taking a closer look into coaching: Integrating coaches’ and clients’ career-relevant variables and microlevel interaction patterns

Stefanie Jordan, Eva-Maria Schulte & Simone Kauffeld
Technical University Braunschweig, Germany

Purpose – To understand critical success factors in coaching, it is necessary not only to investigate single variables, but to analyze broader relationships between coach and client variables. This study therefore aims at integrating findings showing (1) the impact of coaches’ career-related variables (Jordan et al., 2017), (2) the relevance of coaches’ behavior in coaching sessions (e.g., Grant & O’Connor, 2010), and (3) effects of clients’ behavior on coaching success (e.g., Gessnitzer et al., 2016).
**Design/Methodology/Intervention** – We examined 23 coaching dyads over a whole coaching process. Questionnaires (goal orientation and career adaptability) and goal attainment scales were used at the beginning and the end of the coaching process. Behavioral data (coach: solution-focused questions; client: solutions, action planning) were observed in the middle of the process.

**Results** – Coaches’ career adaptability but not coaches’ goal orientation impacts coaches’ use of solution-focused questions. Sequential analyses support the relationship between coaches’ solution-focused questions and clients’ solutions and action planning. Further, clients’ solutions are positively linked to goal attainment, whereas clients’ action planning is positively linked to the increase in clients’ goal orientation and clients’ career adaptability.

**Limitations** – Due to sample size it was not possible to test the overall model simultaneously.

**Research/Practical Implications** – By integrating coaches’ career-related variables, coaches’ and clients’ interactions as well as goal attainment and clients’ career-related outcomes, we contribute to the understanding of success-relevant coach-behavior and to the improvement of train-the-coach courses.

**Originality/Value** – This longitudinal study investigates the relationships between coach and client variables by using both questionnaire and behavioral data.

---

**How social identity theory (SIT) furthers understanding of the triangulate coaching relationship: An integrated perspective from the coach, coachee and organisation.**

Dr Yi-Ling Lai (CPsyhol)

Faculty of Business and Law, University of Portsmouth, UK

**Purpose** – The quality of the coaching relationship is recognised being an essential antecedent for positive outcomes (Bozer & Jones, 2018). Nevertheless, the latest coaching reviews indicate that the social context has largely been overlooked in existent coaching research (Shoukry & Cox, 2018). Most studies are restricted to coaches and coachees (Athanasopoulou & Dopson, 2017). This study takes an initial step to investigate how social processes in the organisation, such as power dynamics and multiple agendas, influence the coaching relationship, through combining the multiple stakeholders’ perspectives.

**Design/Methodology** – The study builds on existing coaching research on multiple stakeholders (e.g. Louis & Fatien, 2014) by conducting 25 in-depth interviews (n=25) with coaches, coachees, HR professionals and line managers, as well as three sets of Q-sorting analysis (n=10) to consolidate and prioritise findings from interviews.

**Results** – Results suggest that the identity integration process (decategorization – recategorization) from social identity theory (SIT) takes a key role when multiple parties in the coaching process seek alignment (Haslam, 2007). Several factors for the identity integration process, such as a transparent contracting process and collaborative working
relationship are distinguished that facilitate better understanding, trust and affiliation between stakeholders.

**Limitations** – The participation of organisational stakeholders was limited due to restricted resources.

**Research/Practical Implications** – Linking SIT to the triangulate coaching relationship lays the basis for future empirical quantitative investigations. The identified indicators provide coaching practitioners with specific guidelines for enhancing the coaching relationship.

**Originality/Value** – This research extends existing coaching theories by drawing upon SIT to conceptualize the triangulate coaching relationship.

---

**A theoretical framework of culturally sensitive workplace coaching:**

**The importance of coachee regulatory focus**

Gil Bozer Ph.D. ¹* & Marianna Delegach Ph.D. ¹*

¹ Sapir Academic College, D.N. Hof Ashkelon, Israel

**State of the Art** – Despite the increasing popularity of workplace coaching as a global learning and development tool for enhancing employees' professional capabilities, little is known about the role of cross-cultural factors in coaching, and their relationship to coaching practice and personal factors.

**New Perspectives/Contributions** – We draw from the extant coaching research and from established fields of research in applied psychology to develop a theoretical framework and propositions. The theoretical framework incorporates contextual (high vs. low uncertainty avoidance cultures, developmental vs. remedial coaching), coachee (chronic and situational regulatory focus), and coaching approach (problem vs. solution focus) factors of coaching outcomes.

**Research/Practical Implications** – We suggest that chronic regulatory focus is an underlying mechanism that predicts effectiveness of coaching approach in specific societal cultural contexts (i.e., uncertainty avoidance). Furthermore, we propose that coaching context elicits coachee situational regulatory focus, and the conjunction of both chronic and situational regulatory focus moderates the association between coaching context and coachee pre-coaching motivation. Our theoretical framework can help practitioners to make better informed decisions when designing and implementing cross-cultural coaching by ensuring that the right learning and development approach is selected and applied.

**Originality/value** – This work enhances our understanding of how certain coaching practice factors can be more or less impactful based on coachee's regulatory focus and cultural features. It is particularly important to the development of coaching theory and subsequent empirical examination of its effectiveness in various cultural contexts and situations.
What is team coaching? Conceptualizing the distinctiveness of team coaching

Rebecca J. Jones Ph.D.1*, Uwe Napiersky Ph.D. 2 & Joanne Lyubovnikova Ph.D. 3

1 Henley Business School, University of Reading, UK, 2 Aston Business School, UK, 3 University of Liverpool, UK

Purpose – Team coaching is a popular new addition to the team learning and development toolkit. However, the conceptualization of team coaching and the distinction between team coaching, team training, team development and team building interventions remains unclear.

Methodology – We address this significant gap by abductively exploring how team coaching is conceptualized in practice (n = 410). We survey practitioners engaged in delivering team coaching to ask how they would define team coaching and distinguish it from other team interventions.

Results – A thematic analysis of our data reveals eight themes: common team goal; focus on team performance; team learning and reflection; team coaching activities; team as a system; advanced coaching skills; coaching techniques and longer-term.

Limitations – As we did not obtain any data on the effectiveness of the team coaching provided by our participants, we are unable to determine whether the characteristics defined in our paper as conceptualizing team coaching do indeed lead to desired outcomes.

Research/Practical Implications – The absence of a clearly defined construct is hindering the development of a rigorous theory of team coaching. The contribution of our paper is therefore a clear and comprehensive definition of team coaching which can be used by researchers and practitioners alike when working within the domain of team coaching.

Originality/Value – Our paper provides the first systematic exploration of a definition of team coaching in relation to alternative team interventions. By utilising an abductive approach in our research, we are able to capitalise on practitioner experience in this practice-led field.
Coaching Entrepreneurs: Characteristics and Functions of Entrepreneurial Coaching throughout the Entrepreneurial Process

Isabell Diermann, Dr. Silja Kotte, Jun.-Prof. Dr. Kathrin Rosing & Prof. Dr. Heidi Möller
University of Kassel, Germany

Purpose – Coaching has received little attention compared to other forms of entrepreneurial education such as training and mentoring. Our study aims at identifying characteristics and functions of entrepreneurial coaching. It investigates how coaching contributes to developing competencies of entrepreneurs throughout different stages of the entrepreneurial process.

Design/Methodology – We conducted 67 semi-structured telephone interviews with entrepreneurial coaches (n=44) and coachees, i.e. entrepreneurs (n=23), in order to explore their respective perspectives on coaching. Interviews were analyzed using qualitative content analysis.

Results – We identified key characteristics that distinguish entrepreneurial coaching from other coaching fields, e.g. a stronger emphasis on expert vs. process orientation and on support in ambiguous situations. Data analysis showed that coaching fulfils different functions throughout the entrepreneurial process (e.g. developmental, resourcing, quality assuring) and fosters different knowledge, skills and abilities depending on the stage of the entrepreneurial process.

Limitations – The study is limited by its focus on subjective perspectives of coaches and coachees. We hence cannot conclude on the effectiveness of entrepreneurial coaching.

Research/Practical Implications – Our results lay the ground for further inquiries into success factors for entrepreneurial coaching. For coaching practitioners, understanding the distinctive characteristics of entrepreneurial coaching and the varying needs of entrepreneurs throughout the entrepreneurial process allows more targeted coaching interventions.

Originality/Value – Our study opens the black box of entrepreneurial coaching and carves out its characteristics, both in contrast to other types of coaching and to other forms of entrepreneurial education. By extracting the implications of the different entrepreneurial stages for coaching, we provide a dynamic perspective.
736 - POLITICS WITH A CAPITAL ‘P’ IN ORGANISATIONS: THE GLOBAL EFFECT OF POLITICS ON THE WELLBEING OF ORGANISATIONS

TITLE AND NAME OF THE PROPOINENT (S) OF THE SYMPOSIUM:

Chair
Dr. Christina Montaiuti, University of Liverpool (C.montaiuti@liverpool.ac.uk - christina.montaiuti@online.liverpool.ac.uk)

Presenters
Dr. Christina Montaiuti, University of Liverpool; UK; Professor Ritsa Fotinatos-Ventouratos, The American College of Greece, Athens, Greece; Professor Jo Silvester, University of Exeter, UK; Senior Professor Ashley Weinberg, University of Salford, Manchester UK; Dr. Wyatt, University Of Kent, UK

SCOPE
Foster a discussion, cross-fertilisation of ideas and research collaboration on politics in organisations, as they pertain to political climates.

DESCRIPTION
A collection of empirical and theoretical work about the relationship between politics and organisations

State of the Art
Social change, major movement of populations, and economic turbulence carry with them associated risks of significant social fragmentation. Some are reflected in the present Western-world’s political climates which see the rise of populist movements, and an increasing fragmented society overall. While the advantages of healthy political work environments seem obvious, we offer evidence about how both global and internal political factors affect the effectiveness of leadership, job performance, satisfaction, and wellbeing in organisations.

New Perspectives/Contributions
An International perspectives on how politics influence organizations’ angle, what can we learn from political roles, and how economics and psychological wellbeing are closely related to political frameworks in countries and organisations.

Research/Practical Implications/
A number of political factors such as gender, power, and economics, and leadership affect organizational climate. In this symposium we will address politics with a large ‘P’ as highlighted by the economic downturn in the Western world of the 2008 financial crisis, and as they relate to the wellbeing of organisations in the present time, including how to address change and wellbeing of organisations during or after Brexit or Brexit-like events, and gender in politics.

Originality/Value
The relevance and usability of the symposium is to inform, and to inspire further research on how politics affect organizational wellbeing in Europe and beyond.
AUTHOR (S), INSTITUTION (S): Professor Ritsa Fotinatos-Ventouratos, The American College of Greece, Athens, Greece; Professor Sir Cary Cooper, Alliance Manchester Business School, University of Manchester, UK

PRESENTER: Professor Ritsa Fotinatos-Ventouratos, The American College of Greece, and Athens, Greece

State of the Art
The Economic Crisis hit most European Countries in 2008, which subsequently sent ripple effects on an international scale, causing unprecedented psychological and social effects equivalent to the Great Depression of the late 1920s (Fotinatos-Ventouratos & Cooper, 2015).

Contributions
It was evident, that no individual, organization or society was left untouched: The lessons learnt from this Economic Crisis were the existence of the close and vicious interrelationships between human attitudes on the one hand, and unemployment, poverty, mortgage default, and human ill health and suffering on the other. This paper highlights how the financial status of any government appears to be a common denominator in assessing whether economic prosperity will develop and sustain, and in parallel, how such factors are of pivotal importance in maintaining and ensuring wellbeing at work.

Research/Practical Implications
At the underpinnings of any global recessions are the actual economic operations of most nation states: This presentation will showcase the practicalities of how economics and psychological wellbeing are closely interrelated, and in order for wellbeing at work to manifest, it is of paramount importance that economies and government policies remain transparent at all times.

Originality/Value
It is acknowledged that economic problems and debts are a worrying state of affairs, which encapsulate everyone at the individual, organizational and societal levels: The financial status of any government, with its suitable policies and practices, appears to be a major contributor in assessing whether economic prosperity will materialize – and subsequently & importantly, whether wellbeing at work will manifest, sustain & become solid reality in the future.
State of the art

Prior to Brexit, the UK had the highest number of workplace well-being policies in the European Union, however its Industrial Strategy for the ten years following Brexit has omitted specific mention of employee psychological health. This paper considers the workplace implications of Brexit for employee well being.

New Perspectives/Contributions

Not only are there significant health-related outcomes of large-scale uncertainty following organisational change (e.g. Vahtera et al, 2004), but also of citizen-related outcomes following political events (Kaniasty and Jakubowska, 2014). It should come as no surprise that leaving the EU will impact on UK organisations and employees, particularly in relation to workforce recruitment and coping with change. This paper highlights the associated implications for employee well-being ‘post-Brexit’.

Research/Practical Implications

The UK National Institute for Health and Care Excellence (NICE) has previously issued guidance for improving employee well-being. Evaluation of its uptake has shown awareness of this is relatively high, yet the implementation rate is only 12% and is particularly low among private sector and small organisations. However where employee health and well-being features as a regular board agenda item, awareness and implementation are significantly higher. This highlights the need for UK organisations to recognise the impact of Brexit-related change – including uncertainty, workplace attitudes and recruitment practices – on employee well-being.

Originality/Value

By recognising the likely impact of Brexit-related change on organisations and employees and raising awareness of both the need for, and role of appropriate guidance, the UK government and employers are encouraged to prioritise employee well-being.
AUTHOR (S), INSTITUTION (S): Professor Jo Silvester, University of Exeter Business School, University of Exeter, UK

PRESENTER: Professor Jo Silvester, University of Exeter Business School, University of Exeter, UK

ABSTRACT TITLE: Political Work In The British House of Commons

State of the art

Political activity is often viewed as a Machiavellian activity detrimental to performance and engagement, but little attention has been paid to work that exists to enable political process.

New Perspectives/Contributions

This paper presents findings from a study to examining political work undertaken by clerks and professional staff in the British House of Commons (HoC), for whom navigating and enabling politics is integral to their role.

The research was conducted as part of a project to investigate organisational culture in the House Service, following a governance crisis in 2014 and a HoC Report calling for a more unified culture.

Research/Practical Implications

162 members of House Service (e.g., clerks, library, facilities, and security) attended one of twelve workshops, to discuss the HoC culture, identify and agreed important values and, individually, provided examples of behaviour for each value. While analysis revealed five shared values for the House Service (i.e., Responsibility, Collaboration, Service, Integrity, and Respect), further thematic analysis of 1,350 written behaviours provided a more nuanced insight into how values are enacted by different groups of House staff. Importantly, a super-ordinate ‘service versus stewardship’ theme differentiated Clerks and Professionals: Clerks advocating a slower, inclusive, more deliberative approach to decision-making (stewardship), and Professionals clarity, speed and efficiency (service).

Originality/Value

These differences are explained in terms of the closer involvement Clerks have with Members of Parliament and therefore their need to work with ambiguity, competing interests and democratic procedures typical of pluralistic Parliamentary power structures. This potentially conflicts with managerial power structures typically experienced by professionals trained in corporate settings.
Statesmen or cheerleaders: Gendered leadership identity granting through developmental feedback

State of the art
The current study explores how gender impacts the developmental feedback received by leaders in political office and refines emerging scholarship on leadership identity construction theory (DeRue & Ashford, 2010).

New Perspectives/Contributions
We conceptually frame developmental feedback as a mechanism through which leader identities are granted and validated and draw on psychological theories pertaining to gender bias to highlight the gendered nature of developmental messages leaders receive through feedback. We analyzed 1312 qualitative feedback comments provided for 146 local political leaders in the UK as part of a leadership development program and used Structural Topic Modelling to organize the data into 12 topics. We subsequently coded narrative comments across topics to examine differences in the content of feedback received by male and female political leaders.

Research/Practical Implications
We found five overarching themes: In comparison to female leaders, the feedback for men focused more on (1) their entitlement to claim leadership positions, (2) guided them to take a strategic rather than operational view of political office, (3) encouraged them to develop their power bases and political influence skills, (4) suggested they display, rather than possess more confidence, and (5) offered less criticism for agentic behaviours.

Originality/Value
Taken together, our findings reveal subtle biases whereby males are encouraged to incorporate in their leader identities leadership qualities more likely to be valued by organizations. We discuss theoretical and practical implications of this gendered perspective on how developmental feedback contributes differently to leader identity construction.
State of the art. Employability research has flourished in recent years, generating many new insights into its importance in the contemporary world of work. However, in-depth research is needed to address the several blind spots related to employability in different career stages, occupational groups and employment relations. In three interrelated symposia following the 2018 EAWOP Small Group Meeting organized by Pascale Le Blanc and Beatrice Van der Heijden, these topics are addressed. Together, these symposia aim to contribute to academic progress in the field and to improving (HRM) policies and practices in business. This first symposium on sustainable employability (SE) explores new frontiers with regard to individual and job characteristics, leadership, and unemployment in connection to SE.

New perspectives. First, Fleuren et al. predict change in SE from employment characteristics and underline the need for integrative longitudinal research. Second, Wooning et al. consider the issue of age discrimination using a qualitative approach. Third, Yeves et al. assess how age and perceived employability may protect job satisfaction in situations of job insecurity among Chilean employees. Fourth, Kooistra et al. discuss the potential role of sustainable leadership. Fifth, Van Dorssen et al. consider how employees can manage themselves in fostering SE. And sixth, Zaharie et al. broaden the scope from employees to unemployed individuals to qualitatively identify facilitators and barriers to labour participation in Romania.
Implications. The symposium suggests that an integrative approach is indispensable in facilitating SE. Insights gained can help employees and employers in designing and achieving sustainable employment.

The following contributions will be presented during this symposium:

(1) We need to slow down: A two-wave observational study on the predictors of healthcare employees’ sustainable employability

Bram Fleuren\textsuperscript{1,3}, Fred Zijlstra\textsuperscript{1}, Andries de Grip\textsuperscript{2}, IJmert Kant\textsuperscript{3}

\textsuperscript{1}Faculty of Psychology and Neuroscience, Maastricht University, the Netherlands
\textsuperscript{2}School of Business and Economics, Maastricht University, the Netherlands
\textsuperscript{3}Faculty of Health, Medicine, and Life Sciences, Maastricht University, the Netherlands

Purpose. Demographic changes, technological development, and changes in employment conditions complicate the demands healthcare employees face. Meanwhile, due to increases in the retirement age employees need to work longer, which requires them to be sustainably employable. Therefore, this article aims to investigate which work- and work contextual factors contribute to healthcare employees’ sustainable employability.

Design. First, using self-report data from 2672 employees participating in two waves of the Maastricht Cohort Study on various aspects of employment, we compare employees from multiple sectors to see whether developments in sustainable employability are different in the healthcare sector than in other sectors. Second, we estimate a series of structural equation models including work- and work contextual factors as potential predictors of the development in sustainable employability in a subsample of 455 healthcare employees.

Results. The first analyses reveal that there are small sectoral differences between development in SE and its components, mainly between employees working in the healthcare and industry sectors. Second, we find several predictors of sustainable employability and its dimensions. The most interesting and substantial finding is that developmental HR practices
positively affect perceived employability, but negatively affect the health dimensions of sustainable employability.

**Discussion.** These findings suggest that intersectoral differences in sustainable employability exist. Moreover, developmental HR practices have negative side-effects on healthcare employees’ health. This shows the relevance of using an integrative approach to sustainable employability that explicitly incorporates health. A limitation to the study is that only two time points are included and curvilinear relationships could not be tested.

(2) **Workplace age-related discrimination from a grounded theory approach**

Marianne Wooning¹, Ellen Peeters¹,², Judith Semeijn¹,³, Marjolein Caniels¹

¹Open University of the Netherlands,
²University of Ghent,
³Maastricht University

**Purpose.** Age discrimination at work can affect the sustainable employability of older workers negatively. For example, older workers may have lower chances to get hired or selected for training. The literature still lack consensus regarding which theoretical approach is most relevant for understanding how age discrimination leads to negative outcomes for older workers. In this study, we aim to assess the relationship between age and employability, and to better understand the role of age discrimination in this relationship. Since age discrimination cannot be observed directly, we apply an indirect approach by considering several proxies (e.g. learning opportunities) through which discrimination may manifest itself.

**Design/Methodology.** The study analyses multiple case studies using a grounded theory approach. To this end, five semi-structured interviews were conducted using a purposive sampling strategy. An additional wave of interviews will be conducted in the autumn of 2018.

**Results/Limitations/Implications.** Several themes emerge from the initial analyses. We find that the influence of age discrimination on employability can be situationally dependent. That is, in some situations the explicit presence of age stereotypes affects employability and employability related decisions. Moreover, we find that age discrimination manifests itself through proceedings, such as the purpose of training for older workers and only providing training when sufficient return of investment is expected.
Originality. We use an indirect and grounded theory approach to assess the influence of age discrimination on sustainable employability of older workers. Thereby, we bypass suggestive questions and corresponding answers, enabling valid conclusions regarding the mechanisms of age discrimination.

(3) Age and perceived employability as moderators of job insecurity and job satisfaction.

Yeyes, Jesús; Bargsted, Mariana; Cortés, Lorna; Merino, Cristóbal; Cavada, Gabriela
Adolfo Ibáñez University, Chile

Purpose. In the context of sustainable employability, personal characteristics can act as buffers of the negative effects of job insecurity on job satisfaction. The aim of this research is to investigate the moderating roles of perceived employability and age in the relationship between job insecurity and job satisfaction.

Design/methodology. The design of this study is cross-sectional with a representative sample of 834 Chilean workers. Based on self-report data, a multiple regression model including job satisfaction as dependent variable and a three-way interaction between job insecurity, perceived employability and age on the independent variable side was estimated.

Results. The results show that job insecurity negatively affects job satisfaction. This effect is weaker among older employees with high perceived employability compared to young employees with high perceived employability. Conversely, the effect is weaker among younger employees with low employability than among older workers with low employability.

Limitations. The cross-sectional design does not allow for causal inferences and job insecurity is measured using a single-item.

Research/practical Implications. Considering the ageing of the workforce and the changing labour market, it is relevant that both employees and organizations generate and implement practices and policies to address job insecurity at different ages. Here, improving employability may help to buffer the negative effects of job insecurity.
Originality/value. This study uniquely considers the interaction between age, perceived employability and job insecurity. Thereby, it demonstrates the relevance of perceived employability for older workers in coping with job insecurity and sustaining their job satisfaction.

(4) Sustainable leadership: managing paradoxes in developing sustainable employability

Daniel Kooistra1* (Daniel.Kooistra@ou.nl), Sara De Hauw1 (Sara.deHauw@ou.nl), Judith Semeijn1,2 (Judith.Semeijn@ou.nl), and Beatrice Van der Heijden3,1,4,5

1Open University of the Netherlands
2Research Centre for Education and the Labour Market (ROA), Maastricht University, the Netherlands
3Radboud University, Institute for Management Research, Nijmegen, the Netherlands
4Kingston University, London, UK
5Hubei University, Wuhan, China.

Purpose. Previous literature suggests a positive impact of career management practices on the sustainable employability of workers. Following self-determination theory, we propose that the under-researched phenomenon of sustainable leadership empowers workers in developing autonomy and in dealing with today’s complex – sometimes contradictory – needs of different stakeholders. For this reason, this study empirically tests whether sustainable leadership can contribute to sustainable employability by strengthening the positive impact of career management practices.

Approach. Data are collected in three Dutch organizations by means of surveys among employees and their supervisors. The surveys include context-specific measures on organizational career management practices, sustainable leadership and sustainable employability. As no validated instrument for sustainable leadership is available yet, the construct is operationalized via relevant aspects (e.g. ethical and paradoxical leadership).
Results. The results are expected in the fall of 2018. The planned analyses involve structural equation modelling.

Research/Practice implications. This study examines the importance of consistency in terms of contributions to sustainability and sustainable employability. Not only should sustainability be supported by the organisation, but also by the supervisors.

Limitations. The concept of sustainable leadership needs to be further developed in future research. The presented findings are cross-sectional.

Originality/Value. This study is the first to generate insights into the role of sustainable leadership in facilitating sustainable employability. Therefore this study may offer relevant directions for further developing a sustainable work context for all.

(5) Training self-leadership as a way to sustain employability of healthcare professionals

Pauline van Dorssen-Boog (Intrinzis, The Netherlands)
Karen Pak (Tilburg University, the Netherlands)
Tinka van Vuuren (Open Universiteit, The Netherlands)
Annet de Lange (HAN University of Applied Sciences, The Netherlands)

Purpose. This study investigates whether a training self-leadership is effective for healthcare professionals in terms of improving their vitality, work ability, internal and external employability.

Intervention / Research method. Healthcare professionals from 14 different healthcare organizations voluntarily participated in the study and were randomly assigned to the experimental (n = 230) or the control group (n = 336). Participants in the experimental group were provided with a blended learning training in self-leadership to improve their vitality and employability. Self-report data for sustainable employability and self-leadership (i.e. self-observation, goal-setting, evaluation of thoughts and assumptions, natural rewards strategies and independent action) were collected just before and 3 to 5 months after the intervention, using existing scales. The two conditions were compared using repeated measures MANOVA.
Results. Results showed that, unlike those in the control group, participants in the experimental group scored significantly higher on general sustainable employability, vitality, work ability and internal employability over time. For external employability no significant effects were found. Self-observation was the only dimension of self-leadership that significantly increased over time as a result of the intervention.

Limitations. Only a selection of self-leadership strategies was measured, while the specific strategies of self-reward, self-cueing, and positive thinking were also trained and might have influenced the results.

Practical implications. Training self-leadership is a helpful intervention for improving the sustainable employability of healthcare professionals.

Originality. This study includes employees from 14 different healthcare organizations, which may contribute to the generalizability of the results for healthcare professionals.

(6) Expired workers or family right hand: employment barriers of the elderly unemployed

Monica Zaharie & Codruța Osoian

Babeș-Bolyai University, Faculty of Economics and Business Administration, Romania,

Purpose. Labour shortages and aging impose a need to retain labour market participation and sustainable employability. However, sustainable employability has been traditionally studied among employed people. As such, exploring the sustainable employability among unemployed individuals (cf. Fleuren et al. 2016) may bring valuable insights to increasing labour market participation. Therefore, this study aims to understand how unemployed individuals of various ages can be facilitated to participate in work.

Design/methodology. Based on a qualitative approach, the study explores the perceived barriers and facilitators to participating in labour among unemployed individuals in Romania. A sample of 61 unemployed individuals (aged between 22 and 63) participated in semi-structured interviews focusing on self-categorization (Turner et al. 1987), unemployment
duration, previous work experiences, and social support (Aquino, 1996) as factors in unemployment.

**Results.** Analyses reveal that age-based self-stereotyping was negatively related to job search behaviours. Moreover, perceived social support for seeking employment differed between young and elderly unemployed individuals. Additionally, beliefs regarding the requirement of work experience limited job seeking behaviour among both older and younger individuals. That is, older individuals believed that their experience would not be valued, whereas younger individuals thought they would not fulfil the high experience requirements. Finally, various beliefs about the value of employment limited job seeking regardless of age.

**Limitations.** The qualitative nature of the study may limit the external validity of the findings.

**Implications and value.** Nonetheless, the findings may aid employment oriented intervention programs for unemployed individuals and thus contribute to their sustainable employability.
A SHOCKING CHANGE
EXAMINING THE ROLE OF CAREER SHOCKS IN CAREER TRANSITIONS

Chairs
Jos Akkermans
Scott Seibert
Stefan Mol

State of the art. Career research has heavily emphasized the role of individual agency in career development, arguing, for example, that career resources and crafting behaviors are at the core of career success and employability. Although this deterministic approach has yielded important insights, it neglects the important role that more or less uncontrollable events, known as career shocks, have in shaping contemporary careers. This symposium offers a collection of studies that research the role of such career shocks in different career processes and changes.

New perspectives. The session comprises three perspectives on the role of career shocks in career change and development. First, Udayar et al. and Peters et al. each examine a concrete type of career shock and its role in careers, respectively a positive shock in the form of a promotion and a negative shock in the form of burnout. Second, Okay-Somerville and Nalis et al. provide insight into the conceptualization of career shocks by reporting on a qualitative study on career narratives from a radio program and to uncover and explore the interplay between career agency and career shocks. Finally, Rummel et al. and Siebert et al. focus on the role of career shocks among entrepreneurs and the role thereof in entrepreneurial careers.

Implications. The studies in this symposium show that career shocks play a major role in different types of career transitions and changes, and underscores the importance of studying the interplay between agency and context (i.e., career shocks).

Does promotion bring happiness? A study on the role of promotion in work-related and general well-being among Swiss employees

Shagini Udayar1,2, Ieva Urbanaviciute1,2, Christian Maggiori1,3, & Jérôme Rossier1,2
1Swiss National Centre of Competence in Research LIVES, University of Lausanne, Switzerland,
2Institute of Psychology, University of Lausanne, Switzerland, 3University of Applied Sciences and Arts Western Switzerland

Purpose – The present study investigates the role of promotion in employees’ work-related and general well-being. Our purpose was to analyze promotion as a career shock in terms of its valence and impact by inspecting the changes in employee well-being from the pre-promotion to the post-promotion period.
**Design** – The study was based on a 3-wave design that encompassed 1 year before the promotion, the year of the promotion, and 1 year after the promotion. It also allowed to compare the “promotion” sample (N = 129) with a sample of employees (N = 236) who had not experienced a career advancement during the time of the study. Latent growth curve modeling was used to analyze the data.

**Results** – A significant growth in work stress was observed in the promotion sample. No such growth was observed in the no-promotion subsample. Furthermore, the no-promotion subsample reported a slight decrease in job satisfaction over a 3-year period, whereas such a trend was not observed among the promoted employees. Interestingly, the ratings of general well-being (i.e., life satisfaction) remained stable and were similar in both groups.

**Limitations** – This study was based on rather moderate sample sizes and did not control whether the promotion as a career shock was (un)expected.

**Implications** – Although considered as a positive career shock, the findings suggest that the promotion may have equivocal effects on employees’ well-being that need to be taken into account.

**Originality** – The promotion experience was investigated longitudinally, with pre- and post-promotion measurements of employee well-being.

“**All Work and No Play Makes Jack(y) Burned-Out**”. Extending the Career Shock Literature by Looking into the Impact of Student Burnout on Future Workers’ Internal Career

_Pascale Peters¹, Carolin Ossenkop¹, Beatrice van der Heijden¹²³⁴, Iris Lueb¹_

¹Radboud University Nijmegen, the Netherlands, ²Open University of the Netherlands, ³Kingston University, UK, ⁴Hubei University, China

**Purpose** – This study contributes to the career literature by exploring the role of experiencing a student-burnout, viewed as a career shock, in individuals’ framing of their (internal) career to better understand and anticipate its short- and long-term consequences.

**Design** – We used in-depth semi-structured interviews to retrospectively explore change processes in terms of interviewees’ framing of their (internal) career in the period foregoing and following a student-burnout.

**Results** – We revealed five patterns of how having experienced a student-burnout may change individuals’ framing of their future (internal) career: 1) frame weakening; 2) frame broadening; 3) frame shifting; 4) frame focusing; and 5) frame keeping. Moreover, we found two underlying mechanisms bringing about these change processes: 1) self-exploration (i.e., releasing oneself from ‘external pressures’ and focusing on the self) and 2) learning from the body and mind (i.e., improving one’s physical and mental health conditions by placing more
value on health, balance and well-being). Not changing one’s framing of the (internal) career may lead to unsustainable future careers (e.g., reoccurring experience of burnout).

**Limitations** – Future research may include a quantitative and qualitative diary study.

**Implications** – We suggest both theoretical and practical implications of how to support individuals to develop sustainable future (internal) careers after the experience of a student-burnout.

**Originality** – Our analysis provides a case for the importance of considering intra-personal factors in individuals’ (future) career development. Furthermore, our study highlights the need for extending the life-course approach on sustainable careers by including individuals’ educational careers and potentially emerging (pre-)career shocks.

**Nature and role of career shocks:**
A narrative analysis of the BBC Radio 4’s *Desert Island Discs*

*Belgin Okay-Somerville*¹
¹*University of Glasgow, UK*

**Purpose** – This study explores (1) the frequency and (2) the nature of career shocks (e.g., personal vs professional); and (3) their impact on individual career agency via an innovative analysis of rich data from a radio program.

**Design** – The study is based on an exploration of 56 career histories recorded by the UK BBC Radio 4’s *Desert Island Discs* program.

**Results** – Preliminary findings show that scientists/engineers report less frequent career shocks as part of their overall career narrative, and when they do these tend to revolve around professional career shocks in comparison to participants with creative/arts backgrounds. Personal career shocks (e.g., major life events) are more prominent in narratives of the latter group. Perceptions of career shocks as threat vs. opportunity was influential in how career shocks influenced career agency, for example in terms of career exploration and planning.

**Limitations** – The sample is composed of individuals who are publicly regarded as successful in their career. One major limitation of the study is therefore restriction of range.

**Implications** – These findings contribute to the a greater understanding of the role of career shocks. More specifically, the study extends the boundaryless-bounded career debates, beyond the duality of agency and structure considerations, and informs the career success literature.
Originality – With its focus on the holistic account of a person’s life course and how they represent themselves Desert Island Discs provide an invaluable resource for exploring career narratives.

From shock to shift.
A qualitative case comparison of career changes in mid-career

Irina Nalis¹, Bettina Kubicek¹, Christian Korunka¹
¹Faculty of Psychology, University of Vienna, Austria

Purpose – This study explores how career shocks ignite and impact career change. A qualitative case study approach was chosen to unearth the interplay of individual (agency) and contextual (structure) resources for career development.

Design – A sample of 23 mid-career individuals in the “rush hour” of their lives, aged between 35 and 45 years, was recruited via purposeful sampling according to the criterion of ruptures in their work biography. Analysis followed the typology of career shocks (frequency, predictability, valence, duration, source) and specifically the distinction between positive and negative shocks that stimulated career change. Furthermore, theoretical keystones of the protean career concept, interpersonal, and public resources were integrated into the investigation.

Results – Different typologies detailing the impact of shocks on change are laid out. Several agentic as well as structural resources for career development appeared: a protean career orientation serves as protective factor in dealing with change and pursuing one’s calling; reference groups not only serve as a social net but can also be perceived as a burden to the new role; and public resources operate as enabler for the change process.

Implications – The results suggest a fertile yet often overlooked interplay of agency and context: career shocks, both negative and positive, can trigger individuals to make use of a combination of external and internal resources to facilitate the desired career change.

Originality – The study responds to various calls for more research on the interplay of agency and structure in career development, and the often overlooked role of career shocks.

Shocked Into Entrepreneurship:
An Explorative Study of Career Shocks Among Graduate Entrepreneurs

Sophie Rummel¹, Jos Akkermans¹, Rowena Blokker¹, & Marco Van Gelderen¹
School of Business and Economics, Vrije Universiteit Amsterdam, the Netherlands

Purpose – The aim of the study is to explore the positive and negative career shocks that graduate entrepreneurs experience in the process of starting a business and the impact of career shocks on their entrepreneurial careers.
Design – The qualitative study draws upon 25 semi-structured interviews with graduate entrepreneurs up to the age of 30, who started a business in various European countries. The Gioia method was applied to induce theoretical dimensions of career shocks and their impact on career development.

Results – Our findings show that there is a clear difference between shocks experienced before vs. after starting a business. Before starting a business, the shocks that graduate entrepreneurs experienced were mostly related to ‘push factors’ that caused graduates to go into entrepreneurship, such as meeting influential people or experiencing a disappointing job search experience. After starting a business, the shocks they experienced were mostly unexpected (financial) successes (positive shocks) or unexpected (financial) disappointments (negative shocks). In all, shocks seemed to occur on a personal level, a business level, and a career level.

Limitations – A limitation is that our sample consisted of people still in entrepreneurship, possibly causing a bias in the results because we missed people that got “shocked out of” entrepreneurship.

Implications – The findings provide insight into reasons for moving into and out of entrepreneurship among young graduates.

Originality – Our paper integrates the literatures on career shocks and entrepreneurship, thereby providing an interdisciplinary perspective on graduate entrepreneurship.

Awakening the entrepreneur within:
Entrepreneurial identity aspiration and the role of displacing work events

Scott Seibert¹, Jordan D. Nielsen², Maria L. Kraimer¹
¹School of Management and Labor Relations, Rutgers University, USA, ²Tippie College of Business, University of Iowa, USA

Purpose – This paper develops and tests a model of the transition from paid employment to entrepreneurship. Building on Shapero’s seminal but largely untested insights, we use recent developments in the study of discrete events to propose that displacing work events (i.e., career shocks) moderate the effect of entrepreneurial identity aspirations, a future possible-self role identity, on engagement in nascent entrepreneurial activities.

Design – We collected two waves of survey data from a final sample of 226 adults (32% response rate) who were in paid employment at time 1. Latent moderated structural equation modeling techniques were implemented via Mplus 7 to assess moderated mediation and calculate contingent indirect effects.
**Results** – Our findings show that a number of displacing workplace events moderate the relationship of entrepreneurial identity aspirations to nascent entrepreneurial behaviors such that the likelihood of such behavior is higher when these negative shocks occur. We also found personality factors (risk propensity and proactive personality) and experiential factors (previous experience as an entrepreneur and completion of classwork on entrepreneurship) had positive associations with entrepreneurial identity aspirations.

**Limitations** – Although we examined nascent entrepreneurial behaviors we did not collect data on actual new venture formation. The shocks themselves have low base rates, limiting the applicability of any one shock.

**Implications** – Our study contributes to the literatures on entrepreneurial career transitions, entrepreneurial role identity, and career shocks.

**Originality** – This is the first quantitative examination of a key tenet of Shapero’s entrepreneurial event model using recent theoretical and methodological developments in the study of career events.
747 - MINDFULNESS IN WORK CONTEXTS: UNDERSTANDING WHEN AND HOW MINDFULNESS HAS BENEFICIAL EFFECTS

Authors: Ana Junça Silva¹, Francesco Montani²
¹ISCTE-IUL Instituto Universitário de Lisboa
²International University of Monaco

Abstract

State of the art: Research has demonstrated that mindfulness is related to several aspects of positive workplace functioning. In particular, studies have shown that being mindful and practicing mindfulness have health-related benefits and increase creativity at work. Despite the advancement of knowledge on the benefits of mindfulness at work, there is little knowledge on mechanisms and boundary conditions associated with these effects.

New perspectives/contributions: The proposed symposium encompasses five communications that investigate different mediating processes and boundary conditions (moderating factors and types of mindfulness-based interventions). Specifically, Silva and colleagues show that mindfulness may be a trigger that warns individual that he/she needs to recover after having a day with workload. Second, Montani and colleagues provide evidence for an inverted U-shaped relationship between role conflict and creativity in which the relationship is stronger and positive at intermediate levels of role conflict and for employees with high levels of mindfulness. Mendonça and colleagues demonstrate that mindfulness enhances positive behaviors (creativity) and decreases negative ones (procrastination), and highlights the mechanisms underlying these effects. The fourth and fifth communications clarify the types of mindfulness-based interventions that are most effective in enhancing specific work outcomes: Baron and colleagues examine the impact of a consciousness development and mindfulness training on leadership capacities, whereas De Mondehre and Grégoire investigate the beneficial effects of an Acceptance and Commitment Training program on employee well-being.

Research/Practical implications: This symposium provides new knowledge on how and when mindfulness is beneficial, thereby addressing key unresolved questions and providing important inputs for future research.

Presentation 1

Title: How being Mindful and Recover from Work Increases Work Engagement after Role Overload

Authors: Ana Junça Silva¹, António Caetano¹, Rita Rueff Lopes²
¹ISCTE-IUL Instituto Universitário de Lisboa
²ESADE Business School
Abstract

Purpose: Research has recently started to elucidate the benefits of mindfulness to important work-related outcomes. In a context, in which employees experience high levels of workload, it becomes important to understand the role that mindfulness plays between role overload and work engagement. Plus, surprisingly, the link between mindfulness and work engagement has been disregarded. The present study attempts to fill this void by identifying mindfulness and recovery as mediating mechanisms that are responsible for reducing role overload’ negative effects on work engagement. Building on the conservation of resources theory, we propose that mindfulness, by promoting self-concordant choices and a reappraisal of work-related experiences as pleasurable or meaningful, would rise the likelihood of conserving valued resources, increasing the recovery actions and, consequently, being more engaged at work. Recovery behaviour, in turn, is expected to provide the energizing potential that instigates and sustains work engagement.

Methodology: We conducted a diary study with 152 employees to test our hypotheses.

Results: Results supported our hypotheses.

Limitations: The self-report nature of our studies raises issues of common method variance.

Research/Practical implications: This research sheds light on the motivational processes linking overload with work engagement and offers new insights into how employee can keep cultivate their engagement behaviours at work.

Originality/Value: This is the first study to examine mindfulness and recovery as mechanisms driving the static and dynamic effects of overload on work engagement.

Presentation 2

Title: Does Role Conflict Fuel Employee Creativity? Evidence for a Curvilinear Relationship Moderated by Mindfulness

Authors: Francesco Montani¹, Ilaria Setti², Valentina Sommovigo², François Courcy³, Gabriele Giorgi⁴

¹International University of Monaco
²University of Pavia
³Université de Shrebrooke
⁴European University of Rome

Abstract

Purpose: This study aims to clarify to what extent and under what conditions role conflict is positively related to employee creativity. Building on activation theory and conservation of resource theory, we hypothesized an inverted U-shaped relationship between role conflict and creativity in which the relationship is stronger and positive at intermediate levels of role conflict. Additionally, we predicted that this curvilinear path would be moderated by mindfulness, such that the beneficial effects of a moderate level of role conflict would hold only for employees with high levels of mindfulness.
Design/Methodology: We conducted two independent studies – a cross-sectional study among 123 employees from an Italian firm and a time-lagged study among 134 employees from various Canadian firms – to test our hypotheses.

Results: Consistent with our predictions, polynomial regression analysis results provided evidence for an inverted U-shaped relationship between role conflict and creativity. Moreover, when mindfulness was high (versus low), intermediate levels of role conflict were associated with increased creativity.

Limitations: The self-report nature of our studies raises issues of common method variance.

Research/Practical implications: Our findings enhance current understanding of the conditions under which different levels of role conflict boost or impair creativity at work, and offer new insights into how employee can maintain an optimal level of creativity in spite of conflict role demands.

Originality/Value: This is the first study to document non-linear relationships between role conflict and employee creativity, as well as to identify mindfulness as a boundary condition shaping the creativity-enhancing effects of role conflict.

Presentation 3

Title: Does Mindfulness Matter for Positive and Negative Behaviors? Relationships with Procrastination and Creative Performance

Authors: Helenides Mendonça¹, Taís Alvin¹, Valcênia Novaes²

¹Pontifícia Universidade Católica de Goiás, ²Universidade Estadual de Goiás

Abstract

Purpose: The present study attempts to broaden the understanding of mindfulness in different contexts, specifically its influence on two different behaviors – creative performance and procrastination. Building on the conservation of resources theory, we propose that mindfulness by opening awareness and attention in the optimization of work experiences and personal resources, consequently, can stimulate positive behaviors and avoid negative ones, as creative performance and procrastination, respectively. Cobserver of resources theory states that individuals try to strengthen their personal resources, which may, therefore, give rise to positive affective states, attitudes, and behaviors. Thus, building on this theory we propose that being conscious and focused on the present moment, individuals enhance their ability to obtain more personal resources, such as self-efficacy and consequently buffer procrastination and enhance creativity.

Design/Methodology: Two cross-sectional studies were carried out to test our hypotheses: The first study was a research on 261 employees and the second one was conducted on 1281 employees. These studies were conducted with different outcome variable – creative performance and procrastination, respectively. Data analyses were conducted using PROCESS for SPSS.

Results: Results supported our hypotheses.
**Limitations:** The cross-sectional nature of the study limits the generalization of its results. Also, self-reported data is subjected to common method biases.

**Research/Practical Implications:** The study fills a gap in the literature and extends previous knowledge on the relationship between mindfulness and work behaviors.

**Originality/Value:** The research highlights the understanding of emerging literature on mindfulness by establishing personal conditions that can promote positive behaviors or inhibit negative ones.

**Presentation 4**

**Title:** The Impact of a Training Program Promoting Consciousness Development and Mindfulness on Leadership Capabilities

**Authors:** Charles Baron¹, Félix Brochu¹, Mario Cayer¹

¹Université Laval

**Abstract**

**Purpose:** Two studies investigated the impact of a training program promoting consciousness development and mindfulness on executives’ leadership capabilities.

**Design:** The program was designed to help executives to become aware of, to refine and to move beyond the limitations of conventional action logics and worldviews (also known as conventional stages of consciousness). In Study 1 (\(n = 46\)), a quasi-experimental design was used to determine whether participation in the program is associated with a progression in stages of consciousness and in leadership capabilities. Study 2 (\(n = 120\)) used a multi-cohort mixed-method to further the understanding of the factors promoting a progression from conventional to post-conventional stages and to document the impact of mindfulness practices on leadership capabilities.

**Results:** Results reveal that participation in the program support the progression from conventional to post-conventional stages, as well as a down to earth management style and conversational capabilities conducive to collaborative learning and change. Surprisingly, results also show that the program fails to support consciousness development in executives who are already at post-conventional stages.

**Implications:** Our finding points to an opportunity to identify specific developmental approaches and practices for executives who operate already at a post-conventional stage.

**Limitations:** Generalization of these findings is limited by homogeneous and non-probabilistic sample in both studies.

**Originality/Value:** These studies are the first to show that it is possible to support executives in their transition to post-conventional stages and in their leadership capabilities over a one-year period through the use of mindfulness practices.
Title: Acceptance and Commitment Training for Employees’ Wellbeing: Results from a Randomized Controlled Trial

Authors: Laurence De Mondehare¹, Simon Grégoire¹

¹Université du Québec à Montréal (UQAM)

Abstract

Purpose: An intervention based on Acceptance and Commitment Training (ACT) was developed and offered to employees working in two types or organizations (a rehabilitation center and a college).

Methodology: A randomized controlled trial was used to assess changes in psychological wellbeing and psychological distress among fifty-two (n=52) employees over the course of the intervention. Data were collected with self-report questionnaires both before and after the intervention. Two focus groups were held two weeks after the workshop to explore employee’s experience.

Results: Analysis of covariance showed that compared to a wait-list control group, employees who took part in the workshops reported a significant increase in social harmony and a significant decrease in anxiety and depression. During focus groups, employees explained that they had found many ways to integrate what they had learned during the workshops into their everyday life, at home and at work. They also mentioned that it was beneficial to have the opportunity to take a pause at work to take care of their wellbeing, becoming more aware of their behaviors, clarify their values and take concrete actions to live a more engaged and meaningful life.

Research/Practical implications: This study introduces a novel ACT intervention specifically designed for employees, assessing its impact in two different workplaces on psychological wellbeing and distress at work and exploring participant’s experience through focus groups.

Limitations: No active control group was used in this trial.

Originality/Value: The study has a mixed design combining a randomized-controlled trial to qualitative data.
Abstract of the overall Symposium/Forum:

State of the Art: The emergence of humanitarian work psychology in recent years has provided a platform for work and organisational psychologists (WOP) to explore ways in which our discipline can contribute to poverty reduction and global inequality. This symposium highlights research demonstrating the role that WOP can play in organisations working in the humanitarian and aid sector, while also highlighting its role in strengthening a pro-social focus in all organisations.

New Perspectives/Contributions: This symposium showcases 5 innovative research projects that apply the principles of WOP to initiatives addressing global poverty and inequality. Haar et al present data on the working poor in New Zealand, demonstrating the importance of perceptions of pay fairness for job satisfaction and work-life balance. Building on the topic of fair reward, McWha-Hermann et al examine the paradoxical tension between social values and competitiveness faced by international aid organisations and the influence this has on how they structure their reward systems. Cook-Lundgren explores how inequality is reproduced or disrupted in different types of Kenyan development organisations: INGOs and social enterprises. Atkins examines how NGOs can harness online WOP expertise to improve humanitarian and aid response, specifically in this project through the development of competency frameworks. Finally, Jaga et al look at workplace support for breastfeeding among amongst vulnerable women working in low-income roles in clothing factories in South Africa.

Research/Practical Implications: Together, these projects provide cutting-edge examples of how WOP can be applied to humanitarian contexts, and can contribute to poverty reduction and global inequality.
**Purpose:** The present study challenges the organizational justice theoretical assumption of fairness around pay and compensation as being universal, especially when considering the working poor. We test pay fairness as a predictor of job satisfaction, mediated by work-life balance (WLB), with pay-level as a moderator. We extend these effects further by testing a moderated-mediation model, whereby pay level is tested as a boundary condition.

**Design/Methodology/Approach/Intervention:** Self-reported survey of 1000 New Zealand low-wage employees in three groups: upto NZ$20,000, NZ$20-40,000, and NZ$40-60,000, with the latter group including the median wage. CFA in AMOS, reliable constructs (all α > .75), and analysis in SPSS using PROCESS 3.1 for moderated-mediation (model 7).

**Results:** Support for pay fairness predicting WLB and job satisfaction, with WLB having partial mediation effects. In addition to two-way moderation effects, the Index of Moderated-Mediation is significant, and the graphed effects indicate that there are significant positive effects of WLB as a mediator across all levels of income. While WLB is found to be universal for working poor employees, its importance does rise as income rises. The models accounted for small amounts of variance for WLB (10%) but much larger for job satisfaction (35%).

**Limitations:** Self-reported data, although analysis showed common method variance was not present.

**Research/Practical Implications:** Implications are that as workers gain more income they can live ‘richer’ lives through enhanced work-life balance – which in turn, facilitates their attitudes towards job satisfaction.

**Originality/Value:** Focus around pay-fairness for working poor makes strong originality.

---

**Presentation 2: Reconceptualising INGO Reward: addressing tensions between social values and competitiveness**

**Ishbel McWha-Hermann, Jakov Jandric, Emily Cook-Lundgren – University of Edinburgh Business School**

**Stuart C. Carr – Massey University**

**Purpose:** within international contexts reward tends to be structured around a dual-salary system, where national and international employees are paid on different pay and benefits scales. Such a system is increasingly being perceived as unfair. This study examined how international NGOs reward national and international staff in light of their commitment to social justice and the ways in which senior HR and reward managers rationalise their approach to reward.

**Design/Methodology/Approach/Intervention:** semi-structured interviews with senior HR and reward managers from 15 international NGOs were undertaken. The organisations vary in size from 90-17,000 employees, are headquartered in a range of continents, and engage in a wide programmatic focus.
Results: INGOs take a range of different approaches to reward, which is different to that reported in the literature on MNC reward. We found seven themes underpinning the decisions to implement these systems, and a paradoxical tension between the need to be competitive while also upholding the social values underpinning the organisation.

Limitations: limited sample size, need to hear from other stakeholders, including top management, donors, beneficiaries and employees.

Research/Practical Implications: this research provides evidence for the unique way INGOs reward their employees further developing the literature on reward management in international contexts. It highlights a tension between competitiveness and social values, and gives insight into how senior HR and reward managers manage this tension.

Originality/Value: This study identifies alternative approaches to reward, which have yet to be documented in the literature.

Presentation 3: Equality for whom? Organisational context and international-local (in)equality in Kenyan development organisations

Emily Cook-Lundgren - University of Edinburgh Business School

Purpose: Recent research has drawn attention to disparities between international and local employees in international development organisations. The current study builds on this by exploring how such inequalities manifest under different forms of organisation, how inequalities are challenged or disrupted, and obstacles to achieving more inclusive and equal organisations.

Design/Methodology/Approach/Intervention: Qualitative study drawing on 40 semi-structured interviews with Kenyan and international employees in two international development organisations in Nairobi, Kenya: a traditional international non-governmental organisation (INGO) and a social enterprise startup. Interviews were complemented by non-participant observation carried out during a 3-month period.

Results: Inequalities tend to be more pronounced and resistant to change in an organisational context of longer history, steeper hierarchy, and less open culture. Internal and external pressures as well as individual actions can challenge inequalities and facilitate change. However, focusing on one basis of inequality (international versus local) may overlook other bases of inequality (i.e. gender) and limit efforts towards inclusivity.

Limitations: Due to the in-depth nature of the study, results may not be generalisable.

Research/Practical Implications: International development organisations exist to tackle global challenges of poverty and inequality across the globe, yet internal inequalities between staff groups risk undermining these goals. These findings offer insights into how organisations and individuals can challenge inequalities and create more inclusive and effective operating environments.
Originality/Value: This study moves beyond demonstrating the existence of inequalities to understanding how they are maintained or challenged, and offers a novel contribution to the understanding of the role of organisational context and structure in reproducing or disrupting inequalities.

Presentation 4: Optimising competency profiles for staffing humanitarian aid teams
Stephen G. Atkins - Otago Polytechnic of New Zealand & Rotary’s Global Water And Sanitation/Hygiene (WASH) eClub

State of the Art: There’s been, in humanitarian-aid arenas, inadequate consideration for human-talent profiles in staffing field-work-affiliated online advisory teams (Atkins, et al, 2018). Accurate talent requirement profiles enable optimisation of ‘worker-to-job’ fit. This presentation will describe a project within Rotary International’s WASH community in which Aguinis, et al’s (2009) online ‘frame-of-reference (FoR) approach has been customized to humanitarian water-aid. We describe a state of the art model which other aid arenas can utilize.

New Perspectives/Practical Implications: We migrate ongoing research/development (R&D) work improving New Zealand spacecraft-industry recruiting/talent management. This builds upon Rotary co-funded research dedicated to do likewise for global-humanitarian WASH communities. Hundreds of relevant talent-dimensions are being captured from very recent scholarly proceedings using “full-project life-cycle” R&D papers to refresh older talent-requirements taxonomies. The FoR approach then prepares project leaders to define their envisioned team’s talent needs via team work analysis scales from Atkins (2012/2018). It also trains humanitarian-aid workers to self-assess their talents against identified aid-project team requirements.

Research/Practical Implications: These are largely proposed ‘replication-with-extension’ efforts re: Aguinis, et al (2009) coupled to Atkins (2012; 2013). But given the water-aid extension is designed to ‘talent-profile’ up to 1/6th of the world’s 1.2 million Rotarians, and capture ‘talent-requirements’ for hundreds of water-aid projects, the practical implications are substantial (...and more so once migrated to other aid arenas).

Originality/Value: There is considerable value in this project because of its potential for making life-saving (...and global...) contributions. The project demonstrates very innovative application of technologies not originally developed for humanitarian work.

Presentation 5: Supporting breastfeeding at work among low income clothing factory workers in South Africa
Ameeta Jaga and Gina Botha, University of Cape Town
Bianca Stumbitz, University of Middlesex

Purpose: South Africa (SA) had the lowest exclusive breastfeeding rates in the world in 2012 at 8%, this has increased to 36% in 2016 but the progress is still too slow. Returning to work
is one of the main reasons women stop breastfeeding. Our research on advancing support for workplace breastfeeding focuses on a vulnerable group of women working in clothing factories, a female dominated industry (89%) in SA. These women are mainly black and poor. High poverty rates in this context often mean that they return to work soon after childbirth because of economic necessity, placing further constraints on breastfeeding. Although covered by legislated maternity protection and breastfeeding breaks, the enforcement of these laws is very low. Low skill, low income women are more easily replaceable, have less access to resources, and little bargaining power to request their breastfeeding rights.

Method: This research presents findings from a qualitative pilot study conducted in five clothing factories. In-depth semi structured interviews were conducted with mothers who had a baby in the past two years as well as managers.

Implications for practice and significance: With these findings, we present low-cost recommendations for improving workplace support for breastfeeding. Workplaces that are supportive of women breastfeeding at work encourage mothers to breastfeed their children for longer, improving both the infants’ health (e.g., reduced malnutrition, child mortality and morbidity) and mothers’ health (e.g., reduced ovarian cancer). This work will contribute to an important body of knowledge that can impact policy and policy implementation in SA and is aligned to the United Nations’ (UN’s) Sustainable Development Goals.
Symposium Chairs:

Professor Jose M: Peiró. University of Valencia, Spain.

Professor Karina Nielsen, University of Sheffield, UK.

Safety and health at work is a key goal in the Western world. In spite of progress made, there are still areas and target groups were important challenges remain. The construction sector has been identified as being at high risk for accidents and injuries (Buckley et al., 2016). The construction sector is heavily reliant on a migrant workforce. The UN defines "migrant worker" as a person who is engaged or has been engaged in a remunerated activity in a State of which he or she is not a national (UN, 1990). In the US, between 1996 and 2001, nearly one of four migrant workers who died on the job was employed in construction (Loh & Richardson, 2004).

Safety training of migrant workers may be one way forward to improve safety. In the present symposium, we will present preliminary findings from a EU-funded project on training migrant workers in construction. The first presentation will be a literature review on the safety training of migrant workers to date focusing both on the transfer and outcomes of training. The second presentation will present the results of focus groups and interviews in Spain elaborating on the challenges of migrant workers suggesting ways forward to safety training of migrant workers. Third, we will present a bespoke training package that has been developed to address the particular challenges of migrant workers in construction. Finally, we will present a conceptual training evaluation model considering both training transfer and the ability of training to improve safety behaviours.

Discussant.

Professor Kevin Kelloway. Saint Mary’s University, Canada.

Enhancing Safety Training for Migrant Workers in the Construction Industry: A Systematic Review

Rose Shepherd
The University of Sheffield, Sheffield, UK.

Professor José Maria Peiró
University of Valencia, Valencia, Spain.

Professor Karina M. Nielsen
The University of Sheffield, Sheffield, UK.
Dr Michela Vignoli
University of Bologna, Bologna, Italy.

Dr. Felisa Latorre
University of Valencia, Spain.

Purpose
Whilst there are extensive literatures on safety and training, there are few studies of migrant construction workers in Europe, a group particularly at risk. With the aim of improving safety for this group, this paper presents the findings of a systematic literature review of studies focusing on the design, implementation and evaluation of safety training for migrant construction workers.

Methodology
Multiple databases (e.g., Web of Science, Scopus) were searched for papers in the disciplines of psychology, medicine and engineering between 2000 and 2017. Of the 890 papers identified, 42 related to the safety of migrant construction workers, with only 10 empirical studies focused on training design, implementation and/or evaluation.

Results
All 10 studies were conducted in the US and primarily concerned Hispanic or Latino workers. They focused on technical skills, identifying difficulties relating to language, safety attitudes/values, poor workplace integration and lack of learning/knowledge retention. Evaluation was particularly scarce, with no studies assessing post-training transfer.

Limitations
Assessing the transferability of the findings of this small number of US studies to Europe is challenging, as migrants are from multiple nationalities and speak many different languages.

Implications
The literature review highlighted the challenges associated with training migrant construction workers, such as language barriers and cultural differences, which must be considered when designing training interventions. Additionally, soft skills training and training transfer evaluation frameworks are needed.

Value
To enhance safety for migrant construction workers it is essential to review the current literature and identify implications for future research, practice and policy.
Issues and Challenges of Training Construction Migrant Workers in Spain: A Qualitative Study on the multiple stakeholders’ views

Professor José Maria Peiró
University of Valencia, Valencia, Spain.

Ass. Professor Laura Lorente
University of Valencia, Valencia, Spain.

Professor Alicia Salvador
University of Valencia, Valencia, Spain.

Professor Vicente Martinez-Tur
University of Valencia, Valencia, Spain.

Purpose.
This paper aims to identify the critical issues and challenges of the safety training for the migrant construction workers in Spain.

Methodology.
Qualitative methodology with a combination of semi-structured interviews (7 migrants and 3 national workers) and focus groups with Safety and Health trainers (6 participants), work-sites’ managers (7 participants) and safety professionals (6 participants). The analysis has been carried using template analysis and inserted on within NVivo.

Results.
Information about the issues on the training, language, design, methods and communication addressed by the different stakeholders. Migrants and national workers emphasized safety outcomes while experts focus on the risks the workers face.

Limitations.
The study provides relevant insights but it needs to be complemented by a quantitative analysis.

Implications.
Understanding the specificities of training for low skilled migrant workers has theoretical and practical implications.

Value.
The study contributes to clarify the training context, conditions, processes, and outcomes providing insights for a better design and practice of migrant constructions workers training.
The Safety Training Package: a new training to ensure safety outcomes for migrant workers in the construction sector

Dr. Michela Vignoli
Department of Education Studies, University of Bologna, Bologna, Italy

Professor Dina Guglielmi
Department of Education Studies, University of Bologna, Bologna, Italy

Dr. Marco Giovanni Mariani
Department of Psychology, University of Bologna, Cesena, Italy

Professor Marco Depolo
Department of Psychology, University of Bologna, Cesena, Italy

State of the art.

Many studies demonstrated that safety training is an important preventive measure (e.g. Freitas and Silva, 2017) and effective in modifying workers’ behaviours (e.g. Robson et al., 2012). According to the strategic framework on safety and health at work (European Commission, 2014), European regulations on safety training generally provide longer safety training courses for high risk sectors such as the construction one, which heavily relies on immigrant workers that usually have lower skills and language issues. Despite this attention, there is a lack of knowledge on the effectiveness of safety training for migrant workers in the construction sector.

New perspectives/Contributions.

Starting from these issues and based on an extensive research (composed by academic and applied literature, regulations, focus groups and interviews) we developed a Safety Training Package (STP) dedicated to migrant workers in the construction sector which took into account the key elements of transfer of training and potential barriers. The STP is composed by both on-line and engaging classroom training and will include both safety technical and non-technical skills (which have never been investigated before in the construction sector).

Research/Practical Implications.
STP is a reliable and effective instrument for organisations in the construction sector aiming to increase the level of safety for migrant workers.

Originality/Value.

STP is based on different data sources that cover almost all the knowledge on this topic.

The Effectiveness of Safety Training for Migrant Construction Workers: A Training Transfer and Evaluation Framework

Professor Karina M. Nielsen
The University of Sheffield, Sheffield, UK.

Rose Shepherd
The University of Sheffield, Sheffield, UK.

Dr Michela Vignoli
University of Bologna, Bologna, Italy.

State-of-the-Art
In the construction industry, challenges associated with language barriers and cultural differences mean that migrant workers are more at risk of injuries, accidents and fatalities than native workers. Although evaluation models are well established within the wider training literature, there are none directly focused either on the construction industry or migrant workers.

Contributions
This study contributes to this important area by presenting a framework developed specifically for evaluating safety training for this high risk group of workers within the construction industry in Europe. Specifically, it extends existing evaluation models by drawing together three key research areas, realist evaluation, training transfer and training evaluation. In contrast to previous models, the framework has a sequential and longitudinal design and incorporates pre-and post-measures of intended training outcomes.

Implications
Through evaluating the effectiveness of training, this framework will have direct implications for the design and delivery of future training programmes for migrant workers in the construction industry in Europe. The transferability of the framework to other international contexts in the construction industry could be explored in future studies.
Value
To the best of our knowledge, this study is the first to present a framework to evaluate the effectiveness of safety training with the aim of reducing the risk of injuries, accidents and fatalities for migrants working in the EU construction industry.
THE INFLUENCE OF DARK PERSONALITY TRAITS ON LEADERSHIP SELECTION AND WORKPLACE HEALTH (SYMPOSIUM)

Convener: Prof. Dragos Iliescu, University of Bucharest, Romania

Discussant: Prof. Cornelius König, Universität des Saarlandes, Saarbrücken, Germany

State of the Art

The Dark Triad, a conglomerate of the apparently undesirable personality traits of Machiavellianism, Narcissism and Psychopathy, is a hot topic in both personality research and applied settings where personality has an impact. Research published during the past decade has shown that these three personality traits have value for practical applications in work settings, and that the initial expectations, demonizing these three personality traits, are not necessarily grounded in reality.

New Perspectives/Contributions

A number of significant gaps continue to loom on the Dark Triad, some of the related to the quality of measurement, some of them related to the impact dark traits may have on constructs and contexts where we know that personality is an important predictor. This symposium brings together 5 papers addressing such gaps. The first two papers focus on the influence of dark personality traits on leadership behaviors, alone and in combination with other traits. The third paper looks deeper into the construct of Machiavelianism. The fourth paper addresses the issue of measurement equivalence of dark traits between high and low stakes testing. The fifth paper discusses the impact of dark traits as moderators in the dominant model for the explanation of occupational health and engagement.

Research/Practical Implications

The symposium has important implication for the selection and healthy workplace development of leaders.

PAPER 1

Title, name and affiliation of the authors

The Good and the Bad, an Effective Personality Combination for Leaders?

Prof. Dr. Marise Ph. Born, Erasmus University Rotterdam

Dr. Alec W. Serlie, Erasmus University Rotterdam & GITP
Purpose

There is ample research on the relation between bright side personality traits and effective leadership, and on dark side traits in relation to toxic leadership. Only few studies combine both sides to predict job criteria for leaders. The present study fills that void by investigating the incremental validity of dark side personality over the bright side, when predicting job criteria for employees in a leader position.

Design/Methodology/Approach/Intervention

We assessed the relation between bright (Big Five) and dark (Hogan development survey) personality traits and leadership orientation, leadership versatility, performance, counterproductive work behavior (CWB), and organizational commitment (OC). Data of 127 leaders were acquired via self-report questionnaires and appraisals made by trained psychologists. All had participated in an assessment center up to two years earlier for inferences about their leadership potential.

Results

Dark side traits showed incremental validity for leadership behavior, leadership versatility and leader performance. The trait Reserved had a negative and Diligent a positive incremental effect. Exceptions were CWB and organizational commitment, only showing a relation with Honesty-Humility and conscientiousness, respectively.

Limitations

The study limitations are the moderate sample size and the self-reported leadership criteria.

Research/Practical Implications

In assessment centers more attention should be paid to dark-side traits, which show an incremental validity when predicting leadership performance indicators.

Originality/Value

Many managers derail in their career. Assessing the darker sides of eligible managers, may avert wrong hiring choices, and can also give the assessee a fair warning where potential threats lie.

PAPER 2

Title, name and affiliation of the authors

Successful Psychopathic Leaders: Evidence for a Differential Configuration Model

Dr. Jasmine Vergauwe, Ghent University, Belgium
Prof. Dr. Bart Wille, Ghent University, Belgium
Prof. Dr. Joeri Hofmans, Vrije Universiteit Brussel, Belgium
Prof. Dr. Filip De Fruyt, Ghent University, Belgium

Purpose

Three potential frameworks were proposed for conceptualizing “successful psychopathy” (Lilienfeld et al., 2015): the differential-severity model, the moderated-expression model, and the differential-configuration model. This study aims to provide evidence for a differential configuration model, such that successful psychopathy differs from unsuccessful psychopathy in the sense that it is characterized by a different constellation of traits.

Methodology

Leaders’ (N = 204) psychopathic traits (Psychopathic Personality Inventory-Revised; PPI-R) were related to (1) subordinate-rated success indicators (i.e., job performance and charismatic leadership), and to (2) other personality traits, using both “bright” (NEO-FFI) and “dark” side (HDS) measures.

Results

Results showed that leaders’ fearless dominance (PPI-I) was positively related to performance and charismatic leadership, while self-centered impulsivity (PPI-II) and cold-heartedness (PPI-III) negatively related to professional success. Further, divergent relationships were found between the different psychopathy factors and the leaders’ personality traits using both “bright” and “dark” side personality measures.

Limitations

While the multi-rater design in this study can be considered as a major strength, we recognize the possibility of selection bias, as each leader nominated one subordinate willing and able to evaluate them.

Originality

Although the existence of successful psychopathy is fascinating in many ways, it is scientifically controversial, and to date, it remains unclear what characterizes successful psychopathy. This study supports a differential configuration model, such that successful psychopathy in leaders is characterized by a different constellation of traits (cf. fearlessness, stress immunity, social influence) than is unsuccessful psychopathy.

Title, name and affiliation of the authors

Why Conventional Measures do not Tap Successful Machiavellians

Bastian Kückelhaus, University of Bonn, Germany

Iris Kranefeld, University of Bonn, Germany

Prof. Gerhard Blickle, University of Bonn, Germany
Purpose

A meta-analysis showed (O’Boyle et al., 2012) that Machiavellians seem to be associated with low performers at work. This is surprising because Niccolò Machiavelli had success in mind when he repudiated traditional morality as naïve. Collison et al. (2018) suggested that conventional measures of Machiavellians are saturated with a lack of self-control. They posit that successful Machiavellians combine amorality and distrust with high levels of self-control. Jones (2014) argued that successful Machiavellians with high self-control demonstrate lower levels of counterproductive workplace behavior (CWB) in order to appear morally minded and thereby achieve higher levels of promotions.

Methodology

In an anonymous online study 687 employees rated the Machiavellian personality inventory, a self-control scale, and reported CWB, and their number of promotions over the past five years. Data were analyzed with hierarchical, quadratic, moderated regression analyses.

Results

We found that Machiavellians with low self-control reported both higher levels and higher gradients of CWB than those with high levels of self-control. Machiavellians with high self-control, however, achieved higher numbers of promotions. Our study resolves the paradox, why, in the past, research mostly failed to show associations between Machiavellian personality and success at work. Indeed, it is high scores on traditional scales of Machiavellianism combined with high self-control which makes these individuals successful at work.

Limitations

In this study we used a cross-sectional design. Future studies should address longitudinal effects.

Originality

We contribute to new conceptions of Machiavellian personality scales combining high self-control with amorality and distrust.

PAPER 4

Title, name and affiliation of the authors

The Measurement Invariance of the Short Dark Triad in Low and High Stakes Contexts

Mihaela Grigoras, University of Bucharest, Bucharest, Romania
Andreea Butucescu, University of Bucharest, Bucharest, Romania
Dr. Cristian Opriuc-Dan, “Ovidius” University of Constanta, Constanta, Romania
Prof. Dragos Iliescu, University of Bucharest, Bucharest, Romania
Purpose

The present study addresses the appropriateness of employing dark personality measures in high stake contexts given the increased interest in these traits in work settings. Specifically, we investigated item and scale level differential functioning of the Short Dark Triad (SD3; Jones & Paulhus, 2014) measure across high and low testing contexts.

Methodology

Measurement invariance of the SD3 was examined in applicant (N=457) and non-applicant (N=592) samples using a mixed-method approach. Item-level invariance was tested using an IRT-based approach, while scale-level invariance was investigated using Exploratory Structural Equations Modeling (ESEM).

Results

Item-level analyses show a differential item functioning for half of the SD3 items. Results of scale-level analyses supported configural and metric invariance, but not scalar invariance.

Limitations

Our research employs a between-subject design, so we could not control for individual differences biases.

Originality

Our study uses a comprehensive approach to measurement invariance, using both item and scale level analyses. Also, it is one of the first to investigate the measurement invariance of a dark triad measure across testing contexts.

PAPER 5

Title, name and affiliation of the authors

Understanding Dark Triad at Work: Perceived Job Characteristics and Work Attitudes

Andreea Butucescu, University of Bucharest, Bucharest, Romania
Mihaela Grigoras, University of Bucharest, Bucharest, Romania
Prof. Dragos Iliescu, University of Bucharest, Bucharest, Romania

Purpose

The main objective of this study is to investigate how dark traits influence the perception of job characteristics, which in turn can impact their work attitude. We tested how Dark triad influence the perception of job characteristics from the perspective of the JD-R model (job resources, e.g., feedback; and job demands, e.g., cognitive demands) in order to explain
organizational attitudes (e.g., engagement). The role of personal resources is also discussed (i.e., optimism and self-efficacy).

Methodology

The study employed a convenience sample of 147 workers/ with different Holland codes. We use hierarchical regression, mediation and moderation analysis (Hayes & Preacher, 2014) to better fit our models.

Results

Preliminary analyses show results vary upon criteria and the Dark Triad trait investigated. For example, individuals high on psychopathy and Machiavellianism perceived their workplaces as being more demanding (e.g., having role conflicts) than resourceful (e.g., not having the opportunity to apply their talent), whereas individuals high on narcissism perceived their workplaces as having more opportunities and fewer demands. The level of their engagement or exhaustion also differs, as well as their personal resources. For example, self-efficacy is typically for Machiavellianism and narcissism, but not for the psychopathy.

Limitations

The causal conclusions drawn from this study should be taken with caution because of the cross-sectional design of the research.

Originality

The study is one of the first to investigate perceived job characteristics and work attitudes in relation to Dark Triad traits. Valuable practical insights can be inferred: since personality traits are stable and less malleable on organizational interventions, this study emphasise the need for the HR department to screen in dark personality preferences in order to ensure particularized resources upon different typology.

Maria Tomprou (Carnegie Mellon University, US)
Maria Simosi (Royal Holloway University of London, UK)

Symposium Abstract

State of the Art:

This symposium brings together exciting new research on how leaders manage their relationships with their followers.

New Perspectives:

George Graen once mentioned: “if you want career success, you must have a good relationship with your leader.” (Anecdote, 2011). Following on this statement that highlights the importance of the relationship, we organize this symposium capturing new developments in the field.

Contributions:

We offer two papers of new scales that assess leadership behaviors and relationships with followers offered for interventions improving the quality of the leader-member relationship. Jepsen and Rousseau develop a measure of followers’ perception of supervisor evidence use to address the importance of well-informed managers for leading team relationships. Chaudhry utilizes a profile approach with a new scale to investigate leader and follower’s assessments of currencies of the exchange. Two more papers discuss leader-member relationships within the emerging trends of new workplace. Coun, Peters, and Blomme argue how emergent leaders develop and the implications for sharing such a status and managing it in virtual workplaces. Kerschreiter and Alex show that leaders crafting a shared team identity may aspire their followers with implications to their health. A final study by Freeney, van der Werff, and Collings brings attention to a long-standing problem of female employees returning to work after maternity leave; this research addresses how supervisors engage (or disengage) in promoting new mothers’ careers.

Research/Practical Implications:

The symposium contributes in theory and practice bringing up-to-date research on leader’s relationships with their followers with implications for interventions.
Abstract

Purpose:
This research establishes a measure of perception of supervisor evidence use and investigates relationships between those perceptions and other important workplace relationships.

Design/Methodology:
The perceptions of evidence use scale was tested in multiple contexts, demonstrating excellent test-retest reliability and discriminant validity with leadership (MLQ, LMX), organizational justice and perceived organizational support.

Results:
Structural equation modelling used the eight item, single factor scale which demonstrated important relationships with trust in supervisor, workplace learning, psychological distress and perceptions of organizational quality.

Limitations:
Despite longitudinal scale development design, the cross sectional hypothesized model limits causality interpretation.

Research/Practical Implications:
Evidence use’s relatively large contributions to both LMX and trust in leader suggest an opportunity to rethink leadership theory, particularly effective leadership and behaviors that good leaders manifest. How information-rich leaders use scientific evidence and organizational data may now be a source of important leader qualities in itself.

Originality/Value:
The evidence-based management construct introduces a new dimension to leadership research and practice. As a mode of management practice with implications for both workplace relationships and learning, evidence-based management introduces the quality of decision making information and leader efforts to generate evidence via experimentation as important dimensions of leader behavior and contributors to leader-member relationships.
Understanding one’s manager’s efforts to base decisions on good quality information may help reduce anxiety associated with the decisions on which employees are required to act, and may reduce the sense of politics associated with organizational decisions.

Author
Anjali Chaudhry, Dominican University, Illinois, US

A Profile Approach to LMX

Abstract

Purpose:
Utilizing the “currencies of exchange” concept (Dienesch & Liden, 1986), this study examines differences in leader-member understanding of what is exchanged in the relationship.

Design/Methodology/Approach/Intervention:
This measure expands LMX-MDM (Liden & Maslyn, 1998) and assesses what is provided to and what is received from the other party on four dimensions: affect, contribution, loyalty, and professional respect. Consistent with previous work, data was analyzed using hierarchical cluster analysis.

Results:
Findings show five clusters of employees’ LMX: ‘Mutual Admiration’ (high affect and professional respect), ‘Transactional’ (low affect, high contribution and professional respect), ‘Bad Soldier’ (employee beneficiary score lower than leader beneficiary score), ‘Good Soldier’ (employee beneficiary score higher than leader beneficiary score), and ‘Bad Relationship’ (low scores on all dimensions). The leader’s LMX provided three clusters: ‘Reciprocated In-group’ (employee beneficiary score higher than leader beneficiary score), ‘Unreciprocated In-group’ (employee beneficiary score lower than leader beneficiary score), and ‘Outgroup’ (low scores on all dimensions).

Limitations:
Weaknesses of this exploratory study: small sample and multi-collinearity.

Research/Practical Implications:
This study moves research away from the simplistic low/high LMX treatment and suggests that the lack of agreement in LMX is of substantive consideration. Practically, it highlights that leader and member value different aspects of their relationship.

Originality/Value:
This research adds value to LMX research by empirically testing different exchanges. It also tests the assertion that low agreement between LMX ratings leader and member is due to the quality of the data.

Understanding leadership as an emerging process across team and organizational boundaries: consequences for the employment relationship

Abstract
State of the art:
Contemporary workers cooperate in multiple, temporary, boundaryless and often virtual teams to pursue shared value-based goals. The growing empowerment implies that future leadership will be increasingly diffuse, which is reflected in how the employment relationship is managed.

New Perspectives/Contribution:
We argue that leadership is no longer simply appointed to a formal leader, but refers to an emerging process by which individuals are expected to be pro-active and to motivate themselves (self-leadership) and others (shared leadership). However, hierarchical leadership still remains important to create and communicate meaning and direction in organizational activities. Formal leaders increasingly delegate the management of the employment relationship to their followers and teams, who have to take over aspects of the governance of the employment relationship (e.g. via peer or clan control), who become part of the exchange relationship (e.g. via knowledge sharing and mutual support) and have to co-shape the cooperation dimension (e.g. via partnerships based on ‘swift’ trust). The emergent leadership process should lead to better individual outcomes (e.g. psychological need satisfaction, shared goal-orientation and psychological empowerment, proactive behaviors) necessary to stimulate organizational performance (e.g. co-creativity and ongoing innovation).

Research/Practical Implications:
Whoever takes on the leadership role (organization, formal leader and team members), has a responsibility in managing the employment relationship and need to understand how individuals can be motivated.

**Orginality/Value:**

Building on insights from HRM, leadership and organizational behavior literature, our study explores how changes in leadership (outsourcing the leadership role) influences the extension of the employment relationship.

**Can leader identity entrepreneurship reduce follower depressive symptoms and burnout? Testing a serial mediation model with work group identification and loneliness at work as mediators**

**Abstract**

**Purpose:**

Depression and burnout bring about tremendous costs, not only for individuals but also for organizations. In organizations, leaders' activities oriented towards crafting a shared social identity in their teams (leader identity entrepreneurship) have been linked to follower health and well-being. Yet, at present, little is known about the psychological processes responsible for the beneficial effects of leader identity entrepreneurship.

**Design/Methodology:**

Addressing this gap, we proposed and tested a serial mediation model that links leader identity entrepreneurship to follower depressive symptoms and burnout. These relationships were hypothesized to be serially mediated by follower (1) work group identification and (2) feelings of loneliness. We tested the model in a longitudinal field study with 303 participants from the working population in Germany.

**Results:**

Results support the proposed serial mediation model. Higher levels of leader identity entrepreneurship related to lower levels of follower depressive symptoms and burnout. Moreover, these relationships were serially mediated by (1) increased follower work group identification and (2) decreased loneliness at work.

**Limitations:**
Conclusions are derived from a sample of followers participating in a longitudinal study with two points of measurement. Hence, no definite inferences about causality are possible.

Research/Practical Implications:
This research demonstrates that leader identity entrepreneurship translates into reduced follower depression and burnout. Moreover, we further the understanding of the mediating processes.

Originality/Value:
To the best of our knowledge, this study is the first that examines the effect of identity leadership on follower depression and burnout through work group identification and loneliness at work.

The effect of maternity leave in the leader – new mother employee exchange: Implications for managing employment relationships

Abstract
Purpose:
This paper examines relational aspects of workplace transitions, specifically, how leaders manage professional relationships with women resocializing into the workplace following maternity leave. Drawing on this context, we explore shifts in workplace relationships during this transitional period and the emotional responses that result from the perceived changes within this leader-follower dyad.

Methodology:
We interviewed 27 dyads within organizations, resulting in 54 interviews with women returning to work and their line managers.

Results:
Our findings demonstrate how relational shifts can shape the return to work experience lead to positive and negative changes in psychological contracts. Finally, we identify the various emotional responses to these shifts.

Limitations
While the majority of our sample is drawn from recognizable multi-national firms representing a range of industries, all of the participants were employees within the Irish jurisdiction and so the findings may not generalize to different countries where maternity leave conditions vary considerably.

**Research/Practical Implications:**

The paper presents implications for future research, both in relation to theories of resocialization as well as practical implications for how leaders manage relationships through resocialization practices in the context of maternity leave programs and career interventions aimed at retaining and supporting talented women.

**Originality:**

This study emphasizes the significant role of the relationship with a line manager during workplace transitions, a somewhat overlooked topic in the career transition literature. Further, it presents clear evidence of the scope for positive shifts to occur in psychological contracts, in addition to breaches that are extensively studied in the extant literature.
ANTECEDENTS TO LEADER EMERGENCE AND LEADERSHIP BEHAVIOURS

SYMPOSIUM

Chair:
Anika Cloutier, Queen’s University (Smith School of Business), Kingston Canada

Symposium Abstract:

Current state. Although much is known about the positive and negative consequences of leadership, far less empirical evidence exists to explain leader emergence, and the antecedents of positive and negative leadership behaviours. With organizations constantly seeking evidence-based information in which to base hiring and promotional decisions, this is an important shortcoming.

New perspectives. This symposium presents a collection of novel antecedents to describe who emerges as a leader and consequently who may not, as well as what leads to or prevents engagement in positive and negative leadership behaviours.

Proponents. Two presentations consider distal early life events that influence leader emergence, including early exposure to domestic violence (presentation 1) and early engagement in externalizing behaviours (presentation 2). The 3rd presentation poses a theoretical model explaining how the leader label may differentially affect motivation to lead for males and females. Finally, two presentations consider more proximal events that influence the quality of leadership behaviours. Across two studies, the fourth presentation considers how leaders’ performance-related attributions of followers affect abusive supervision; while the fifth presentation investigates the boundary conditions by which safety training enhances positive safety leadership behaviours.

Implications. Collectively, results from these five studies provide empirical evidence regarding the importance of developmental and contextual events within and beyond the workplace in predicting leader emergence and positive leadership behaviours.

Presentation #1

Title:
Does a History of Domestic Violence Affect Leader Emergence?

Authors:
Anika Cloutier, Queen’s University (Smith School of Business), Kingston Canada [presenter]
Julian Barling, Queen’s University (Smith School of Business), Kingston Canada

Abstract:

Purpose and value. Early life events have the potential to shape experiences throughout adulthood, and we consider how early personal and vicarious exposure to domestic violence influe
as a child affects later leadership emergence. Given the relational nature of leadership, we predict that early negative relational experiences with primary caregivers will negatively affect leader emergence by harming the ability to successfully navigate social relationships. Specifically, we predict that early experiences of physical violence by one’s parents, or vicariously witnessing parents engage in inter-partner violence will result in the development of anxious and avoidant attachment styles. In turn, anxious and avoidant attachment styles will decrease the likelihood of later leader emergence. We also predict that the negative effects of anxious and avoidant attachment styles will be more harmful for females, as they are expected to have higher relational skill.

**Method.** To test this model, we draw on a sub-sample of participants \( n = 1709 \) from the NCS-R.

**Results.** Using Hayes’ (2013) Process macro, (1) witnessing parental violence and (2) experiencing violence by one’s parents increased anxious (but not avoidant) attachment, and in turn, decreased leader emergence. Contrary to our hypothesis, these effects were stronger for males than females.

**Limitations.** Results may be limited by mono-method bias and cross-sectional data, however, the presence of an interaction excludes the possibility of mono-method bias, while the temporal precedence of events studied somewhat reduces concerns about sole reliance on cross-sectional data.

**Implications.** This research contributes novel insights into how parental relationships affect later leadership.

**Presentation 2:**

**Title:** The “L-word”: How Granting Leader Identity Impacts Leadership Emergence Differently by Gender

**Authors:**

Julie Weatherhead, Queen’s University (Smith School of Business), Kingston, Canada [presenter]

Julian Barling, Queen’s University (Smith School of Business), Kingston, Canada

Nick Turner, University of Calgary (Haskayne School of Business), Calgary, Canada

Wren Montgomery, Western University (Ivey School of Business, London, Canada)

**Abstract:**

A critical step in the leadership emergence process is being selected into a leadership role. We are interested in the role of individuals’ motivation to lead and their likelihood of being selected to be a leader. This is part of a larger study looking at the relationship between socioeconomic status, motivation to lead, and leadership emergence. We propose that showing indications of a high level of motivation to lead will make job applicants more
attractive in the recruitment and hiring process than individuals who do not indicate a motivation to lead. To test this we use a resume study, in which we manipulate fictional applicants' motivation to lead. HR professionals who work in recruitment and selection will judge the resumes of fictional applications and rate the quality of the applicant as well as indicate the likelihood that the applicant would be selected to be a leader.

Participants will be instructed that they will be reading a resume from an applicant applying to a managerial role. Across conditions the resumes are the same other than the 'overview' section, in which we manipulate the applications motivation to lead by providing details that indicate the candidates’ level and type of motivation to lead. The four conditions are as follows: 1) affective/identity motivation to lead, 2) normative motivation to lead, 3) non-calculative motivation to lead, and 4) the control. These are based on Chan and Drasgow's (2001) model of motivation to lead. Data collection and analyses will be completed by the presentation deadline.

**Presentation 3:**

**Title:** Leader Identity, Gender, and Motivation to Lead

**Authors:**

Alyson Byrne, Memorial University (School of Business), St. John's, Canada [presenter]

Ingrid Chadwick, Concordia University (School of Business), Montreal, Canada

**Abstract:**

**State of the Art**

Understanding leader identity is a critical piece to understanding leadership emergence. Research suggests that leaders who are able to both claim a leader identity and have that identity granted to them are more likely to seek out development experiences and have increased motivation to lead. Yet, the very function of claiming and being granted a leader identity may be nuanced by gender, an area that has received little empirical attention.

**New Perspectives/Contributions**

We argue that claiming and being granted a leader identity is in conflicts with gender identity. We suggest that labeling women as leaders is incompatible with their gender identity, given the juxtaposition of masculinity inherent in implicit leadership theory. Consequently, claiming and being granted a leader identity becomes a hurdle to women’s leadership development. In contrast, we argue that claiming and being granted the label of leader for males boosts the likelihood that they will seek out leadership development experiences, as it is aligned with their male identity.

**Research/Practical Implications**
Understanding the effects of labeling individuals as leaders, through a gender and identity lens, provides a nuanced approach to leadership development. Getting leaders to feel positively about their leader identity is critical to their leadership, but must be understood in light of contextual differences such as gender. Practically speaking, understanding the gendered effects of labeling individuals as leaders is critical for effective leadership training and development.

**Originality/Value**

This work helps to examine the gender and identity nuances associated with leadership development and leadership emergence.

**Presentation 4:**

**Title:** Employee Performance and Experienced Abusive Supervision via Supervisor Attributions

**Authors:**

Jennifer Bozeman, West Chester University (School of Business), Pennsylvania USA  
M. Sandy Hershcovis, University of Calgary (Haskayne School of Business), Calgary, Canada  
Nick Turner, University of Calgary (Haskayne School of Business), Calgary, Canada  
Zhanna Lyubykh, University of Calgary (Haskayne School of Business), Calgary, Canada  
J. Valerie Shan, University of Calgary (Haskayne School of Business), Calgary, Canada [presenter]

**Abstract:**

**Purpose**

Drawing on attribution theories, we argue that supervisors are susceptible to attribution biases such as fundamental attribution error and intentionality bias, over-attributing employees’ poor performance to low conscientiousness and intention, which will later translate into abusive supervision.

**Methodology**

In Study 1, we collected data from a sample of 109 employee-supervisor dyads. In Study 2, we used a vignette design to test the underlying mechanism: whether or not supervisors over-attribute internal factors to employees’ undesirable performance and subsequently engage in abusive supervision.

**Results**

Study 1 found support for the proposition that supervisors tend to attribute low conscientiousness to the poor performance of employees, which results in a higher likelihood of abusive supervision. We did not find support for similar effect for intention. We are currently in the process of collecting data for Study 2 and the results will be available in time for the conference.
Limitations
The main limitation of Study 1 is that we measured intentionality using a reference-based approach, which set up an unfair comparison between conscientiousness and intentionality.

Research Implications
The present study explains why employee performance can trigger abusive supervision.

Value
This paper contributes to abusive supervision literature by examining not only the performance determinants of abusive supervision, but also attributional mechanisms that explain why employee performance triggers abusive reactions.

Presentation 5:
Title: Workload and Training Transfer in Safety Leadership
Authors:
E. Kevin Kelloway, Saint Mary’s University (Department of Psychology), Halifax, Canada [presenter]
Timur Ozbilir, Saint Mary’s University (Department of Psychology), Halifax, Canada
Jennifer Wong, University of Canterbury (Department of Psychology), Christchurch, New Zealand
Stephanie Gilbert, Cape Breton University (Shannon School of Business), Sydney, Canada
Michael Teed, Bishop’s University (School of Business), Sherbrooke, Canada

Abstract:
Purpose: Like other forms of leadership training (e.g., Barling, Weber & Kelloway, 1996; Mullen & Kelloway, 2009), the S.A.F.E.R. approach (Wong, Kelloway & Makhan, 2015) to training safety leaders requires leaders to set specific behavioral goals to change their behavior. Based on the observation that leaders may not “follow through” on their goals, the current study examined workload as a potential determinant of training transfer (i.e., goal implementation).

Design: Following a 3–hour S.A.F.E.R. leadership workshop, leaders (n=73) completed monthly (k=4) measures of workload and self-rated S.A.F.E.R. leadership.

Results: Longitudinal mixed model regressions showed that S.A.F.E.R. leadership behaviors declined over time (b=-.33, p < .01), and that leaders reported fewer leadership behaviors when they experience high workload (b=-.18). However, time and load interacted such that the decline in leadership over time was less for leaders experiencing high levels of work load.

Limitations: Data are all based on leaders’ self-report and are all drawn from one health care organization.

Implications: Consistent with the training transfer literature, the results of the study suggest that workload may influence the outcomes of leadership training but that this influence may be both negative (fewer behaviors implemented) and positive (smaller decline in leadership behaviors over time) for leaders with high work load.
State of the Art

Flexible work defined as (1) flexibility in time and (2) flexibility in working locations, (3) supported by information and communication technologies (ICT), is spreading rapidly. Current Eurofund/ILO data categorize 10% to 35% of the European workplaces as highly flexible. Empirical studies so far confirm both positive and negative effects of flexible working on the quality of working life of the employees. The concept of organizational paradoxes, but also the integration of effects outside work may help to explain such differences.

New Perspectives/Contributions

The symposium brings together an international group of researchers dealing with diverse aspects of flexible work and their role on quality of working life. Four studies deal with flexibility in office work, both within the offices (Korunka et al., ter Hoeven et al., Uhlig et al.), and in blended work settings (Wörtler et al.). Agile working is investigated as a new form of organizational flexibility (Knecht & Krause). Two studies examine the effects of flexible work across work boundaries (smartphone use in the evening: Binnewies et al.; work-life conflict: Mellner). One large study analyzes effects of work flexibility on well-being in the US: Ray & Pana-Cryan).

Research/Practical Implications

Combining and integrating the different approaches to the investigation of flexible work as an important current trend in work organization may help to better understand this new phenomenon. The studies show that personal preferences and the organizational context matter for positive and/or negative outcomes of flexible work.

Moving into a flexible office: (I) The role of leadership and organizational culture

Christian Korunka*, Lars Uhlig*, Bettina Kubicek**

*University of Vienna, Austria
**University of Graz, Austria

Purpose
Flexible offices are a current trend in today’s organizations. Supported by information and communication technologies employees are offered flexible use of time and locations within the office building. Empirical studies show both increases and decreases of quality of working life in such office concepts. Organizational paradoxes, like the autonomy paradox, may help to explain such contradictory results.

**Design**
This study is designed as a comprehensive longitudinal study accompanying the move into a new flexible office. The new office consists of different work zones. Measurements were taken before the move into the new building (t1), two months after the move (t2) and about 8 months after the move (t3).

**Results**
Up to 497 employees participated at each of the measurements. 238 cases were available for longitudinal analyses. The move into the flexible office was accompanied by significant increases in flexible use of work locations. Quality of working life diminished at t2 and improved slightly again at t3. Improvements were observed only for managers. Perceptions of high organizational trust at t1 as the most important predictor of change management were accompanied by improvements in quality of working life.

**Limitations**
Data were collected in a longitudinal design, but the data stem only from one specific case.

**Research/Practical Implications**
Contradictory results related to the implementation of flexible offices may be explained both by aspects of organizational change culture (organizational trust) and different effects for employees and managers.

**Originality/Value**
This is one of the few longitudinal studies dealing with flexible offices.

**Moving into a flexible office: (II) Effects on job stressors and employee motivation**
Lars Uhlig*, Bettina Kubicek** & Christian Korunka*

*University of Vienna, Austria
**University of Graz, Austria

**Purpose**
More and more organizations are switching to flexible office designs in order to adapt to the requirements of flexible work organization and to save costs. However, flexible offices have been found to produce more distractions for employees. Distractions can be a source of stress and hinder employees to concentrate. As a result, flexible offices hold the potential to weaken employee engagement.

**Design**
We conducted a three-wave longitudinal study accompanying the move of a large Austrian company into a new flexible office. Measurements were taken two months before the move (T1), two months after the move (T2) and 8 months after the move (T3). Up to 497 persons participated in each wave.

**Results**

In order to capture the changes of distractions and engagement we analyzed the data using latent change score modelling. Distractions increased significantly at T2 and stayed at a stable high level at T3. Positive changes in distractions from T1 to T2 predicted simultaneous negative changes in engagement but subsequent positive changes in engagement from T2 to T3. These results suggest that the increase in distractions after the move first led to a decrease in engagement which later got reversed, possibly due to adaptation processes.

**Limitations**

The single group design limits the generalization of results. Further, all constructs were measured using self-reported data.

**Originality**

Using latent change score modelling our study is the first to investigate how changes during a move to a flexible office affect simultaneous and subsequent changes in employee engagement.

“If you experience noise, you just haven’t planned your work well”: Individualization and regulation within a flexible work design.

Claartje L. ter Hoeven*, Eva van Gemert** & Caryn E. Medved***

*The Amsterdam School of Communication Research A.SCoR, University of Amsterdam
**Department of Sociology, Erasmus University Rotterdam
***Department of Communication Studies, Baruch College

**Purpose**

This study investigates the spatial dimension of flexible work designs (FWDs) by mapping the experiences of employees as they try to acclimate to open-plan offices and drop-in desks.

**Method**

23 in-depth interviews were conducted with employees of an international construction company (here: CONSTRUCT)

**Results**

Findings show the interaction between occupational context and personal preferences in employees' FWD experiences. Employees’ differential success in adapting to FWD also exemplifies what we term the flexibility paradox: While FWDs ostensibly allow for employees’ freedom to choose when, where and how to work, these workplace structures paradoxically impose a surprising level of rigidity – a rigidity, perhaps, that results from the unquestioned
use and valorization of the flexible knowledge worker as the model for the design of flexibility in the workplace.

Limitations
Our single-organization case study method provides the perspectives only of employees at CONSTRUCT and their perspectives at only one point in time in the adaptation of FWDs.

Practical Implications
We encourage human resource professionals and managers to design and implement FWDs by keeping in mind there exists a variety of employee needs and preferences; design for flexible flexibility.

We demonstrate how FWDs govern employee conduct by prescribing a specific way of working understood as ‘flexible’ while delegitimizing others. By exploring occupational status in relation to boundary management strategies, we differentiate among four employee categories. All personnel must perform within the FWD, although it seems designed for knowledge workers. Employees cope with the resulting FWD tensions through the individualization of the problems and their solutions.

The importance of employees’ job-related psychological needs for blended working
Burkhard Wörtler*, Nico W. Van Yperen*, Kiki M. M. De Jonge*, Eric F. Rietzschel*

*Department of Psychology, University of Groningen, Groningen, the Netherlands

Purpose
The opportunity to seamlessly blend on-site and off-site working (i.e., blended working) is enabled by the availability of continuously improving ICTs that provide employees with almost constant access to job-relevant information and coworkers. The aim of our research was to examine when blended working is likely to entail desirable outcomes by focusing on the role of employees’ job-related psychological needs.

Design/Methodology
We conducted two independent cross-sectional survey studies. We recruited a sample of 348 and 657 employees for the first and second study, respectively.

Results
In the first study, we found that employees low in need for relatedness and structure, and high in need for autonomy, tend to perceive blended working to be effective for them. In the second study, we obtained evidence that the perceived opportunity for blended working can maintain employees’ intrinsic work motivation when quantitative job demands are high, given that employees have a strong job-related need for autonomy.

Limitations
The design of both studies denied conclusions about causal relations between the variables.

Research/Practical Implications
Our findings contribute to the literature by highlighting the importance of fit between work context and employees’ psychological needs. We recommend to practitioners in organizations to consider employees’ psychological needs to decide for whom blended working is likely to be advantageous, rather than adopting a ‘one-size-fits-all approach’ by offering the opportunity for blended working to the entire workforce.

Originality/Value
We provide evidence that blended working may be a contemporary resource for employees, yet individual differences in job-related psychological needs are likely to influence its usefulness.

The association of agile methods, team processes and engagement
Michaela Knecht, Marcel Baumgartner, Andreas Krause, Jonas Mumenthaler, Ariane Vetter & Albert Vollmer
University of Applied Sciences Northwestern Switzerland FHNW, School of Applied Psychology

Purpose
Agile working is becoming more and more prevalent. Agile working is highly flexible. Agile teams do not follow a long-term project schedule but they plan step-by-step and decide continuously what delivers most values to the customer or user. Agile teams use several different methods to implement agile working. In the current study, we focus on the agile methods iterations and retrospective meetings. An iteration is a short two to four weeks single development cycle, where a team finishes several tasks (in the software context a running software). In retrospective meetings, teams reflect and analyze their way of work. Aim of the current study is to assess association between agile methods, team processes and engagement of the employees.

Design/Methodology
The sample consists of \( N = 148 \) employees nested in 33 teams, working as software developer in three Swiss companies, mostly males (87%). Multi-level regression analyses will be conducted to assess the relations for individuals and teams.

Results
First results show a positive association between agile methods and several team processes such as team autonomy, team job crafting, or team resilience. Furthermore, there is a positive relationship between agile methods and engagement. Data analysis is still ongoing.

Limitations
It is a cross-sectional study with a sample of only software developer.

Research/Practical Implication
The study suggests positive effects of agile methods on team processes that go along with higher engagement.

Originality/Value
This study adds to the small empirical database on the IO-psychological aspects of effects of agile practices.

Is every smartphone use in the evening detrimental? The role of different smartphone activities for employees recovery and well-being
Carmen Binnewies, Kristin Holtrup & Suzana Milicevic
University of Muenster, Muenster, Germany

Purpose
The goal of our study was to examine the daily use of different smartphone activities during leisure evening time for employees’ recovery and well-being. Based on the study of Sonnentag (2001) distinguishing different leisure time activities, we examined the role of work-related, private-duty, health-related, social and amusement smartphone activities for employees’ recovery experiences (psychological detachment, relaxation) and affective well-being in the evening. We assumed detrimental effects of work-related and private-duty smartphone activities and beneficial effects of health-related, social and amusement activities for recovery experiences and affective well-being.

Design/Methodology
We conducted a 5-day diary study with a mixed sample of 77 employees (providing data of 297 days).

Results
Results of hierarchical linear modelling showed that work-related smartphone activities were detrimental for psychological detachment and relaxation in the evening and for negative affect and work-family conflict. Social and amusement smartphone activities were positive for psychological detachment but showed no relations with affective well-being. Health-related smartphone activities did not show the expected relations. Additionally, we found some relationships contrary to our hypotheses, e.g. negative relationships between work-related and private-duty smartphone activities with fatigue.

Limitations
Despite our diary design and focus on within-person processes we cannot draw conclusions about causality.

Research/Practical Implications
Results show that simple implications to not use your smartphone are not reflecting more complex pattern which activities are useful or detrimental for different outcomes.

**Originality/Value**

Our study is one of the few studying the use of specific smartphone activities during evening leisure time.

**Individual Perceptions of Boundary Control Mitigate the Effect of (in) Congruence Between Workers’ Preferred Work/Non-Work Boundaries and their Enacted Boundary Management on Work-Life Conflict**

Christin Mellner*, Pascale Peters** & Susanna Toivanen***

*Stockholm University, Sweden
**Radboud University, Nijmegen, Netherlands
***Stockholm University/Karolinska Institutet, Stockholm, Sweden

**Purpose**

Rapid development of boundary-transcending ICTs have led to more flexible forms of work organization, marking a fundamental shift in the flexibility and permeability of employees’ work-nonwork boundaries. This study investigates the inter-relationships between employees’ boundary management types, representing boundary (in)congruence between their preferred and enacted boundary management, and work-life conflict, and the potential moderating role of perceived boundary control herein.

**Design/Methodology**

Data comprised 3,154 Swedish professional workers in different occupations within both the public and private sector. Correlations, t-tests, Chi square tests and univariate general linear model analyses (ANCOVA) were performed.

**Findings**

Enacted integration as well as boundary incongruence were both positively associated with work-life-conflict. Moreover, incongruence accompanied by a high degree of enacted integration increased work-life conflict. Finally, boundary control mitigated work-life conflict. This was especially the case among employees preferring segmentation but enacting integration, i.e., boundary incongruence, but also among employees both preferring and enacting integration, i.e., boundary congruence.

**Practical implications**

This study provides new and valuable knowledge on different boundary management types, reflecting boundary (in)congruence, that are associated with increased work-life conflict depending on the specific type of (in)congruence in question, and the role of boundary control herein as an important factor to combat work-life conflict. This kind of knowledge is of high relevance in contemporary working life characterized by an ever-increased blurring of work-
nonwork boundaries. Organizations play an important role in creating new legitimate beliefs and as such, leisure norms could be implemented that promote employees’ boundary control, and subsequent reduced work-life conflict.

**Work flexibility and well-being across work arrangements in the US**

Tapas K Ray* & Rene Pana-Cryan*

*NIOSH/CDC; Washington DC, USA

**Purpose**

We assessed the prevalence of work flexibility by work arrangement type among US workers during 2002-2014. We further investigated whether work flexibility was associated with work related well-being – job satisfaction, job stress, and health related quality of life.

**Design/Methodology**

We used data from the Quality of Work life (QWL) module of the General Social Survey (GSS). We analyzed pooled cross sectional data from 2002, 2006, 2010, and 2014 (weighted sample of 5911 observations). To understand work flexibility, we used the following variables: 1) Work schedule; 2) Telework; 3) Ability to take time off work for non-work matters; 4) Work demands; 5) Productivity-conducive work conditions; 6) Opportunity to develop special abilities; 7) Availability of help and equipment at work; and 8) Freedom to decide. We assessed the effect of work arrangement on work flexibility and the association between work flexibility and work related well-being.

**Findings**

Overall work flexibility changed minimally during 2002-2014 in the US, although some individual flexibility variables followed cyclical trends. Work arrangement was an important determinant of work flexibility. After controlling for demographics and overall health status, work flexibility was positively associated with well-being.

**Practical Implications**

The study demonstrated the importance of work flexibility for well-being and provided valuable information about flexibility by work arrangement type.

**Originality/Value**

As far as we know, this is the first study on this topic in the US context. Our findings are relevant for stakeholders, including policy makers.
State of the Art. Employability research has flourished in recent years, leading to many new insights into its importance in the contemporary world of work. However, more in-depth research is needed to address several blind spots related to employability in different career stages, occupational groups and employment relations. In three interrelated symposia stemming from the 2018 EAWOP Small Group Meeting organized by Pascale Le Blanc and Beatrice Van der Heijden, these topics are addressed. Together, these symposia aim to contribute to academic progress in the field and to improving (HRM) policy and practices in business. This third symposium explores new frontiers regarding employability of workers in non-standard work types.

New Perspectives/Contributions. The contemporary labor market has witnessed a rise of non-standard employment types, including solo self-employed workers, crowdworkers, and project managers. Although these non-standard workers are increasing in numbers, research on their careers has been minimal (Lo Presti, Pluviano, & Briscoe, 2018). We therefore aim for
a better understanding of the career attitudes of workers in non-standard work types, how they build their careers, and the consequences for their employability and career success.

**Research and Practical Implications.** Research on employability of different types of non-standard workers will be shared from a career perspective. We will advance knowledge on this uncovered topic and explore avenues for future research. Additionally, more knowledge on the careers and potential vulnerability of non-standard workers can challenge policy makers and organizations to promote the employability and career success of non-standard workers through interventions and career-enhancing facilities.

(1) The importance of participating in (in)formal professional networks. Consequences for freelancers’ employability competencies and career outcomes.
Sabet Van Steenbergen¹, David Stuer¹, Ans De Vos¹ and Beatrice Van der Heijden²

¹Antwerp Management School and University of Antwerp, Belgium
²Institute for Management Research, Radboud University, Nijmegen, the Netherlands, Open University of the Netherlands, Kingston University, London, UK, Hubei University, Wuhan, China.

**Purpose.** Research has shown the importance of participating in (in)formal networks for employees’ career success. This might be particularly relevant for freelancers who cannot depend on organizational career support. Building strong relations with client organizations and putting effort into developing and maintaining professional networks with other freelancers can be fundamental in sustaining and promoting their employability, career success and future career prospects. This paper takes both an input-based and output-based perspective on employability and investigates whether freelancers’ participation in networks is positively associated with career outcomes, through the mediating role of employability-enhancing competencies.

**Design/Methodology.** Hypotheses will be tested through Structural Equation Modelling using a sample of 1.874 independent workers in Belgium, France, Germany, The Netherlands and the United Kingdom.

**Results.** Initial results, obtained by using linear regression analysis, show a positive association between social network participation and employability-enhancing competencies, and between employability-enhancing competencies and career success, perceived employability and future career optimism. Structural equation modeling is currently performed to test the full model.
Limitations. Reversed causality cannot be ruled out.

Research Implications. This research calls for attention to freelancers’ participation in networks and the effect on sustaining and promoting their employability, career success and future career optimism.

Originality/Value. Our knowledge about how freelancers can safeguard their employability, despite the lack of an organizational context providing support for career development, is limited. This study tries to address this gap.

(2) The career development of solo self-employed workers – A qualitative study

Sjanne Marie Van den Groenendaal¹ and Chen Fleisher²
¹Department of Human Resource Studies, Tilburg University
Utrecht University School of Economics & Utrecht Centre for Entrepreneurship²

Purpose. Research on solo self-employed workers mainly focused on the decision to become self-employed. Little research investigated what happens after launching a business, and particularly the consequences for entrepreneurial careers and future employability. Therefore, we aim to advance knowledge on the career development of solo self-employed workers. We examine how entrepreneurial motivation, investments in personal and business development, and goal-setting behaviors influence how they build their business and make career choices accordingly.

Design/Methodology. Data collection is ongoing. We interviewed 60 Dutch solo self-employed workers on their work history, entrepreneurial motivation, building the business, and future goals. This study is part of a larger project in which we examine a heterogeneous sample of solo self-employed workers in various contexts, industries, business ages, and education levels, and explore how these aspects influence their entrepreneurial career.

Results. Preliminary results reveal that solo self-employed workers do not engage explicitly in goal-setting behavior as they do not seem to set goals to foster personal development which may affect their employability.

Limitations. Focusing on a specific work type is likely to influence the generalizability of the findings.

Research/Practical Implications. More research is necessary to better understand careers of solo self-employed workers. In practice, interventions to create awareness among solo self-employed workers of the importance of personal and business development to sustain employability are needed.
Originality/Value. This study looks beyond the start-up phase of the business and examines the career development of a heterogeneous sample of solo self-employed workers, thus applying a career perspective.

(3) The Interplay between Career Attitudes and Organizational Factors for Project Managers’ Career Success. Does Employability make a difference?

Alessandro Lo Presti¹, Angelo Elia², Pasquale Concilio³

¹University of Campania “Luigi Vanvitelli”, Caserta, Italy,
²Project Management Institute - Italy Chapters
³University of Campania “Luigi Vanvitelli”, Caserta, Italy

Purpose. This paper aims at examining, through a mixed-method approach, the interaction between protean and boundaryless career attitudes and organizational factors in predicting project managers’ subjective and objective career success. Moreover, it examines the intermediate role of employability in mediating these associations.

Design/Methodology. Study 1 was carried out on 552 Italian project managers who filled an online survey; responses were analyzed through conditional process analysis (PROCESS macro). Study 2 results were based on 50 structured interviews, which were analyzed through co-occurrence text analysis (T-LAB).

Results. As for Study 1, objective boundarylessness, protean and boundaryless career attitudes, employability culture, clear career paths and organizational project management orientation were significantly associated with subjective career success, while objective career success was predicted by protean career attitude, employability culture and team project management orientation. Employability did not emerge as a mediator in neither cases. Several interactions between predictors were found. As for Study 2, numerous themes emerged in regards to employability, career and success: growth, autonomy, values, training, organizational culture, gratification, role and economic rewards.

Limitation. Cross-sectional design and self-report data are the main limitations.

Research/Practical Implications. Our study showed that both organizational factors and career attitudes contributed to predicting project managers’ career success, while employability’s role was negligible. Project-based organizations should care of these
predictors, through appropriate interventions, in order to foster their employees’ career satisfaction and attainments.

**Originality/Value.** This is the first study focusing on Italian project managers’ career success and its determinants. The mixed-method research approach provided additional value.

(4) *The Right Tools for the Job: Device Inequalities in Crowdworking Careers*

Gemma Newlands and Christoph Lutz

1BI Norwegian Business School

**Purpose.** Crowdworking platforms have provided career opportunities for freelancers across the globe. However, crowdwork careers differ from traditional alternatives as they offer more limited pathways to upward mobility and skill development. One understudied aspect is that these careers increasingly rely on personal financial investments into their practical crowdworking infrastructure, such as IT devices, software, home-office furniture, and internet connectivity. If scarce crowdworking opportunities are directed towards those who have invested the most, then the career chances and upward mobility of lower-income crowdworkers become increasingly limited.

**Design/Methodology.** This study is based on a survey of Amazon Mechanical Turk workers, conducted in autumn 2018. Open and closed questions relating to worker experiences, device use, and investment were included in the survey.

**Limitations.** The cross-sectional design limits causal inferences.

**Research/Practical Implications.** Preliminary findings indicate that the most effective and income-generating crowdworkers rely on a mixture of devices and operate with high-quality access to technological infrastructure. These findings suggest that access to career-enhancing crowdwork could be broadened with greater attention paid on behalf of platforms and requesters to the particular requirements of mobile-first, device-sharing, or internet-restricted populations.

**Originality/Value.** The results of this study extend our understanding on how crowdworkers invest in the future through expensive equipment and software, creating additional inequalities between crowdworking ‘haves’ and ‘have-nots’. This study is one of the first to examine crowdwork from a device perspective.
From Job Crafting to Building Resilience: A Crowdworkers’ Story

Sut I Wong¹, Christian Fieseler¹, Dominique Kost²

¹BI Norwegian Business School
²Oslo Metropolitan University

Purpose. We showcase how crowdworkers cope with the relatively isolated work environment that comes with online, computer-mediated gig labor, through proactively changing their work towards self-constructed narratives of meaningfulness of their work and work identity. We employ a bottom-up approach and argue that crowdworkers may, despite the seemingly isolated work environment, prosper in this work environment depending on their ability to engage in both individual and collaborative job crafting that builds resilience.

Design/Methodology. This study is based on a two-wave longitudinal survey of 334 crowdworkers from Amazon Mechanical Turk (MTurk). We used PROCESS to test the moderating and moderated mediation hypotheses.

Limitations. The cross-sectional design limits causal inferences.

Research/Practical Implications. Our findings show that degree to which crowdworkers engage in individual job crafting and collaborative job crafting activities strengthens their personal resilience and subsequently their commitment to a crowdwork career. Although the platform-mediated crowdwork environment seems isolated on first inspection, crowdworkers benefit from taking proactive steps reaching out to others. Recommendations are formulated towards platforms to break down their currently isolating design structure and to facilitate more collaborative opportunities among crowdworkers.

Originality/Value. The results of this study extend our understanding on how individuals under a relatively constrained environment may go beyond their boundaries in shaping their work.
State of the Art

While it is widely accepted that leaders are a key component of change management, our knowledge of what they actually do and how they influence change is still surprisingly underwhelming. Such literature is often clouded with myths and assumptions (By et al., 2016), which contribute to the confusion. As Ford and Ford (2012) put it: “unfortunately [we] can’t say what that influence is, what leader actions and interactions are responsible for it” (p. 33).

New Perspectives/Contributions

Our symposium provides novel evidence on the role and importance of leaders for successful change implementation. We achieve this goal by incorporating five papers that use a diverse set of methods (experimental, longitudinal, multiple sources) and concepts related to leadership (servant, empowering, transformational and instrumental leadership) and change (change construal, adaptive performance, intentions to resist future change). Our discussant will help integrate the knowledge stemming from this international collection of studies and provide insights for future research.

Research/Practical Implications

This collection of studies advances theory by highlighting the importance of factors that remain largely unexplored in the change management literature such as managers’ own construal of change, perceptions of visionary leadership, structural and cultural factors, or intentions to resist future change. From a practical perspective, it brings to our attention elements of leadership that are seldom integrated in change-oriented training and demonstrates that leadership for change can be trained.

Discussant: Birgit Schyns (NEOMA Business School, France)

Title (1)

CLT at the Interface of Managers and Employees During Organizational Change: Introducing the Concept of Change Construal

Name and affiliation of the authors
Purpose
How people think about change plays a central role in how they react to it. Given the high levels of ambiguity that typically exist during change, there is much room for diverging interpretations of the change by members of the organization, including change leaders. In the present study we aim to capture these interpretations through the concept of change construal. We propose that differences in the level at which managers construe organizational change are predicted by the visionary leadership of these managers' supervisors, and, in turn, that managers' change construals interact with their perceived control over the change for predicting unit performance in the context of an organizational change.

Method
To test our predictions we developed a measure of change construal, and collected change construal data among 311 department managers, and the visionary behavior of their 37 branch managers.

Results
As expected, branch managers’ visionary leadership was linked with their department managers’ change construal, which in turn interacted with perceived control for predicting departments’ performance.

Limitations
Given the challenge of obtaining field data from senior managers, our sample of branch managers is rather small.

Implications
Our findings highlight the important role of how change is construed by change recipients, and points to the route through which these construals are shaped.

Originality
Our study is among the first to integrate construal-level theory into a theory about responses to change. Moreover, it is the first to demonstrate the role of leaders’ visionary leadership on the construal of change.

Title (2)
Servant leadership and work engagement as antecedents of employees’ adaptational performance during organizational changes

**Authors:**
Janne Kaltiainen, Finnish Institute of Occupational Health
Jari Hakanen, Finnish Institute of Occupational Health

**Purpose**
This study examined whether employees’ experiences of servant leadership and work engagement foster work-related outcomes through enhancing employees’ adaptive performance during organizational changes.

**Design/Methodology/Approach/Intervention**
We utilized a two-wave longitudinal survey sample with one-year interval (N=2453). The respondents were Finnish municipality workers who experienced changes in their work due to nationwide change initiatives. To model within-person changes in the constructs, data were analyzed by using latent change score modeling.

**Results**
The findings showed how employees’ favorable perceptions of servant leadership were related to increases in work engagement. Increases in engagement in turn were associated with increases in adaptive behaviors (i.e., creativity, stress management, team adaptation, and reactivity). Especially increases in stress management were consequently related to increases in work performance and commitment, whereas increases in team adaptation mitigated burnout.

**Limitations**
The use of survey data and lack of temporal separation between the examined latent change scores limits causal inferences.

**Research/Practical Implications**
These findings provide new insights regarding the importance of leadership and work engagement as antecedents of employees’ adaptive performance in the context of organizational changes. Amongst the four types of adaptive behaviors, the results suggested that team adaptation and stress management are most important for fostering employees’ performance and commitment, and reducing burnout.
**Originality/Value**

Whereas prior organizational research has investigated antecedents of adaptive performance and work engagement, this is the first study that shows (a) how work engagement may affect adaptive behaviors and (b) how different types of adaptive performance influence work-related outcomes during organizational changes.

**Title (3)**

Effects of a change-oriented training in transformational and instrumental leadership: A two-study experiment.

**Name and affiliation of the authors**

Catrin Millhoff (TU Dortmund, Germany)

Jens Rowold (TU Dortmund, Germany)

**Purpose**

Leadership plays a key role in the implementation of organizational change processes. Previous studies show that transformational (TL) and instrumental (IL) leadership in particular have a positive effect on implementation. Based on these findings and the assumption that both leadership styles are learnable as behavior-based leadership concepts, this study pursues the goal of evaluating a training on TL and IL and showing positive effects on change-relevant criteria.

Specifically, we posit a moderated mediation model in which the training variable moderates the indirect effects of the difference values of IL and TL between the pre- and posttest on the difference value of change outcomes.

**Method**

According to a pre-test post-test control group design, data were collected about 1 months before and 4 months after training. The experimental group (EG) consists of N = 59 and the control group of N = 54 executives.

**Results**

RM-Ancova and multilevel path analysis showed significant positive differences between the estimated leadership behaviors before and after training. Additionally, the indirect effects of the difference values of leadership on the change outcomes were significant for leaders of the EG.

**Limitations**
The internal validity of the study is low and no statements can be made about a long-term effect of the training.

**Implications**

The two-day training efficiently supports executives through change. The high demand for evaluated training concepts has been met so far only with a few empirical studies.

**Originality**

This study demonstrates a high level of practical orientation and extends the previous research on a training approach to the development of IL.

**Title (4)**

Empowering leadership and organizational trust: Implications for intentions to resist future change

**Name and affiliation of the authors**

Pedro Neves (Nova School of Business and Economics, Portugal)

**Purpose.**

Change events do not occur in a vacuum and are strongly influenced by a long time span. However, most change efforts are prepared as the beginning of a new cycle, rather than a part of the organizational life cycle. Although recent research has signaled the importance of taking into account individuals’ intentions to resist future change (Neves et al., 2018), there is still little research on its underlying process. Our study examines the roles of two key factors, empowering leadership and organizational trust, on intentions to resist future change.

**Design/Methodology/Approach/Intervention.**

Our sample was composed by 300 employees (who rated their psychological and structural empowerment, organizational trust and intentions to resist future change) and their respective supervisors (who rated their own empowering leadership).

**Results.**

Our findings suggest that empowering leadership, via structural and psychological empowerment, predicts intentions to resist future change. The structural empowerment - intentions relationship is largely conditional on the levels of organizational trust.
Limitations.
Cross-sectional design.

Research/Practical Implications.
The main implications are that a) organizations need to take into account intentions to resist change and b) shows that empowerment efforts do not always work. It also sheds light to the need to prepare for change in times of stability and provides tools that can help employees make sense of organizational life.

Originality/Value.
Our findings advance our (yet scarce) knowledge of the antecedents and mechanisms that predict intentions to resist future change and show that the process involves multiple factors simultaneously.

Title (5)
Organisational structure, climate and culture: Conceptual issues and empirical evidence regarding working conditions and individual outcomes of leaders and employees

Name and affiliation of the authors
Corinna Steidelmueller, German Federal Institute of Occupational Safety and Health
Anja Wittmers, German Federal Institute of Occupational Safety and Health

Purpose
The purpose of this review is to analyse the associations of organisational structure, climate and culture with working conditions and individual outcomes for both leaders and followers.

Design/ Methodology
We conducted a scoping review to identify and summarise corresponding research. We scanned the databases Medline, PsycINFO, PsycARTICLES, PSYNDEX and EconLit using relevant key terms. To get at a manageable number of studies, we concentrated our search on reviews and meta-analyses. After removing duplicates and irrelevant articles, we included 56 articles in a qualitative synthesis. The appraisal of the manual search is still in progress.

Results
A narrative overview of the results will be provided based on a developed category system of structure, climate and culture elements. The preliminary results of our review confirmed presumed,
direct associations with health, attitude and behaviour variables, but also reveal a highly undifferentiated use of terminology, conceptual difficulties and empirical research gaps.

**Limitations**
Due to the broad research question we revealed a completely heterogeneous field of evidence. A more focused search on primary studies should be undertaken subsequently.

**Implications**
The scoping review emphasizes the necessity of a substantiated and distinct definition of organisational constructs as well as a careful selection of adequate measuring tools. Moreover, valuing leadership as a key function in dynamic change processes, we should consider more perspectives and possible factors of influence in leadership research.

**Originality/ Value**
This review highlights the impact of organisational frame conditions on multiple variables and contributes to its purposeful application in work and organisational psychology.
828 - LEADING FOR CREATIVITY AND INNOVATION

Proponents: Eric Rietzschel (University of Groningen), Barbara Wisse (University of Groningen and Durham University), Diana Rus (Creative Peas and University of Groningen)

State of the art: This symposium takes a new look at two core organizational constructs: leadership and creativity/innovation. Although leaders have long been acknowledged to be a crucial influence on creativity and innovation, this symposium aims to broaden our view, addressing questions such as: do people have different prototypes of creative leaders versus generic leaders, how does ambidextrous leadership contribute to team innovation, at which levels can leadership or management affect employee creativity, and how does leader emotion regulation shape team creativity?

New perspectives/contributions: This collection of presentations highlights new research in leadership in the innovation process. With a wide variety of topics (ranging from the importance of leader personality and ambidexterity to the effects of leader emotional competencies and leader prototypes), and employing a variety of methodologies (from experimental and field research to meta-analytic review), this symposium showcases the leadership research of the future.

Research/practical implications: The research presented in this symposium will contribute to a shift in our thinking about leadership, emphasizing (a) the multilevel nature of leadership, (b) the various (e.g., emotional) competencies leaders may need over and above ‘classic’ and unidimensional leader skills, and (c) the importance of (meta-analytic) integration of the field. Ultimately, this research will enable leaders as well as their followers to achieve their ultimate aim: working for the greater good.

Presentation 1

Title: Leaders’ Emotional Regulation Strategy and Team Creativity

Authors: Qin Zhou and Yitao (Dorothy) Qian (Durham University Business School)

Purpose: We proposed a model that explains the processes through which leaders’ emotional regulation strategies influence team creativity. We specifically focus on two emotional regulation strategies (reappraisal and suppression) that have been shown to have differential implications in interpersonal contexts.

Methodology: We tested the model with survey data drawn from a sample of 49 teams (144 employees) from an elevator manufacturer in China.

Results: Results showed that reappraisal, compared to suppression is more effective in fostering a positive team climate leading to creativity. However, the positive indirect effect of reappraisal on team creativity via positive team climate is stronger when team interdependence is high rather than low.

Limitations: The results need to be interpreted with cautions given the small sample size and the cross-sectional design.

Practical Implications: When confronted with negative situations, leaders could encourage teams to alter their perceptions of the cause of the problem, rather than suppress negative emotions. In so doing, leaders could foster a positive team climate leading to team creativity. This could be particularly effective when team members rely on each other to accomplish their tasks.
**Originality/Value:** Although leaders are known for their influences on employees’ emotions and creativity, it remains unclear whether leaders can manage team emotions to influence team creativity. Our study is an initial effort to address this knowledge gap.

**Presentation 2**

**Title:** Ambidextrous Leadership: Balancing Opening and Closing Behaviors for Creativity and Innovation.

**Authors:** Jesus Mascareno (University of Groningen); Barbara Wisse (University of Groningen, Durham University); Eric F. Rietzschel (University of Groningen)

**Purpose:** Creativity (idea generation) and innovation (the promotion and implementation of these creative ideas) are important for organizational performance. Unfortunately, however, creativity does not always translate into innovation. We argue that both employee creativity and the transition from creativity to innovation could benefit from the flexibility of ambidextrous leadership, because ambidextrous leaders display both opening behaviors (fostering exploration) and closing leader behaviors (fostering exploitation), as the situation requires. In the current study, we test the hypothesis that opening leader behaviors stimulate innovation by promoting creativity, but that the relationship between creativity and innovation will depend on whether the leader also shows closing behaviors.

**Design/Methodology:** We collected survey data from 201 dyads of leaders and followers in Dutch organizations across different industries.

**Results:** Consistent with predictions, we found that opening leader behaviors predicted innovation by promoting creativity. Moreover, as expected we found that closing behaviors strengthened the relationship between creativity and innovation.

**Limitations:** The correlational nature of the study does not allow us to establish a causal relationship.

**Research/Practical implications:** Our results suggest that leaders should display opening leader behaviors to foster employee creativity. However, in order to stimulate the promotion and implementation of ideas, leaders should supplement this with closing behaviors. **Originality/Value:** The transition from creativity to innovation is still understudied, and we need a better understanding how leadership can contribute to this process. Our research contributes to this.

**Presentation 3**

**Title:** The Creative Leader: Competent but not Warm

**Authors:** Roni Reiter-Palmon (University of Nebraska, Omaha), Tiffany Keller-Hansbrough (Fairleigh Dickinson University)

**Purpose:** To examine how the creative leader prototype differs from that of a generic leader.

**Methodology:** Two studies were conducted. 1) 240 students in 6 conditions described a creative leader, effective leader, ineffective leader, leader of a creative team, leader of an effective creative team, or leader of an ineffective creative team. 2) 660 respondents in 2 conditions indicated how well
124 items generated from Study 1 as well as items from other ILT measures described a creative leader or leader of a creative team.

**Results:** Creative leaders were described as intelligent and gifted but not kind and warm. However, leaders of creative teams were described in line with characteristics previously associated with generic leaders.

**Limitations:** Samples drawn from student and MTURK populations may not be representative.

**Research/Practical Implications:** Creative leaders were considered competent but not warm. This suggests that creative leaders may be given greater latitude for negative, or even abusive, behaviors in organizations. This exception making is consistent with Hollander’s (1958) notion of idiosyncrasy credits whereby exemplary group members are allowed greater deviation from group norms.

**Originality:** Previous research primarily focused on the characteristics associated with typical leaders. Our work provides insight into what individuals think about a specific type of leader—the creative leader.

**Presentation 4**

**Title:** Trying is not Enough: A Three-Level Multilevel Approach to the Effort–Output Relationship in Employee Creativity

**Authors:** Bart Verwaeren and Tim Vriend (University of Groningen)

**Purpose:** Researchers and practitioners often assume that employees can come up with creative and innovative ideas simply by putting in the effort. Empirical evidence of this relationship, however, is mostly inconsistent and far from conclusive. In this study, we adopt a multilevel interactionist approach to explore how team- and organization-level characteristics moderate this inconsistent individual-level relationship between employees’ creative process engagement and creative outcomes. We argue that team leaders and organizations have the ability to provide a supportive environment for creativity by providing autonomy and support to their employees to facilitate (or hinder) creative efforts.

**Method:** We collected multilevel survey data comprising 580 employees, 127 teams, and 22 CEOs employed in 23 SMEs.

**Results:** Controlling for personal and job characteristics, we find partial support for our hypotheses. Specifically, the results show a stronger relationship between creative efforts and outcomes when leaders openness is high and when organizational norms for creativity are stronger.

**Limitations:** The cross-sectional nature of the data limits the conclusions regarding the causal effort-outcome relationship.

**Research/practical implications:** The results shed light on the creative effort–outcomes relationship, a topic of concern for theorists of creative processes, but also a common problem for organizations not fully realizing their creative potential.

**Originality/value:** While recently some work has started to examine the relationship between creativity and innovation, this work zooms in on the relationship between individual creative efforts and leader-rated creative outcomes.
Purpose: We aim to provide a meta-analytic review on the role of leadership in team creativity and innovation, studying leadership as (1) a *predictor* of team creativity and innovation, (2) a *moderator*, and (3) a *catalyst* that strengthens the link between creativity and innovation.

Design/methodology: After a systematic literature search and subsequent screening of the database, we will collect and synthesize the relevant statistics in a meta-analytic procedure according to Borenstein, Hedges, Higgins, and Rothstein (2009). Notably, while some aspects of leadership (such as transformational leadership, LMX, and ambidexterity) have regularly been linked to team creativity/innovation, others have not (such as authoritarian leadership).

Results: We are currently in the process of compiling the database, and expect to have preliminary results soon. We expect that leadership is effective both as a predictor and a moderator, but that its role as an innovation catalyst cannot yet be reliably assessed.

Limitations: Much of the literature is correlational in nature, precluding causal conclusions. The file-drawer problem may raise questions related to the validity of the conclusions of any meta-analysis.

Research/practical implications: Our results identify crucial knowledge gaps and help us to outline a future research agenda. Getting reliable estimates of effects will also be crucial for effective intervention and/or leadership training.

Originality/value: Although practitioners and researchers alike claim that leadership is crucial for team creativity and innovation, previous meta-analyses have not focused on this specific link.
State of the art
Although studies have shown that leadership training has a positive impact on leadership behavior and performance (e.g., Barling et al., 1996; Hardy et al., 2010) the range of effects have been found to be inconsistent and large variability in effect size has been found (Avolio et al., 2009). More research are needed on factors that help explain when and why leadership training is effective. The purpose of the present symposium is therefor to present new and innovative approaches to leadership training that may shed light on this issue.

New perspectives/ contributions
The five presentations in this symposium contribute to the leadership literature by evaluating safety specific leadership training, examining how leader-team perceptual distance may predict outcomes of leadership training, identifying factors support leaders’ adherence to digital training of leaders, exploring contextual antecedents to intervention specific leadership during an organizational intervention as well as identifying factors that facilitate transfer of leadership training (i.e., the application of new knowledge and skills back at work).

Research/Practical implications
The present symposium will enrich our understanding of how to approach leadership training, as well as expanding our knowledge of when, why, and for whom leadership training is effective. Three important lessons will be learned; 1) whom shall organizations send to leadership trainings, 2) how context may influence leaders’ ability to develop during training 3) how the use of new knowledge and skills may be maximized when leaders return to work.

Purpose: This study provides an initial evaluation of the S.A.F.E.R. (Wong, Kelloway & Makhan, 2015) model of training safety leaders. Rooted in safety specific transformational leadership (Mullen & Kelloway, 2009), the S.A.F.E.R. model focuses on five key leadership behaviors: Speaking about safety, Acting safely, Focusing on safety, Engaging others in safety and Recognizing safe behaviors.

Design: We conducted a two-wave longitudinal survey of operational employees at a large bus company. Just after T1 data collection all leaders in the organization participated in S.A.F.E.R. leadership training. A matched sample of 245 employees completed measures of S.A.F.E.R. leadership, safety compliance, safety participation and injuries.

Results: Participants reported increased perceptions of S.A.F.E.R. leadership from T1 (M= 5.40) to T2 (M=5.79). Longitudinal mixed model regressions with participants nested within leaders showed that S.A.F.E.R. leadership was associated with changes in safety participation (b=.26, p < .01) and safety compliance (b=.40, p < .01) but was not associated with changes in injuries.

Limitations: The lack of a control group makes it impossible to unambiguously attribute changes to the training.

Implications: The results of this initial study are promising in suggesting that S.A.F.E.R. leadership is associated with significant improvements in organizational safety outcomes.
Leader-Team Perceptual Distance on Organizational Practices Affect Outcomes of Leadership Training

Susanne Tafvelin1,2, Robert Lundmark1 Karina Nielsen3, Ulrica von Thiele Schwarz1,4 & Henna Hasson2,5

4 Mälardalen University
5 Centre for Epidemiology and Community Medicine, Stockholm County Council, Sweden

Abstract

Background and Purpose
Whether leaders and their teams agree or not on perceptions of the work environment has been found to impact follower well-being and performance. Less is known about how agreements or disagreements play a role in relation to leadership training. The present study examined how leaders’ and followers’ perceptual distance on organizational practices prior to a leadership training is related to outcomes of leadership training.

Method and Results
The present paper is based on data from a natural experiment; a leadership training program in the Swedish forest industry. Thirty eight leaders and their employees completed surveys before and after training. Polynomial regression with response surface analyses revealed that the agreement between leaders and their followers regarding organizational practices including innovation, formalization, and employee orientation before training was positively related to training outcomes in terms of improved transformational leadership. Leaders who rated formalization and employee orientation higher than their employees before training had less favorable training outcomes.

Limitations and Implications
There was no control group that did not participate in the leadership training, therefore causal inferences cannot be made. However, our study suggests that agreement between leader and their teams on perception of the organization impacts outcomes of leadership training, and organizations therefore needs to consider these prior to training.

Originality/Value
The study contributes to the literature on leadership training, by suggesting that leader-team perceptual distance may influence the effectiveness of leadership training.

Title
Digital training of leaders for team development: What factors support adherence?

Purpose
Intervention research recommends a two-step approach to health-oriented team development: First, team leaders are trained to see, talk and act on the issue of work and health. Second, they analyse job demands and resources together with their team and develop improvement actions. We developed a fully automatised tool («wecoach») that guides leaders through such a team development process, by means of a rule-based chatbot, training materials, surveys and online tools. In this study, we analyse what factors support the leaders’ adherence to the wecoach during the training phase.

Design/Methodology/Approach/Intervention
The wecoach inherently collects data on context, process and outcome. During the e-coaching process, the leader answers short surveys and fills in various forms. We implemented a range of scales, measuring self-efficacy in regard to team development, previous experience, health awareness, readiness for change, implementation leadership, team climate, perceived risks and chances, and usability perception. With regression analysis, we will analyse what factors predict a leader’s adherence to the wecoach and her/his intention to follow through with the team development.

Results
Preliminary results will be presented at the conference.

Limitations
Due to the novelty of this research, many scales had to be adapted or newly developed.

Research/Practical Implications
These results will inform other researchers developing online tools on the factors supporting adherence and what needs to be considered in their design.

Originality/Value
Presently, we are not aware of any other fully automatised digital trainings for team leaders.
STUDY 4:

TITLE: Learning to lead the change - the importance of manager, unit and context factors for iLead

Authors:
Marta Roczniewska, Ulrica von Thiele Schwarz, Henna Hasson, Anne Richter
1Karolinska Institutet, Stockholm, Sweden
2Mälardalen University, Västerås, Sweden

Purpose
Although organizations introduce changes quite frequently, research shows that two-third of changes introduced in service organizations fail. This has tremendous consequences for the organization, the employees, and service-receivers, e.g. patients in healthcare. For that purpose we designed and implemented a transformational leadership intervention (iLead). In this study, we investigate if outcomes of the intervention are conditional on managers' motivation to participate, work group's ability to participate in the change, their perception of fit and opportunity as well as social resources on the work group level.

Design/Methodology/Approach/Intervention
The intervention was conducted in healthcare sector in Stockholm County (Sweden), where first- and second-line managers were invited to participate. The intervention comprised five half-day workshops, where managers developed implementation skills that they could use for the upcoming changes in their units. We also included a control group. We applied questionnaires at three time points (pre-, directly after the intervention, and 6 months post-intervention) along with qualitative interviews to assess (1) intervention effectiveness, and (2) the influence of implementation skills on subordinates' well-being during the changes.

Results Preliminary analyses showed the importance of context factors for the outcome of the implementation leadership intervention.

Limitations
The relatively small number of units (level 2) poses a threat to the power of the multilevel analyses.

Research/Practical Implications
The results demonstrated that implementation skills are generic leaders' abilities that can be trained, however that context factors are of importance.

Originality/Value
This intervention is a novel contribution to the implementation literature, demonstrating the importance of manager as well as context factors to understand the outcomes of an intervention.
STUDY 5:

**Title:**
The association between span of control, leadership style, and employee outcomes in conjunction with a leadership training

**Authors:**
*Lundmark, Robert, PhD, & Tafvelin, Susanne, Associate professor, Umeå University*

*Corresponding author

**Purpose:**
As the role of line managers becomes more salient during organizational interventions, span of control can lead to more, or less, opportunities for high-quality interactions, time to plan for activities and follow-up of intervention goals, ultimately influencing the possibilities for leadership training transfer, and in the long run outcomes of the intervention. Thus, the purpose of the study to examine the prospective relationship between span of control (as a contextual antecedent), line managers’ constructive and destructive intervention leadership, and intervention outcomes.

**Design:**
Data is collected from an organisational intervention which initially focused on training managers in intervention-specific leadership as a pre-intervention component. Multilevel analysis in Mplus will be used to analyse the data.

**Results:**
Preliminary analysis has shown that span of control is related negatively to a constructive intervention leadership, and positively to a passive destructive intervention specific leadership.

**Limitations:**
Limitations include a relative small number of workgroups for multilevel analysis, and only studying one contextual antecedent.

**Implications/Originality:**
Assessing contextual conditions can help secure the resources needed for line managers to lead interventions effectively after training. This is the first study investigating the influence of destructive forms of leadership during organizational interventions, it is also the first to consider the importance of span of control as an antecedent to different forms of intervention leadership.
840 - EXPLORING THE COMPLEXITY OF LEADER-FOLLOWER RELATIONSHIPS

Co-Chairs: Kerrie Unsworth & Elisa Adriasola

State of the Art
We know that leader-follower relationships are key to strong performance and well-being. One theory has dominated research into these relationships – leader-member exchange. While this theory has provided a substantial bank of knowledge, we must move beyond to understand wider dynamics of leader-follower relationships.

New Perspectives and Contributions
In this international symposium we examine the complexity of leader-follower relationships. Adriasola investigates how people can be both a leader and a follower while engaging in shared leadership in Chile; Wang and Unsworth explore how a pre-existing friendship with a start-up leader can affect followers’ engagement in the UK and China; Foti tests the effect of the pattern of congruence between leaders’ and followers’ implicit theories on relational outcomes in the US; and Song and colleagues show that paradoxical leader behaviour can undermine the effects of a good leader-follower relationship on firm performance in China. Kevin Lowe, University of Sydney, Australia, will synthesize the implications of the papers and identify future research directions.

Research and Practical Implications
The symposium demonstrates the need to go beyond LMX and engage in broader dyadic theorising and research. Across longitudinal, multi-source and qualitative data, and using both inductive and deductive approaches, we highlight the need to question taken-for-granted assumptions about the relationship between leaders and followers.
Effects of Dyadic Personality & Task on Shared Leadership
Elisa Adriasola, Giuliani Coluccio, Alvaro Espejo
Universidad Adolfo Ibanez, Chile

Purpose
In a dynamic, complex environment, a leader needs to be able to take a backseat and get advice from his/her followers. But what affects a leader’s ability to not only influence others’ but also accept influence from others? In this study we explored how conscientiousness and agreeableness within the dyad related to shifting roles from leading to following and from following to leading.

Methods
We collected data from 233 hospital employees working in 61 teams. We measured personality at baseline and then shared leadership at the end of four consecutive work-shifts.

Results
We found that dyads in which both individuals rated themselves highly in conscientiousness were more likely to shift leading and following roles related to task. However, task difficulty moderated this relationship, such that when the task was perceived as more difficult, there was less shifting between leader and follower roles.

Limitations
Self-report data although longitudinal collection.

Implications
We show that high dyadic conscientiousness, particularly when tasks are not difficult, can create the requisite complexity and the ability to provide adaptive dyadic responses to the environment.

Value

Dyadic relationships often function with a power structure already defined, such is the relationship of the leader and the follower. It has been argued that requisite complexity can come from individuals (i.e., leaders), but also can be co-created within dyads and teams. Our study is one of the first to look at the combination of the leader, the follower and the situation on shared leadership.
Congruence of leader and follower ILTS affecting relationship quality
Roseanne Foti
Virginia Tech University, USA

Purpose
Leader-follower relationships are assumed to rely on similar beliefs about leadership and followership but research has not directly addressed the patterns of congruence. The purpose of this study was to investigate different patterns of implicit theory congruence at the leader-follower dyad level.

Methods
Latent class analysis (LCA) was used to describe classes of leader-follower dyads with specific patterns of prototype congruence. A multivariate general linear model (GLM) was constructed to compare within class means on LMX, perceived support, and perceived contribution, as rated by both dyadic partners. Finally, relational outcomes were tested for mean-level differences by gender.

Results
Results showed that while congruence between partners on one role (e.g. leader) improves that partner’s perception of the relationship (e.g. leader rated relationship quality), congruence on both roles is needed to achieve mutually high ratings of relationship quality.

Implications
The maintenance of high quality relationships is important for both partners in a leader-follower relationship. This research shows that to achieve those high quality relationships, both the leader and the follower need to have congruent expectations of each other.

Value
The extent to which leaders and followers hold similar ILT’s has been shown to impact leaders’ assessment of relationship quality, while similarity on IFT’s predicts follower assessed relationship quality (Engle & Lord, 1997; Coyle & Foti, 2015, Topakas, 2011). To date, however, all investigations of congruence have used variable-oriented analyses which assume characteristics specified in implicit theories (e.g. intelligent) are equally meaningful.
How do Pre-Existing Friendships Affect the Leader-Follower Relationship and Engagement in Small Start-ups?
Mingchu Wang & Kerrie L. Unsworth
University of Leeds, UK

Purpose
Start-up founders often look to their own network first when recruiting staff. But 93% of start-up leaders report problems associated with pre-existing friendships (PeopleCapital, 2016). We therefore investigated both leaders’ and followers’ perceptions of pre-existing friendships in affecting employee work engagement.

Methods
We interviewed five leaders and 10 friend-followers across five start-ups in China (more interviews are planned with another 9 companies). Participants were chosen to represent gender, age and tenure of both leaders and followers. We used inductive grounded-theory-type analyses.

Results
We identified a friendship taxonomy based on interaction frequency and friendship length: companion, acquaintance, encounter and latency. This affected engagement directly but engagement was also influenced by identity (boundary) and power (balance) conflicts originating from both leaders’ and followers’ viewpoints. A process model was developed.

Limitations
The interviews were done at one point in time; ideally these would be longitudinal to unpack relationship development. We also took a relatively simplistic view focusing on the dyadic relationship but co-founders and multiple friendships will need to be examined in future research.

Implications
From the perspective of start-up founders, this research offers insights on psychological preparation and coping techniques for selecting, recruiting, maintaining and motivating friend-followers.

Value
Very little research has examined pre-existing friendships and nothing has looked at its role in followers’ work engagement in the start-up context.
Is Paradoxical Leader Behaviour Really Helpful? A Moderated Mediation Test of CEO LMX with Followers, Entrepreneurial Orientation and Firm Performance
Lynda Song, Jinyun Sun, Linyi Ouyang, & Byron Lee
Renmin University of China, Fudan University, Renmin University, China Europe International Business School

Purpose
This study examines the effects of CEO and followers’ relationship (LMX) on various measures of other-rated firm performance in entrepreneurial firms. We develop and test a moderated-mediation model based on identity theory showing that CEO’s paradoxical leader behaviour moderates entrepreneurial orientation (EO)’s mediated effect between LMX and firm performance.

Methods
We sampled 169 start-up firms and measured the CEO’s LMX, EO (Covin & Slevin, 1989) and paradoxical behaviour (Zhang et al., 2014) and an external rating of firm performance (McDougall et al., 1994).

Results
Results from a sample of 169 firms show a positive impact of LMX on EO and firm performance, while EO mediates the relationship between LMX and performance. Led by CEOs with high quality LMX, start-ups are more innovative, proactive, and risk-taking, which results in higher performance. During this process, the positive impact of EO on firm performance is undermined by paradoxical CEO leadership behaviours, specifically, their uncertain management style regarding task rigid/flexibility, uniformed/individualized deals and self-/other-centeredness create ambiguity of identity in start-ups, which leads to lower firm performance.

Limitations
These data were taken at one point in time, although common method bias is minimised due to multiple sources.

Implications & Value
Our exploration of relationship between leader and followers demonstrates the need for CEOs to (1) develop a high quality relationship with subordinates, and (2) behave consistently in their leadership behaviours instead of demonstrating paradoxical leadership behaviours in order to improve firm performance.
Significant PLB Sub-dimensions in Moderation

**Uniformly**
Treating subordinates uniformly while allowing individualization

**Enforcing**
Enforcing work requirements while allowing flexibility

**Centered**
Combining self-centeredness with other-centeredness
848 - USING PERSONALITY TYPE TO ENHANCE WELL-BEING IN THE MODERN WORKPLACE

Chairperson: John Hackston, OPP Ltd.

State of the Art

Can the personality type help individuals cope with new workplace trends, or even enhance wellbeing? This symposium presents research findings, practical applications and a case study exploring this topic.

New Perspectives/Contributions

Contributions include:

- **The role of personality in the ‘always on’ culture**, where smartphone internet access is available 24/7. The research demonstrates how this relates to workplace stress and presents personality-based guidelines for managing the ‘always on’ culture.

- **Gig work: Does personality matter?** Research identifies personality differences in why individuals become gig workers and what is seen as good and bad about gig work; guidelines for workers and organizations are presented.

- **The impact of personality on exercise preferences and attitudes**. Although exercise has positive health impacts, many people aren’t exercising enough. This research examines the impact of personality on preferences for and attitudes about exercise and can form the basis for developing customized personality-based exercise feedback.

- **Workplace well-being: gender, occupation, age and personality influences**. Identifies links between well-being at work, age, gender, occupation and personality type in a global sample of over 10,000 individuals.

- **Using type to navigate organisational change within Macmillan Cancer Support**. Explores how the authors worked with a large, recently-merged delivery team as they underwent significant organisational restructure and change.

Research/Practical Implications

Many individuals already know their MBTI personality preferences; this symposium demonstrates how this knowledge can be used to enhance wellbeing.
The role of personality in the “always on” culture

Nikhita Dost, OPP Ltd (presenter).
Helen Rayner, OPP Ltd.

Purpose
To understand how people of all personality types navigate the “always on” culture, in which smartphones and internet are available 24/7 and people struggle to “switch off”.

Design/Methodology
Results below are based on a preliminary sample of 274 survey respondents. Respondents answered questions about their MBTI personality type, behaviour, stress and organisational culture. Data collection is ongoing (current n=1056) and full results will be reported at the conference.

Results
• Those with access to work emails at home reported more difficulty switching off, compulsive checking of phones and work-home conflict, than those without. However, they also reported higher work engagement and satisfaction.
• Introverts had a greater desire to keep work and home life separate than Extraverts. Stress and difficulty switching off was more likely for those preferring Judging (preferring structure and closure) than those preferring Perceiving (preferring flexibility and keeping options open).
• Respondents reporting greater job-related stress reported greater work/home conflict, difficulty switching off, distraction and compulsive phone checking. They were also less likely to have a workplace culture of separating work and home.

Limitations
Correlations show relationships exist, but not why.

Research/Practical Implications
This research suggests organisations should minimise workplace stress by creating a culture of switching off from work. The results also inform personality-based guidelines for managing the always on culture, which attendees will receive.

Originality/Value
This study is the first to explore links between the always on culture and personality.
Gig work: Does personality matter?

John Hackston, OPP Ltd.

Purpose

Gig workers are essential to many organizations, forming a significant part of the workforce. This study investigated how personality and other factors relate to gig work, in order to help gig workers thrive and organizations manage them.

Design/Methodology

1,308 individuals completed an online survey about their gig and/or regular job and provided their MBTI personality type.

Results

Compared with others, gig workers were more likely to:

- Have an Intuitive personality type
- Rate their job as enjoyable, flexible and financially rewarding (but as less empowered and with less additional benefits)
- See autonomy and flexibility as the best thing about their job and insecurity and uncertainty as the worst

Analysis suggested three factors underlying why people became gig workers; positive reasons, temporary or contingent reasons, and needing to work.

Limitations

The research used a correlational design and a convenience sample, largely in ‘white collar’ roles; however skilled workers do make up a large proportion of the gig economy (Burke & Cowling, 2015).

Practical Implications

People with different personality type preferences mentioned different features as the best and worst things about gig work. This was used to develop guidelines for people of each type. Organizations can use the findings to help keep valuable gig workers engaged; for example, providing opportunities for autonomy and flexibility.

Originality/Value

There has been little systematic research into how an individual gig worker’s personality relates to how they thrive at work.
The Impact of Personality on Exercise Preferences and Attitudes

Nancy A. Schaubhut, CPP Inc. (presenter)
Richard C. Thompson, CPP, Inc.

Purpose

Exercise is the single best way to improve health. Research shows it has a positive impact on every aspect of health including physical, mental, and cognitive. Yet, too many people around the world aren’t getting enough exercise. This study examines whether personality impacts people’s preferences for and attitudes about exercise. Findings can be used for developing customized personality-based exercise feedback.

Design

International survey data was collected from 722 individuals who responded to exercise-related items on topics such as activities, reasons, interest in company-sponsored support, and barriers to exercise. Participants previously completed the MBTI® and opted-in to participate in research. Analyses were conducted to examine differences based on personality.

Results

T-tests showed differences in exercise preferences and attitudes between MBTI types. The most differences occurred on the TF, JP, and EI pairs. Extraverts were more open to using resources if offered by their employers, including discounted gym memberships, fitness classes at work, and lunchtime walking groups. There were differences in reasons for exercising, with those preferring Feeling more likely to exercise to reduce stress, boost confidence, and sleep better. People preferring Perceiving were more likely to/want to engage in 17 different activities, from swimming to dancing to tennis.

Limitations

This study is reliant on self-report data.

Research/Practical Implications

This research demonstrates potential value in providing customized exercise-related feedback based on differences found between personality types.

Originality/Value

There has been limited research using personality type to examine exercise preferences, although the MBTI is widely used in other contexts.
Title: Workplace Well-being: Gender, Occupation, Age and Personality Influences.

Richard C. Thompson, CPP Inc. (presenter)
Martin Boult, CPP Asia Pacific
Nancy A. Schaubhut, CPP, Inc.

Purpose
An increasing body of research has identified how a person’s well-being influences a wide range of life outcomes, including health, relationships, academic performance, creativity, collaboration, and income (Amabile, Barsade, Mueller, & Staw, 2005; Bryson et al., 2014; Diener & Tay, 2012; Heintzelman & King, 2014; Khaw & Kern, 2015; Lyubomirsky, King, & Diener, 2005; Seligman, 2011; Swart & Rothmann 2012). This study explores the links between well-being at work, age, gender, occupation and personality type in a global sample.

Design/Methodology
In 2016, 2017, and 2018 over 10,000 combined international respondents rated their well-being on a measure of workplace well-being derived from Seligman’s (2011) PERMA (Positive emotions, Engagement, Relationships, Meaning and Accomplishment) model of well-being. In addition, key demographic items and personality type measured by the MBTI® were obtained.

Results
Results showed differences in workplace well-being based on age and occupation, with differences in the specific elements of well-being being higher or lower. The study also shows some dispositional differences in workplace well-being based on personality type. Unexpectedly, there were no differences based on gender.

Limitations
All data was self-report from samples of convenience.

Research/Practical Implications
The study shows workplace well-being is generally high, and that age and occupation along with personality type play roles in workplace well-being. The findings provide insights for practitioners involved in assessing and developing employee well-being.

Originality/Value
The study is the only multi-year international evaluation of workplace well-being known to the authors.
Using type to navigate organisational change within Macmillan Cancer Support

Alice King, OPP Ltd (presenter)

Catherine Ellwood, OPP Ltd

State of the Art

Increasingly organisations report that they are operating in a state of almost constant change and flux, all of which can be unsettling and disruptive for employees. An understanding of our own and others’ reactions to change can help individuals and teams navigate organisational transitions – allowing them to better support themselves and each other to maintain individual well-being and organisational performance.

In this paper, we explore how we worked with a large, recently-merged delivery team from Macmillan Cancer Support as they underwent significant organisational restructure and change.

New Perspectives/Contributions

Taking place over a period of more than two years, this paper explains how we used tools, including the Myers-Briggs Type Indicator (MBTI) to raise awareness, build relationships and prepare the team for the challenges ahead. Participants will understand how we designed, delivered and evaluated a multi-event team development programme, working in close partnership with a client for an extended period of time.

Practical Implications

This paper will provide facilitators and practitioners with support and ideas when looking to work with individuals and teams going through significant change. It will also provide practical examples to bring personality and psychological theory to life – demonstrating how these ideas can have real organisational benefit.

Originality/Value

It is unusual to be able to share the experience of working at depth with one team across several years.
State of the Art

The experience of employees inside classic American companies is changing faster and faster, while it also varies company by company. There is a quickening and more intense focus on productivity and results that can hurt professional relationships, physical well-being and career satisfaction. In some companies, while new technology can inspire awe and grow business, plenty of employees are worried about losing their jobs to artificial intelligence, robots, while there is little understanding of what these changes will impact, how, when, and how significantly. In yet other companies, one can find focus on work-life balance, respect, growth, ethics, and human collaboration.

**New contributions** proposed in this symposium include practical understanding and effective working with organizational culture that drives results; the concept of intrapreneurship as a driving force of innovation and engagement; internalities as processes that shape and impact employee experience; storytelling as a leadership and change tool. As the symposium tackles promoting employee excellence from different angles, the presentations are united by a common belief that when employee succeeds, the organization succeeds.

Research / Practical implications

When employee is perceived as a business partner who helps driving the business forward, it drives results for the company bottom line. The symposium discusses practical ways of achieving that excellence for employee, enterprise, and their partnership.

**Leverage, Align, Transform, or Design? How to Do Culture Work That Drives Results**

Olga Tararukhina, Ph.D., Allstate Insurance Corp.

**State of the Art**

Changing organizational culture is a hot topic for organizations and organizational consultants today. Books, magazines, podcasts, consulting methodologies seem to emerge every day. Most approaches to working with organizational culture are lacking something: sometimes lacking practicality, equating culture to engagement, reputation, employee morale, or otherwise simplifying a complex phenomenon; other ones not looking at the relationship between culture and business/operating strategy; or proposing to measure culture through
self-reporting surveys; or not making a difference between different life stages or situations that companies go through; otherwise prescribing a culture that is good for every company.

**New Perspectives/Contributions**

The approach proposed here is offering an answer to all of these concerns: a coherent theory of what is organizational culture, its 5 layers, leverage points that provide the opportunity for the most impact when influencing culture; ways of effective study, diagnose, and measurement of culture.

**Research/Practical implications**

This approach provides actionable insights that drive bottom line in a practical way; as well as four ways of working with culture at different stages and needs of organizational lifecycle: starting a new organization, sagging productivity and performance, need to respond to significant changes in the company environment, or mergers-acquisitions.

**Originality/value**

This approach, grounded in processes of social learning, combining the empirical and theoretical approaches to diagnosis, measurement, and execution, has been tested multiple times within different organizations, and produced impactful and actionable results.

**Maria Odiamar Racho, MSOD, Allstate Insurance Corp.**

**Gifford Pinchot III, Ph.D., American entrepreneur, author, and inventor.**

**State of the Art**

The intrapreneur, just like the entrepreneur of a small business, is the driving force behind their idea and vision, as well as a source of continuous innovation for organizations. In 1978, the concept of intrapreneurship was coined by Gifford and explored since with thinkers and businesspeople such as Steve Jobs and Richard Branson.

**New Perspectives/Contributions**

In corporations around the globe, Intrapreneurs are nested deeply into systems with ideas and drive to bring ideas to life. With the changing expectations of a millennial and generation Z workforce, and the influence of technology and access to information, intrapreneurship is an employee value proposition that can help shape and enable the future of work. It’s a new contract between employees and employers that can provide more career growth and options for employees, while creating a pipeline of innovation from an army of employees willing to drive it.

**Research/Practical implications**

Learn about what companies are doing offering platforms, resources, access and skills that are enabling employees to bring their ideas to life and how it’s helping organizations
transform. Hear about insights into the characteristics of employees being drawn to the intrapreneur programs and the potential it can offer with the changing workforce expectations.

**Originality/value**

Discuss what intrapreneurship is, how it’s evolved over the years, current day application and the important role it plays in innovation and the future of work.

**Organizational Internalities and Their Impact on Employee Performance, Retention and Engagement**

Daniel Reimer, Ph.D., Allstate Insurance Corp.

**State of the Art**

The concept of externalities was introduced to the organizational psychological literature by Biglan (2009).

**New Perspectives/Contributions**

Building on that work, we introduce the economic concept of internalities and discuss how it can be integrated into positive organizational practices. Practices that produce “organizational internalities” will be analyzed, with a discussion on how positive internalities can be promoted by an organization’s leadership, and how negative internalities can be mitigated.

**Research/Practical Implications**

Organizational internalities provide a useful framework to discuss the promotion of practices within an organization that benefit and enrich employees. It can be used to discuss benefits to employee programs which may not appear to have a positive impact on an organization’s bottom line. Subsequently, it can frame discussions on potential long-term practices which are harmful to employees and, thus, to the organization.

**Originality/Value**

Utilizing economic principles can enhance the application of psychological practice within organizations. The collaboration between the two fields leads to a more comprehensive understanding of human behavior in the workplace and expands the vocabulary the field can use to communicate the value of employees to an organization.

**How Leaders Can Use Storytelling to Drive Change**

Chad Graham, MSLOC (Candidate) Northwestern University, Evanston, IL; Allstate Insurance Corp.
Purpose

How can business leaders use storytelling to positively impact employee experience with change? We examine how one of the oldest forms of communication can guide modern change efforts in an increasingly complex business world.

Design/Methodology/Approach/Intervention

We present new research conducted in association with Northwestern University that provides perspective on storytelling. It revealed barriers and enablers to senior leaders taking a storytelling approach. We then suggest ways that storytelling can better integrate into change communications.

Results

Some senior leaders are reluctant to use an intentional and strategic storytelling approach due to key three reasons: A misunderstanding of the concept of storytelling, a lack of training and the desire to avoid vulnerability. Yet leaders who regularly employ storytelling report greater engagement, buy-in and trust with employees navigating change.

Limitations

This research consisted of qualitative interviews with 10 senior leaders. It would be valuable to incorporate additional interviews, in various geographies.

Research/Practical Implications

This session will help participants determine the best ways to use storytelling in change situations and help train senior leaders.

Originality/Value

More than three decades of academic research shows that storytelling, as part of a leadership change communications strategy, can spark employee action, strengthen team trust, deepen knowledge sharing and help employees better visualize the future. Yet, for all indications that strategic leadership storytelling should be universally embraced, questions remain if that is happening.
Symposium Chairs:
Tanja Hentschel, Amsterdam Business School, University of Amsterdam, the Netherlands
Michelle Ryan, University of Exeter, United Kingdom; and University of Groningen, the Netherlands

State of the Art. Women are underrepresented in leadership positions. Previous research has identified gender biases and organizational barriers as limits to women’s advancement. However, more women than men decide against pursuing leadership careers. This symposium shifts focus to women’s active roles and their responses in the face of bias.

New Perspectives/Contributions. In six presentations, we discuss how women’s career and leadership ambitions are influenced by self-stereotyping processes, reactions to external biases, and the context in which they are imbedded. First, Hentschel (Netherlands) provides a theoretical analysis of how prescriptive self-stereotyping differently affects women’s and men’s career decisions. Second, Meeussen (Belgium) extends this notion demonstrating how women’s felt pressure to be a perfect mother negatively relates to work-family-balance and diminishing career ambitions. Third, Begeny (UK) demonstrates how distinctive work treatment may lessen career ambitions. Forth, Sczesny (Switzerland) shows that women experience more stress than men in interviews for leadership positions particularly when interviewing for male-typed leadership positions. Fifth, van Veelen (Netherlands) expands on this finding showing that the gender identity threat that women face in male-dominated environments negatively influences their career confidence. Finally, Schaumberg (USA) addresses a mitigating factor and finds that in individualistic, but not collectivistic cultures, imagining a self-reliant female leader can increase women’s leadership aspirations.

Research/Practical Implications. Research on women’s active roles and reactions to being a target of gender bias is limited. This past omission is consequential as resulting distinct career ambitions of women and men can be a pivotal driver of unequal career trajectories.

Abstract 1

The person I ought to be: Prescriptive self-stereotyping of men and women

Authors:
Tanja Hentschel, Amsterdam Business School, University of Amsterdam, the Netherlands
State of the Art. Women and men often have different career outcomes. Research shows that this is, in part, due to three types of gender stereotypes: (1) descriptive stereotypes (others’ assumptions about what other men and women are like); (2) prescriptive stereotypes (others’ expectations about what other men and women should be like); and (3) self-stereotypes (one’s descriptive assumptions of what they themselves are like). Stereotypes influence hiring, evaluation, and promotion decisions – and people’s own career decisions.

New Perspectives/Contributions. We propose another – fourth – type of stereotype currently not recognized: Prescriptive self-stereotypes. Prescriptive self-stereotypes are personal expectations about what “I as a man” or “I as a woman” ought to be. We theorize that such stereotypes influence both career and family decisions because people feel may feel obliged to behave in a stereotype-congruent manner, or indeed, they themselves may want to behave in such a manner.

Research/Practical Implications. The concept of prescriptive self-stereotypes and its effects is of major importance for both academics and practitioners. The gendered nature of prescriptive self-stereotypes may constrain women’s and men’s career choices, reinforcing gendered career outcomes and inequality. For example, to be stereotype-congruent (to be the person they think they ought to be), men may strive for careers while women may prioritise other aspects of their lives, such as domestic or parenting achievements.

Originality/Value. Our key aims are to introduce prescriptive self-stereotypes theory to the field, uncover their pervasiveness and impact on gendered career outcomes, and consider ways to limit their potentially detrimental effects.

Abstract 2

Feeling pressure to be a perfect mother relates to parental burnout and career ambitions

Authors:
Loes Meeussen, University of Leuven, Belgium
Colette Van Laar, Research Foundation Flanders, Belgium

Purpose. Intensive mothering norms provide a stereotypical view that mothers have an innate capacity to be great parents. While this is a positive group stereotype, it prescribes women to be perfect mothers. We examine how mothers regulate such pressure towards perfect mothering affectively, cognitively, and behaviorally, and how such regulation may relate to parental burnout. Moreover, we examine how feeling pressure towards perfect mothering may affect mothers’ work aspirations.

Methodology. Through Prolific Academic, an online survey was sent to fulltime working mothers in the UK and USA with at least one child living at home (N = 169).
**Results.** Feeling pressure to be a perfect mother was positively related to parental burnout, and this relation was mediated by parental stress, by a stronger cognitive prevention focus aimed at avoiding mistakes as a mother, and by higher maternal gatekeeping behaviors taking over family tasks from one’s partner. Moreover, mothers with higher felt pressure towards perfect mothering experienced lower work-family balance, which in turn related to lower career ambitions.

**Limitations.** The data are correlational and self-reported.

**Implications.** Intensive mothering norms might have severe costs for women’s family and work outcomes. Insights into how to change intensive mothering norms are needed to reduce women’s risk of parental burnout as well as gender inequalities in work and family domains.

**Value.** This is the first study to evidence social risk factors of parental burnout, and to show that mothering norms may drive women’s ‘choices’ to reduce career ambitions.

---

**Abstract 3**

**How women and men are treated at work: Experiences of distinctive treatment and its implications for one’s confidence and career ambitions**

**Authors:**

Christopher T. Begeny, University of Exeter, UK

Michelle Ryan, University of Exeter, United Kingdom; and University of Groningen, the Netherlands

**Purpose.** A popular narrative for explaining why women are underrepresented in certain industries (e.g., IT/tech), particularly in more senior positions, is that women (compared to men) are less ambitious and/or lack the confidence necessary to achieve those positions. Our research tests an alternative explanation: that the strength of any individuals’ confidence and career ambitions has less to do with their gender per se, and more to do with how they are treated by colleagues at work.

**Methodology.** Five studies (e.g., longitudinal, experimental) examine how individuals are treated at work—specifically, how often colleagues seek them out for ideas or advice on work-related issues, termed distinctive treatment—and how this shapes their self-concept (seeing themselves as valued/admired), their confidence and career ambitions.

**Results.** Results demonstrate that individuals’ treatment at work impacts their self-concept and in turn their confidence and career ambitions. Overall, these effects are evident among both women and men. However, women in male-dominated industries are less likely to be treated in these distinctive ways.
Limitations. The complexity of workplace interactions precludes systematic accounting of certain aspects (e.g., nonverbal communication).

Implications. Embedded in individuals’ everyday workplace interactions are both overt and subtle messages, signalling what colleagues think of them. This shapes how individuals see themselves and ultimately their levels of confidence and career ambitions. Importantly, both women’s and men’s confidence/ambitions are affected by these interactions, albeit in subtly gendered ways.

Originality. To our knowledge, this is the first program of research explicating how distinctive treatment shapes individuals’ confidence/career ambitions.

Abstract 4

Women’s perceived lack of fit for leadership predicts their physiological stress response and performance evaluations in simulated job interviews for leadership positions

Authors:
Sabine Sczesny, University of Bern, Switzerland
Christa Nater, University of Bern, Switzerland
Nadine Messerli, University of Fribourg, Switzerland
Madeline E. Heilman, New York University, USA
Alice H. Eagly, Northwestern University, USA

Purpose. Determining how perceived lack of fit affects women’s and men’s physiological and self-reported stress responses in a selection situation and subsequent evaluations of their performance by themselves and others.

Design/Methodology/Approach/Intervention. 2 (Participant’s sex: female vs. male) x 2 (Gender-typing of leader position: female vs. male) between-subjects design. The sample included 209 management students.

Results. In the preparation phase prior to the interview, women reported less self-ascribed fit accompanied by lower performance expectations than men. Moreover, among women, those interviewing for the male-typed leadership position reported lower fit and performance expectations than those interviewing for the female-typed leadership position. In the actual job interview, women presenting for the male-typed position experienced more physiological stress than women presenting for the female-typed position, whereas men’s physiological stress did not differ. However, regardless of the leadership position, women reported experiencing more stress, more actively monitored their behavior, and more negatively evaluated their performance than men. In addition, independent raters evaluated women’s performance as worse than men’s.
Limitations. We examined job interviews for leadership positions exclusively. Nevertheless, knowledge about women’s stress responses in job interviews for other positions could deepen the understanding of the present findings.

Research/Practical Implications. This study is the first to demonstrate that women’s perceived lack of fit results in higher levels of physiological stress in job interviews for leadership positions.

Originality/Value. Job interviews for male-typed leadership positions are especially stressful for women, and extra efforts are required to overcome this first hurdle on their way to leadership.

Abstract 5

Double trouble: How being outnumbered and negatively stereotyped threatens career outcomes of women in STEM fields

Authors:
Ruth van Veelen, Utrecht University, the Netherlands
Belle Derks, Utrecht University, the Netherlands
Maaike D. Endedijk, University of Twente, the Netherlands

Purpose. Masculine work contexts form an important source of social identity threat for working women. This study aimed to disentangle the unique and joint influence of two aspects of masculine work contexts, namely a numerical majority of male colleagues and negative gender stereotypes about a professional field, on the experience of identity threat among women working in STEM fields.

Method. A field study was conducted via an online survey distributed among alumni holding an educational degree in STEM. Respondents (N=177 women; N=630 men) either worked in- or outside the STEM sector (i.e., stronger vs. weaker gender stereotype) and estimated the ratio of men to women in their direct work environment.

Results. Results from a multi-group SEM model showed that for women (not men), the combination of working almost solely with male colleagues (being outnumbered) and working in the STEM sector (where women are negatively stereotyped) predicted the highest levels of gender identity threat, with negative downstream effects for work engagement and career confidence.

Limitations. This study relied on cross-sectional self-report data. Therefore, potential limitations regarding causality and common-method bias were carefully considered.
Practical Implications. Policy to optimize a gender-inclusive workplace should *simultaneously* focus on decreasing numerical underrepresentation of women, and defeating negative gender stereotypes about women's belonging and competence in STEM.

Originality/Value. Considering that the women in this sample already hold a degree in STEM, and have proven their competence in STEM, this research reveals how in naturalistic work settings, prevailing social identity threats continue to affect women's professional careers.

Abstract 6

Cross-cultural differences in the benefits of self-reliance for women's leadership

Authors:

Rebecca Schaumberg, University of Pennsylvania, USA
Julia Bear, Stony Brook University, USA

**Purpose.** We assess whether the benefits of self-reliance for women's leadership outcomes are stronger in higher than lower individualism cultures.

**Design.** We recruited a cross-cultural sample of students and measured the individualism of their home country (Study 1). We then ran an experiment in which participants thought about a highly self-reliant or a highly-dominant exemplar (randomly assigned) and then reported their leadership aspirations. We also used data from the World Values Survey to assess the relationship between self-reliance and leadership attainment for men and women in higher or lower individualism countries (Study 2).

**Results.** We find that women have lower leadership aspirations than men after thinking about a dominant exemplar, but higher leadership aspirations than men after thinking about a self-reliant exemplar, but only among participants from higher, not lower, individualism countries (Study 1). We further find a significant, positive relationship between self-reliance and actual attainment of leadership roles for women, but not for men, but only among participants from higher, not lower, individualism countries (Study 2).

**Limitations.** The current studies do not assess our theoretical mechanism of attainment expectancy. They also leave open the possibility that self-reliance manifests differently for men than women and/or differently in higher than lower individualism cultures.

**Practical implications.** This paper shows how an agentic quality – self-reliance—can be more motivating for women's than men's leadership, thereby helping to address gender difference in leadership.

**Originality/Value.** This paper demonstrates an important, and theoretically consistent, boundary condition to the benefits of self-reliance for women's leadership outcomes.
Computational modeling (CM) has been used for decades in weather forecasting, physics, biology, and other hard sciences. Until recently, applications of CM in industrial-organizational (I-O) psychology and related disciplines have been quite limited (e.g., Monte Carlo studies). However, with the rising interest and emphasis on processes in I-O psychology and increasing use of CM in our field, many researchers are interested in learning more about CM, but how do they get started? The purpose of this symposium is to provide a concise seminar of CM so the interested researcher can get oriented to basic CM concepts. Four presentations are proposed to provide an introductory, concise overview of computational models, describe common myths and realities of what CMs can do, outline principles for CM theory development, and demonstrate the integration of theory, method, and data that is inherent in CM research.

This symposium provides an introduction to organizational researchers on how to apply computational models to advance organizational research. It is designed to inspire and facilitate the development and application of computational models by audience members in their own research. The four presentations are arranged to provide an initial high-level overview and then progress in detailed examinations of CM, culminating with an example of the data that CMs can generate to further develop theory and research. In lieu of a discussant, the chairs will facilitate an interactive exchange between the presenters and members of the audience so learning points and insights can crystalize.
An Overview of Computational Modeling

Steve W. J. Kozlowski  
Georgia T. Chao

Michigan State University  
National Science Foundation

The first presentation provides an overview of what CM is and how it can be used. It will highlight the distinction between CM – the formal theoretical specification – and computer simulation (i.e., software code) in which CM is instantiated. Different simulation approaches will be discussed, but the primary focus will be on agent-based simulation (ABS), because it is uniquely well-suited to emulating organizational systems. Different potential uses of CM will be presented. In particular, the use of CM in an intellective capacity as a means to build, evaluate, and refine theory will be contrasted with the use of CM in an emulative capacity as a means to predict, prescript, and optimize a target system. Steps for the application of CM in research, key references to consult, and available software packages will be discussed. The goal is to orient interested researchers to key resources they need to start using CM.

Basic steps for using CM / ABS include: (a) identify the phenomenon and synthesize the theory; (b) specify substantive content, processes, and mechanisms; (c) operationalize the CM in an ABS with process algorithms (i.e., what, when and how specific elements interact in the system), and (d) evaluate the CM / ABS with virtual experiments. Unlike most experimental and correlational studies, CM / ABS research is not constrained by small or nonrepresentative samples, limited variables, and time restrictions. Systems can be heavily stressed and low probability “what if” scenarios can be explored. They are ideally suited to study dynamic behavior in human systems.
The Uses and Utility of Computational Modeling: Debunking Common Misconceptions

Michael T. Braun

University of South Florida

Computational modeling (CM) represents an exciting approach to study the multilevel, dynamic nature of organizations. While CM has gained traction, there are still many misconceptions with respect to its goals, strengths, and weaknesses for advancing understanding of organizational phenomena. Therefore, the second presentation will highlight four common misconceptions and identify the realities that underlie them so that CM can be better understood, applied, and evaluated.

- **Misconception 1:** *Computational modeling is a new means of quantitative data collection (and should be evaluated as such).* The reality is that computational data allow the modeler to “see” what data would “look like” given their theory is true and ask “what if” questions to examine data patterns under different hypothetical conditions.

- **Misconception 2:** *Since computational data are “made up,” they are not useful.* The truth is that computational data test whether the computational theory is logically consistent (i.e., can even produce data) and then can be compared to human data to evaluate whether the theory provides a plausible explanation for observed phenomena.

- **Misconception 3:** *Computational data should reveal interesting new patterns of results.* In reality, computational data can reveal novel data patterns resulting in unexpected insights; however, they also can simply match previously collected human data, which provides evidence that modeled mechanisms could be generating known relationships.

- **Misconception 4:** *Computational models should perfectly explain phenomena.* Like statistical models, computational models should be parsimonious. Rooted in complexity theory, the goal of computational modeling is to broadly explain complex phenomena with the fewest, simplest mechanisms possible.
Developing and testing computational theories requires an alternative conceptual lens to conventional paradigms commonly employed in the organizational sciences. Contemporary approaches most often focus on describing the covariation among variables/constructs (e.g., construct A positively relates to construct B; construct C mediates the relationship between constructs D and E). In contrast, the objective of computational theories focuses on describing how lower-level mechanisms in a system operate (e.g., if person 1 performs behavior A, then person 2 performs behavior B). This is a distinction between thinking in terms of “variable-based” theory versus “process-based” theory. The goal of this presentation is to summarize a small number of concise principles for facilitating the requisite thinking required to develop and evaluate computational theories. The principles will be described through the use of concrete examples that highlight unique considerations, decisions, and foci that accompany computational theorizing. A summary of these principles is provided below:

- **Principle 1—Think and theorize in terms of what actually happens.** Computational theories explain how and why phenomena emerge from interactions within a system; that is what, when, and why events occur.

- **Principle 2—Consider the goal of the theory early and often.** Computational theories can be used for prediction, proof, discovery, explanation, critique, prescription, and empirical guidance. Which of these goals is emphasized establishes important boundaries for the computational theorist.
The Interplay between Computational Modeling and Empirical Data

Goran Kuljanin, Neal B. Outland, Elizabeth A. Guth, Jake A. Weiss, Ashlyn P. Lowe
DePaul University

This presentation focuses on integrating computational modeling with empirical methods and data. We discuss the types of empirical observations necessary to examine proposed process mechanisms, how to evaluate CMs with respect to empirical data, and how to initiate the iterative scientific process between computational theorizing and empirical data. Besides a conceptual discussion, this presentation highlights the iterative comparison process between data and CM with professional basketball teams. The goal is to familiarize audience members with how CM and data work together to advance understanding, and how the interplay between computational theorizing and empirical data initiates iterative science.

A researcher may integrate computational modeling with empirical data to iterate understanding on three theoretical foci: inputs, processes, and outcomes. First, a researcher focuses on iterating through a range of empirical values found in the research literature to represent inputs in a computational model. Second, the researcher iterates on mapping observed empirical processes to modeled computational processes. Third, the researcher iterates on mapping observed phenomena (e.g., an inferiorly-resourced team defeating a superiorly-resourced team) or effects (e.g., mean differences between groups or correlations between variables). Depending on the research goals, the researcher may compare (1) whether computationally-generated process or outcome data matches empirically-observed process or outcome data, (2) whether particular processes lead to desired outcomes, and/or (3) alternative explanations for observed phenomena. Of course, a researcher may

- **Principle 3—Take note of patterns, not parameters.** Computational theories afford the potential to identify nonlinearities, thresholds, equilibria, attractors, etc. that are not adequately reflected in our common statistical indices.
integrate computational modeling with empirical data by jointly iterating understanding on all three theoretical foci.
State of the Art

The use of information and communication technologies (ICT) for health promotion, prevention, and rehabilitation is well researched in clinical psychology (Richards & Richardson, 2012). In the field of work and organizational psychology, meta-reviews have shown that digital coaching can be effective to reduce stress – if it is focussed (goal setting, action plans), has a short time span (up to 2 months), and is combined with personal support (Heber et al., 2017). Nevertheless, reach and transfer stay the main challenges for occupational health interventions.

Contributions

This symposium presents digital approaches and intervention studies that range from blended coaching to smart-phone applications and stand-alone tools operating with chatbots:

1. Coaching leaders and teams with a chatbot («wecoach»)
2. “Holidaily” - a smartphone application promoting recovery post-vacation
3. Efficacy of a self-guided recovery online-training to improve sleep for employees
4. Enhancing resilience and well-being at work through web-based trainings
5. Blended coaching to promote work-life balance of small business owners

Implications

Psychologists have accumulated much knowledge on how to change individual and organizational behaviour. If they aim to apply this knowledge to the digital level, they need the help of programmers and graphic artists to design attractive user interfaces, trigger an engaging user experience, and build reliable operating systems. Consequently, researchers need usability and user experience studies, and they have to rethink their research methods: Digital approaches generate big data on the coaching context, process and outcome – and machine learning opens new fields for intervention and evaluation research.

SYMPOSIUM PRESENTATION 1

Coaching leaders and teams with a chatbot – design and preliminary results of an RCT-study

Luisa A. Grimm¹, Gregor J. Jenny¹, Rebecca Brauchli², Georg Bauer¹
Purpose
E-Coaching tools are becoming popular in the field of Organizational Health Psychology. Many e-coaching tools are already available for improving individual health and well-being, but as of today, there are very few tools that operate on team-level. We developed a team-level e-coaching tool for improving working conditions; the «wecoach». In this study, we examine the effectiveness of this tool.

Design
The «wecoach» empowers a team leader to conduct a team survey and a participatory team workshop to develop actions for improving job demands and resources. She/he is coached by means of a chatbot through the entire improvement cycle (incl. self-evaluation). Team leaders were recruited for a waitlist RCT study. Both subjective and objective data on context, process, and outcome are collected automatically as part of the «wecoach». Data is analysed by means of multi-level methods.

Results
Preliminary evaluation results will be available until the EAWOP conference, where we will present first findings.

Limitations
The e-coaching approach is limited to a self-selected target group that might not be representative of the entire population.

Implications
This research will generate knowledge on the feasibility of team-level online interventions. In addition, this project will show how evaluation research methods can make use of digital methods to collect data on a change process often invisible and hardly accessible to researchers.

Originality
As of today, we are unaware of e-coaching tools that operate on the team-level, especially ones that empower leaders to perform a team development autonomously.

SYMPOSIUM PRESENTATION 2

Extending the magic of vacations. “Holidaily” - a smartphone application promoting recovery post-vacation: preliminary results from a randomized-controlled trial

Alexandra Smyth\textsuperscript{1}, Jo Annika Reins\textsuperscript{1,5}, Christine Syrek\textsuperscript{2}, Jessica de Bloom \textsuperscript{4,5}, Markus Domin\textsuperscript{1,3}, Monique Janneck\textsuperscript{3}, Dirk Lehr\textsuperscript{1}
Purpose
To extend the positive vacation effect for workers mental health the app “Holidaily” was developed with the aim to use vacations as a motivational kick off to foster recovery behavior beyond vacation and during daily working life. The user receives 3 daily inspirations to increase recreational activities. Holidaily was developed according the DRAMMA model, claiming that recreational activities lead to the experience of mental-detachment. The aim of this randomized-controlled trial (RCT) is to evaluate the efficacy of Holidaily in reducing work-related rumination.

Design
To date N=107 employees have been included in this RCT. The intervention group i.e. app users will be compared to a waitlist control group (WLC) on the basis of intention-to-treat (ITT) analyses. The primary outcome measure is work-related rumination.

Results
Preliminary analyses of covariance (ANCOVA) has shown that Holidaily users, compared to the WLC, reported significantly less work-related rumination two-weeks post-vacation ($F_{1,104}=14.028$, $p<0.001$) with an effect of $g=0.48$ (95% CI, 0.096-0.867).

Limitations
These preliminary results should be interpreted with caution, as the planned sample size is not yet reached. The study dropout was higher than expected. However, completer analyses and ITT analyses lead to comparable results.

Implications
Despite the short-lived vacation effect, vacations can be a promising starting point to integrate recovery into daily working life through a recovery-app to sustain the beneficial recovery effect.

Originality
To the best of our knowledge, Holidaily is the first app aiming at sustaining the recovery effect beyond workers vacation and the first digital intervention based on the DRAMMA model.

SYMPOSIUM PRESENTATION 3
Efficacy of a self-guided recovery online-training to improve sleep for employees: results from a randomised controlled trial in universal prevention

Dörte Behrendt¹, David Daniel Ebert²; Kai Spiegelhalder³, Dirk Lehr¹

¹ Department of Health Psychology and Applied Biological Psychology, Institute of Psychology, Leuphana University of Lueneburg, Lueneburg, Germany
²Department of Clinical Psychology and Psychotherapy, Friedrich-Alexander-University of Erlangen-Nuremberg, Erlangen, Germany
³Department of Psychiatry and Psychotherapy, Medical Centre – University of Freiburg, Faculty of Medicine, University of Freiburg, Germany

Purpose

This study examined the efficacy of a self-guided online-training to improve sleep among the general working population and investigated general and work-related cognitive activation as mediators of intervention’s effect.

Design

180 participants were randomised to either an internet-delivered intervention based on cognitive-behavioural therapy for insomnia (iCBT-I) or control group. Data were assessed at baseline, after 8 weeks and after 6 months. Primary outcome was insomnia severity. Secondary outcomes included cognitive activation, mental and work-related health.

Results

Analyses of Covariance showed that, relative to controls, the iCBT-I group reported significantly lower insomnia severity after 8 weeks, \( F(1,177)=59.10, p<.001, d=0.90 \) and after 6 months \( F(1,177)=44.1, p<.001, d=0.76 \). Significant differences, with small-to-large effect sizes, were also detected for secondary outcomes. Parallel multiple mediation demonstrated that general and work-related cognitive activation, measured as worry and work-related rumination, mediated the intervention’s effect.

Limitations

Effective behavioral interventions for employees run the risk that potentials of workplace-related interventions are overseen.

Practical Implications

Based on findings the next step might be an implementation of the online-training in routine occupational health care. Work-related rumination as a mediator of intervention’s effect indicates
that tailoring interventions to the work life domain might be an important principle for designing iCBT-I for employees.

**Originality**

While iCBT-IIs have been shown to be effective in clinical samples, this study demonstrates efficacy in the general working population in the short and long term.

**SYMPOSIUM PRESENTATION 4**

**Enhancing resilience and well-being at work through web-based trainings on mindfulness, self-efficacy, and optimism**

Roman Soucek¹, Christian Schlett², Nina Pauls², Anja S. Göritz², & Klaus Moser¹

¹Friedrich-Alexander University Erlangen-Nürnberg, Germany
²University of Freiburg, Germany

**Purpose**

Today’s employees are facing high demands at work that put their well-being at risk. We introduce resilience as an approach to cope with such situations and present an intervention that aims to strengthen personal resources for resilience, namely mindfulness, occupational self-efficacy, and optimism.

**Design**

The intervention was provided as three self-administered web-based trainings. Each training consisted of five sessions of 5 to 10 minutes’ length. The order of the trainings was randomized. The effectiveness of the intervention was tested with 520 employees who participated in a longitudinal evaluation study with six waves.

**Results**

The intervention was successful in enhancing personal resources for resilience and had positive effects on proximal and distal outcomes. The increase in personal resources enhanced resilient behavior in the workplace, which in turn improved psychological well-being and work engagement.

**Limitations**
Since the personal resources are related to each other, we did not always observe an exclusive effect of the particular training on the respective resource. Though we assumed an immediate effect on personal resources, the effectiveness of the trainings might reveal not immediately but rather incubate over time.

Implications
Interventions should not only aim at personal resources for resilience but may directly promote the development and application of behavioral strategies for coping with adverse situations at work (i.e., resilient behavior).

Originality
Web-based interventions are a scalable approach for the enhancement of personal resources as well as resilient behavior, and therefore, a promising avenue for promoting psychological well-being at work.

SYMPOSIUM PRESENTATION 5

Blended coaching to promote work-life balance of small business owners

Christine Busch¹, Romana Dreyer¹, Markus Domin², & Monique Janneck²

¹ Universität Hamburg, Germany,
² Technische Hochschule Lübeck, Germany

Purpose
In this study we investigated blended coaching for entrepreneurial couples of small businesses. Small business owners in craft industry are a vulnerable sample when it comes to Work-life balance (WLB) and health. They evince unique demands, e.g., highly integrated roles and blurred lines but also facilitating factors, e.g., supply of regional network social support in implementing innovations and of spousal social support in creating a satisfying WLB.

Design
We combined realist evaluation with a quasi-experimental wait-list control group design and process evaluation. We successfully reached small business owners by offering the intervention to regional craft networks and entrepreneurial couples (N=27). We focused the digital coaching parts on attractive knowledge transfer, e.g., by video. The digital coaching parts were mandatory for the subsequent face-to-face or tele-coaching sessions.
**Results**

The coaching intervention successfully managed to enhance satisfaction with WLB and to reduce casual blood pressure. Nevertheless, a third of the intervention couples dropped out because they felt mentally overstrained, had technical problems, showed mental disorders or were not open-minded in regard to self-reflection.

**Limitations**

The main limitation of the study is the small sample size.

**Implications**

Based on our findings, blended coaching to improve WLB of small business owners is successful, when regional networks and couples are involved, when the owners are open-minded with regard to self-reflection and when the digital parts are very much focused on attractive knowledge transfer.

**Originality**

This study shows a successful blended health intervention for the vulnerable sample of small business owners.
887 - IFPOC SYMPOSIUM: DISCOVERING ANTECEDENTS AND CONSEQUENCES OF COMPLEX CHANGE RECIPIENTS’ REACTIONS TO ORGANIZATIONAL CHANGE

Chairs: Maria Vakola (Athens University of Economics and Business) & Karen Van Dam (Open University)

Discussant: Mel Fugate (American University, Washington, D.C)

State of the art

Organisations are required to continuously change and develop but there is a high failure rate associated with change implementation success. In the past two decades, change researchers have started to investigate change recipients' reactions to change recognizing the crucial role of these reactions for successful change. This symposium aims at identifying and discussing the complex processes that underlie the relationships among antecedents, reactions and outcomes associated with organizational change.

New perspective / contributions

This symposium consists of five studies that extend our knowledge in the field by (i) providing an analysis of change recipients' reactions going beyond the dichotomous approaches (acceptance or resistance) (ii) revealing understudied antecedents-reactions and reactions-consequences patterns and relationships (iii) shedding light on the role of contextual factors i.e team climate and individual factors i.e emotion regulation on the adaptation to change. This symposium is based on a combination of both quantitative (i.e diary, survey) and qualitative (i.e interviews) research methodology.

Research / practical implications

This symposium aims to increase our understanding of the complex processes associated with change recipients' reactions to change. Discovering how these reactions are created and what are their results may reveal important contingencies that can explain how positive organizational outcomes during times of change can be stimulated which is beneficial for both researchers and practitioners.

Synthesizing research on organizational change reactions: A systematic review

Rouven Kanitz, Ludwig-Maximilians-University Munich
Purpose
Because individuals play a key role in successfully implementing change in organizations, recipients’ explicit reactions to change have become an important theme research. With contributions stemming from a range of theoretical perspectives using qualitative as well as quantitative methods, the literature has become fragmented. The diversity of theoretical perspectives is one of the greatest challenges for researchers. The purpose of this study is to synthesize the literature and develop cumulative knowledge on reactions to change.

Methodology
This study systematically reviews the diverse literature streams to provide a more integrated view.

Results
We provide an overview of the types of reactions studied, revealing patterns and understudied antecedent-reaction relationships. By doing so, we also aim to identify underdeveloped areas.

Limitations
Given the large body of literature, we focus the review on a certain time frame (2000-2018) and consider only a subset of relevant journals.

Research implications
By integrating perspectives and by summarizing antecedent-reaction relationships situated within various types of changes and organizations, we identify gaps in the current body of knowledge and provide a basis for new scholarly perspectives to flourish.

Originality and value
Given the splintered conceptual underpinnings and diverse theoretical perspectives that have developed in the field, we advance cumulative knowledge by bridging between qualitative and quantitative scholars.
Ambivalence and adaptive performance: The moderating role of work engagement

Maria Vakola (Athens University of Economics and Business), Kleanthis Katsaros (Hellenic Ministry of Finance) & Paraskevas Petrou (Erasmus University Rotterdam)

Purpose

There is still a high rate of change failure and there is vast agreement among change researchers that employees adjustment is a factor of critical importance. Change recipients' reactions to change are conceptualized as negative or positive so far neglecting the fact that employees may exhibit more complex reactions that include positive and negative reactions at the same time. The paper aims at examining the relationship of change recipients' ambivalence and adaptive performance to change and the role of work engagement.

Design/methodology

Participants were employed by a local cosmetics company which was recently acquired by a multinational one. 57 employees filled in a diary survey lasted from 3-5 working days.

Results

The analysis showed that on days that ambivalent employees feel work engaged, they adapt to change.

Limitations

We used only self-reports but we collected information at different measurement points

Research/Practical implications

Research will benefit from results to build a solid framework regarding ambivalence and change outcomes. We can better understand change recipients' reactions and as a result we can design better change interventions and foster work engagement.
Originality/Value

This paper is based on a diary methodology offering results on a within person basis. Also, it is important to clarify constructs such as ambivalence and understand its impact on both individuals and organizations.

Taking an event-based approach to understanding emotional responses to ongoing change

Tina Kiefer (Warwick Business School) & Laurie Barclay (Wilfrid Laurier University)

Purpose

Organizational change has well-established implications for employee attitudes, wellbeing and behaviour, triggering a myriad of – largely negative – emotional responses. Despite well-established theoretical and empirical links between events and emotions, the field as overlooked the importance of understanding how large-scale change trickle down to everyday experiences. This paper uses an event-based paradigm to shifts focus to how change is experienced “in the here and now”. Drawing on appraisal theory of emotion, we develop and test a framework to understand antecedents and consequences of positive and negative everyday emotional events and explore how those affect attitudes and behaviours towards change over time.

Design/Methodology

Diary study with 472 public service employees, reporting on 10 working days, using an event-sampling approach, followed by a survey.

Results

Within and between person analysis support our hypotheses that emotional events affect daily attitudes, well-being and behaviour and stack up to affect commitment towards change in emotion-specific ways. Positive change events are more impactful than expected.

Limitations:

self-report data only; shortened scales; repeated measures can affect responses.

Research/Practical Implications
An event-based paradigm opens up different ways to theorise the impact of change on employees. Change agents should pay attention to “the little things”, which significantly impact on change attitudes and behaviours.

**Originality/Value**

Focusing on how change trickles down to everyday experiences, allowing to analyse negative and positive change experiences simultaneously over time.

**Positive organizational change: The role of sense making and emotion regulation for adaptive performance**

Cornelia Niessen (*Friedrich Alexander University of Erlangen-Nürnberg*)

Karen van Dam (*Open University of the Netherlands*)

**Purpose**: Research has generally emphasized the negative impact of organizational change for employees’ change responses. The purpose of this study was to investigate the conditions (i.e. job control and team climate) that might stimulate employees’ sense making (i.e. seeing their job as a meaningful contribution to the organization) and emotion regulation, and, in turn, their adaptive performance during change.

**Design/Methodology**: A total of 273 employees, in situations of organizational change, completed surveys on 2 occasions. We used a time lag of two months between our two data collections because we wanted to measure predictor variables and criteria separately in order to reduce common method bias.

**Results**: Structural equation modeling showed that job control and team climate were positively related to sense making, which predicted emotion regulation. In turn, emotion regulation was a strong predictor of adaptive behaviour during the change.

**Limitations**: The study is limited because of the issue of causality, and the self-reported nature of the measures.

**Implications**: By providing a positive work environment, organizations may increase employees’ perception that their work matters. This sense making can serve as a positive force in times of organizational change, and can help strengthen employee adaptability to change.

**Originality/Value**: Whereas much previous research had pointed at the negative outcomes of organizational change, this study focused on the...
positive side of change processes by showing that positive work conditions can enhance employee adaptive performance.

Accepting failure: A configuration-based perspective on organizational failure

Dave Bouckenooghe, Brock University (Canada)

Gavin Schwarz, UNSW (Australia)

Purpose

This paper proposes a new way of interpreting individual’s response towards organizational failure. Instead of focusing only on failure as something to be avoided, we introduce the concept of accepting failure, or the ability of individuals experiencing failure to switch from avoidance-type to a functional view of failure.

Design

First we collected data from interviews and inferred that two dimensions characterize individual’s response towards failure. Each response is based on (1) the approval of failure, which is the extent to which individuals consider failure reasonable, and (2) a defense of failure, which represents the extent to which individuals actively embrace failure. Next, we designed two scales to measure both dimensions and drew from configurational perspective to analyze these profiles.

Results

Combining both dimensions, our qualitative and quantitative data offers support for four types of responses to failure (acceptor, rejecter, endorser and fearer).

Limitations

This study finds evidence for different responses towards to failure, yet it overlooks the reasons why people become acceptors, rejecters, endorsers or fearers.

Implications
By calling attention to the acceptance towards failure orientation, we have presented an alternative way of categorizing failure in organizations (i.e., the successful failure).

Originality
This paper attempts to get past viewing failure as something to be avoided. From this vantage point we propose that failing is not a constraining course of action, but also enabling mechanism that translates into different acceptance responses.
Symposium chair: Christine JEFFRION

The evolution of the working environment has led business leaders to rethink the way they manage their company by experimenting innovation managerial practices. Empowering leadership (EL) promotes the share of power and responsibilities between the manager and his/her team by engaging employees to act autonomously and to take the responsibility to bring job improvements (Boudrias et al., 2009). Thus EL is positively related to proactive performance in general (Lee et al., 2018).

The researchers of this international symposium come from three universities: the University of Montreal (Canada), the University of Nantes (France) and the International University of Monaco. They share a common interest on innovative managerial practices and their links with psychological health and performance. The two first presentations highlight the benefits of EL behaviors on the performance (proactive workplace behavior and commitment) by taking into account the interactions with the psychological health. Indeed, both positive and negative sides of health at work are investigated: psychological well-being and psychological distress. The third presentation examines the social exchange resources (with teammates and leaders) that drive the effects of well-being on proactivity. The last presentation is a practical application to foster empowering leadership by involving employees in the decision-making process.

If the link between well-being at work and performance are clearly established (Courcy, Boudrias & Montani, 2018), the originality of our symposium is the integration of innovative managerial practices as key theoretical explicative factors and great leverage to foster healthy organizations.

ABSTRACT 1

Authors: Alison CAILLÉ*, Christine JEFFRION* & Jean-Michel GALHARRET*

*University of Nantes - Psychology Laboratory of Pays de la Loire (EA 4638)

Title: How does “empowering leadership” fosters the job and organizational commitment? The mediating role of well-being at work.
Purpose: The shift in the world of work and the arrival of new generations in the workplace have led organizations to reconsider their managerial practices by enhancing participative methods focusing on trust, autonomy, team work and collaboration. Since four years, an aerospace industry experiments empowering leadership within a production unit of about 300 employees. In an action-research perspective, our survey intended to study the link between empowering management, well-being at work and commitment (well known as a performance factor).

Methodology: A questionnaire, composed of scientifically validated scales, (Bien-Etre Psychologique au Travail - Gilbert, et al., 2011; Leadership Habilitant - Yahia et al., 2018; Engagement au travail - Rich et al., 2010; Engagement organisationnel - Meyer et al., 1993) has been filled in by 260 employees of the “empowered unit”.

Results: The results highlight the predictor role of “empowering leadership” on job commitment ($r=.46; b=.30$) and on affective organizational commitment ($r=.52; b=.59$). More specifically, it appears that “giving meaning to the work” and “showing confidence” are the two behaviors of the leader that promote employees commitment. The results also show that the psychological well-being at work has a mediating effect in this relation.

Originality/value: Our research brings significant theoretical contributions by investigating the “empowering” style of leadership as a determinant of performance (with the measure of commitment) through the promotion of well-being at work.

Practical implications: This study provides recommendations to companies in order to accompany their organizational change and support their initiatives of managerial innovation.

Limitations: Future researches should investigate these topics in a longitudinal perspective.

ABSTRACT 2

Authors: Vincent ROBERGE*, Jean-Sebastien, BOUDRIAS*

*Université de Montréal, C.P. 6128 Succ. Centre-ville, Montréal (Québec), H3C 3J7, Canada
Title: The moderating role of employee distress on the empowering leadership – proactive performance relationship

Purpose: Empowering leadership (EL) engages employees to act autonomously and to take the responsibility to bring job improvements. Therefore, EL is positively related to proactive performance in general (Lee et al., 2018). However, because EL puts a lot of emphasis on employee’s resources investment, it is likely that employees will end up in situations characterized by a high level of cognitive demands (Sharma and Kirkman, 2015). The purpose of this study is to investigate the benefits of EL behaviors on proactive workplace behaviors while considering employees psychological distress as a moderating factor.

Design/Methodology/Approach/Intervention: This study was carried out with a two-time measurement design and data was collected through self-reported questionnaires. A total of 723 Quebec workers participated to this study.

Results: Moderation analyses revealed that EL had positive effects on employees’ proactive performance and that these effects were attenuated by employees’ level of psychological distress. Examination of these effects at EL dimensions-level indicates that the link between some specific leader behaviors and proactive performance are more susceptible to be attenuated.

Limitations: This study is a non-causal one and measures are self-reported.

Research/Practical Implications: This study supports the idea that the relationship between empowering leadership and proactive performance depend on the psychological health of employees. Organizations intending to increase the proactive behaviors of their employees through empowering leaders should first focus on reducing employees’ distress.

Originality/Value: To our knowledge, this study is the first to examine psychological distress as a moderator in the relationship between EL and proactive performance.

ABSTRACT 3

Authors: Jean-Sébastien Boudrias*, Francesco Montani** & Viviane Masciotra*

*Department of Psychology, University of Montreal
Title: How and when well-being fuels the social-exchange fire of proactivity: A moderated mediation model.

Purpose: The mechanisms and conditions enabling well-being to influence employee proactivity are disregarded. This study examines the social exchange resources that drive the effects of well-being on proactivity and the conditions that moderate these effects. By integrating conservation of resources and social exchange theories, we hypothesize that well-being improves social exchanges with teammates (TMX) and leader (LMX), thereby providing relevant resources for employee proactivity. Furthermore, we propose that high levels of job complexity and task interdependence enhance the need for these social resources, thereby improving the social-exchange effects of well-being.

Methodology: A three-wave, time-lagged study was conducted on 362 employees and their supervisors from multiple organizations. Employees rated well-being, job complexity and task interdependence at Time 1, and TMX and LMX at Time 2, whereas supervisors evaluated employees' proactivity at Time 3.

Results: The results of hierarchical regressions show that LMX positively mediates the well-being–proactivity relationship, and that this mediated relationship improves at high levels of job complexity. Unexpectedly, TMX exerts a negative mediating effect on the well-being–proactivity relationship, which occurs only at low levels of task interdependence.

Originality/value: The longitudinal and multi-source nature of data are a strength.

Practical implications: This study indicates that that promotion of well-being and LMX to foster proactivity is especially important for high complex jobs. In contrast, the promotion of TMX is not recommended in contexts characterized by low task interdependence.

Limitations: Future studies should consider not only the social, but also the cognitive and motivational mechanisms linking well-being to proactivity.

ABSTRACT 4

Authors: Alison CAILLÉ* & Christine JEOFFRION**

University of Nantes - Psychology Laboratory of Pays de la Loire
Title: Participation in decision-making and Employees Empowerment: proposal of a tool/guide for managers

Purpose: Nowadays, employees empowerment is more and more recognized as a leverage towards company efficiency and well-being at work. In regards to topics such as the participation in the decision-making process, what benchmarks do managers have to orient their position with respect to their team? The aim of this presentation is to propose a practical tool for managers.

Methodology/Intervention: A research-action has been co-designed between scientists and operational managers in order to involve more members of the teams in the decision-making process.

Results: As a result, a grid has been developed by using Heller and Yukl model (1969). According to these authors, the participation of employees in decision-making can be perceived along a continuum: from managers who make all their decisions on their own (“authoritarian” leadership) to managers who give their team a high degree of freedom (“empowering” leadership). It depends on the decision’s level of information shared with the team. Moreover, the authors put forward a typology of three organizational levels of decision-making (operational, tactical, and strategic).

Originality/value: Based on a theoretical background, this new tool can be used to draw up a framework to determine the team's room for manoeuvre and thus provide transparency and clarity about each person's role (as much for managers as for their team).

Practical implications: Our table has been experimented by several managers of a production unit within an aeronautic industry. It gives benchmarks for changing managerial practices towards a greater empowerment, or at least to open a dynamic dialogue about the employee’s expectations.

900 - THE BURNOUT ASSESSMENT TOOL (BAT) SYMPOSIUM 1 – A NEW INTERNATIONAL BURNOUT MEASURE

Wilmar Schaufeli (1) - Hans De Witte (2)

Universiteit Utrecht, Utrecht, Netherlands (1) - KU Leuven, Leuven, Belgium (2)
The Burnout Assessment Tool (BAT)
Symposium 1 – A new international burnout measure

Chair: Wilmar Schaufeli 1,2
Co-Chair: Hans de Witte 2,3
Discussant: Michael Leiter 4

1 KU Leuven – Leuven, Belgium
2 Utrecht University – Utrecht, Netherlands
3 Optentia Research Focus Area – Vanderbijlpark, South Africa
4 Deakin University – Melbourne, Australia

State of the Art. Burnout is a favorite topic in occupational health psychology (95,000 publications in Google Scholar and 12,000 in PsychINFO). 90% of the research uses the Maslach Burnout Inventory (MBI), so that it acts as the ‘gold standard’. However, not all that glitters is gold. Since its introduction conceptual, psychometric and practical problems with the MBI have been identified. For instance, the role of professional efficacy as a constituting element of MBI-burnout is questioned and instead of one score the MBI produces three scores which precludes the identification of ‘burned-out’ employees. In short, the use of MBI as a diagnostic tool is limited. Therefore an international consortium set out to develop a new burnout measure -- the Burnout Assessment Tool (BAT).

New perspectives. Based on literature research, qualitative interviews, and preliminary psychometric analyses, the BAT was developed that includes four symptom clusters – exhaustion, mental distance, and impaired emotional and cognitive control.

Research. In this symposium the first results are presented of the international research consortium. After a brief introduction in which the nature and the initial development of the BAT are discussed, Ana Vazquez and Chiara Consiglio report on the dimensionality of the BAT in Brazil, and Italy, respectively. Next, based on South African data, Leon de Beer shows how the BAT can be integrated in the Job-Demands Resources model, which adds to its conceptual validity. Finally, Steffie Desart reports on the establishing clinically validated cut-off points that allow distinguishing between burnout and non-burnout cases.

Conclusion. The preliminary results with the BAT in four countries are encouraging.

Evidences of Validity of the BAT in a Brazilian sample

Ana C. S. Vazquez 1, Clarissa P. P. Freitas 2, Cristian Zanon 3, Claudio S. Hutz 3

1 Federal University of Health Sciences - Porto Alegre, Brazil
2 Salgado de Oliveira University (UNIVERSO) – Niteroi, Rio de Janeiro, Brazil
3 Federal University of Rio Grande do Sul, Porto Alegre, Brazil

Purpose. This study investigated the dimensionality of burnout, using the Brazilian adaptation of the Burnout Assessment Tool (BAT-23 and BAT-12).

Methodology. Participants were 941 workers from all Brazilian regions. The four subscales of 23-item BAT measure exhaustion, mental distance, impaired emotional control and impaired
cognitive control. Exploratory factor analyzes were conducted to assess the dimensionality of the BAT-23 and BAT-12. Based on these results, different models were evaluated through confirmatory factor analysis. By correlating burnout and its dimensions with engagement, satisfaction with life, and hope, evidence of convergent validity of the BAT was obtained.

**Results.** Exploratory factor analysis suggested a unidimensional model as the best solution for BAT-23 and BAT-12. Confirmatory factor analysis indicated that the bi-factor model in which all items load on one factor showed the best fit for both versions. On the common burnout dimension of BAT-23 and BAT-12, item loadings varied between .43 and .86. Items on the common burnout factor showed loadings higher than .48, whereas those on the sub-dimensions were higher than .30. As expected, burnout and its dimensions measured by BAT-23 and BAT-12 showed negative correlations with engagement, hope and satisfaction with life.

**Conclusion.** This study supports the view that burnout – as assessed with the Brazilian version of the BAT – should be considered as a one-dimensional construct that includes four highly correlated aspects. Results were similar for the extended and shortened versions of the BAT. The practical implication is that the BAT can be used to assess burnout in Brazil.

---

**Psychometric properties of the Italian Version of BAT: preliminary evidence of its validity**

Chiara Consiglio, Cristiano Violani, Roberto Cenciotti, Diletta Pinzuti

Sapienza, University of Rome

**Purpose.** The Burnout Assessment Tool (BAT) is a newly developed questionnaire to assess burnout, comprising four different aspects (exhaustion, mental distance, impaired cognitive control and emotional control) and targeted to produce an overall burnout score. This study investigated the psychometric properties of the Italian adaptation of the BAT.

**Methodology.** Dimensionality of the BAT was firstly tested using a sample of 300 Italian employees. Additionally, an in-depth analysis was conducted using 1200 employees (health care, administrative, and technical staff). Different factorial models were compared to identify the best fitting solution. Associations were also analyzed of the BAT (dimensions and single score) with a number of burnout correlates, and demographic and organizational characteristics.

**Results.** An exploratory factor analysis confirmed the four-factor structure; each factor demonstrated high reliability. Confirmatory factor analysis confirmed this factorial structure as well. Moreover, burnout and its dimensions were associated, significantly and in the expected direction, with job characteristics, personal resources, health indicators and job attitudes. Relevant differences in burnout scores emerged across occupational and demographic groups.

**Conclusion.** Results provided preliminary evidence of the validity of the Italian version of the BAT as a tool able to measure burnout with a single score, according to its definition as a syndrome including a specific set of symptoms. Limitations of the study refer to the sample, that is not representative at a national level, and that predictive validity was not tested. Nevertheless, these preliminary results are encouraging. A sound overall burnout measure could be relevant for psychosocial risk assessment and organizational interventions.
A preliminary job demands-resources model in the context of the Burnout Assessment Tool

Leon T. de Beer

North-West University – Potchefstroom, South Africa

**Purpose.** This study investigates a preliminary job demands-resources (JD-R) model where burnout is measured with the new Burnout Assessment Tool (BAT).

**Methodology.** A convenience sample of South African employees was used (n = 304). Structural equation modelling (SEM) methods were applied to specify the model. In terms of job demands, overload and emotional load were used; for job resources – autonomy, colleague support, supervisor support and role clarity were used. Burnout was specified as a second-order latent factor represented by the four proposed symptom clusters of exhaustion, mental distance, and impaired emotional and cognitive control. Work engagement was also used. The outcome variables of the model were psychological distress symptoms (PDS), psychosomatic complaints (PSC) and turnover intention.

**Results.** Fit statistics revealed that the model was an acceptable fit to the data (e.g. CFI = 0.91). The structural paths revealed that emotional load was the strongest positive path to burnout, but that overload was also a significant. Supervisor support was the only job resource to have a significant negative path to burnout. Supervisor support and role clarity showed significant positive paths to work engagement. None of the job demands or job resources had significant direct paths to either PDS or PSC. However, burnout was revealed strong positive paths to both. Work engagement showed no significant paths to PDS or PSC. Finally, burnout showed a positive path, and work engagement a negative, to turnover intention.

**Conclusion.** This study supports the traditional health impairment process in which job demands impacts burnout and turnover intention.

Establishing clinically validated cut-off points for the Burnout Assessment Tool

Steffie Desart 1, Wilmar Schaufeli 1,2, Hans De Witte 1,3

1 KU Leuven – Leuven, Belgium
2 Utrecht University – Utrecht, Netherlands
3 Optentia Research Focus Area – Vanderbijlspark, South Africa

**Purpose.** The present study investigates the clinical validity of the Burnout Assessment Tool (BAT). The BAT is a new instrument to measure burnout that assesses four core symptom clusters – exhaustion, mental distance, and impaired emotional and cognitive control.

**Methodology.** Using a Relative Operating Characteristics (ROC) analysis, the trade-off between sensitivity and specificity is used to calculate the clinically validated cut-off points for each subscale of the BAT, and the overall BAT. This method determines how good a questionnaire is in discriminating between a pre-defined problematic and non-problematic group. In our case the problematic group is a patient sample, which have received the diagnosis burnout (N=150), whereas the non-problematic group is a representative sample of the Flemish working population (N=1,403). A score is considered to be ‘problematic’ if the trade-off between
specificity and sensitivity is at its maximum, and ‘very problematic’ if the specificity is equal or above .90. After establishing the clinically validated cut-off points they were re-applied to a representative sample of the Flemish working population to determine the prevalence of burnout in Flanders.

**Results.** The Area Under the Curve (AUC) varies from .86 to .95, indicating that the BAT can adequately discriminate burnout from non-burnout cases. In total, about 8% of the Flemish working population has a high risk of burning out, whilst 11% has a medium risk of burning out.

**Conclusion.** This study supports the clinical validity of the BAT. Furthermore, it contributes to the use of the BAT in both research and practice to identify employees with elevated burnout risks.
Integrated summary

State of the art

To survive as well as flourish, organizations increasingly need to foster employee creativity. Therefore, it is imperative to understand the precursors of creativity, namely, individual and situational triggers of creativity and, most importantly, their interaction. Additionally, to address current discussions among creativity researchers and practitioners, this symposium explores whether creativity may be unethical or create conflict for employees.

New perspectives/contributions

The studies in the present symposium use multiple methodologies, including experiments (Study 1 and Study 4), a diary survey study (Study 2), and a weekly survey study (Study 3). Together, they reveal that creativity increases when individuals with avoidance motivation work on structured tasks (Study 1), when young employees experience negative emotions or old employees experience positive emotions (Study 2), and when moderately rebellious employees experience high promotion focus or low negative emotions (Study 3). Furthermore, despite popular claims, creativity is not hampered by ethical goals, although ethical outcomes may be hampered by creativity goals (Study 4).

Research implications

Future research is yet to confirm whether these findings are relevant for all phases of creativity (e.g., idea generation, validation and implementation) or the cognitive processes that influence idea generation (e.g., problem definition, identification, recognition or construction).

Practical Implications

Our findings highlight tools organizations may use (task structure, emotions or regulatory focus) to enhance creativity of certain employees (e.g., avoidant, rebellious or old employees).

Presentation 1:
Providing structure to facilitate creativity

Dr. Marieke Roskes, VU University Amsterdam (Presenter)
Purpose

Ironically, although the saying goes that necessity is the mother of invention, generating novel ideas is easier when striving for improvement (approach motivation) rather than striving to avoid failure (avoidance motivation). Providing task structure may reduce anxiety, provide direction, and fit the systematic way of thinking associated with avoidance motivation, and could therefore enhance creativity under avoidance motivation.

Methods

In two experiments, individual differences in approach and avoidance motivation were measured and students wrote intervention proposals about the refugee crisis (study 1, N=100) or food waste (study 2, N=130). All students could prepare their assignment, but only half structured their task by making an outline (study 1) or a mind map (study 2).

Results

Task structure led to higher grades in both studies, specifically for originality of the proposals, and especially for students higher in avoidance motivation.

Limitations

First, of the many ways to structure tasks, two were assessed, leaving questions open regarding what characterizes effective structure. Second, future research should test whether generalization to situationally induced avoidance motivation.

Implications

For people with a strong avoidance motivation, and potentially also in avoidance motivation evoking (e.g., threatening) situations, it is useful to structure creative tasks.

Originality/Value

The popular notion is that creativity requires uninhibited thinking, and is obstructed by external constraints and structure. However, when applied correctly, structure improves creativity. For people high in avoidance motivation creative tasks are out of character, stressful, and difficult. Task structure reduces these hindrances and liberates people high in avoidance motivation to think creatively.

Presentation 2:

Daily affective experiences and daily creativity: The moderating role of age

Judith Volmer, Otto-Friedrich University of Bamberg (Presenter)
Creativity and innovation are crucial for organizational performance, growth, and survival. In today’s workforce, we observe a rapid increase in employees’ average age. Existing research has emphasized the role of affect for creativity, yet findings have been mixed. Drawing on age-related changes in affective experiences, we suggest that employee age might explain discrepant findings.

Design

We applied a web-based diary study over five consecutive working days (Monday to Friday) of a typical working week from various companies in Germany (N = 116 employees).

Results

In line with our assumptions, results from hierarchical linear modeling revealed differential effects with respect to the affect-creativity association. Whereas older employees were most creative on days with a high level of positive affect, younger employees were most creative on days with a high level of negative affect, also when controlling for the general level of positive and negative affect and perceived time-pressure. Finally, explorative tests of curvilinear age effects revealed no significant results.

Limitations

First, our study focused on high-activated affect. Second, further aspects of the social environment (e.g., leadership styles) should be considered in future research.

Research/Practical Implications

Our findings highlight the beneficial impact of positive affect at work on creativity. At the same time, organizations should provide a positive, creativity enhancing environment.

Originality/Value

Our study expands previous research on the affect-creativity link by showing differential effects in the association between daily affective experiences and creativity, depending on employees’ age.

Presentation 3:
The creative rebel: A weekly survey study among employees
Paraskevas Petrou, Erasmus University Rotterdam (Presenter)
Dimitri van der Linden, Erasmus University Rotterdam
Charalampos Mainemelis, ALBA Graduate Business School
Oana Catalina Salcescu, Erasmus University Rotterdam

Purpose

Although literature implies that rebelliousness can be a precursor of creative behavior, this assumption has rarely been tested. In the present study, we hypothesized that trait-level rebelliousness has an inverted U-shaped relationship with week-level creativity. Additionally, we expected that the effect is pronounced under any of the four following conditions: Individuals (1) strive for success (i.e., high promotion focus), (2) they are not failure-avoidant (i.e., low prevention focus), (3) they display high positive emotions, and (4) low negative emotions.

Design

We conducted a weekly survey study with three measurements among a heterogeneous sample of 156 employees to test our hypotheses and we conducted multilevel analyses with MLwiN to analyse the data.

Results

While we did not find a direct significant nonlinear link between rebelliousness and creativity (i.e., highest levels of creativity at moderate levels of rebelliousness), we did find that such an effect occurs under the conditions of high promotion focus or low negative emotions. Prevention focus and positive emotions did not moderate the link.

Limitations

All variables are self-reported.

Research/practical implications

Organizations and managers should be open to consider moderately rebellious employees as an asset rather than a danger. However, they should make sure that rebelliousness is complemented with the right employee states (i.e., promotion focus and absence of negative emotions).

Originality/value

Our study reveals that moderate rebelliousness is not sufficient by itself to unlock creativity. Instead, we uncover two discrete conditions that amplify the effect: employees are motivated to succeed and they refrain from negativity.

Presentation 4:
Dual Ethical-Creative Goals and Outcomes
Andra F. Toader, University of Konstanz (Presenter)

Purpose
Previous research has uncovered, concerningly, that creative people tend to be more unethical. While this suggests an inherent conflict between creativity and ethics, no research so far has explored the nature of this conflict. By using a dual goal pursuit model of ethics and creativity, we aim to get at the root of this conflict.

Design
An experiment (study 1) and a survey (study 2) were conducted. In study 1, people were assigned ethical goals, creative goals, both or none. In study 2, people had to report on their ethical and creative goals. Cognitive conflict, creativity and ethical behavior were measured.

Results
People with creative goals only experienced the highest amount of conflict and lowest ethical outcomes, supporting previous research. People with dual ethical-creative goals, however, did not experience conflict, and instead had similar creative outcomes as people with creative goals only and higher ethical outcomes.

Limitations
In the experiment, we did not assess actual ethical behavior, but quality of ethical ideas (study 1). The outcomes were self-reported in the survey.

Implications
Our results suggest that creativity and ethics may actually not conflict, but conflict may be inherent to the creative personality. Ethical goals seem to curb this effect of creative personality, thereby having a high practical relevance.

Originality
This is the first study that explored the implicit conflict between creativity and ethics.
Chair: Simone Kauffeld, TU Braunschweig
Discussant: Beatrice van der Heijden, Radboud Universiteit Nijmegen

State of the Art
With this symposium, we aim to shed light on careers in academia. Academia is a highly competitive, insecure and instable environment. There is little importance of organizational boundaries and a strong focus on protean aspects. Researchers often work on temporary, part-time contracts and their career paths are less predictable than the ones in other sectors. Therefore, we think that the academic context offers a well-suited background to discuss career goals, and resources required for a successful career.

New Perspectives/Contributions
This symposium brings together a series of empirical studies that address challenges within academic careers, career goals of academics, and important resources in the light of career success. A common core of the papers is a focus on academia and careers, including a resource perspective.

Research/Practical Implications
The presented papers help to sharpen our understanding of career goals in academia and resources needed in the light of successful careers and coping with demands (e.g., career insecurity). The studies offer advice on career interventions and career counselling.

Career goal profiles of PhD students and doctorate holders – A latent profile approach
Ruth Noppeney, Anna M. Stertz & Bettina S. Wiese
RWTH Aachen University, Germany

Purpose
PhD students and doctorate holders have multiple career options that include the academic track but also careers in non-academic fields. For a better understanding of career decisions of this group of highly educated scholars and by adapting ideas from the sociology of professions, this study looks at the career goals from a person-oriented perspective.

Design/Methodology/Approach/Intervention
Using Latent Profile Analysis, we investigated different career goal profiles. The sample consisted of N = 2038 doctoral students and doctorate holders from the STEM fields (60.2% men). Participants were asked to indicate to what extent they aspired to each of the following five career goals: professorship, management position, entrepreneurship, other research activities, other career positions within industry (each to be rated on a six-point scale).

Results
A four-class-solution obtained the best model fit: Profile 1 is characterized by low interest in all five career goals, Profile 2 by high interest in all goals, Profile 3 by high interest in both professorship and other researcher positions, and Profile 4 by high interest in management positions and entrepreneurship.

Limitations
We solely considered participants from the STEM fields.

Research/Practical Implications
The existence of multiple career goals has to be considered when investigating predictors of career decisions. Striving for multiple career goals should also be paid attention to in career counselling.

Originality/Value
This study draws a more complete picture of the representation of career goals. Discovering goal profiles offers a better understanding of individual’s career development.

Applying the job demands-resources theory: A longitudinal study in academia
Nora Nixon\(^1\), Daniel Spurk\(^2\) & Simone Kauffeld\(^1\)
TU Braunschweig, Germany\(^1\)
University of Bern, Switzerland\(^2\)

Purpose
Job demands-resources theory majorly influenced research over the last decades. Following Bakker and Demerouti (2018), we build a model of resources (e.g., autonomy), demands (e.g., insecurity), motivation (e.g., work engagement), strain (e.g., irritation), and performance (e.g., creativity) fitting to the demands and resources relevant in academia.

Design/Methodology/Approach/Intervention
We test our model with a sample of academics (N = 1062) in a longitudinal design over three years. According to theory, we analyze direct and indirect paths from resources and demands to performance over strain and motivation.

**Results**

We found support for the indirect effect model on the motivation-performance link, but not for the strain-performance link. The resources, autonomy and optimism, were significant predictors of work engagement, which in turn, was a significant predictor of creativity. Work-family conflict, but not insecurity, is significantly positive related to irritation, and irritation is not significantly related to creativity.

**Limitations**

The sample consists of German researchers only; therefore, it is limited to the field of academia with highly educated people. Only a few selected demands and resources were added in the model.

**Research/Practical Implications**

We found support for the resources-motivation-performance link – a possible buffering effect of these paths on the strain-link could be analyzed in the future.

**Originality/Value**

To our knowledge, we are the first to apply a comprehensive model of the job demands-resources theory to the context of academia. We used a longitudinal design over three measurements and included a set of resources and demands important in the field of careers and academia.

**The interplay of career insecurity and self-management: A longitudinal study**

Aida Alisic, Christian L. Burk & Bettina S. Wiese

RWTH Aachen University, Germany

**Purpose**

Academic careers are characterized by high levels of uncertainty. Therefore, successfully dealing with career insecurity is a central developmental demand for young scholars. Building on the social cognitive theory of self-regulation (SCT; Bandura, 1991) and the conservation of
resources theory (COR; Hobfoll, 1989, 2001), the present study investigates the longitudinal relationships between self-management and perceived career insecurity.

**Design/Methodology/Approach/Intervention**

We collected questionnaire data (online survey) at six measurement points (with six months intervals) from a sample of 3091 PhD students and PhD holders from the STEM-fields, and used random intercept cross-lagged panel modeling (RI-CLPM; Hamaker, Kuiper, & Grasman, 2015) for data analysis.

**Results**

Self-management and career insecurity were found to be negatively correlated at the between-person level. At the within-person level, all time-lagged effects from self-management to career insecurity as well as all from career insecurity to self-management reached significance.

**Limitations**

The sample was limited to highly educated respondents from the STEM fields.

**Research/Practical Implications**

Results are in line with the idea of gain and loss spirals that are central to the COR theory and SCT. More attention should be paid to interventions (e.g., coaching, training) that support the development of self-management skills.

**Originality/Value**

We implemented a longitudinal design with six measurement points and a large sample size. Methodologically, with using RI-CLPM (Hamaker et al., 2015), the study builds on a new development in cross-lagged modeling.

---

**Social Capital as Predictor of Objective Career Success in Academia**

Luisa Barthauer & Simone Kauffeld  
TU Braunschweig, Germany

**Purpose**

According to the social capital of career success theory, an individual’s social network is crucial for achieving career success. Within this study, we assessed whether social capital in the form
of structural aspects (e.g., density), social resources (e.g., contacts in other functions), and network benefits (e.g., career support) within developmental networks is predictive of objective career success in academia (i.e., research funding, the number of publications).

**Design/Methodology/Approach/Intervention**

The sample consists of 278 German researchers in their PhD and postdoc phase within versatile research fields. The proposed model was verified by means of a time-lagged mediation analysis with the Hayes macro in SPSS 24.00.

**Results**

The results suggest that weak ties (i.e., density) are predictive of objective career success in academia (i.e., number of publications and grants) two years later and that this relationship is mediated by the number of contacts into other functions than the own and the amount of career support received from this social network.

**Limitations**

The study is limited in its generalizability due to a German sample.

**Research/Practical Implications**

For being objectively successful in academia, the study suggests that researchers should have a dispersed network and to be connected to other researchers in other functions than their own.

**Originality/Value**

We assess the composition of researchers’ social networks and indicate how they can foster a career in academia.

---

**Positive psychological capital – a key to career success in academia?**

Philipp Kaucher¹, Daniel Spurk² & Simone Kauffeld¹

TU Braunschweig, Germany¹

University of Bern, Switzerland ²

**Purpose**

Positive Psychological Capital (PsyCap; Luthans & Youssef, 2004) was neglected in the context of career success research. Therefore, the aim of the current study is to examine the effect of PsyCap on subjective and objective career success as well as the mechanisms that lead to this
effect. PsyCap is defined as an individual’s positive psychological state of development linking self-efficacy, hope, optimism, and resilience to a higher order construct (Luthans et al., 2007). Applying conservation of resources theory, we argue that personal key resources, like stable traits (e.g., PsyCap), lead to the facilitation, obstruction, and development of other career resources (e.g., career planning, networking) and, hence, to career success.

**Design/Methodology/Approach/Intervention**

We tested our hypotheses with a sample of N = 1100 academic scientists that filled in an online survey three times with an interval of about a year.

**Results**

Results suggest a positive effect of PsyCap on subjective and objective career success that is stronger for subjective career success. We found support for our mediation model: The effect of PsyCap on career success was mediated by career related resource management behaviors (e.g., career planning and networking).

**Limitations**

The results should be carefully interpreted outside the sample that is scientists in Germany.

**Research/Practical Implications**

The presented results can be fruitful for applying PsyCap training or interventions to foster career success.

**Originality/Value**

We combine positive psychology and conservation of resources theory within the context of academic careers using structural equation modeling with longitudinal data.
MANAGING MENTAL ILLNESS AND PROMOTING GOOD MENTAL HEALTH IN THE WORKPLACE.

Proponents: Sheena Johnson¹ and Laurent M. Lapierre².

¹Alliance Manchester Business School, University of Manchester, UK.
²Telfer School of Management, University of Ottawa, Canada.

State of the Art: Remarkably little is understood about poor mental health in the workplace in terms of how best to support the mental health challenges of employees. This is surprising given the estimates of high costs related to mental health for both organisations and employees. Supporting individuals facing mental health challenges can help to reduce such costs but greater understanding of how best to implement support is needed.

New Perspectives/Contributions: This symposium presents 5 studies investigating different aspects of mental health research, with a focus on workplace support. Presentations will cover: understanding the disclosure of mental health challenges at work; the impact of Mental Health First Aid; understanding context in effective stress management interventions; poor psychological health and the development of practical guidance for improved wellbeing in the veterinary profession; mental health effects on bystanders who witness workplace bullying and their support needs.

Following the presentations a panel Q & A session with audience members will allow wider discussion of mental health support research and initiatives.

Research/Practical Implications: Understanding and improving workplace support for poor mental health is important for organisations and yet there is a lack of research available to reliably inform support decision making. This symposium collates a range of research studies into mental ill health and investigates ways in which support for mental health challenges can be best implemented.

Title: An Exploration of Why and How Employees Disclose Having a Mental Illness

Author and affiliation: Laurent M. Lapierre¹, Sheena Johnson², Silvia Bonaccio¹, Jane O’Reilly¹, Ivy Bourgeault¹, Magda Donia¹, Yanhong Li¹.

¹Telfer School of Management, University of Ottawa, Canada.
²Alliance Manchester Business School, University of Manchester, UK.

Purpose: Employed individuals living with a mental health challenge, particularly one relating to anxiety, depression, and/or substance abuse, is of increasing concern. Disclosing mental health struggles, especially to one’s immediate manager, is important for receiving support and accommodations that could reduce or prevent significant costs stemming from reduced
productivity, absences, and turnover. Many employees refrain from disclosing, and thus avoid seeking help, primarily due to the fear of stigmatization, shunning, or retaliation. Understanding disclosure decision making is important to encourage disclosure. This study explores possible antecedents and manifestations of disclosing one’s mental illness at work.

**Design/Method:** Open-ended interviews conducted with employed individuals from a variety of occupations/organizations in Canada and the UK who are currently experiencing or have recently experienced a mental health struggle.

**Results:** Interviews will be completed by December, 2018. Meaningful themes will be extracted for presentation at the conference.

**Limitations:** Inductive/exploratory results can only point toward theoretical possibilities, not generalizable truths.

**Implications:** After being tested deductively/quantitatively, theoretical insights gained from this work will ultimately help managers to foster more supportive work settings where employees feel more comfortable disclosing their mental health struggles and actually receive needed support after doing so.

**Originality/Value:** There is limited understanding of the disclosure decision-making process. This study is the first stage of a wider research project investigating mental health disclosure in the workplace.

**Title:** An investigation into individual and organisational impacts of Mental Health First Aid (MHFA) initiatives in a Media Organisation.

**Author and affiliation:** Susannah Robertson-Hart & Sheena Johnson, Alliance Manchester Business School, University of Manchester, UK.

**Purpose:** To explore the impact of workplace Mental Health First Aid (MHFA) initiatives on psychological wellbeing of recipients and deliverers of MHFA support. The role of Psychological Capital (PsyCap), Emotional Labour, absence and productivity will be explored.

**Method:** A mixed-methods two stage study. (1) Interviews, already completed, have explored perceptions of MHFA and informed Stage 2 study design. (2) MHFA training participants will be surveyed before and three months after training. A cross-sectional organisational survey will explore organisation-wide perceptions. Interviews will explore outcomes relating to MHFA support.

**Results:** Preliminary findings from Stage 1 interviews suggest a positive impact of MHFA on psychological wellbeing with PsyCap and Emotional Labour both relevant factors. Stage 1 and interim stage 2 results will be presented at EAWOP2019.
Limitations: The main limitation of MHFA research relates to the challenges of implementing robust methodology to assess recipients of MHFA support, given its confidential and sensitive nature. This risk is minimised by the access the researcher has to the organisation.

Implications: The research provides unique insights and is directly relevant to employers using MHFA as a workplace mental health strategy.

Originality/Value: Very little is currently known about the impact of MHFA on psychological wellbeing. This research will be the first study to explore the impact of MHFA in a large, international organisation.

Title: Unlocking the “Black Box”: An Investigation of Contextual Variables Influencing the Effectiveness of Stress Management Interventions

Author and affiliation: Lina Siegl, PhD Student, The University of Manchester

Purpose: Finding ways to improve employee mental health and engagement is a common goal of many academics, practitioners and organisations alike, however, studies are showing inconsistent effects of Stress Management Interventions (SMIs). This study examines the extent to which two contextual variables, in form of Psychosocial Safety Climate (PSC) and Job Insecurity (JI) may influence the effectiveness of SMIs in improving both employee well-being and work engagement.

Design/Method: A cross-sectional research design was utilised comprising of an online survey completed by 204 employees of a large engineering firm in the UK.

Results: PSC significantly moderated the relationship between implemented SMIs and employee well-being so that the positive relationship was stronger under high PSC conditions. When PSC was low, SMIs were not effective in improving employee well-being. No significant moderating effect of JI was found.

Limitations: The absence of baseline data, the cross-sectional design and the focus on a single-level of analysis prevented a more rigorous evaluation of the effectiveness of the implemented SMIs and the influence of the contextual variables.

Implications: Creating a high PSC environment may lay the foundation for SMIs to achieve more consistent positive effects. Additionally, implementing SMIs could have positive effects on employee outcomes even during times of restructuring.

Originality/Value: The first empirical examination of the influence PSC and JI can have on the effectiveness of SMIs.
Title: Psychological Health and Wellbeing in Veterinary Surgeons

Author and affiliation: Elinor O’Connor, Sheena Johnson and David Hughes.

Alliance Manchester Business School, University of Manchester, UK

Purpose: Evidence of elevated suicide rates among veterinarians (e.g. Platt et al, 2010) is a matter of concern for the veterinary profession. Occupational stress has been suggested as a factor in veterinarians’ poor psychological health (e.g. Bartram and Baldwin, 2010), but research evidence regarding stressors in veterinary work is limited, hindering identification of appropriate stress management interventions for veterinarians.

Methodology: An interview study was conducted with 18 UK-based veterinarians to explore their experience of work stressors. Data were analysed inductively using thematic analysis.

Results: Principal stressors identified included work-life balance, interaction with animal owners, staff management, and aspects of animal euthanasia. High perfectionism was apparent among some participants. Critical self-evaluation is a component of perfectionism associated with psychological distress and suicidality (O’Connor, 2007), and might also lead to greater strain in the face of work-related stressors, particularly those that reinforce self-criticism, such as client complaints.

Limitations: Shonfeld and Farrell (2010) highlight the benefits of qualitative methods in stress research, but qualitative studies have recognised limitations. A quantitative, longitudinal study is being undertaken to examine the relationship between stressors and strain in veterinary work, including the role of individual differences in perfectionism. Initial results of the study will be presented.

Research/Practical Implications: The research underpins a project being undertaken with the UK veterinary profession to develop practical guidance for veterinary workplaces on enhancing wellbeing and managing stress at work.

Originality/Value: The research contributes to understanding of stress in veterinary work and to identification of stress management initiatives for the profession.

Title: Mass effect: A review of mental health effects of workplace bullying bystanders

Author and affiliation: Kara Ng, Alliance Manchester Business School, University of Manchester.

Purpose: Although workplace bullying occurs in social contexts, researchers have tended to ignore the experiences of bystanders. Past studies suggest that workplace bullying bystanders can experience negative psychological outcomes. Consequently, it is important to consider and deepen our understanding of those not directly involved in bullying. This review examines existing literature on the mental health effects of these individuals.
**Design:** A review of key online search databases was conducted, supplemented by additional manual searches of reference lists.

**Results:** Preliminary results suggest that bystander exposure to workplace bullying is associated with detrimental outcomes similar to those experienced by victims, such as depression, stress, or burnout. It may also be important to understand bystanders who are *not* affected and who can act destructively.

**Limitations:** This review focused on English language studies since 1990. Thus, certain bodies of literature may have been excluded. Different keywords or review questions may have yielded different results.

**Implications:** Findings highlight the need to view workplace bullying as a social phenomenon. It is important to treat bullying holistically and acknowledge that those outside of the dyad may also suffer. This review can help academics and practitioners to better understand the bystanders in workplace bullying, as well as provide directions for future research.

**Value:** Research on bystanders is small relative to workplace bullying literature. This review goes beyond the ‘epicentre’ of the bullying dyad and acknowledges the consequences of being a bystander.
IMPLICIT MOTIVES IN I/O: NEW FINDINGS AND PRACTICAL APPLICATIONS

J. Malte Runge and Jonas W.B. Lang
Ghent University

Discussant: Tanja Bipp (University of Würzburg)

State of the Art

Implicit motives are typically described as stable preferences for classes of affectively charged incentives such as need for achievement, power, or affiliation. They are commonly measured through indirect means because they are not accessible through introspection. Researchers have long been interested to study the effect of implicit motives on people’s work life and found that implicit motives predict task and contextual performance (Lang, Zettler, Ewen, & Hülsheger, 2012), career success (Spangler, 1992; Winter et al., 1998), entrepreneurial success (Rauch & Frese, 2007; Wainer & Rubin, 1969), and Counterproductive Work Behavior (CWB; James et al. 2005).

New Perspectives/Contributions

All four presentations contribute to the understanding of implicit motives as individual differences that cover central motivational aspects of employees in organizations. The first paper (Galić, Ružojčić, & Restubog) predicts CWB with an interaction effect between the implicit motive to aggress and machiavellism. The second paper (Runge & Lang) shows incremental validity of implicit motives above explicit personality measures in the prediction of CWB. The third paper (Brueckner, Lang, & Bosak) studies gender differences in CEO implicit motives. The fourth paper (Van Cauwenberghe & Velghe) presents the application of an implicit motive measure in a personal selection process including test development, practical implementation of the test procedure, and empirical evaluation of reliability and validity.

Research/Practical Implications

Overall, this symposium presents new findings in implicit motive research in I/O expanding existing literature on employee CWB, CEO motivation, and performance. Additionally to those theoretical contributions, the symposium has a high value for practitioners who are interested in implementing implicit motives in personnel selection.

Integrating implicit and explicit personality: Machiavellianism channels implicit aggressiveness into deviant workplace behavior.

Zvonimir Galic (University of Zagreb), Mitja Ružojčić (University of Zagreb), and Simon Restubog (University of Illinois)
Purpose

Guided by the channeling hypothesis (Winter et al., 1998) which postulates that wishes, desires and goals that stem from implicit personality are directed in behavior through explicit personality traits, we examined the interactive effects of implicit aggressiveness (IA) and Machiavellianism (Mach) on workplace deviance (WD).

Design/Methodology/Approach/Intervention

We conducted two studies on samples of Croatian employees in which IA was captured by the Conditional Reasoning Test for Aggression (CRT-A) whereas Mach was assessed with questionnaires. In Study 1, we asked a sample of employees ($n = 286$) to complete the CRT-A and a Mach scale, and collected ratings of WD from their co-workers. In Study 2, another sample ($n = 187$) completed the CRT-A, another Mach scale, and self-reported about WD. Additionally, in Study 2, we collected self-reports about inclinations toward moral disengagement.

Results

The results from both studies showed a significant interaction between IA and Mach: the effect of IA on WD was stronger for participants higher on Mach. A moderated mediation analysis indicated that employees who are high both on IA and Mach might be especially inclined to WD due to their readiness to morally disengage from undesirable behavior.

Limitations

Both studies were conducted in a specific cultural context.

Research/Practical Implications

Our findings indicate a value of considering both explicit and implicit personality aspects to better understand/predict WD.

Originality/Value

Our study is among the few that explored the interplay between implicit and explicit personality in determining workplace behavior.

Counterproductive Work Behavior: Do Implicit Motives Have Incremental Validity Beyond Explicit Traits?

J. Malte Runge and Jonas W. B. Lang (Ghent University)

Purpose

I/O psychologists have long been interested in understanding the individual difference correlates of employee counterproductive workplace behavior (CWB). Existing research has,
amongst others, studied explicit personality traits (e.g. Five Factor Model) as antecedents of CWB. The goal of the present presentations is to extend this research for implicit personality and study whether the implicit achievement, power, and affiliation motive contribute to the prediction of CWB above explicit personality traits.

**Design/Methodology/Approach/Intervention**

We report two studies with employee samples. The first study (N=263) is a reanalysis of an earlier sample (Lang, Zettler, Ewen, & Hülsheger, 2012). In this study, explicit personality traits were measured with the Big Five Inventory, and the three implicit motives with the Operant Motive Test (OMT). CWB was self-rated using the scale from Bennet and Robinson (2000). The second study (N=121) extends the first study by using supervisor ratings instead of self-ratings (Berry, Carpenter, & Barratt, 2012) and the HEXACO personality inventory to control for honesty-humility.

**Results**

Results revealed that implicit motives had significant incremental validity in both Study 1 ($\Delta R^2=.03, p<0.01$) and Study 2 ($\Delta R^2=.08, p=0.03$). In Study 1, this incremental validity resulted from a significant effect of affiliation motivation. In Study 2, both affiliation and power motivation had a significant effect on CWB.

**Limitations**

Both studies use a cross-sectional design.

**Research/Practical Implications**

Implicit motives may be useful in applied and research contexts to prevent and predict CWB.

**Originality/Value**

We study the role of implicit motives as a buffer for employee CWB.

**Implicit Motives in the Upper Echelons: Gender Differences in CEOs’ Expression of Power and Affiliation Motivation**

Julie Brueckner (Dublin City University), Jonas W.B. Lang (Ghent University), and Janine Bosak (Dublin City University)

**Purpose**

The present research aims to advance the understanding of how gender relates to CEOs’ expression of implicit achievement, power, and affiliation motives.

**Design/Methodology**
The study samples 45 male and 45 female CEOs sourced from the ExecuComp database. CEOs were matched using a propensity score method. Archival materials were collected to measure motives by means of Winter’s (1994) manual for scoring motive imagery in a blind triple-coding process with trained raters.

Results

T-tests revealed that in the present sample male CEOs express a higher need for power than female CEOs and female CEOs express a higher need for affiliation. The authors found no gender difference in CEOs’ achievement motivation.

Limitations

The underrepresentation of female CEOs in the S&P Index limits the possibility of generating a larger sample.

Research/Practical Implications

Adding empirical evidence of how male and female CEOs express their motivational needs positively contributes to the field of management diagnostics and development and has practical relevance for investor relations.

Originality/Value

This research is the first of its kind to systematically investigate differences in the motives of top-managers in a gender-balanced sample by applying a validated research method in a novel way: Specifically, analyzing CEO letters, one of the most important communication channels in the CEO-shareholder relationship, through a well-established tool for scoring motives in running text (Winter, 1994) allows to study leaders’ motives from a distance. Further, the study adds value by addressing inconsistent findings in the literature regarding the extent to which men and women differ in their motivational needs.

Developing an automated implicit motivation test for personnel selection

Marijn Van Cauwenberghe & Cédric Velghe (The VIGOR Unit, Belgium)

Purpose

Despite the widespread application of motivation assessments in the selection context, measures for implicit motivation have seen little use. This is, in part, attributable to the resource intensive manual scoring methods for common implicit motivation measures. We developed a measure for implicit affiliation, achievement, and power motivation based on self-ratings for the selection procedure of a large public employer, using real applicants.
Design/Methodology/Approach/Intervention

In the new test, applicants see 10 pictures. They chose one of four items that describe the scene in the picture best and one that describes it least. The items are directly linked to an implicit motive. We applied the test in a real selection procedure (n = 452) and successfully fitted a Thurstonian IRT model (DTM; Lang, 2014) to score the test, evaluate items, and study IRT reliability. Data on predictive validity with supervisor ratings of performance using the relative percentile method (Goffin et al., 2009) are currently being collected.

Results

Results suggest that forced choice scoring of implicit motives using written out stories can be effective.

Limitations

The closed answer format reduces applicants’ freedom of response. As a result, the instrument is in between implicit and explicit motives.

Research/Practical Implications

As implicit measures have shown incremental predictive validity over explicit measures (Bing et al., 2007), the development of an automated projective test creates a useful additional tool for personnel selection.

Originality/Value

This study proposes a novel approach for the item development, response-format, and the automated response scoring of a projective test for implicit motives.
State of the art. As a consequence of demographical changes many organizations face a growing age diversity. Similar to gender and cultural diversity, age diversity is a “double-edged sword”: some studies report positive effects on well-being and performance whereas others report negative or no effects.

New perspectives. The effects of age diversity can be better understood if we focus more in-depth on mechanisms explaining the link between age and outcomes. The present symposium addresses this issue by including five studies focussing on the role of (1) age (dis)similarity between employees, and (2) an age supportive climate.

Research. The first contribution by Gamboa and colleagues examines to what extent HRM measures contribute to preventing turnover intention in an age homogenous group of young graduates. In the second contribution, Ellen Peeters and colleagues focus on the effect of age (dis)similarities between employees and supervisors and the effect on self-perceived and supervisor-rated employability. In the third contribution, De Meulenaere and Kunze introduce the concept of age distance to understand the impact of two types of age diversity on firm performance. In the fourth contribution, Maria Peeters and colleagues demonstrate that a positive intergenerational climate in organizations is related to engagement and performance via a mediating role of strengths’ use behavior. Finally, Kilroy and colleagues show that a supportive climate aimed at older workers increases perceived organizational support, which in turn results in higher levels of vitality and dedication. Tinka van Vuuren will moderate an open discussion about how the presented studies advance theory on age diversity and what the possible implications are for organizational practice.

Preventing turnover among overqualified young graduates: The role of human resources management practices for reducing the propensity to leave the job and the company

Juan P. Gamboa¹, Ana Hernández², Carmen Picazo¹², Inés Tomás², Vicente González-Romá²

¹OPAL, University of Valencia
²IDOCAL, University of Valencia
Purpose. Overqualification is a problem not only for young graduates, but also for organizations that, frequently, are afraid overqualified employees will be quitting the job and the organization as soon as they can. This study analyzes whether human resources management (HRM) practices in relation to people flow (e.g. training, development and promotion), employment relationships and performance management contribute to buffering the effects of young graduates’ overqualification on their propensity to leave the company and the job.

Methodology. The moderation model was tested in a Spanish sample of 81 recent graduates that had a job. Sample age was relatively homogenous. Overqualification and HRM practices were measured six months after graduation. Propensity to leave the job and the company were measured about three months later.

Results. Overqualification positively predicted the propensity to leave both the company and the job. The three HRM practices negatively predicted the propensity to leave the company. Regarding the moderating effects of HRM practices, the results showed that only HRM practices related to people flow buffered the positive relationship between overqualification and propensity to leave the company. Limitations. Generalizability is constrained because graduates came from only one university.

Implications. HRM practices that pay attention to people flow contribute to preventing the propensity to leave organizations of young graduates that are overqualified to some extent.

Originality/Value. This study provides an extended understanding for preventing the negative consequences of overqualification for organizations.

Age and Employability: A Polynomial Test of Age-Related Stereotyping

Ellen Peeters1,2, Judith Semeijn1,3, Beatrice Van der Heijden4,1,5,6

1Open University of the Netherlands (The Netherlands),
2University of Ghent (Belgium),
3Maastricht University (The Netherlands),
4Radboud University (The Netherlands),
5Kingston University, London, UK,
6Hubei University, Wuhan, China.

Purpose. Literature on (age-related) stereotyping argues that individuals who are more similar, rate each other more positively, which can have consequences for employability. Consequently, to gain more insight, this study focuses on the effect of age (dis)similarities between employees and supervisors, the effect on self-perceived and supervisor-rated employability, and the role of employability competencies also rated by the employee and the supervisor.
**Design.** The analyses were performed using 203 dyads of employees and their direct supervisor through polynomial regressions and are plotted in three-dimensional graphs.

**Findings.** The results of this study indicate mainly significantly negative slopes of the similarity and dissimilarity lines with age of the employee and age of the supervisor as independent variables, with different types (internal, external, qualitative, quantitative) of self- and other-rated perceived employability as dependent variables. With regard to the distinguished employability competencies, age did not have any relationship with occupational expertise, but we did find effects of (dis)similarity slopes and curvatures for anticipation and optimization, corporate sense, balance, and personal flexibility.

**Conclusion and originality.** The results indicate similarity and dissimilarity effects, mainly in the light of personal flexibility as ranked by the supervisor, but also for other indicators of employability. In sum, the effect of age on employability may be explained by age-related stereotyping and needs further in-depth studies.

---

**How an inclusive age climate at work relates to well-being and performance:**

**The mediating role of strengths’ use behavior**

Maria C.W. Peeters\(^1\)\(^2\), Sonja Rispens\(^2\), Beatrice Van der Heijden\(^4\)\(^3\)\(^5\)\(^6\)

\(^1\)Utrecht University, The Netherlands
\(^2\)Eindhoven University of Technology, The Netherlands
\(^3\)Open University of the Netherlands
\(^4\)Radboud University, The Netherlands
\(^5\)Kingston University, London, UK
\(^6\)Hubei University, Wuhan, China

**Purpose.** Several societal and demographical trends reinforce a development towards a more age-diverse workplace. In some workplaces, as many as four generations of adults can be found working together. For organizations it is important to know how they can foster positive consequences of the increasing prevalence of age diversity. In this study we test the assumption that an inclusive intergenerational climate in organizations will contribute to well-being and performance. Moreover, based on the information/decision-making perspective on diversity, we hypothesize that these relationships will be mediated by strengths’ use behavior.

**Methodology.** Three different Dutch samples have been used to test our hypotheses building upon cross-sectional designs. For measuring the intergenerational climate in an organization, we translated and adapted The Workplace Intergenerational Climate Scale (WICS) of King and Bryant (2016) for use in the Dutch work context.
Results. The results confirm our hypothesis that a positive perception of the intergenerational climate in organizations is related to higher scores on engagement (being an important indicator of well-being) and performance (i.e. innovative behavior and extra-role behavior). Also, we found empirical support for the mediating role of strengths’ use behavior.

Limitations. Cross-sectional design and self-reports only.

Practical Implications. The study shows that it is important for supervisors and/or HRM practitioners to invest in an age-inclusive climate in organizations/teams.

Originality. It is the first time that the WICS is used in a non-English speaking country and that the potentials of strengths’ use behavior are illustrated as a consequence of a positive age diversity climate.

Engaging Older Workers; the Role of a Supportive Climate

Steven Kilroy¹, Dorien Kooij¹ and Karina Van de Voorde¹

¹Tilburg University, The Netherlands

Purpose. This study argues that a supportive climate specifically aimed at older workers will increase their perceived organizational support, which in turn will result in higher levels of vitality (‘can work longer’) and dedication (‘want to work longer’).

Design/Methodology/Approach/Intervention. A longitudinal multi-level study was employed among Dutch university employees. 281 older employees (> 45) nested within 52 work units participated.

Results. Multi-level results revealed, while controlling for prior organizational support, vitality and dedication at T1, a positive relationships between a supportive climate for older workers at T2 and vitality and dedication at T2, which are mediated by perceived organizational support at T2.

Limitations. Limitations include not measuring a supportive climate at time 1 and because of the lack of universal cut off points for distinguishing age groups, the choice for this study may not be universally applicable.

Practical Implications. A significant challenge for HR managers is to encourage older workers to remain engaged and active members of the workforce for as long as possible. This study identifies a useful strategy for tackling this issue and explains the process through which it occurs.

Originality. The study offers unique insights of how to engage and retain older workers.
Reflecting on the role of age in contemporary organizations

Tinka van Vuuren¹,²

¹Loyalis Kennis & Consult, The Netherlands
²Open University of the Netherlands

Are we giving too much credit to age differences in organizations? Positive effects and negative or no effects of age diversity on well-being and performance are found. The presented studies explain the link between age and outcomes by more in-depth mechanisms as the existence of an age supportive climate and age distance between employees. Can we translate this in practical implications for organizations, or is this too much of a good thing? To stimulate an interactive discussion with the audience several propositions will be made to bring into the discussion.
WORK-FAMILY INTERFACE: GOING THROUGH PROCESSES AND LIFESPAN

Donatienne Desmette (1) and Gabriela Topa (2)

(1) Université catholique de Louvain (UCLouvain), Louvain-la-Neuve, Belgium
(2) National Distance Education University (UNED), Madrid, Spain

State of the art: Although research on work-family interface (WFI) has grown over and over the past several decades, some scholars have argued that we still need a better understanding of how and why work-family conflict (WFC, i.e. when experiences in a role interfere with requirements of another role, Greenhaus & Beutell, 1985) and work family-enrichment (WFE, i.e., positive relationships between work outcomes work and family, e.g., Greenhaus & Powell, 2006) may have important implications for well-being, work outcomes and family functioning (McNall et al., 2010). Additionally, work-family interface has rarely been examined from a life course perspective (Allen & Fikelstein, 2014).

New perspective/contribution: In reply to that, using a vast panel of methods, the studies that are presented highlight new explanatory processes for WFC and/or WFE and their consequences, in relation to individual and/or organizational variables. The symposium contributes also to disentangle causal relationships between WFC and work outcomes. Finally, it provides a valuable tool for analyzing WFC in relation to age matter.

Practical implications: Our symposium provides researchers and organizations relevant knowledge and tools about which organizational and individual resources likely can either reduce the negative side of the work-family interface or to reinforce its positive side.

Five papers are presented, in an international perspective. The contribution of the symposium will be envisioned by the discussant before the general discussion is open.

The effects of new technologies on the work-family interface: A comparative study between Italy and France

Monica Molino*, Sophie Wodociagb & Chiara Ghislieria

aUniversity of Turin, Psychology Department, Turin, Italy
bUniversité de Haute-Alsace, CREGO (Centre de Recherche en Gestion des Organisations), Mulhouse, France

Purpose: Recent studies have investigated the effects of the use of new technologies for work purposes during off-work time (Derks et al., 2014); nevertheless, little attention has been dedicated to its determinants so far. In France, the “Loi Travail” regulates the technology-assisted work during off-work time, while in Italy this practice is common but not regulated. The study’s aim is to investigate the mediational role of the frequency of technology use during leisure time between job demands (workload, destructive leadership) and job resources (job autonomy, colleagues support) on the one hand, and work-family conflict (WFC) and enrichment (WFE) on the other, comparing Italy and France.
**Design/Methodology/Approach/Intervention:** The study involved a convenience sample of 696 workers (Italian=313, French=383) who filled-in a self-report questionnaire. Analyses were conducted through SPSS24 and Mplus7 for the full multi-group structural equation model (MG-SEM).

**Results:** The MG-SEM \(\text{Chi-square}(458)=990.30; \ p<.01; \ CFI=.91; \ TLI=.90; \ RMSEA=.06; \ SRMR=.06\) showed a positive relationship of workload (only in the Italian sample), destructive leadership and autonomy with frequency of technology use, which, in turn, showed a positive relationship with both WFC and WFE, in both samples.

**Limitations:** Cross-sectional design, the use of a self-report questionnaire and the convenience samples are the main limitations.

**Research/Practical Implications:** Practical implications should aim at addressing the use of technology during leisure time and its determinants, in both Countries. For Italy, a legislative intervention should be considered.

**Originality/Value:** This study contributes to the literature on work-life interface analysing the role of new technologies and comparing two Countries with different practices.

---

**Costs and Benefits of Self-Regulated Work:**
**A Diary Study on the Ambivalence of Regulatory Demands**

Bettina Kubicek\(^1\)*, Roman Prem\(^2,3\)*, Vera Baumgartner\(^2,3\)

Sabine Sonnentag\(^4\), and Christian Korunka\(^3\)

\(^1\)Institute of Psychology, University of Graz, Graz, Austria

\(^2\)Faculty of Informatics, Communication and Media, University of Applied Sciences Upper Austria, Hagenberg im Mühlkreis, Austria.

\(^3\)Faculty of Psychology, University of Vienna, Vienna, Austria.

\(^4\)Department of Psychology, University of Mannheim, Mannheim, Germany.

**Purpose:** This study aims at assessing the ambivalent nature of regulatory demands by testing simultaneously positive and negative associations with work-home outcomes and uncovering the underlying psychological processes. Specifically, we analysed whether structuring one’s work and coordinating work with others, as two types of regulatory demands, are positively associated with both work-to-home conflict and work-to-home enrichment via two distinct serial processes that include cognitive load and reduced psychological detachment on the strain side and learning to organize oneself and cognitive flexibility on the learning side.

**Design:** Using a diary study with two daily measurement occasions over ten workdays, we collected data from 54 employees of an IT company who provided 334 day-level data entries.
Results: Contrary to our expectations, multilevel serial mediation analyses revealed that the two regulatory demands spark differential rather than ambivalent processes. While structuring one’s work is associated with learning to organize oneself, which in turn relates to work-to-home enrichment via cognitive flexibility, coordinating work with others is associated with cognitive load, which in turn relates to work-to-home conflict via reduced psychological detachment.

Limitations: All variables are based on self-reported data.

Research/Practical Implications: These findings suggest that regulatory demands as a whole may be ambivalent, yet their specific components spark either positive (learning) or negative (strain) processes.

Originality/Value: The results highlight the underlying strain and learning processes that link regulatory demands to positive and negative work-home outcomes.

Work investment, HR practices, and justice at work: What lights on the dynamic of work-to-family interface and well-being at work?

Audrey Babic (1), Marie Barbier (1), Isabelle Hansez (1), Françoise Bertrand (2), Florence Stinglhamber (3)

(1) Human Resources Development Unit, University of Liege, Liège, Belgium.
(2 ) Belgian Defense, DGHR, Department of recruitment and selection, Research & Development, Bruxelles, Belgium
(3) Psychological Sciences Research Institute, Université catholique de Louvain (UCLouvain), Louvain-la-Neuve, Belgium

Purpose: Through this research, we investigated four questions focusing on work-to-family conflict and enrichment (WFC/WFE):

1. The mediating role of WFC between organizational justice, perceived organizational support and individual outcomes (job satisfaction, intention to quit, job strain and work engagement)*

2. The causal relationships between WFC/WFE and individual outcomes (job strain and work engagement)**

3. The mediating role of WFC/WFE between high performance work systems and individual outcomes (job strain and work engagement)*
4. The mediating role of work investment between workload, opportunities for development and WFC**

**Design:** Four quantitative studies based on data from Belgian organizations were conducted (*cross-sectional designs /**longitudinal designs).

**Results:** We found that fairness, support, opportunities for development and high performance work systems lead workers to perceive lower WFC and/or higher WFE. Workload influences employees’ investment, affecting therefore their perception of WFC. By experiencing WFC, workers are less satisfied and think more to leave. Over time, WFC increases workers’ stress and reduces their engagement; these states increase in turn WFC (vicious circle). Workers perceiving WFE feel more engaged over time; increasing in turn their perception of WFE (enriching circle).

**Limitations:** Limitations concern notably the generalizability of the results and the use of self-reported measures.

**Practical Implications:** This research highlights the importance of promoting fairness, proving support and help when needed, and allowing workers to develop personal resources in order to manage work and family responsibilities.

**Originality/value:** This research responds to recent recommendations and gaps identified in the work-family literature.

---

**Work-family conflict: the role of occupational future time perspective and coping strategies.**

Hélène Henry^1^ and Donatienne Desmette^1^

^1^Université catholique de Louvain (UCLouvain), Psychological Sciences Research Institute, Louvain-la-Neuve, Belgium

**Purpose:** As workforce is aging, it is important to understand the consequences of age on balancing work and family demands. On the basis of socio-emotional selectivity theory (Carstensen, 1999), the first study examines effects of occupational future time perspective (OFTP) on work-family conflict (WFC) among older workers. The second study extends these findings among workers of all ages, and analyses coping strategies as a moderator of the relationship between OFTP and WFC.

**Methodology:** Using a cross-lagged panel design, data from Study 1 were provided online by 362 workers from the UK (61% of women, mean age = 52.3 years, SD = 5.4). Study 2 used cross-sectional data from 303 Belgian employees (51.8% of male, mean age = 45.89 years, SD = 10.16). OFTP, WFC and coping strategies were measured with validated scales (e.g., Zacher & Frese, 2009).

**Results:** Results showed that the dimension "focus on limitations" of OFTP had a positive lagged effect on WFC. In addition, Study 2 demonstrated that proactive coping strategies moderated the relationships between "focus on opportunities" and WFC, such that negative effects were stronger among those highly engaged in proactive coping.

**Limitations:** Limitations concern the use of self-reported measures.
Research/Practical Implications: Because aging is likely to be related to a limited OFTP, which increases WFC, this study highlights the importance of giving resources to older workers to helping them to extend their OFTP.

Originality/Value: To our knowledge, this study is the first which empirically demonstrates that OFTP contributes to WFC changes over lifespan.

Eldercare-Work conflict Spanish scale: Psychometric properties and effects on late career intentions.

Gabriela Topa (1), Carlos-María Alcover (2), Hélène Henry (3) and Donatienne Desmette (3).

(1) National Distance Education University (UNED), Madrid, Spain
(2) Universidad Rey Juan Carlos, Madrid, Spain
(3) Université catholique de Louvain (UCLouvain), Psychological Sciences Research Institute

Purpose: As population ages, the eldercare-work conflict (EWC) increases, along with its detrimental consequences on caregivers’ well-being and on their late career decisions (National Alliance for Caregiving, 2009).

This paper aims, first, to test the psychometric properties of the EWC scale with Spanish population and, second, to explore the sequential mediation of occupational future time perspective (OFTP) dimensions in the relationships between EWC and late career indicators.

Methodology: Two studies were conducted. The first cross-sectional study, with 147 Spanish workers, (23% males, mean age= 40.8 years, SD= 7.5) applied the EWC (Henry & Desmette, 2017) and the Spanish SWING (Romeo et al., 2014). In Study 2, with a panel design (N= 247 Spanish workers, 68% females, mean age = 41.5 years, SD = 11.8), we measured at Time 1 the EWC scale and at Time 2, OFTP, early retirement intentions and motivation to continue working.

Results: Study 1 showed that psychometric properties of the EWC scale Spanish were adequate. Study 2 found that both direct effects of EWC on early retirement intentions and the indirect effects via OFTP (Focus on opportunities) and OFTP (Focus on limitations) were significant. Results for motivations to continue working were not significant.

Limitations: Among others, our findings are based on self-reported measures.

Practical implications: The EWC Scale Spanish seems a valuable instrument assessing a phenomenon that can have a medium and long-term impact in late careers of workers.

Value: This paper continues exploring the complex relationships between older workers’ conditions and their late career choices.
**General discussion**

Marco Depolo, University of Bologna, Department of Psychology.

The general contribution of the symposium will be envisioned in relation to each presentation before the general discussion is open.
State of the Art. This symposium is the second symposium on the Burnout Assessment Tool (BAT), a new instrument to assess burnout. The BAT was developed in response to the conceptual, psychometric and practical problems with the Maslach Burnout Inventory (MBI), which is dominantly used to measure burnout. In the first symposium the conceptualization of the BAT was discussed and preliminary findings were presented of an international research consortium that analyzed the psychometric properties of this newly developed questionnaire in a variety of countries. In the BAT, burnout is conceptualized to include four symptom clusters – exhaustion, mental distance, and impaired emotional and cognitive control.

New perspectives. In this second symposium, further evidence is presented on the validity of the Burnout Assessment Tool, and its nomological network is explored. Data from five European countries are used: Belgium, the Netherlands, Finland, Ireland and Poland.

Research. Schaufeli, Witte and Desart first of all analyze data from two countries to test whether a single score can be used. They conclude that the BAT measures a one-dimensional construct that includes four highly related sub dimensions. Hakanen continues by exploring the relative contribution of a variety of job demands, job resources and job crafting behaviours to three versions of the BAT as well as to job boredom and work engagement. He concludes that hindrance demands and workload are the strongest predictors of burnout. Bosak tests (and confirms) the construct validity of the BAT by analyzing its link with perfectionism, and the mediation of that relationship by work-to-non-work interrupting behaviours and boundary control. She thus offers insights into the why and when perfectionism fosters burnout. Finally, Basinska, Gruszczynska and Schaufeli test whether job burnout mediates the relationship between two job demands (work overload and illegitimate tasks) and two kinds of performance (in-role versus extra-role behaviours). The results of the four papers will be discussed by Arnold Bakker.

Conclusion. The results regarding the validity at the BAT are encouraging.

The dimensionality of burnout

Wilmar Schaufeli 1,2, Hans De Witte 1,3, Steffie Desart 1

1 KU Leuven – Leuven, Belgium
**Purpose.** The present study investigates the dimensionality of burnout, using the newly developed Burnout Assessment Tool (BAT). The issue whether burnout can be expressed in a single score, or that various independent dimensions should be used has haunted burnout research from the outset.

**Methodology.** Using two representative samples of the working population from Flanders and The Netherlands of about 1,500 employees each, the dimensionality of the BAT was studied. The BAT consists of four subscales tapping exhaustion, mental distance, and impaired emotional and cognitive control, respectively. Three types of analyses were conducted: (1) explorative and confirmative factor analysis, (2) Rasch analysis, and (3) Latent Class Analysis. These analyses were carried out independently in both samples.

**Results.** Explorative factor analysis showed that all items load high (> .70) on the first unrotated factor. Furthermore the best fit was achieved for a bi-factor confirmatory factor model in which all items load on one single burnout factor, as well as on a their respective subscale. Rasch analysis – a method based on Item Response Theory to test the homogeneity of a set of items – confirmed the one-dimensionality of BAT as a measure of burnout. Finally, Latent Class Analyses revealed that a five-class solution best represents the data, whereby respondents are classified in a similar way across all four subscales as (very) high, average, and (very) low on burnout. Only minor differences were found in the results of these analyses between both samples.

**Conclusion.** This study strongly supports the view that burnout – as assessed with the BAT – should be considered as a one-dimensional construct that includes four aspects that are intimately related. This agrees with the notion of burnout as a syndrome: i.e., a group of symptoms that occur together and characterize a particular condition. The practical implication is that the BAT can be used to assess burnout, for instance in the context of psychosocial risk assessment.

---

**Relative contribution of different job resources, job demands and proactive behaviors to future burnout (BAT), job boredom, and work engagement**

Jari Hakanen

Finnish Institute of Occupational Health

**Purpose.** The aim of this half-longitudinal study was to investigate the relative importance of three organizational job resources (servant leadership, justice, and social capital), four job demands (challenge and hindrance demands, workload and work underload) and four job crafting behaviors (increasing structural and social resources and challenging demands and reducing hindering demands) for the BAT-4, BAT-13 and BAT-23 versions of the newly
developed Burnout Assessment Tool (BAT) and its four sub-dimensions as well as for job boredom and work engagement.

**Methodology.** An 18-month follow-up study among employees of 34 municipalities (N=2453) was conducted. All the predictors were measured at T1 and all the outcomes at T2. Dominance analysis was used to determine the relative contribution of each predictor to each outcome.

**Results.** Regardless of the BAT instrument, hindrance demands was the strongest and workload the second strongest predictor of burnout. Work underload was the strongest contributor to the mental distance dimension of BAT, job boredom, and work engagement. As regards job crafting strategies, reducing hindering demands contributed most to burnout and job boredom, and increasing challenging demands to work engagement.

**Limitations.** BAT was only available at T2 and only self-reports were used.

**Research/practical implications.** This study compares different work characteristics and job crafting strategies and identifies relatively speaking the most important predictors of different types of employee well-being. This knowledge can be used in organizations to enhance employee-well-being.

**Originality.** A longitudinal design was used to study a new measure of burnout. Dominance analysis is rarely used in work and organizational psychology.

---

**When and why perfectionism and burnout are close friends**

Janine Bosak

Business School, Dublin City University

**Purpose.** Previous research has shown that perfectionism is associated with worry and rumination in relation to work, which may negatively impact work-life balance, health, and wellbeing (Flaxman et al., 2012; Mitchelson, 2009). Perfectionism is one of the personality dispositions that predicts burnout in employees (Taris et al., 2010). Interestingly, despite the prevalence of perfectionism in the work domain, research on perfectionism has paid little attention to employees. To address this gap, this study tested (a) the validity of the new burnout assessment tool (BAT); (b) work-to-non-work interrupting behaviors and boundary control as process variables underlying the link between perfectionism and burnout; and (c) the moderating role of segmentation preferences in the mediated model.

**Methodology.** The study used cross-sectional survey data from 1011 Irish employees who completed validated measures of burnout, work-to-nonwork interrupting behaviors, boundary control, segmentation preferences and critical perfectionism.

**Results.** The findings (a) confirmed the construct validity of the BAT for the Irish sample; (b) showed that perfectionism was positively related to work-to-nonwork interrupting behaviors which in turn were negatively associated with boundary control; and (c) found that for
segmenters (but not integraters) work-to-nonwork interrupting behaviors were negatively linked to boundary control.

**Limitations.** The cross-sectional data do not allow for causal inferences.

**Implications.** The study provides further insights into the why and when perfectionism fosters burnout and in doing so, provides ideas for future interventions.

**Originality.** This is the first study to integrate boundary theory and the Job-Demands-Resources model to understand the processes underlying and conditions for the perfectionism-burnout link.

**Job demands and performance: the indirect role of job burnout**
Basinska, B.A.¹, Gruszczynska, E.², Schaufeli, W.B.³

¹Gdansk University of Technology, Gdansk, Poland
²SWPS University of Social Sciences and Humanities, Warsaw, Poland
³KU Leuven, Leuven, Belgium & Utrecht University, Utrecht, Netherlands

*Funded by the National Science Centre, Poland, grant no. UMO-2017/26/M/HS6/00451*

**Purpose.** The aim of the study is to examine the indirect role of job burnout in the relationship between job demands and performance. Job demands were operationalized by work overload and illegitimate tasks (red type), and job performance by in-role and extra role performance.

**Methods.** The JD-R Questionnaire (Schaufeli, 2015) and the BAT (Desart, Schaufeli, De Witte, 2017) were used in a cross-sectional design. A group of 293 white-collar workers took part in the survey.

**Results.** After controlling for work overload, mental distance and loss of cognitive control mediated the relationship between illegitimate tasks and in-role performance. Further, the relationship between illegitimate tasks and extra-role performance was mediated via loss of cognitive control.

**Contribution.** The new job burnout measurement allows to explain how primary symptoms of job burnout can enhance the health impairment process between job demands and job performance.
977 - JOB INSECURITY SYMPOSIUM 2: ORGANIZATIONAL OUTCOMES

Hans De Witte\textsuperscript{1,2} & Eva Selenko\textsuperscript{3}

\textsuperscript{1} Research Group Work, Organizational and Personnel Psychology, KU Leuven, Belgium
\textsuperscript{2} Optentia Research Focus Area, North-West University, South Africa
\textsuperscript{3} School of Business and Economics, Loughborough University, United Kingdom

State of the Art

Research on the consequences of job insecurity (JI) has mostly focused on health and well-being, whereas organizational consequences received lesser attention from scholars. In this symposium, we address this lacuna by focusing on a variety of organizationally relevant outcomes: trust, organizational justice, safety outcomes, and turnover (intentions).

New Perspectives/Contributions

This symposium contains six presentations, covering studies conducted in Europe and the USA. By looking at labour market prosperity Doden et al. introduce a macro-economic level moderator to the relationship between JI and trust in the employer. Lazauskaitė-Zabielskė et al. analyze the longitudinal relationship between qualitative JI and organizational justice, suggesting reversed rather than normal causation. Two papers focus on safety outcomes. Petitta et al. analyze whether economic stress mediates the relationship between emotional contagion at work and safety outcomes. They test these relationships in Italy and the USA. Probst et al. continue this two country comparison by showing that the JI-safety outcomes relationship is mediated by sleep disturbances. The last two papers focus on turnover. Vander Elst et al. examine whether JI predicts voluntary versus involuntary turnover 6 months later, and whether availability of an alternative job in the future plays a role. Finally, Selenko & De Witte investigate whether the JI-turnover intentions relationship is mediated by relative deprivation in a 4 wave study.

Research/Practical Implications

This symposium underlines the importance of JI for organizations, by presenting new findings and explanations of the associations of JI with relevant organizational outcomes.

Job Insecurity in the Face of Attributions:

How the Macroeconomic Context Shapes Employees’ Trust in Their Employer

Wiebke Doden\textsuperscript{1}, Manuela Morf\textsuperscript{2}, Gudela Grote\textsuperscript{3} & Bruno Staffelbach\textsuperscript{2}
Purpose. Job insecurity (JI) rose sharply after the financial crisis in 2008 with about 30% of the European workforce feeling insecure about their jobs. Studies have shown that JI can have a negative impact on employees’ trust in their employer. However, meta-analyses demonstrated that the relationship between JI and organizational trust varies in effect sizes, suggesting the role of moderator variables. While most studies focused on moderators at individual levels, factors at the macroeconomic level have largely been neglected. Drawing from attribution theory, we argue that employees respond differently to JI depending on whether the organization is assessed to be responsible for their situation. We hypothesize that the association between JI and organizational trust is weaker for employees in regions with less prosperous market situations. Labor market characteristics may determine whether employees blame their employer for why their job is at risk or whether they attribute their JI to the market situation.

Design/Methodology. We tested our hypotheses in a sample of 4,436 employees nested in 55 macro-regions in Central Europe. To illustrate macroeconomic conditions, we collected data on regional unemployment rates from statistical offices.

Results. The results confirmed our hypotheses that high unemployment rates act as a buffer.

Limitations. Socio-psychological mechanisms (e.g., attribution) have not been explicitly measured.

Research/Practical Implications. Our study helps practitioners and policymakers to better understand how macroeconomic contexts and individual processes are interrelated.

Originality/Value. We highlight the importance of macroeconomic factors when it comes to individual attribution processes as a reaction to JI.

On the Relationship Between Qualitative Job Insecurity and Organizational Justice: Longitudinal Evidence

Jurgita Lazauskaitė-Zabielskė¹, Ieva Urbanavičiūtė¹ & Hans De Witte²,³

¹ Institute of Psychology, Vilnius University, Lithuania
² Research Group Work, Organizational and Personnel Psychology, KU Leuven, Leuven, Belgium
³ Optentia Research Focus Area, North-West University, Potchefstroom, South Africa
Purpose. Perceived organizational justice is usually considered as an organizational antecedent of job security (Lee et al., 2018). Building upon uncertainty management theory (Lind & Van den Bos, 2002), some studies (Wang et al., 2015) show perceived justice to buffer the negative effects of job insecurity on manifold outcomes. Other studies rely on the social exchange framework (Cropanzano & Mitchell, 2005) and suggest job insecurity to impair employee’s fairness perceptions (Bernhard-Oettel et al., 2011). Given the ambiguous role of perceived justice for job insecurity, the current study is aimed at analyzing the relationship between qualitative job insecurity and different types of perceived organizational justice over time.

Design/Methodology. The hypotheses were tested using cross-lagged structural equation modeling based on two-wave data from 126 employees working in a public sector organization.

Results. The results showed that perceptions of organizational justice were related to lower qualitative job insecurity one year later. However, qualitative job insecurity did not have a cross-lagged effect on perceived organizational justice. The same pattern of results was observed for all four types of justice, including distributive, procedural, informational, and interactional.

Limitations. While the longitudinal design is undoubtedly a strength of this study, the results were obtained from one organization only. Therefore, additional evidence is needed to generalize the results.

Research/Practical Implications. Managers and HR practitioners who aim to prevent job insecurity in organizations may consider focusing on individual justice perceptions when planning preventive efforts.

Originality/Value. This study provides an insight into the longitudinal effect of perceived justice on job insecurity.

Emotional Contagion, Economic Stress, and Safety Outcomes: A Cross-country Study

Laura Petitta1; Tahira M. Probst2; Valerio Ghezzi1; Claudio Barbaranelli1

1 Sapienza University of Rome
2 Washington State University Vancouver

Purpose. The world-wide economic instability produced by the financial crisis of 2008 increased employment-related (i.e., job insecurity) and income-related (i.e., financial stress)
economic stressors. The purpose of the current cross-country research was to examine the extent to which emotional contagion of negative and positive emotions at work contributes to increases or decreases in affective job insecurity and financial stress. Moreover, we test whether these economic stressors mediate the relationships between emotional contagion and employee work-related injuries and accident under-reporting.

**Method.** Using survey data from employees in Italy (N=366) and the USA (N=498), we first assessed measurement invariance across countries and then tested the invariance of the hypothesized conceptual (structural) model.

**Results.** Results were invariant across countries. Specifically, greater anger contagion levels predicted higher experienced levels of financial stress and affective job insecurity whereas greater joy contagion reduced these economic stressors. Furthermore, financial stress was the primary mediator between emotional contagion and poor safety outcomes.

**Limitations.** Although results were consistent across two different cultural contexts, these findings could be strengthened by collecting cross-lagged data.

**Implications.** Employees' concerns about their income (financial stress) may take precedence over their worries regarding job instability (affective job insecurity) in prompting higher injuries and accident under-reporting. Moreover, higher levels of anger contagion among employees are associated with increased financial stress.

**Originality.** This is the first study to empirically examine how social exchanges of positive/negative emotions (contagion) at work may be related to employee levels of economic-related stress and subsequent accident reporting behaviors and injuries.

**The Impact of Job Insecurity on Accidents and Injuries:**

**A Moderated Mediation with Production Pressure and Sleep Disturbances**

Tahira M. Probst¹; Laura Petitta²; Claudio Barbaranelli²; Valerio Ghezzi²; Erica L. Bettac¹

¹Washington State University Vancouver

²Sapienza University of Rome

**Purpose.** Research has found that job insecurity results in adverse employee safety outcomes. The purpose of the current study was to test whether disturbed sleep accounts for (i.e., mediates) this relationship, as well as if organizational production pressure exacerbates the impact of poor sleep on safety outcomes.

**Method.** Using survey data from employees in Italy (N=1140) and the USA (N=366), we conducted second-stage moderated mediation analyses in both countries to assess the direct
and indirect (via sleep) effects of job insecurity on safety outcomes, as well as the moderating impact of production pressure.

Results. Results were consistent in both countries. Specifically, job insecurity was significantly associated with increased sleep disturbances in IT and the US (B=.08 and .52, respectively). Sleep disturbances in turn were significantly and positively associated with accidents (B=.67 and 1.36) and injuries (B=.59 and 1.20). Finally, production pressure significantly exacerbated the relationship between sleep and accidents (B=.22 and .56) and injuries (B=.18 and .53).

Limitations. Although results were consistent across two different cultural contexts, these findings could be strengthened by collecting longitudinal data.

Implications. Impaired sleep appears to fully mediate the impact of job insecurity on adverse safety outcomes. Moreover, the detrimental effects of nighttime sleep disturbances are compounded when employees face high levels of production pressure.

Originality. This is the first study to explore the extent to which impaired sleep accounts for the negative effects of job insecurity on employee accidents and injuries. Moreover, we examine an organizational contextual variable that may further worsen these relationships.

Perceived job insecurity predicting involuntary and voluntary turnover 6 months later
Tinne Vander Elst¹,², Nele De Cuypers², Hans De Witte²,³, Anja Van den Broeck³,⁴, & Magnus Sverke⁵,⁶,⁷

¹ Knowledge, Information and Research Center (KIR), IDEWE Group, Leuven, Belgium
² Occupational & Organisational Psychology and Professional Learning, KU Leuven, Belgium
³ Optentia Research Focus Area, North-West University, South Africa
⁴ Department of Work and Organisation Studies, KU Leuven, Belgium
⁵ Department of Psychology, Stockholm University, Sweden
⁶ Stockholm Stress Center, Stockholm University, Sweden
⁷ WorkWell Research Unit, North-West University, South Africa

Purpose. This study aimed to investigate perceived job insecurity (i.e., the threat to lose the current job) in relation to future involuntary (i.e., getting fired) and voluntary turnover (i.e., quitting). We predicted that employees would only quit their job when they were able to find another job.

Methodology. Logistic regression analysis was conducted on a sample of 650 Belgian permanent workers who were surveyed twice six months apart.
Results. First, job insecurity was associated with involuntary turnover within six months. Second, job insecurity predicted future voluntary turnover, however conditional upon the availability of an alternative job six months later.

Limitation. The voluntary turnover variable was based on people’s situation at Time 2: did they have an alternative job or not? Future research should also survey specific job offers or other personal arrangements at the time of quitting.

Practical implications. As job-insecure employees might leave the organization when they are actually able to find another job, we encourage managers to set up interventions to reduce feelings of uncertainty, for instance by investing in realistic communication programs.

Value. By linking job insecurity to future involuntary turnover, we showed that feelings of job insecurity concern realistic perceptions of the objective precarious job situation. Further, the relationship between job insecurity and involuntary turnover among individuals with another job six months later might explain the lack of a significant relationship in certain previous studies in which the condition of having an alternative position was not taken into account.

I deserve better than this, I quit!

Relative deprivation as an explanation of turnover in times of job insecurity

Eva Selenko¹ & Hans De Witte²

¹Loughborough University, United Kingdom,
²KU Leuven, Belgium

Purpose. Job insecurity is not something that fits most people’s expectation of good employment. Drawing on relative deprivation theory and justice research we argue that job insecurity is likely to violate people’s deservingness expectations. These feelings of relative deprivation can motivate people to withdraw from an organisation. In this study we set out to investigate whether (1) job insecurity indeed triggers feelings of relative deprivation and (2) whether this explains turnover intentions.

Methodology. In a longitudinal survey study among 1,000 British adults, qualitative and quantitative job insecurity, perceived relative deprivation as well as turnover intentions were assessed over four measurement waves.

Results. Results at all four time points confirm that the effect of job insecurity (quantitative as well as qualitative) on turnover intentions is mediated by feelings of relative deprivation. Longitudinally, our hypotheses are only partially confirmed; relative deprivation significantly predicted changes in turnover intentions over time, but it was only qualitative job insecurity that predicted it.

Limitations. This is the first study looking on the relationship between job insecurity and relative deprivation, the robustness of the effects still need to be confirmed and explored further.
Research/Practical implications. This study shows that attributions, especially of relative deprivation play an important part in explaining outcomes of job insecurity.

Originality. This is the first study that looks at relative deprivation as an explanatory mechanism in the context of job insecurity and shows that feeling relative deprivation in response to job insecurity will have pervasive effects on a person’s intention to quit.
Inclusive organisational socialisation: Perspectives on integrating and supporting new employees

Proponents: Helena D. Cooper-Thomas\(^1\) & Saša Batistic\(^2\)

Discussant: Helena D. Cooper-Thomas

\(^1\) Auckland University of Technology, NZ; \(^2\) Tilburg University, NL

State of the Art:

Organisational socialisation is defined as a learning and adjustment process that enables an individual newly entering an organisation (“newcomer”) to assume a given role in a manner that meets both their and the organisation’s needs. Ideally, organisational socialisation enables newcomers to fulfil their potential, finding their work motivating and meaningful, performing well, developing creative ideas and bringing these to fruition as innovations. As work is configured in different ways (e.g., virtual work), and different kinds of workers need to be integrated (e.g., volunteers, resettled refugees), socialisation will need to look and function differently so that these newcomers can become fully contributing organisational members.

New Perspectives/Contributions:

This symposium is wide-ranging in its scope. It includes researchers from the UK, US, the Netherlands, Italy, China, Australia and New Zealand; a range of research types (survey, interview, experimental, theoretical); and a variety of novel types of newcomers are investigated, including low-skilled, volunteers, resettled refugees, and employees working virtually, as well as graduates.

Research/Practical Implications:

Organisations are managing diverse workers, with different work experience, skill levels and working conditions (e.g., voluntary work, virtual work). From a research perspective, it is important to investigate these different types of worker and work conditions to better
understand how to improve organisational socialisation to meet both individual and organisational needs. Practically, each presentation will emphasise how newcomers, organisations, and where possible society, can work towards more inclusive and meaningful newcomer adjustment.

Understanding newcomer role orientation in the workplace: A self-determination theory perspective

Jenny Chen¹ & Helena D. Cooper-Thomas²

¹ University of the West of England, UK; ² Auckland University of Technology, NZ

Purpose. Newcomers can be a source of innovation for organisations, bringing fresh perspectives and novel solutions. Thus, in many organisations, it is desirable for newcomers to adopt an innovative (versus custodial) role orientation. Using self-determination theory (SDT), this study investigated how competence (investiture socialisation tactics), autonomy (job autonomy) and relatedness (perceived insider status) predict newcomers’ motivation (work engagement) to adopt an innovative role orientation. Specifically, in line with SDT, we propose that autonomy and competence will predominantly predict work engagement, whereas perceived insider status is proposed to have a more distal, moderating role on the relationship of work engagement with innovative role orientation.

Design. Data were collected from 102 Chinese university graduates across two timepoints.

Results. Support was found for the mediating effect of work engagement on the relationship between job autonomy (but not investiture) and innovative role orientation. Further, newcomers’ perception of insider status had a significant moderating effect such that the positive relationship between work engagement and innovative role orientation was stronger for those newcomers who do not perceive themselves as insiders in their new organisation.

Limitations. Data are self-report and collected from graduates in China; the results may not generalize.

Practical implications. Given the value of graduate newcomers being innovative, we discuss how organisations can leverage these findings to optimise conditions for innovative role orientation.

Originality. While newcomer role orientation has been a theoretical focus of newcomer research, relatively little empirical research has been conducted, especially on the effects of work context.
Unpacking the Role of Adaptability Components in the Successful Socialisation of Low-Skill Workers in China: An Interactive Framework

Émilie Lapointe ¹ & Gary Schwarz ²

¹ Nottingham University Business School China, The University of Nottingham Ningbo China, China; ² SOAS London, UK

Purpose: The main workforce for many low-skill jobs in China is migrant, young, mostly female, and possesses low levels of education. Despite the fact that many Chinese organisations heavily depend on this group of workers, little is known about the factors that lead to successful organisational socialisation among them. Adopting an interactive framework, this paper examines how trust in the supervisor interacts with, respectively, learning adaptability and interpersonal adaptability, to predict two socialisation outcomes, task performance and innovative work behaviours, among Chinese low-skill workers.

Design/methodology: Questionnaires were completed by 179 Chinese workers performing low-skill jobs.

Results: The trust-performance relationship is significantly moderated by learning adaptability and interpersonal adaptability, such that it is stronger at high levels of learning adaptability and weaker at high levels of interpersonal adaptability. The trust-innovative work behaviours relationship is significantly moderated by interpersonal adaptability, but not learning adaptability, such that it is stronger at high levels of interpersonal adaptability.

Limitations: Self-reported, cross-sectional data were used in this study.

Research/Practical Implications: Adaptability, particularly its interpersonal component, plays an important, yet paradoxical role, in shaping the trust-socialisation outcomes relationships. Organisations employing low-skill workers should not only support supervisors in establishing trustful relationships with them, but also consider, in their recruitment and job design practices, which adaptability components and which socialisation outcomes should be sought for.

Originality/value: This study represents one of the first attempts at examining socialisation outcomes among Chinese low-skill workers, and identified adaptability components as variables that, interestingly, can help and hinder socialisation outcomes.

Towards a more inclusive workplace:
Resetted refugee experiences adjusting to work in New Zealand.

Tamsin Dehar ², Helena D. Cooper-Thomas ², Jay Marlowe ³, & Claire Cartwright ³
Purpose: New Zealand has demonstrated an ongoing commitment to assisting refugees since the Second World War. Employment is a critical factor enabling successful integration into a new society, yet resettled refugees experience more difficulty securing employment than other migrant groups. This study explored the experiences of resettled refugees in New Zealand to identify ways to facilitate their adjustment to work.

Design/Method: Semi-structured, in-depth interviews were conducted with 16 refugee-background adults, 11 men and 5 women, from a range of African, Middle Eastern and Asian countries. An inductive thematic analysis was performed on the qualitative data.

Results: Six main themes were established: Navigating a new landscape; the importance of work; pathways to suitable employment; (re)settling for unemployment and underemployment; newcomer experiences in work; and issues of social policy. Particular attention is paid to newcomer adjustment experiences and how these can provide insight into making workplaces more inclusive.

Limitations: New Zealand is recognised as one of the most accepting countries for refugees in the world, therefore the experiences of resettled refugees in New Zealand may be more positive than those in other countries.

Practical Implications: The outcomes of this research provide guidance for both social policy and employer strategies to maximise resettled refugee work adjustment.

Originality: Limited research has examined resettled refugee adjustment to work. Given the increasing refugee population, it is important to understand resettled refugee perspectives, as such learning can have wide-ranging benefits for such employees, employers, and society at large.

Digitize me – implications of new employees’ strategic value for their virtual organizational socialisation

Sasa Batistic¹, Helena D. Cooper-Thomas², Renata Kenda¹

¹ Tilburg University, NL; ² Auckland University of Technology, NZ

Purpose. Virtual work is increasingly pervasive, yet little is known about how newcomers can be socialized effectively into virtual environments in ways that prevent undesired outcomes for the organization and individuals, such as stress or turnover intentions. To explore this issue, we tap into three domains of literature – human resources (HR), organizational
socialisation, and virtuality, in order to provide three key typologies how newcomers can be socialized in a virtual environment.

**New Perspectives/Contributions.** Drawing on these typologies we provide three contributions. First, we propose an integrative framework linking HR and information communication technology (ICT) to inform the socialisation process and its three major aspects – socialisation tactics, socialisation agents, and newcomer proactive behaviour. Second, we extend the notion that newcomers vary in both their own expectations and needs, and relatedly, their strategic value for the organization. This yields different combinations of virtuality and socialisation type. Last, we focus on the dynamics of socialisation as a process and introduce the idea of intensity.

**Research/Practical Implications.** Our theoretical framework provides testable propositions for future research, as well as practical suggestions on what organizations could do to socialize newcomers with varying degrees of virtual work.

**Originality/Value.** In merging three theoretical lenses we provide an integrative approach indicating how virtual newcomers might be socialized more effectively. Moreover, as virtual work becomes a more pervasive phenomenon across all workplaces, it is vital to consider how such workers can be effectively socialized.

---

**Motivating Volunteers: Getting It Right From The Start**

*Jane X.Y. Chong*¹, *Marylène Gagné*², *Patrick D. Dunlop*², & *Djurre Holtrop*¹

¹ *School of Psychological Science, University of Western Australia*

² *The Future of Work Institute, Curtin University, Australia*

**Purpose:** Retention of volunteers is a pressing issue for many non-profit organisations, yet little is known about the causes of volunteer turnover. Drawing from extant research involving paid employees, which suggests that effective socialisation shapes newcomers’ adjustments and long-term commitment, this study aims to distinguish the effects of different newcomer experiences on volunteer retention. Using Self-Determination Theory (SDT), we investigate the effects of different newcomer socialisation tactics on volunteers’ retention outcomes through their impact on newcomers’ autonomous and controlled motivations (Figure 1).

**Design:** Partnering with Scouts Australia and using a rolling-recruited sample of adult volunteers, a three-wave longitudinal data collection is underway. Volunteers are surveyed at the 3-, 6-, and 12-month mark of their volunteer journey.

**Results:** Preliminary results from the first wave suggest different socialisation tactics do indeed affect volunteers’ autonomous and controlled motivations, and subsequently their intentions to remain at Scouts. Results from the second wave will also be presented at the symposium.
**Limitations:** Although socialisation tactics differ across Scouts branches, the data collected are nonetheless drawn from a single organisation and may limit the generalisability of findings.

**Implications/Value:** A novel, SDT perspective of newcomer socialisation is tested. No research has examined how socialisation practices influence volunteer motivation and retention, something that could help forestall the high rate of turnover in this sector. Practically, this piece of research is valuable for not-for-profit organisations such that it provides evidence-based strategies to facilitate autonomous motivation of volunteers right from the very start of their volunteer journey.

![Research model](image)

**Figure 1. Research model.**

**The inclusion of uniqueness: The role of need for closure and expertise in the adoption of newcomers’ unique ideas in a group**

*Annalisa Theodorou¹, Stefano Livi¹, John M. Levine², Arie W. Kruglanski³, & Antonio Pierro¹*

¹*Department of Social and Developmental Psychology, Sapienza University of Rome, Italy*

²*Department of Psychology, University of Pittsburgh, USA*

³*Department of Psychology, University of Maryland, USA*

**Purpose.** In workgroups, innovation is often valued for ensuring greater performance (Paulus & Nijstad, 2003). Among others, substantial evidence points to new members as important bringers of innovations (Choi & Levine, 2004). However, not everyone adopts newcomers’ ideas. It is likely that individuals with high (vs. low) levels of need for closure (NFC; Kruglanski, 2004), accountable for intolerance of different opinions in the group, are more reluctant to be open to newcomers’ innovative ideas. Moreover, when group expertise is high they should “freeze” on the group’s ideas, regardless of the newcomer’s expertise. Nevertheless, when group expertise is low they are supposed to “seize” on the more expert newcomer’s ideas.

**Methodology.** Three experimental studies were conducted, and data were analyzed through ANOVA.
**Results.** Study 1 confirmed that in the presence of innovative (vs. not innovative) newcomer’s ideas, high (vs. low) NFC individuals are more resistant to ideas proposed. In Study 2, naive high NFC individuals are convinced to be part of a group in an online game and both freezing and seizing are captured. In Study 3, the seizing effect is present in artificial groups composed of high (not low) NFC members.

**Limitations.** The research is original and should be replicated by further studies.

**Practical Implications.** Findings suggest that to encourage the inclusion of newcomers’ uniqueness, organizations should consider levels of workers’ NFC and expertise.

**Originality.** This research provides a novel perspective on the important issue of newcomer-induced innovation.
SUMMARY

Game-based assessment (GBA) continues to be a “hot topic” in both research and practice. One reason why GBA enjoys such popularity is because it claims to overcome some of the issues of “classical” psychometric assessment, such as enjoyment and perceived innovation. Overall, GBA seems to be a promising new development - however, which of the promises do they really hold?

State of the Art

This symposium incorporates both theoretical groundwork and international empirical research on game-based assessments with data gathered in the US and Europe. It takes a critical view on the positive voices that have been published so far.

New perspectives

Overall, this symposium shows that GBAs and their effects on candidates vary a lot. The paper by Warszta & Siemsen describes how individual game design elements have different impacts on candidate’s perception of flow. Bhatia provides empirical evidence for the relationship between flow and gamification for one type of GBA – while the research by Siemsen & Warszta found no differences between other types of GBA and traditional assessments in test performance, attractiveness, fairness and motivation. Finally, the paper by Jöhnk looks at video games that were not originally designed to measure abilities or personality and how they relate to intelligence.

Research/Practical Implications

Most research done on GBA so far has been very positive. However, this symposium shows that results vary depending on what kind of GBA is used. Thus, when doing research on GBA or using in in practice, a closer and more specified look is needed.
The Impact of Game Design Elements in Game-Based Assessment

Tim Warszta¹ & Alina Siemsen²

¹West Coast University of Applied Sciences
²cut-e Group

Purpose

This conceptual paper gives an overview on what game elements can be used in Game-based Assessments (GBAs) and how they impact candidates’ motivation and feeling of flow. Conclusions on practical applications are drawn and recommendations for research are given.

Approach

Literature on flow theory and motivation (Csikszentmihalyi, 1975; Ryan & Deci, 2000) as well as insights on game design (Sweetser & Wyeth, 2005; Zichermann & Cunningham, 2011) are used to draw conclusions on which specific game elements can be used in an assessment context, and how they impact the candidate’s motivation and flow.

Results

Many of the “classical” game elements, such as points, levels, interaction, story and context, badges, and leader boards can have a positive effect on candidates’ motivation and flow. However, they come with limitations when used in personnel selection, as they bear certain risks (i.e., leader boards tell candidates their score and compare them to others, which is a violation of data protection). When used for attraction purposes, the possibilities are close to unlimited.

Limitations

This paper proposes a theoretical approach regarding the motivation potential of game design elements. Empirical evidence needs to follow.

Implications

For academia, this paper opens new research possibilities on the field of GBA. For test developers and organizations, this paper gives insights and recommendation for designing and using GBAs.

Originality

This paper is the first to evaluate specific game elements in the recruitment and selection context, and give recommendations for organizations, developers, and future research.

References

Getting into the Game: Applicant Reactions to Game-Based Assessments

Sarena Bhatia
Aon Hewitt

Purpose
This study aimed to compare how applicants respond to use of a game-based assessment in comparison to a traditional assessment in a selection context.

Design
This study utilizes a 2 (GBA, traditional selection assessment) by 2 (made an offer, not made an offer) experimental time-lagged design. Participants imagined they were applying to a role and took one of the assessments. The next day, they were emailed either an acceptance or rejection letter.

Results
Those in the GBA condition were significantly more likely to experience higher rates of flow. Taking the GBA was positively related to perceived job-relatedness (when mediated by flow), justice perceptions, perceived person organization fit, organizational attractiveness and positive intentions to accept the offer. Selection decision was a moderator in that those who were made an offer and perceived the assessment to be job relevant had the highest perceptions of justice.

Limitations
The limitations of this study is that it did not use real applicants, and many of the reactions were evaluated through self-report.

Implications
The implications of this work are assessments that induce flow in candidates can garner more positive reactions, and that using GBAs may result in higher justice and fit perceptions than a traditional assessment can yield.

Originality
This study is one of the first to introduce and measure the role flow to the assessment literature, and to shed light on the relationship between GBAs and many important applicant reactions outcomes.
Traditional vs. Gamified Tests – Are They Really Different?
Alina Siemsen¹ & Tim Warszta²
¹ cut-e Group
² Westcoast University of Applied Sciences

Purpose
This study aims to provide empirical data to look into (1) if and how different kinds of gamification affects test motivation, flow experience, fairness perceptions and organizational attractiveness, and (2) the equivalence of gamified and non-gamified tests with respect to test performance.

Design
Two independent studies were conducted, each involving one version of a GBA (one had a video story “wrapping” the assessments, and in one the assessments themselves were changed graphically) and the traditional equivalent. In both studies, participants first rated their perception of organizational attractiveness, fairness and test motivation, and were then randomly assigned one out of two conditions: GBA vs. the traditional equivalent. Afterwards, the same variables were collected again.

Results
Two-sample t-tests showed no differences in attractiveness, fairness, motivation, and test performance in neither of the studies.

Limitations
Both studies had a between-subject approach. Thus, participants did not rate the assessments in comparison to each other. Additionally, this was a low stake situation.

Implications
The studies show that those gamification approaches used did not have any effect on any of the variables. This implies that the organizations’ aim of being viewed as more attractive and fairer is not reached. On the other hand, as test performance is not affected, gamification can be used for personnel selection without the downside of risking validity.

Originality
This study is the first to systematically look at different kinds of GBAs and provide valuable insights into how they influence test performance and candidate reactions.

Video Games and Intelligence – Correlations between Playing Different Video Game Genres and Cognitive Abilities

Henrik Jöhnk¹, Katharina Lochner², Ulrich Steingen³
¹ cut-e Group
² University of Applied Sciences Europe Iserlohn
Purpose
While playing video games has mostly been connotated negatively in the past, positive effects and associations start to catch the spotlight in modern media psychology (Granic, Lobel & Engels, 2014). The goal of this study is to explore the link between the variety of video game genres with different cognitive abilities.

Methodology
45 people participated in the study. Subjectives' average use of different genres of video games was assessed using a self-report questionnaire. Cognitive abilities (inductive logical thinking and ability to concentrate) were measured using validated ability tests.

Results
Correlations between inductive-logical thinking and time spent on video games were $r = .31$ for action games, $r = .31$ for adventure games, and $r = .36$ for strategy games. Additionally, the correlation between the ability to concentrate and average time spent on adventure games was $r = .25$.

Limitations
Due to its cross-sectional design, no interpretations regarding causality are possible. Thus, further research based on the found correlations - using longitudinal/experimental designs – seems necessary.

Research/Practical implications
The study shows a consistent connection between inductive logical thinking and playing video games, tending to support the modern notion of video games demanding and supporting problem solving skills (Prensky, 2012). Playing video games can be used as an indicator for cognitive abilities in selection.

Originality/Value
It is one of the first studies to differentiate between different kinds of video games being played and thus addressing the issue of generalizing video games.

References

State of the Art  The prospect of sending humans to Mars in the next decades has lead researchers from a variety of disciplines to work with NASA and ESA. Space teams cannot be studied the regular way since access to space is limited and resource intensive. The unique conditions these teams face require us to use analog environments such as polar stations, submarines or other isolated confined and extreme environments.

New Perspectives/Contributions This symposium aims to uncover the secrets of successful collaboration in space using analogue environments. Based on a literature review and interview study Schmutz et al. built a taxonomy of teamwork in isolated, confined and extreme environments. Rico et al., have examined how task fluctuations modify team coordination processes and team cognitions in fire-fighting teams. Marques-Quinteiro et al. conducted a qualitative field study during an Antarctica summer campaign, to identify the main stressors of teamwork and how the teams adapt to these. Bessone proposes cave expeditions as a space analogue training environment to build astronaut team resilience during exploration of new locations. Finally, DeChurch et al. investigate humans in a spaceflight simulator and provide insight into how team performance changes over time in isolation.

Research/Practical Implications: This symposium combines a variety of studies investigating the unique conditions of teams in space analog environments. Based on the results we can draw valuable conclusions on the drivers of teamwork effectiveness in low-orbit and long duration space missions.
Researching Teams across the Extremeness Continuum: The Inherent Challenges and Opportunities

Jan B. Schmutz, Nadine Bienefeld, Travis M. Maynard

1Department of Communication Studies, Northwestern University, Evanston, Illinois, USA
2Department of Management, Technology and Economics, ETH Zurich, Switzerland
3College of Business, Colorado State University, USA

Purpose: The literature about extreme teams is often scattered across disciplines and published in applied journals specific to the environment. Looking closer at the teams that researchers have considered as extreme suggests that they are highly diverse and the question of comparability arises. Therefore, one of the primary goals of this paper is to provide a framework of extremeness in teams.

Methodology: We will apply an iterative approach leveraging the insights drawn from a literature review as well as interviews with researchers who conducted studies with extreme teams. So, we will be able to provide a picture of what types of extreme teams have been investigated as well as how they have been studied.

Results: Based on preliminary examinations, it is clear that the extreme nature not only makes working in these environments difficult but also researching the phenomenon that make for better teamwork. The common theories in traditional team settings may not be appropriate for extreme teams. Further, the literature revealed that extreme can be seen as a continuum with various dimensions.

Limitations: Data is based on literature review and qualitative data only.

Practical Implications: This study will provide valuable insight into challenges of researching extreme teams and provide a general framework that will allow comparability between various extreme team contexts.
Originality: This two-pronged approach of a literature review and data drawn from qualitative interviews with researchers will allow us to better understand the conducted research in the area of extreme teams thus far.

Coordination and Performance: Unpacking Adaptation on Firefighter Teams

Ramón Rico\textsuperscript{1}, Mirko Antino\textsuperscript{2}, Cristina Gibson\textsuperscript{3}

\textsuperscript{1}University of Western Australia

\textsuperscript{2}Universidad Complutense de Madrid

\textsuperscript{3}Penn State University.

Purpose: We examine how teams adapt to changes in their task environment. Applying team cognition theories, we reveal how teams actively understand task fluctuations and subsequently modify team coordination processes to obtain team adaptive outcomes. Specifically, we investigate how change challenges the correspondence between team mental models (TMMs) and team situational models (TSMs).

Method: We employed a multi-wave cross-lagged design using two information sources, and gathered data from 58 emergency firefighter teams working in emergencies and natural disasters in South America.

Results: We found the greater the magnitude of change in a team’s task, the less the TMM-TSM correspondence. Under such conditions, more explicit coordination processes enabled firefighter teams to effectively perform on field missions. Additionally, procedural rigidity reduced the negative relationship between magnitude of change and TMM-TSM correspondence.

Limitations: Bigger sample desirable.

Practical Implications: We contribute to theory and research on team adaptation and effectiveness, first by providing a finer grained approach to understand team adaptation through coordination processes; and second, by testing the role of procedural rigidity in moderating the relationship between changes and TMM-TSM correspondence. This led us to provide practical guidance to
Managers by avoiding the dysfunctional consequences of overly rigid protocols when teams cope with unexpected changes.

**Originality:** The added value of this work resides in developing a process approach to adaptation characterizing team knowledge structures combined and sequenced through coordination processes. Additionally, we tested the TMM-TSM correspondence logic in teams in the wild; providing a methodological approach to do so.

**How Team Adaptation Drives Performance in Antarctica**

Pedro Marques-Quinteiro\(^1\), Walter Eppich\(^2\), Jan B. Schmutz\(^3\), Mirko Antino\(^4\), Travis M. Maynard\(^5\)

\(^1\)William James Center for Research, ISPA- Instituto Universitário, Lisboa, Portugal.
\(^2\)Northwestern University Feinberg School of Medicine, Chicago, USA.
\(^3\)Department of Communication Studies | ATLAS Lab, Northwestern University, Chicago, USA.
\(^4\)Departamento de Psicobiología y Metodología en Ciencias del Comportamiento, Facultad de Psicología, Universidad Complutense de Madrid, España.
\(^5\)Management Department, College of Business, Colorado State University, USA.

**Purpose:** Teams in Antarctica face challenges regular teams never experience. In this research, we aim to understand how Antarctica Science Teams (AST) conduct field research, and how they adapt to maintain and restore team performance during Antarctica campaigns.

**Methodology:** Using grounded theory, we performed on-site observations in multiple scientific base stations and 23 in-depth semi-structured interviews during the 2017-2018 Antarctica summer campaign. Data collection and preliminary analysis proceeded iteratively, and ongoing data analysis using constant comparison support theory development and refinement.

**Results:** Preliminary results suggest that during summer campaigns, AST face a variety of stressors that threaten mission success. We first classified critical episodes requiring adaptation. These include sudden and unpredictable weather changes and logistical challenges related to critical equipment failures. During campaigns, AST maintain and restore performance through deliberate team adaptation influenced by: individual factors such as “keeping a positive mind set” and “being patient,” and collective factors such as “adapting to multiple stressors by changing between tasks,” or
“establishing good collaboration with other scientific/logistic teams.” Likewise, social cohesion appears to enable team adaptation.

Limitations: We studied one specific extreme scenario only.

Practical Implications: We demonstrated the factors that contribute to an AST being successful in the changing environments in which they operate – namely, factors that influence team adaptation.

Originality: Antarctica is Earth’s best space analogue environment to learn and predict how individuals perform in out-of-earth locations. Our empirical data collected at multiple Antarctica stations sheds light into how teams adapt to unexpected events in isolated, confined and extreme environments.

Improving Team Resilience by exposure to Modulated, Controlled Stress in Extreme Environments

Loredana Bessone

1Analogue Training and Exploration Testing Unit, Human and Robotics Exploration Directory, European Space Agency

Purpose: Whilst the technical challenges of long-duration missions outside low-Earth orbit are being systematically overcome by technology advances, mission success depends on human behavior and performance in extreme, alien and poorly characterized environments. Knowledge of which must be either obtained through space research or extrapolated from human experience on Earth.

Methodology: Caving expeditions have recently been developed as a spaceflight analogue for astronaut training purposes. Integrating realistic scientific exploration and documentation objectives with operational protocols, and modulating the level of stress by mission complexity, level of crew autonomy and mission duration, as well as by injection of controlled unknown situations, it is possible to recreate credible mission scenarios, with realistic crew compositions.

Results: Data collection is ongoing. I anticipate that team resilience can be improved by creating similar opportunities for exercising behavioral competencies in a realistic but unfamiliar environment requiring team collaboration, where the consequences of ineffective teamwork can be both technical and safety related.
Limitations: Small sample size.

Practical Implications: The integration of behavioral competency models with the specific technical and scientific requirements for safety and mission success in extreme environments, and the reinforcement created by enforcing combined technical and behavioral crew centered debriefing, can create a positive loop of enhancing team learning, and augmentation of a correct team mental model and as a consequence of the team resilience.

Originality: This research regards cave expedition activities as a space analogue training environment to develop astronauts’ resilience to adversity in unexplored work sites.

Can We Get Along Long Enough to Get to Mars? Team Performance over Time

Leslie DeChurch¹, Lindsay Larson¹, Ilya Gokhman¹, Harrison Wojcik², Suzanne Bell², Noshir Contractor¹

¹Department of Communication Studies, Northwestern University, Evanston, Illinois, USA
²DePaul University, Department of Psychology

Purpose: The workplaces of the future will involve outer space. The jobs will require high functioning teams living in extreme conditions for extended periods of time. This necessitates precision in understanding team performance as it changes, on multiple facets, over time as team members continue living and working together.

Methodology: Participants were 9, 4-person teams who lived in a NASA space analog for either 30 or 45 days. During this time, crews were exposed to confined living conditions, isolation from loved ones, restricted and bland diets, sustained sleep deprivation, monotony, and high workload. We administered a battery of four team tasks, each reflecting one of McGrath’s performance dimensions: generate ideas, choose from among a set of ideas, execute, and negotiate.

Results: Our findings show performance on each of these facets shows different growth trends over time. Execute performance tends to increase and stabilize as crews learn to work together. In contrast, crews are less able to think creatively or to collectively make high quality decisions as time goes on.
Negotiate performance remains relatively stable over time, though we saw substantial variation between crews in their innate ability to negotiate and resolve different member viewpoints.

Limitations: Small sample size.

Practical Implications: Learning how different dimension of team performance change in isolated and confined work environments may help developing effective countermeasures to support teamwork during long duration space missions.

Originality: This study makes one first examination of how team performance changes over time, during extended isolation period missions.
Proponents of the Symposium

Jeske van Beurden, Tilburg University, the Netherlands, Department of Human Resource Studies

Marc van Veldhoven, Tilburg University, the Netherlands, Department of Human Resource Studies

Karina van de Voorde Tilburg University, the Netherlands, Department of Human Resource Studies

Discussion facilitator:

Marc van Veldhoven, Tilburg University, the Netherlands, Department of Human Resource Studies

State of the art

Strategic Human Resource Management literature has started to focus more on the role of employees and employee well-being in the relationship between Human Resource Management policy and practice and performance. In particular, recent research has shown that it is the employee perception of HR practices that influences employee well-being and employees’ behavior, rather than the implemented HR practices as rated by managers. This reinforces the need to study better how employees experience HR practices. Despite the growing interest in research on employee HRM perceptions, there is still a limited understanding of what constitutes the employee perception and how (bundles of) perceived HR practices impact employee well-being and performance.

New perspectives/Contributions

Accordingly, by presenting and discussing four studies in this symposium we aim:

- To provide insights in how employee perceptions of HRM are conceptualized and which challenges are identified in measuring employee perceptions of HRM;
- To understand the theoretical processes between (sets of) implemented and perceived HR practices and employee well-being and performance outcomes;

Research/Practical implications

With this symposium, we aspire to contribute to the theoretical and empirical knowledge on (1) the conceptualization of employee perceptions of HRM and on (2) the effect of (sets of) HR practices on employee well-being and performance outcomes. In addition, insights from this symposium can be applied by practitioners to design and implement HRM in such a way that employee well-being and performance can be optimized.

State of the Art: While initially studies examining HRM-outcome relationships only used management-based ratings of HR practices, arguments have been advanced in favor of using employee-based ratings. To examine this, a systematic analysis of HRM-outcome studies published between 2000-2017 is performed. A total of 211 studies is analyzed, including a subset of 72 studies that made use of employee measures only.

Contributions: Our analysis shows that over time studies have indeed increasingly made use of employees as respondents to measures of HR practices. An in-depth analysis of these measures of perceived HR practices revealed that various problems and issues can be identified when critically reviewing these measures.

Research Implications: It is observed that considerable idiosyncrasy exists in measures of perceived HR practices, coupled with a lack of transparency in how these measures are often reported in existing studies.

Originality: It is shown that a mixture of evaluative and descriptive items is used in measures of HR practices which creates concerns about jingle fallacies in extant research and in turn about the validity of HRM-outcome results. Recommendations are therefore provided to further advance the measurement and conceptualization of this core construct.

Professor Julian Seymour Gould-Williams
Cardiff University
Business School
State of the Art: The ‘High Performance’ label has been loosely used to describe systems of HR practices that are designed to lead to enhanced performance outcomes. Boxall and Macky (2009) begin to provide clarification in this area by distinguishing between ‘high commitment’ and ‘high involvement’ systems.

Contributions: Here, I extend their analysis by theoretically differentiating between ‘high performance’, ‘high commitment’ and ‘high involvement’ HRM systems. In the main, my approach is based on the well-established dichotomy of ‘hard’ and ‘soft’ approaches to HRM (Storey 1992), with ‘high performance’ systems associated with ‘hard’ approaches, and ‘high commitment’ and ‘high involvement’ systems associated with ‘soft’ approaches. Thereafter, I suggest that AMO theory best describes ‘high performance’ systems, whereas social exchange theory (SET) and self-determination theory (SDT) respectively explaining ‘high commitment’ and ‘high involvement’ systems.

Implications: On this basis, each system is theoretically distinct with the respective HR practices making up each system being selected on the basis of the core outcomes associated with each micro-theory, namely, performance (AMO), mutuality (SET), performance and employee well-being (SDT). Further research is needed to: i) test whether the theoretically-based selection of HR practices are empirically consistent within each system, ii) determine whether the ‘hard’ and ‘soft’ HRM systems are conceptually distinct, and iii) determine if their outcomes are congruent with those of the underpinning theory.

Originality: This paper uses theory in the selection of HR practices to form HR systems. This approach is consistent with micro motivational theories and signaling theory.

(3) The effect of perceived HR Practices on Employee Well-being and Performance: investigating HR practice use and effectiveness ratings

Jeske van Beurden
Tilburg University
Department of Human Resource Studies

Marc van Veldhoven
Tilburg University
Department of Human Resource Studies

Karina van de Voorde
Tilburg University
Department of Human Resource Studies

Purpose: Although SHRM research has progressed in integrating employee perceptions of HR practices, what constitutes the employee perception of HR practices is not entirely clear. One specific angle is to investigate the (mis)match between employees’ use of HR practices and employee HR practices effectiveness ratings, and how this matters for employee outcomes. Drawing on expectancy theory, we expect that employees who use HR practices and rate the practices as effective or who do not use HR practices and would not expect the practice to be
effective (match of expectations and experiences), report higher on well-being and performance compared to employees who either use the practices and rate the HR practice as not effective or who do not use HR practices and expect that the HR practice would have made them more effective (mismatch of expectations and experiences).

**Design:** Data was collected from 465 employees working in the Netherlands. Employees’ use of HR practices, HR effectiveness rating, work engagement, exhaustion, and performance were assessed.

**Results:** For most HR practices, findings indicate that the ‘positive and negative match group’ scored significant higher on engagement and performance and lower on exhaustion compared to the mismatch groups.

**Limitations:** The use of a cross-sectional design and self-report measures.

**Implications:** Results emphasize the importance of differentiating between HR practice use and effectiveness ratings and how these match.

**Originality:** This study provides a specific original and useful angle on employee perceptions of HR practices and how these relate to employee well-being and performance outcomes.

**(4) Line Manager HRM Implementation and Employee Wellbeing: The Mediating Role of HRM System Strength**

Na Fu  
The University of Dublin  
Trinity Business School, Trinity College Dublin

Patrick C Flood  
Dublin City University  
Business School

Denise M. Rousseau  
Carnegie Mellon University  
Tepper School of Business

Tim Morris  
University of Oxford  
Saïd Business School

**Purpose:** This study aims to investigate whether and how line manager HRM implementation influences employee wellbeing. The mediating role of HRM system strength was theorized and tested in the HRM implementation – employee wellbeing link.

**Design:** Data was collected from 174 team members within 60 management consulting teams. Multi-level analysis approach was adopted.

**Results:** We found that line manager's implementation HRM is positively linked to employee engagement and negatively linked to employee burnout. The impact of line manager HRM implementation on employee wellbeing occurs via building a strong HRM system perceived by employees.
Limitations: This study is limited by cross-sectional design and same source data collection.

Research Implications: By examining the impact line manager HRM implementation, also called the actual HRM, on employee wellbeing, this study enriches HRM-employee wellbeing research whereby the majority of research has been focusing on employee experienced or perceived HRM. Line managers are the key information source and organisational agents for implementing HRM. Thus, it is important to establish the relationship between line manager’s implementation of HRM and employee wellbeing. In addition, we found that HRM system strength mediates such relationship. In doing so, this study contributes to the antecedent and consequences of HRM system strength.

Practical Implications: Organisations need to upskill line manager’s capability to implement organisational HRM practices which will enhances employees’ experiences of a strong HRM system, ultimately improves their wellbeing.

Originality/Value: This study is the first study linking the HRM implementation, HRM system strength and employee wellbeing.
UNRAVELLING BOUNDARY CONDITIONS AND UNDERLYING MECHANISMS OF SPILLOVER PROCESSES: THE ROLE OF RESOURCES, APPRAISAL, DETACHMENT AND OFF-JOB CRAFTING.

Proponent of the symposium:
Lynn Germeys¹
¹ KU Leuven, Belgium

Discussant of the symposium:
Carmen Binnewies¹
¹ University of Muenster, Germany

State of the Art

Nowadays, many individuals combine work and home responsibilities. Previously, scholars focused on investigating which work/home characteristics enrich or impair the home/work domain (i.e., spillover). However, currently the question remains why and how individuals can increase positive and avoid negative work-home combinations.

New Perspectives/Contributions

This symposium aims to provide insight in the boundary conditions and underlying explanatory mechanisms of episodic beneficial and detrimental spillover processes. We will add knowledge on how to improve positive and impede negative work-to-home and home-to-work spillover by using a rich variety of methods (quantitative and qualitative) and cross-cultural samples. The first contribution by Prof. Dettmers and his colleagues examines how daily family and commute demands influence job performance through fatigue and whether contextual resources moderate these relations. Next, Prof. Tement will share how episodic work intrusions in the home domain influence fatigue and sleep quality depending on the appraisal of the intrusion. The third paper of Prof. Meier and his colleagues investigates how workload influences behavior directed towards one’s partner via psychological availability and whether this relation is conditional upon detaching from work. The fourth contribution by Dr. Germeys and colleagues examines whether receiving collegial support increases the likelihood to provide spousal support via sharing positive work events and detaching from work. Finally, Dra. Kujanopää will present how shaping off-job activities will influence psychological need satisfaction and recovery.

Research/Practical Implications

This symposium will shed light on the complex interrelation between the work and home domain and offer suggestions for successfully juggling both domains.

Exhausted before work? A diary study on demands before work and their impact on fatigue and job performance.

Jan Dettmers¹, Carolin Wendt¹ & Jana Biemelt¹
¹ Medical School Hamburg, Germany
Purpose. Referring to the Work-Home Resources Model, we examined the impact of daily family- and commute-related demands in the morning on the development of fatigue before starting the actual work. We assume that demands increase fatigue between awakening and arrival at work that in turn may predict job performance. Furthermore, we assume contextual resources that may attenuate this effect.

Design/Methodology. We conducted an online diary study with 120 working parents on five consecutive days. Daily fatigue was assessed directly after waking up and at arrival at work on each day. We measured daily demands at arrival at work, daily job performance directly after finishing work. We conducted multilevel analysis to account for the nested data structure and for contextual variables.

Results. The results indicate that fluctuation in daily morning family-related and commute-related demands increased start-of-work time fatigue. Contextual resources such as flexible work time moderated this effect. The daily level of fatigue when arriving at work in turn was associated with fluctuations in daily job performance.

Limitations. All variables were self-report measures and all participants were working parents.

Research/Practical Implications. To enhance job performance and maintain the wellbeing of working parents, future research should pay more attention to contextual factors before daily work starts and should examine the impact of daily resources in the morning as well.

Originality/Value. By focusing explicitly on the home side before work, our study contributes to widen the debate beyond characteristics of the home domain after work and its influence on work-related outcomes.

Episodes of work-related intrusions at home and well-being: The role of appraisal.

Sara Tement¹, Marina Horvat¹, & Kristen Shockley²
¹ University of Maribor, Slovenia
² University of Georgia, USA

Purpose. Work-life researchers are increasingly discussing the importance of role transitions between work and nonwork. However, little work has been aimed at exploring these transitions episodically, which allows for an understanding of their content, valence, and subsequent relation to well-being. With this in mind, the present study aimed at exploring the link between episodes of work-related intrusions at home (i.e., intrusions from the work domain into the home domain) and well-being outcomes (fatigue, sleep quality). Moreover, we tested whether the link is moderated by the appraisal of the intrusion (i.e., positive/negative for work/home domain).

Design/Methodology. To test our assumptions, a study is currently in progress (N≈80 employees). Employees report episodes of work-related interruptions via a daily diary method across five consecutive weekdays and the following weekends. Descriptions of the discrete episodes of intrusions are captured via open-ended items.
**Results.** Preliminary analyses showed that most prevalent work-related intrusions were communication-based (e.g., talking to one’s spouse about work), whereas behavior-based (e.g., work-related ICT use) and cognition-based intrusions (e.g., work-related rumination) showed greater fluctuation across days. The meaning ascribed to each of these intrusions varied greatly across individuals (e.g., some found work-related communication positive, others not).

**Limitations.** The study relies on self-report data across a small sample of time and may thus be biased.

**Research/Practical Implications.** The tentative findings suggest that the nature and valence of the intrusions matter in predicting well-being.

**Originality/Value.** The study introduces a new approach to work-related intrusions at home and broadens the understanding of work-family boundary dynamics.

---

**The role of psychological detachment and psychological availability in the effects of workload on the behavior towards the partner: A diary study among dual-earner couples.**

Laurenz L. Meier¹, Eunae Cho², & Cyril Chariatte¹

¹ University of Neuchâtel, Switzerland
² Nanyang Technological University, Singapore

**Purpose.** Combining the Spillover-Crossover model and the Stressor-Detachment model, we investigated how workload affects behavior towards the partner during off-job time. We tested whether high workload reduces employee’s ability and motivation to direct psychological resources towards the partner (i.e., psychological availability), which then may lead to reduced prosocial behavior and increased antisocial and withdrawal behavior. Additionally, we examined whether psychological detachment moderates the workload-psychological availability link.

**Design.** We conducted a 10-workday diary study among 147 dual-earner couples. (N=294 participants; N=1,632 occasions). Individuals reported their workload after work; at bedtime, they reported their psychological detachment and psychological availability and their partner’s prosocial, antisocial, and withdrawal behavior.

**Results.** High workload predicted low psychological availability in the evening, only when individuals failed to detach from work. Then, low psychological availability related to less prosocial behavior, more withdrawal behavior, and no change in antisocial behavior.

**Limitations.** Convenient sampling was used, which might limit the generalizability of the results.

**Implications & Value.** This study advances the spillover-crossover literature by offering empirical evidence for psychological availability as an underlying mechanism through which
workload shapes employee behavior at home. Findings on detachment as a moderator extend the stressor-detachment model and point to potential interventions to alleviate the adverse impact of workload.

**How do supportive colleagues at work make me a supportive partner at home? The role of interpersonal capitalization and psychological detachment.**

Lynn Germeys¹, Elisabeth Abraham¹, & Marijke Verbruggen¹
¹ KU Leuven, Belgium

**Purpose.** To date, work-home research underexplored positive spillover effects and the underlying mechanisms explaining these effects. In this study, we aim to examine how experiencing collegial support at work can prompt an employee to be more supportive towards his/her partner at home. In addition, we investigated the mediating role of interpersonal capitalization (i.e., reflecting on and sharing positive experiences, emotions and thoughts) and psychological detachment (i.e., abstaining from work-related thoughts, feelings and experiences after working hours).

**Methodology.** Experience sampling data were collected of 130 employees during five consecutive working days.

**Results.** Multilevel path analyses found no direct relation between daily collegial support and an employee’s provision of spousal support in the evening. Collegial support experienced at work fosters interpersonal capitalization and psychological detachment at home, which in turn (marginally significantly) promote being a supportive partner at home. The mediation of collegial on spousal support was only significant through interpersonal capitalization.

**Limitations.** Future research could supplement positive spillover processes by including negative spillover and rely on other-rated data.

**Research/Practical Implications.** Although interpersonal capitalization and psychological detachment seem semantic opposites they can co-occur and improve employees’ private life. Individuals and organizations could benefit from increasing and stimulating both types of behavior.

**Originality/Value.** To the best of our knowledge, this is the first study to examine (1) the effect of interpersonal capitalization and psychological detachment concurrently and (2) the (daily mediating) effect of psychological detachment in positive spillover processes.

**Off-job crafting to proactively shape recovery time**

Miika Kujanpää¹, Jessica de Bloom²¹, & Ulla Kinnunen¹
¹ University of Tampere
² University of Groningen
**Purpose.** Recovery from work during off-job time is essential for employees’ working ability, performance and well-being. But in a changing working life where boundaries between the job and off-job domains become increasingly permeable, employees may need to purposely shape their off-job activities in order to satisfy their psychological needs and to fully recover from work.

**Methodology.** This presentation focuses on off-job crafting based on the newly developed Needs Model of Crafting (de Bloom et al.). The model examines both motives, as well as behaviors associated with off-job crafting. Psychological needs may energize particular types of off-job crafting, while successful crafting efforts may lead to better recovery and need satisfaction, and ultimately to better health, well-being and performance. We conducted several quantitative data collections using a new questionnaire on off-job crafting and job crafting.

**Results.** Preliminary validation data and quantitative results using the new questionnaire in large, cross-cultural samples will be presented along with the theoretical model.

**Limitations.** Our data collections rely on quantitative self-report questionnaires. However, we also conducted qualitative interviews during scale development.

**Implications.** This research advances theory-building regarding crafting the off-job domain, and offers a new framework for understanding how employees proactively improve their well-being both on-, and off the job.

**Originality/Value.** Until now, there are only very few studies on workers’ proactive attempts to shape their recovery time and match their leisure activities to their own goals, needs and preferences.
Developments in Diversity – Towards Effective Diversity Management in Organizations

Chair: Dr. Annemarie Hiemstra
Discussant: Prof. Dr. Michelle (Mikki) Hebl

Overall Symposium Abstract

State of the Art: Western organizations are becoming increasingly diverse due to broad (demographic) developments, such as increased migration, globalization, and participation. Being ‘different’ can have a huge influence at the individual level, on the lives of job seekers and employees, and at the organizational level when trying to effectively manage a more diverse workforce. Driven by these developments, diversity-related research has increased over the past decade.

New Perspectives/Contributions: This symposium discusses the latest empirical and conceptual research on diversity by taking on a multi-dimensional diversity perspective. We include empirical studies that address visual stigma (tattoos, port wine stains), gender, and cultural diversity. Following the empirical studies on these diversity dimensions, an integrative theoretical view on diversity management is presented, with the specific aim to build a bridge between science and practice.

Research/Practical Implications: This symposium aims to increase our understanding of diversity at work by highlighting the role of psychological mechanisms that lead to diversity-supporting and hindering behaviour in organizations. This has important implications for theory and practice: Both the empirical findings and conceptual model will help to better understand how to ‘deal’ with diversity and steer organizations into a more inclusive direction. Elaborating on diversity at work may trigger thinking about relevant developments and models for future research.

Presentation 1.

Title. Effects of visual stigmas on video-resume reviews: An experimental study

Author. Derous, Eva (Ghent University), Buijsrogge, Alexander (Deloitte), Hiemstra, Annemarie (EURotterdam)

Purpose. Organizational diversity starts with the inflow of applicants and implementation of bias-free selection procedures. We investigated whether video-resumes (an upcoming selection tool) are susceptible to hiring discrimination of applicants with visible stigmas (port-wine stains, tattoos). Inspired by social-psychological theories, we examined whether these visible stigmas led to discrimination of (equally) qualified applicants and whether this was more pronounced for applicants with a controllable (tattoo) than a congenital stigma (port-wine stains).

Method. 115 HRM-students who participated in a HRM-simulation screened video-resumes of three male applicants for a commercial job (Stigma: tribal tattoo vs. port-wine stain vs. no stigma; counterbalanced) and decided who to invite for a job interview (binary outcome: yes/no). A professional make-up artist painted the stigmas; study materials were pilot-tested beforehand (n=31).
Results. The chance for inviting an applicant with a tattoo was 4.29 times lower than for an equally suitable applicant without a visual stigma, and 3.04 times lower for an applicant with a tattoo than a port-wine stain.

Limitations. Future research designs might consider decision-makers’ recruiting experience, their attitudes towards (visible) tattoos/port-wine stains, both male and female applicants, and other job types.

Conclusion. Male applicants with a visible tattoo (controllable stigma) but not a port-wine stain (congenital/uncontrollable stigma) were discriminated against. Given their popularity and in light of the realization of organizational diversity, recruiters/policy-makers should also consider body modifications/embellishments as potential grounds of discrimination.

Presentation 2.

Title: Not up for the task? Men and women with work-family conflicts between disrespect and admiration

Authors: Franciska Krings, University of Lausanne, Rebekka S. Steiner, University of Bern

Purpose: The media often depict working mothers’ lives as a constant race between work and family demands, a “life in overwhelmia”, where they are continuously on the edge of a nervous breakdown. Media depictions of overwhelmed working fathers are rare, suggesting that working mothers – but not working fathers - are considered as not being up to the task. Is this media image actually shared, i.e., do co-workers or supervisors indeed perceive women with work family conflict more negatively, compared to men? And if yes, what are the implications, e.g., for how they are treated at work?

Methodology: In four experimental studies, participants (employees, working parents, students; n_total = 1,272) evaluated different target persons described in a vignette.

Results: Most evidence showed that independently of gender, employees with family-to-work conflicts (FWC) were perceived as less competent, were less respected and less likely to be promoted than those with work-to-family conflicts (WFC). However, they were admired as being the better parents.

Limitations: Vignettes were relatively short.

Research/practical implications: This research suggests that employees with FWC mostly suffer for not corresponding to the good worker stereotype, which demands that work is the central focus of one’s life and deserves undivided allegiance. Admiring them as parents does not affect how they are treated at work.

Originality/value: This research reveals important, yet unexplored consequences for employees with FWC that represent additional sources of distress, which add to or may interact with the various negative consequences unravelled by previous work.

Presentation 3.

Title: Antecedents of employees’ cultural diversity support
Authors: Annemarie M.F. Hiemstra (Erasmus University Rotterdam), Marissa Flipse (Erasmus University Rotterdam), Eva Derous (Ghent University)

Purpose: Cultural diversity is one of the most important dimensions of diversity in Western countries. Yet, empirical studies on factors that affect individuals’ diversity support and behavior are limited. This study empirically tested Avery’s (2011) model of causes and consequences of employee diversity endorsement in organizations among Western European employees.

Method: Cultural diversity typologies were measured by a newly developed 16 item scale, 4 items by type: Silence, Championing, Subtle resistance, and Flagrant discrimination. These scales and psychological antecedents (e.g., internal motivation to respond without prejudice; IMS) were tested among 440 participants using a cross-sectional design. Data were collected in the Netherlands (n=150) and Belgium (n=390).

Results: Both intrinsic motivation to refrain from discrimination and positive diversity attitudes were related to championing cultural diversity. Low egalitarianism and negative diversity attitudes were related to active diversity opposition.

Limitations: Future research may distinguish between supervisor, co-worker and customer endorsement as well as study the link between diversity endorsement and activism. Finally, it would be interesting to study different kinds of diversity, like gender and age.

Implications and value: Several psychological factors are related to various responses to diversity ranging from silently supporting diversity to flagrant discrimination. With an increasingly diverse workforce in Europe, and diversity support as an important factor in ensuring the success of diversity initiatives, this study adds to our understanding of psychological antecedents of cultural diversity support in the workplace.

Presentation 4.

TITLE: Towards effective diversity management: building bridges between science and practice

Authors: Wiebren S. Jansen, Naomi Ellemers, Onur Şahin, Jojanneke M. Van der Toorn (Utrecht University)

State of the Art: To foster workplace equality and improve productivity, contemporary organizations spend a fortune on diversity policies, such as network meetings, mentoring programs, and affirmative action policies. Yet, despite, the large costs involved, there is now substantial evidence that these diversity policies are generally ineffective and sometimes even backfire. In addition, while there is a large body of scientific knowledge about the ingredients of effective diversity policies, this knowledge seems to be insufficiently implemented in practice.

New Perspectives/Contributions: We pose that, to be effective, diversity management should be holistic. That is, interventions should cover all HR domains, including recruitment and selection, socialization, promotion, and exit. In addition, we argue that diversity policies should be implemented systematically. That is, each policy should have a clear vision, matching goals, sufficient support from employees, and be evaluated properly. Based on these principles we introduce a tool (The Netherlands Inclusiveness Monitor) that helps organizations to diagnose
the effectiveness of their diversity policies and receive customized advice based on scientific knowledge.

**Research/Practical Implications:** Our tool generates highly detailed research data about which and how diversity policies are implemented by organizations and how effective they are. It will also help organizations to improve the effectiveness of their diversity policies.

**Originality/Value:** This contribution lays out a novel model of effective diversity management and introduces a corresponding tool that aims to build a bridge between diversity science and practice.

5. **Discussion by discussant, prof. Michelle (Mikki) Hebl.**

Professor Hebl is the Martha and Henry Malcolm Lovett Professor of Psychology, Professor of Management at Rice University - Department of Psychology Houston, TX – United States of America. Her research focuses on issues related to diversity and discrimination. Prof. Hebl examines subtle ways in which discrimination is displayed, and how such discrimination is remediated by targets, allies, and organizations.
WORKAHOLISM: TOWARDS A BETTER UNDERSTANDING OF ITS NATURE AND CONSEQUENCES

Proponents: Cristian Balducci1 and Paola Spagnoli2
1 University of Bologna, Bologna, Italy;
2 University of Campania “Luigi Vanvitelli”, Caserta, Italy

State of the Art: In recent years there has been increasing attention towards the phenomenon of workaholism, a dysfunctional form of heavy work investment characterized by a set of recurrent behaviors (e.g., working for long hours) and cognitions (e.g., being mentally focused on work activities even when not at work) that have potentially strong implications for individual and organizational well-being and vitality. Various studies have confirmed a relationship between workaholism and adverse health outcomes, including burnout. Additionally, workaholism doesn’t seem to be related to increased job performance.

New Perspectives/Contributions: Despite these important advancements in the understanding of workaholism, a number of ambiguities still surround the phenomenon, especially because its nomological network has been investigated only partially and, in most cases, with non-robust (i.e., cross-sectional) research designs. Thus, the present symposium collects five different studies that address underinvestigated issues related to workaholism such as its interaction with variables that may buffer or intensify its effect and/or adopt robust research designs including objective (physiological) measures such as blood pressure.

Research/Practical Implications: To remain healthy and competitive, modern organizations need motivated and engaged individuals; not workaholics. All together, the studies included in the present symposium will strengthen the quality of the empirical evidence on workaholism. Specifically, they will further document why workaholics may constitute a significant problem, rather than an important resource, for organizations. Additionally, they will highlight some potential avenues for its prevention or for mitigating its most damaging health-related effect.

Contribution 1:

When is workaholism associated with biomarkers of stress? Exploring the moderating role of work engagement

Authors: Damiano Girardi1, Alessandra Falco1, Laura Dal Corso1, Alessandro De Carlo2
1 University of Padova, Padova, Italy
2 LUMSA University, Roma, Italy

Purpose: Workaholism and work engagement are different forms of heavy work investment. Indeed, workaholism may have detrimental consequences for the health of the worker. Conversely, work engagement is typically associated with positive outcomes, and may buffer
against the negative consequences of workaholism. Therefore, drawing on the allostatic load model, we hypothesized that workaholism is positively associated with serum levels of Interleukin 17 (IL-17), a pro-inflammatory cytokine that may contribute to both acute and chronic inflammation. We also hypothesized that work engagement may buffer this association.

**Design/Methodology/Approach:** One hundred nineteen employees in an Italian healthcare organization completed a self-report questionnaire, and then underwent blood sample collection. Data were analyzed using moderated multiple regression. The analyses were conducted controlling for the effect of gender, age, and body mass index.

**Results:** Workaholism was positively associated with IL-17, whereas the association between work engagement and IL-17 was not significant. Furthermore, work engagement moderated the association between workaholism and IL-17, so that this relationship was not significant when work engagement was high.

**Limitations:** The cross-sectional research design did not allow for causal inferences, and the small sample size may preclude the generalization of the results.

**Research/Practical Implications:** This study showed that workaholism is associated with a possible biomarker of stress, and that work engagement may protect against negative consequences of workaholism. Accordingly, interventions should be aimed at preventing workaholism and fostering work engagement.

**Originality/Value:** This is one of the first studies that investigated the association between workaholism, work engagement, and a possible biomarker of stress.

**Contribution 2:**

**Job demands, workaholism, individual well-being, and stress crossover: A within-person perspective**

Authors: Malissa A. Clark¹, Emily M. Hunter², and Dawn S. Carlson²

¹ University of Georgia, Georgia, USA;  
² Baylor University, Texas, USA

**Purpose:** Workaholism has been consistently linked to a variety of negative outcomes. These studies have assumed workaholism does not fluctuate from day to day, but to date this assumption has not been directly tested. The present study utilizes a within-person design to examine fluctuations in workaholism from day to day as well as other dynamic predictors and outcomes of workaholism.

**Design/Methodology/Approach:** One hundred twenty one U.S. employees and their spouses completed self-report surveys for ten working days. The relationships between daily job demands, workaholism, and self and partner strain outcomes were examined.
Results: Multilevel analyses supported the idea that workaholism varies at the daily level. Trait workaholism was significantly related to daily workaholism averaged across the ten days. At the within-person level, daily job demands were positively associated with daily workaholism, which in turn was directly and indirectly (through evening self-reported strain) related to daily spouse stress crossover.

Limitations: A limitation of this study is all individual well-being outcomes were assessed via self-report (e.g., self-reported physical symptoms). Future research should use objective physiological assessments of well-being.

Research/Practical Implications: Results from this study suggest workaholism may not be as stable as previously thought, and dynamic workplace factors such as daily job demands may enhance workaholism characteristics. Daily workaholism was also related to greater self-reported strain that evening and spouse stress crossover, which provides a deeper understanding of how workaholism impacts well-being outside of work for individuals and their spouses.

Originality/Value: This study is the first to examine within-person variability in workaholism.

Contribution 3:

Workaholism, intensive smartphone use and sleep disorders: a multiple mediation model.

Authors: Paola Spagnoli¹, Cristian Balducci², Giuseppe Barbato¹, Marco Fabbrí¹

¹ University of Campania “Luigi Vanvitelli”, Caserta, Italy
² University of Bologna, Bologna, Italy

Purpose: Recent contributions have reported sleep disorders as one of the health impairment outcomes of being workaholic. However, little is still known on the mechanism underlying this relationship. Moreover, sleep disorders were often observed using measures of sleep quality at night, neglecting the sleep consequences during the day, that is daytime sleepiness. The current study aimed at filling this gaps by exploring the role of intensive smartphone use in this process and using both a measure of the sleep quality and daytime sleepiness.

Design/Methodology/Approach: A multiple mediation model was tested on a sample of 224 employees using conditional process analysis (Hayes, 2017) for testing direct and indirect effects.

Results: Results reported a significant mediating effect of intensive smartphone use in the relationship between workaholism and sleep quality, a significant mediating effect of sleep quality in the relationship between intensive smartphone use and daytime sleepiness, and a significant mediating effect of sleep quality in the relationship between workaholism and daytime sleepiness. Interestingly, the effect of the mediators made the direct relationship between workaholism and daytime sleepiness not significant.

Limitations: The cross-sectional nature of the study and the snowball technique for collecting the data were the main limitations.
Research/Practical implication: Results are discussed through an interdisciplinary perspective including biological and psychological arguments.

Originality/Value: The current study is one of the first on revealing the potential detrimental effect of the intensive smartphone use on workaholism outcomes, such as sleep disorders. Moreover, it proposes a more comprehensive approach to the study of this outcome by considering the sleep-wake cycle.

Contribution 4:
Consequences of workaholism

Author: Jari Hakanen

1 Finnish Institute of Occupational Health, Helsinki, Finland

Purpose: Despite increasing interest in workaholism research, longitudinal studies are sparse. In addition, typically previous longitudinal studies have focused on a limited number (one or two) of outcomes of workaholism. Thus, although the cross-sectional correlates of workaholism are quite well-known, long-term impacts are not. The purpose of this study was to investigate several potential outcomes of workaholism in one professional group.

Methodology: A two-wave four-year follow-up full panel design and a representative sample of Finnish dentists (N = 1877) were used. A series of cross-lagged panel analyses was conducted to test causal, reversed, and reciprocal relationships between workaholism and a) job demands and job resources; b) home demands and home resources; c) personal resources (optimism) and proactivity (personal initiative); d) work-related attitudes; and e) health and mental health.

Results: Most model comparisons supported the “causal model”; i.e. workaholism predicting outcomes (and not vice versa). Half of the expected longitudinal impacts of workaholism were found. Interestingly, both workability and proactivity positively predicted workaholism over time.

Limitations: Only one professional group was studied and only self-reports could be used.

Research/practical implications: This study longitudinally supported the findings of many cross-sectional studies so that workaholism may have detrimental influence on various outcomes both at work and at home, and on personal resources, work-related attitudes and health.

Originality: The current study may be the first one to test simultaneously many potential outcomes of workaholism over a long period of time.

Contribution 5:
A within-individual investigation on the relationship between workaholism and blood pressure

Authors: Cristian Balducci¹ Paola Spagnoli² Stefano Toderi¹

¹ University of Bologna, Bologna, Italy;
² University of Campania “Luigi Vanvitelli”, Caserta, Italy

Purpose: Workaholism can be defined as a unhealthy form of heavy work investment characterized by an obsession for work – that is, workaholics constantly think about work even when they are not at work and spend very long hours in work-related activities. Day level processes by which workaholism exerts its health damaging effects have received little attention. Building on allostatic load theory, we hypothesized that day level workaholic cognition and behavior would be associated with daily systolic and diastolic blood pressure, with this relationship being mediated by daily hours worked.

Methodology: Sixty-one participants with high responsibility jobs (e.g. managers) were administered a preliminary questionnaire and, at the end of each of ten consecutive working days, a daily questionnaire. As part of the daily data collection, blood pressure was also measured with a digital sphygmomanometer.

Results: There were significant daily fluctuations in workaholism. Multilevel structural equation modelling revealed that, over and above daily workload, daily workaholic cognition and behavior positively influenced daily systolic and diastolic blood pressure. The workaholism-blood pressure relationship was particularly strong for males and was partially mediated by the number of hours worked.

Main limitation: The small sample size available for the analyses.

Implications: The daily alterations in blood pressure caused by workaholism may explain its long term effects on health outcomes. Organizations need to limit daily workaholic cognition and behavior to preserve the well-being of their human resources.

Originality: This is one of the first studies showing the daily physiological implications of workaholism.
IN DEFENSE OF DEMOCRACY IN EUROPE: WHAT CAN LEADERS AND ORGANIZATIONS DO TO PROMOTE INVOLVEMENT AND SOLIDARITY AT WORK AND BEYOND?

Thomas Jønsson and Michael Knoll

State of the Art.
During the last decade, nations with a status as ‘Full Democracy’ became less and less (The Economist’s Democracy Index, 2008-2017). Even the status of Europe declined slightly. At least since Kurt Lewin, much Work and Organizational Psychology (WOP) have been based on democratic values and norms. Therefore, it is timely to discuss the role of WOP in facilitating democratic values in organizations and society.

New perspectives/contributions
The talks of this symposium address concepts that are inspired by democratic thinking, norms and values:

- **Freedom of speech** inspired WOP topics like voice and silence, which are central to two studies of the symposium: They provide a cross-cultural analysis of the link between silence and well-being and silence as a mediator between incivility and well-being.
- Democratic elections have inspired **participation in decision-making** and the democratic value of **solidarity** inspires WOP concepts like collective coping and employee solidarity. Two studies examine a) whether participation and solidarity affects innovation and b) whether collective coping reduces stress.
- Democratic norms prescribing **inclusion and respect for individuals and groups** relates to WOP themes diversity management and responsibility. One presentation provides a literature review on responsibility in WOP, and one study investigates how respectful error management culture relates to innovation and CSR.

Practical Implications
The presentations elucidates that nurturing democratic norms and values relates to desirable organizational outcomes, in particular innovation and employee health.

Remaining silent in eleven languages: Validating scales for employee silence motives across fifteen countries

Martin Götz1, Michael Knoll2, Elisa Adriasola Barroilhet3, Alicia Arenas4, Stephen Barrett5, Grégoire Bollmann1, Madeline Carter6, Sue Chui7, Donatella Di Marco8, Vicky Elsey6, Paola Gatti9, Chiara Ghislieri9, Joeri Hofmans10, Thomas F. Jønsson11, Christina Lundsgaard Ottsen12, Jennifer L. Pickett10, Sylwiusz Retowski12, Silvia A. Silva8, Ana Šimunić13, Daria Szücs2, Susana M. Tavares8, Rolf van Dick14, and Hannes Zacher15

1University of Zurich, Switzerland; 2Technische Universität Chemnitz, Germany; 3Universidad Adolfo Ibañez, Santiago de Chile, Chile; 4University of Seville, Spain; 5Institute of Technology Blanchardstown, Ireland; 6Northumbria University Newcastle; 7Durham University, UK; 8ISCTE-IUL Universitário de Lisboa, Portugal; 9Università degli Studi di Torino, Italy; 10Vrije Universiteit Brussel, Belgium; 11Aarhus Universitet, Denmark; 12Szkoła Wyższa Psychologii Społecznej,
Sopot, Poland; 13 University of Zadar, Croatia; 14 Goethe Universität Frankfurt, Germany; 15 Leipzig University, Germany.

Purpose
The exchange of ideas, opinions, and concerns is vital for sustainable individual and collective development. If employees conceal information or withhold their views, potential for improvement and learning lays dormant and negative circumstances may endure which potentially harm, employees, organizations, and stakeholders. Research and media reports indicate that employee silence is an internationally occurring phenomenon. To facilitate research on employee silence, we validate a measure of four forms of silence based on their underlying motives (i.e., fear, resignation, prosocial, and opportunistic; Knoll & van Dick, 2013) across fifteen countries (eleven languages). We expand this measure by two additional motives, namely disengagement and lacking confidence (Brinsfield, 2013), and examine whether relationships between the six motives and relevant antecedents (i.e., psychological safety) and outcomes (i.e., health) of silence differ across motives and samples.

Design/Methodology
We collected cross-sectional survey data in sixteen samples (N = 3'639) and inspected the scale’s reliability and validity across these using latent variable modeling.

Results
Measurement invariance holds across samples. Associations of psychological safety with the silence motives seem invariant across samples (but distinct with respect to motives) whereas the associations with health differ.

Limitations
We used convenience sampling.

Research/Practical Implications
We provide researchers with a validated scale of the six postulated motives of employee silence and explore international differences in silence motives and relationships of silence with psychological safety and health.

Originality/Value
Our large-scale international study is the first to develop and validate a fine-grained measure of silence motives and provides preliminary evidence for its usefulness.

Uncivil behaviors at work make me shut up. The role played by climate for authenticity in the relationship between workplace incivility, prosocial silence and psychological health.

Donatella Di Marco, Silvia A. Silva, & Susana M. Tavares
Instituto Universitário de Lisboa (ISCTE-IUL)

Purpose
The goal of this research is to understand the direct and indirect effect (through prosocial silence) of workplace incivility on workers’ psychological well-being. Moreover, we explore
the interaction of workplace incivility with climate for authenticity predicting prosocial silence.

Methodology
An online study was carried out in order to explore the moderated mediation described above. Participants were 337 employees, working at different organizations.

Results
Our findings show that workplace incivility is associated with lower levels of psychological well-being through prosocial silence. However, this relationship is moderated by climate for authenticity. Thus, for higher levels of climate for authenticity the lower workplace incivility, the lower prosocial silence. For lower levels of climate for authenticity, workplace incivility is not related to prosocial silence.

Limitations
The cross-sectional design and common method variance represent the main limitations of this study.

Research/Practical Implications
The study contributes to understand the complexity of prosocial silence and its relationship with workplace incivility and psychological well-being. Moreover, it helps to understand in which conditions perceiving a climate for authenticity might have a beneficial effect in reducing prosocial silence. At practical level, the study suggests that perceiving a climate where people can show their real self and manifest their feeling can have beneficial effects for the organization and for people’s well-being.

Originality/Value
This study contributes to understand the complexity of silence and its effects on workers’ mental health.

It is not all about competition: The impact of democratic and participative practices in organizations on employees’ solidarity at work and innovative work behavior.

Christine Unterrainer, Wolfgang G. Weber, & Thomas Höge
University of Innsbruck, Austria

Purpose
Contrary to competition, selfish individualism, and other components of neoliberal ideology – which seem to be prominent in Western societies (Bal & Dóci, 2018; Kasser et al., 2007) – citizens’ humanistic, solidary, and prosocial orientations are indispensable for a democratic society (Weber et al, 2008). The workplace as one fractal of society may also provide opportunities to defend democracy. Our study investigates if participative and democratic practices in organizations foster employees’ solidarity at work and if this cooperative, respectful behavior leads to more innovative work behavior.
Design/Methodology/Approach/Intervention
We conducted a self-report questionnaire study with employees from different economic sectors and occupations. Employees were studied at two time points with a time lag of four weeks. To reduce common method bias, we analyzed individually perceived participation, sociomoral-climate and solidarity at work at Time1, innovative work behavior at Time2.

Results
A serial multiple mediation analysis showed that perceived participation in decision making directly and indirectly affects employees’ innovative behavior. Having influence in decision-making fosters the development of an appreciating climate, which in turn increases employees’ solidarity at work and leads finally to more innovative work behavior.

Limitations
The cross-sectional design limits the propositions on the causality of the mediation model.

Research/Practical Implications
Organizations can stimulate workers’ innovative behavior by enabling democratic processes in terms of real empowerment and by supporting employees’ solidarity instead of competitive behavior.

Originality/Value
The present study examines for the first time the potential of a solidary orientation for improving employees’ innovative behavior.

Involvement and collective coping. A mixed methods study of collective coping in organizations.
Author: Tanja Kirkegaard, Department of psychology and behavioral science, Aarhus BSS, Aarhus University

Purpose
The aim of the study is to examine the distributed nature of collective coping and stress in organizations.

Methodology
The study is a mixed methods study consisting of fieldwork, individual and group interviews, a survey distributed three times during a year combined with a social network analysis in two departments in a large Danish organization.

Results
The degree of involvement of the employees in addressing work environmental issues had an impact on the collective coping efforts of the employees. A low degree of involvement of the employees contributed to the development of collective stress. A high degree of involvement influenced solution-oriented collective coping efforts among the employees.

Limitations
The study is conducted in one organization and the external validity is therefore problematic.

Research Implications:
The results accentuate the importance of the degree of involvement regarding the well-being of the employees and their way of coping with work environmental issues. The results contribute to the generation of hypotheses of the possible relation between involvement and collective coping.

**Originality/Value:**
The link between involvement and collective coping is a new research field, which has not yet been addressed within work and environmental research. Future research within this area is needed in order to establish a more profound understanding of the relation between involvement and collective coping.

**An integrated model of work and organizational psychology of responsibility: A literature review**

Thomas Jønsson  
*Aarhus University, Denmark*

**State of the art**
Responsibility may be among the most important elements of organizational life because it is inherent in division of labour and in hierarchical structuring. Though accounting, law and philosophy have their own theoretical concepts, WO Psychology has not yet treated this concept comprehensively. Different conceptualizations exists, which may have different antecedents and consequences. This includes for example what responsibility is or (e.g. tasks, well-being, environment). Responsibility can refer to past events or future actions, to success or failure. It may be ascribed to one self or to others. Moreover, responsibility may be accepted or denied, and motivating or burdensome to have.

**New Perspectives/Contributions**
This literature review integrates extant research on responsibility within WOP into a theoretical model. The model comprises of cross-level dynamics of attributions and acceptance/denial of responsibility between individuals, groups and organizations. Furthermore, the model includes the temporal dimension of responsibility for past or future actions. The experience of responsibility is viewed in perspective of motivation, cognition, and emotion.

**Research/Practical Implications**
The review lays the groundwork for further psychological research on this phenomenon. Future studies may apply the results to understand how and why some persons take, accept or deny responsibility, for example in relation to employee involvement and voice opportunities, professional roles, OCB, power and influence, and business ethics.

**Originality Value**
To the author’s knowledge, no comprehensive theoretical model of responsibility has so far been established in WO Psychology.
A strong error management culture promotes corporate social responsibility: A Multi-level analysis in an international organization across 10 countries

Jürgen Wegge\textsuperscript{a}, Hanna Bärwinkel\textsuperscript{b}, Dominika Wach\textsuperscript{c} & Philipp Kruse\textsuperscript{d}

\textsuperscript{a} TU Dresden, Faculty of Psychology, Technische Universität Dresden, 01062 Dresden, Germany.
\textsuperscript{b} TU Dresden, Faculty of Psychology, Technische Universität Dresden, 01062 Dresden, Germany.
\textsuperscript{c} TU Dresden, Faculty of Psychology, Technische Universität Dresden, 01062 Dresden, Germany.
\textsuperscript{d} TU Dresden, Faculty of Psychology, Technische Universität Dresden, 01062 Dresden, Germany.

Purpose
In organizations with strong error management cultures it is accepted that people make errors. Moreover, organizational norms and practices promote learning from errors, an open communication about errors, helping in error situations and error handling. We investigate potential antecedents of error management cultures at the team level (e.g., age and tenure diversity) and analyze important correlates at the individual level (e.g., innovation and corporate social responsibility), controlling for cultural value differences across 10 different countries.

Design
We analyze a dataset of a large international tele-communication enterprise encompassing 82,927 subordinates in 9,253 teams working in Europe, South America or Asia.

Results: Our multilevel analyses showed, as predicted, that a strong error management culture is positively associated with innovation and corporate social responsibility (both $p < .01$). Team member diversity regarding tenure (not age) had a positive influence on error management ($p < .01$). Finally, uncertainty-avoidance ($p < .05$), tightness ($p < .05$) as well as humane orientation ($p < .05$) had a negative influence on error management.

Limitations
The results are based on cross sectional data.

Research Implications
These findings highlight the importance of error management cultures for promoting innovation and corporate social responsibility in organizations.

Originality
To the best of our knowledge, we provide the first large scale multi-level analysis indicating strong links between error management and moral behavior of employees. Our study also highlights the importance to consider multiple levels (i.e. teams and national cultures), to better understand the antecedents and correlates of error management cultures.
1012 - INTERVENTIONS AIMED AT CREATING HEALTHY WORKPLACES

Chair Diana Rus, Creative Peas, The Netherlands

Overall abstract
This 90-minute symposium will focus on the design and development of the intervention and its application in practice. Scientists and practitioners will describe how they worked together to communicate and apply research to practice. As part of the scientist – practitioner collaborative stream this symposium compliments the conference theme of working for the greater good looking at how to enhance workplace well-being. There will be four presentations exploring linkages and collaboration processes between scientists and practitioners. The academic presentations will explore scientific constructs, the design and data collection within the intervention. These will be followed by a description of the application of a training programme in practice and its evaluation by employees and managers. Presenters will then provide insights and discuss the challenges of translating evidence from research into meaningful tools for sustaining and promoting employee well-being. There will be ample time in the symposium for audience interaction immediately after the papers and in a plenary ending session.

Responding to burnout with “GRRR”!
A training programme for enhancing GRit, Resilience and Recovery in the workplace (Part 1 – scientists’ presentation)

Andrea Ceschi, Arianna Costantini, Verona University, Department of Human Sciences, Italy
Franco Fraccaroli, Trento University, Department of Psychology and Cognitive Science, Italy
Riccardo Sartori, Verona University, Department of Human Sciences, Italy

Purpose: During times of constant changes and impelling deadlines, organizations ask for employees capable of facing the exposure to frequent stress and overwhelming job demands, which, if prolonged, can result in burnout. Scientific literature presents three main psychological constructs which at different stages can prevent, manage, and help to recover from burnout. They are: grit, resilience and recovery in the workplace. Bridging these three constructs together, the present study introduces an ad hoc training, named “GRRR”, that has been developed with the aim of decreasing exhaustion levels in participants.

Methodology: A sample of employees (n=44) from two organizations operating in the private sector followed the GRRR one-day training workshop. After training employees completed a notebook of development in relation to the workshop aims. Participants also wrote a quantitative diary at the beginning and after training.

Results: Preliminary analyses partially supported our hypotheses. Overall, the training improved employee well-being levels. We predicted and found that grit was positively associated with increasing resilience and recovery; and all three constructs were associated
with decreased levels of employee exhaustion. Finally, we were able to establish a causality among the development of the three constructs: grit as a personality trait was associated with resilience development, and resilience with the learning of new recovery coping strategies. 

**Limitations:** Similar to several WOP studies, the present research lacks objective measures. 

**Practical Implications:** Implications for companies consist in a new evidence-based training programme specifically designed for dealing with burnout and exhaustion. 

**Originality:** The present study fills a gap in research by combining grit, resilience and recovery and by applying a quasi-experimental approach for the development of such constructs.

**Keywords:** Grit, Resilience, Recovery, Burnout.

---

**Responding to burnout with “GRRR”!**

**A training programme for enhancing Grit, Resilience and Recovery in the workplace (Part 2 – practitioners’ presentation)**

Andrea Ceschi, Verona University, Department of Human Sciences, Italy 
Marija Gostimir, Evidence-Based Management Consultancy, Verona, Italy 
Stefania Carnevali, Giuseppe Gualandris, Profice, Mantova, Italy 
Marco Malavasi, BPR Group, Mantova, Italy

**Purpose:** Practitioners share their experiences about testing a training programme for enhancing grit, resilience and recovery in the workplace (i.e., GRRR training).

**Design:** Practitioners describe all stages of training design from the conceptual development to the report production describing the evaluation and benefits of training.

**Results:** Practitioners, based on their roles, were differently involved in each part of the training. The training manager helped with the participants targeting, the development of awareness about the constructs of the GRRR training, and with the notebook and the training material production. The trainer who conducted the GRRR programme with employees also took note of participants feedbacks. A second consultant was involved in marketing and strategic positioning of the GRRR programme among companies.

**Practical Implications:** Opinions, suggestions and comments from managers of the companies involved are considered and reported in the presentation.

**Keywords:** Grit, Resilience, Recovery, Burnout.
**Intervention and communication processes to translate research into well-being at work: Evidence from research**

Arianna Costantini, Verona University, Department of Human Sciences, Italy
Evangelia Demerouti, Eindhoven University of Technology, The Netherlands
Andrea Ceschi and Riccardo Sartori, Verona University, Department of Human Sciences, Italy

**Purpose:** Previous research has documented that job crafting is positively associated with work engagement (Vogt, Hakanen, Brauchli, Jenny & Bauer, 2016) and that such a behaviour is volitional (Bipp & Demerouti, 2015). Based on these premises, this investigated the effectiveness of an intervention to translate intentions to engage in job crafting into actual behaviour, in order to indirectly sustain work engagement.

**Methodology:** This is a quasi-experimental study involved non-random assignment to intervention and control groups, with -pre -post, and diary measures. Participants in the intervention group received training focused on self-monitoring, planning, and goal-setting techniques.

**Results** from a cross-domain growth model integrated with a path analysis showed participants in the intervention group (N=55) reported significant positive co-variation between initial levels of behavioural intention and changes in subsequent behaviours. A series of repeated measure ANOVAs showed participation in the intervention was associated with higher levels of work engagement.

**Limitations:** Collected measures were all self-reported.

**Research Implications:** Results suggest the intervention was effective in sustaining implementation processes to engage in job crafting strategies. Also, findings suggest that participation in the intervention was associated with greater work engagement, both across time and compared to the control group.

**Originality:** To the best of our knowledge, this is the first study focusing on whether and how an intervention focusing on supporting intentions to engage in job crafting is effective to sustain both job crafting behaviors and work engagement.

**Keywords:** Job crafting, Interventions, Work engagement.

---

**Intervention and communication processes to translate research into well-being at work: Experiences from practice**

Nicola Salandini, Stefania Benassuti
Clara Magnano, Kelvin S.r.l. – Rittal GmbH & Co. KG
Arianna Costantini, Department of Human Sciences, University of Verona, Verona, Italy
Purpose: This presentation will provide insights and discuss the challenges of translating evidence from research into meaningful tools for sustaining and promoting employee well-being.

Design: Drawing on our experience of collaboration with Verona University, we will elaborate on the processes and communication strategies adopted to share and make use of data collected from a survey to monitor job demands and resources, along with work engagement, among people working at our company.

Results: Experience from our on-going strategy to support employees’ well-being by relying on the collaboration with academics suggests that, in order to capitalise on the value of research, it is essential to define a recursive communication channel to translate evidence from research into meaningful information for people at work.

Limitations: It is difficult to generalise our experiences to an entire range of different organizations.

Practical Implications: We aim to provide insights on how effective communication strategies represent a fundamental tool to boost employee well-being and motivation at work, based on data and evidence from research.

Value: While research often focuses on the processes through which well-being at work unfolds and develops; the way through which well-being can be sustained by making use of research itself remains overlooked. This intervention offers practitioners’ contributions to explore these processes.

Keywords: Job demands and resources, Human Resource Management, Employee well-being.
State of the Art

Thinking about work while at home and not detaching is believed to be an important mechanism to explain the development of poor health as a result of experiencing workplace stressors/demands, mainly by disrupting recovery processes. Indeed, empirical evidence suggests that work-related rumination, which describes the repeated or chronic cognitive activation of stressful work experiences, is related to disruptive recovery, and poor well-being of employees. However, less is known about long-term health consequences of rumination, the effects of cognitive anticipation of upcoming work demands (and not just brooding on past experiences) for recovery, or possible interventions that help detaching from work.

New Perspectives/Contributions

This symposium aims at providing new perspectives on the effects of being cognitively connected to one’s work during off-work hours. The studies presented in the symposium use longitudinal and daily diary designs to investigate health consequences of rumination, shed light on the relationship between rumination and performance, and investigate the relationship between the cognitive urge to check and respond to ICT messages and well-being. Furthermore, they explore the importance of anticipating the demands of the upcoming workweek for recovery, and provide evidence for activities that help to stop ruminating and being active in one’s free time.

Research/Practical Implications

In this symposium we bring together innovative research with strong methodological designs that further explore the role of being cognitively connected to one’s work while out of office for employees’ health and well-being.

Presentation 1

Title: Longitudinal evidence of individual- and team-level effects of workplace stressors on ill health: Rumination as a mediator

Tim Vahle-Hinz, Humboldt University Berlin, Berlin, Germany
Thomas Rigotti, Johannes-Gutenberg University Mainz, Mainz, Germany
Kathleen Otto, Philipps University Marburg, Marburg, Germany

Purpose
In the present study we use a longitudinal design to test the relationship between time pressure and job insecurity with depression and somatic health. Rumination is tested as a mediator of these relationships. Additionally, as workplace stressors are both, an individual and a shared group phenomenon, and evidence suggests that rumination might also function on the team-level (e.g. co-rumination), we also test the proposed relationships on the team-level of analysis.

**Design**
Longitudinal study with three measurement waves (T2 13 month, and T3 20 month). 468 employees, nested in 94 teams. Multilevel path analysis investigating individual-level (within-person), and team-level (between-person) effects.

**Results**
Job insecurity was positively related to depression on the within- and between-person level, and related to somatic health on the between-person level of analysis. There were no direct effects of time pressure. However, the indirect effect of time pressure on both outcomes via work-related rumination reached significance on the within-person level of analysis.

**Limitations**
The test of all effects in one model was not possible because of power limitations on the between-level.

**Practical Implications**
Job stress interventions need to address both, team-level and individual-level stressors. Interventions that reduce rumination might be particularly important on the individual-level.

**Originality**
Rumination is theoretically proposed to be a mechanism translating stressful experiences at work into negative health consequences. However, longitudinal studies that test the indirect relationship between work stressors and illness via rumination are still rare. Additionally, rumination is supported as an individual-level mediator, but not as a team-level mediator.

---

**Presentation 2**

**Title:** Rumination as a Predictor of Subjective Performance in Problem Solving: A Two-Week Diary Study.

**Authors:** Sabrina Krys
**Affiliation:** Kiel University, Kiel, Germany

**Purpose**
Goal-directed ruminative thoughts are generally associated with impairments in well-being and performance. However, rumination is also associated with higher levels of resources put into problem solving, likely leading to an improvement in performance. The current study therefore examines the impact of rumination on problem-solving performance in the everyday context. I argue that this relationship is negatively mediated by perceived stress, negative mood, and tiredness, whereas it is positively mediated by attention and effort put into problem solving.

**Design**
Over a period of two weeks, 147 students completed a brief survey each evening. The design included both weekdays and weekends. Methods: Data were analysed by means of a multiple mediation analysis on within-subject level in the multilevel modelling framework.

**Results**
The analyses revealed that perceived stress and negative mood negatively mediated the relationship between rumination and subjective performance, while attention and effort positively mediated this relationship. Finally, it was found that the direct effect between rumination and performance was negative.

Conclusions
Conclusively, rumination exerted a negative indirect effect on subjective performance via perceived stress and negative mood, whereas it positively affected performance via attention and effort.

Presentation 3
Title: When the phone beeps – A longitudinal study on the relationship between workplace telepressure and well-being

Janina Zinke, Tim Vahle-Hinz, & Annekatrin Hoppe, Humboldt University Berlin, Berlin, Germany

Purpose
When the phone beeps or an e-mail pops up, employees get cognitively involved. They start to think about the need to reply and feel an urge to respond. This phenomenon is described as workplace telepressure. The aim of the present study is to examine the relationship between workplace telepressure and well-being longitudinally. Additionally, we investigate the effect of actually using ICT technologies for work-related purposes during one’s free time on well-being.

Design
Micro-longitudinal study with three measurement occasions within three weeks. 230 employees participated at all measurement occasions. We tested our hypotheses using structural equation modelling.

Results
Results suggest that workplace telepressure has a negative relationship with well-being indicators over time. Using ICT technologies during one’s free time, however, was not related to well-being.

Limitations
As we used a micro-longitudinal design, we cannot predict long term effects. Furthermore, we did not investigate the origin of workplace telepressure and if it may be internally or externally generated.

Implications
As ICTs appear to be indispensable for many work-related tasks, it is important to understand the health effects of stressors related to the ICT use. The cognitive urge to check and respond to ICT messages was related to well-being, but using ICT during one’s free time for work-related purposes was not.
Presentation 4

Title: Are all days created equal? Weekly rhythms in recovery and the role of the future time perspective

Authors: Hülsheger, U. R., Zijlstra, F. R. H., & Walkowiak, A.

Affiliation: Maastricht University, Maastricht, Netherlands

Purpose: Although little attention has been paid to the role of weekly rhythms in recovery-related variables, initial evidence suggests that psychological detachment and sleep quality systematically increase over the course of the week. An explanation put forth for the paradoxical finding that affect and affect-related states seem to be poorest right after the weekend when employees should have recovered from the demands of work, is the future time perspective hypothesis. It suggests that employees anticipate the demands of the upcoming workweek. Yet, this hypothesis has never been tested explicitly. Using a range of recovery-related variables (positive and negative affect, affective rumination), the present study explicitly tests the future time perspective hypothesis and investigates workload as an important boundary condition.

Methodology: To test hypotheses, we used an experience-sampling study involving 3 daily measurement occasions over 7 work days (N = 64 participants, 305 observations).

Results: Growth curve analyses revealed that daily future time perspective, affective rumination and negative affect decreased while sleep quality increased over the course of the week. As expected, daily future time perspective was related to affective rumination, negative affect and sleep quality. Furthermore, work demands moderated weekly rhythms in recovery variables such that weekly rhythms were stronger when workload was high.

Limitations: Future research may extend this research with observer-ratings.

Practical Implications: Knowledge about weekly rhythms in recovery-related states may inform recovery trainings.

Originality/Value: So far, little attention has been paid to the role of time in the recovery literature. This study addresses this gap.
Presentation 5

Title: “Tomorrow I am going to become more active-really!” – the boost of activity and well-being through action-planning and preparatory actions

Kristina Hilckmann & Eva-Kristina Brosch, University of Muenster, Muenster, Germany

Purpose: The goal of our study was to examine the activity-promotion effect of two interventions, one addressing action planning and one additional addressing preparatory actions and its impact on well-being. The Interventions are based on the Health-Action-Process-Approach (Schwarzer, 2008). Well-being indicators and physical activity were assessed on a daily-diary-level and evaluated longitudinal. We propose positive associations between positive well-being indicators and time spent active and negative associations of negative indicators and activity on a daily and longitudinal level. Further we expected a more beneficial effect for the preparatory-actions intervention-group.

Design/Methodology: We conducted a 36-day diary-longitudinal study with a mixed sample of 68 participants (n=1519 days).

Results: Results of hierarchical linear modelling showed that daily time spent active was positive associated with positive affect and serenity at bedtime and negatively associated with negative affect. Over the course of 36 days the weekly activity time increased by more than 30 minutes, with no significant difference between the two intervention groups. In line with our hypotheses negative affect decreased, and serenity increased. Contrary to our hypotheses positive affect decreased, and exhaustion increased.

Limitations: Due to only one daily assessment we cannot draw causal conclusion about the beneficial effect of daily activity on affective states.

Research/Practical Implications: A simple action-planning intervention can help to increase the weekly activity time by more than 30 minutes and comes along with improved daily well-being.

Originality/Value: Our study is one of the first studying the additional effect of a preparatory-action-planning intervention on the promotion of physical activity.

Presentation 6

Title: A DIARY STUDY EXAMINING THE EFFECTS OF BOULDERING AS AN AID TO REDUCE WORK-RELATED RUMINATION

Mark Cropley, University of Surrey, UK
Talia Drew, University of Surrey, UK

Purpose
Ruminating about work has been associated with a range of negative health issues. What is less understood is the actual process of unwinding. One line of research has investigated the activities people undertake post-work as aids to unwinding. This paper reports a study that investigated how indoor bouldering impacts levels of affective rumination.

Design
Members of a bouldering club (n=684), completed a survey and 57 individuals (78% male), opted to complete a diary early and late evening on a bouldering and non-bouldering day following work. Affective rumination mood, stress and demands were assessed. Leisure attitudes, recovery experiences and the perceived restorativeness were also examined.

Results
There was a significant main effect of activity type ($F(1,56)=112.28, p<.001, \eta^2=.67$), due to individuals reporting lower affective rumination on a bouldering evening, relative to a non-bouldering evening ($M=2.0, M=3.5$), and a significant main effect of time ($F(1,56)=23.82, p<.001, \eta^2=.30$) with lower rumination late evening, relative to early evening ($M=2.3, M=3.9$). There was also a significant interaction effect ($F(1,56)=52.52, p<.001, \eta^2=.48$), showing post-work rumination to be significantly lower late evening (relative to early evening) on bouldering days compared to non-bouldering days.

Limitations
This sample was self-selected.

Research/Practical Implications
Although bouldering appears to help people to unwind, in actual fact it may not be the particular activity per se that aids unwinding but the underlying attributes of performing a particular activity.

Originality
The current study adds to the existing literature on activities that aid recovery from work, and demonstrates that bouldering utilises mechanisms (psychological & physical) that enable individuals to unwind post-work.
State of the Art

Research in the field of occupational health has predominantly demonstrated the adverse effects of exerting self-control (Lian et al., 2017). These effects can be explained by the strength model of self-control, which suggest that self-control is effortful and depletes regulatory resources (Muraven & Baumeister, 2000).

Contributions

Despite convincing evidence on the adverse effects of self-control in the work-related field (Lian et al., 2017), research has largely neglected spillover processes (Edwards & Rothbard, 2000) of self-control depletion. The present symposium will address this gap by focusing on spillover mechanisms of self-control across domains (commute to and at work), across time (within and between days), and across individuals (leaders and followers). First, Dana will present depletion of regulatory resources as a mechanism, which links adverse experiences during the commute to workplace conflicts. Second, Fabiola will elaborate on aversive commuting experiences and how these affect flow and work engagement at work. Moreover, she examines self-control demands and basic needs satisfaction as moderators of these relations. Third, Anne examines how emotional dissonance and emotional exhaustion predict the within-day trajectories of self-control depletion. Fourth, Claudia examines trajectories of self-control depletion across the week and how these are affected by sleep quality and quantity variability. Fifth, Nishat looks at spillover of self-control depletion between leaders and followers.

Implications

Our symposium demonstrates that depletion of self-control resources exhibits relatively consistent spillover effects across domains, across time, and across individuals. Moreover, it identifies moderators, which influence these spillover effects.

1. Row Road, Squabble Square, And Argument Avenue. Commuters' Negative Social Experiences as Antecedent of Workplace Conflict and The Role Of Self-Control

D. Unger – Norwich Business School, University of East Anglia, UK
A. Albrecht – Leuphana University, DE
K. Böttcher – Berlin School of Economics and Law, DE
A. Starzyk – NEOMA Business School, FR

Purpose

Investigating spillover processes from commuting to work, we examine how commuters’ negative social experiences in the morning are related to workplace conflict before noon. We expect positive indirect effects of negative social experiences on workplace conflict via
diminished self-control capacity and increased negative affect. Furthermore, we hypothesise that negative events at work exacerbate the relationship between negative social experiences and workplace conflict.

**Methodology**

Over one work week, 215 commuters filled in daily surveys in the morning after commuting and at noon. We conducted multi-level analyses with both a within- and a between-person model.

**Results**

At the within-person level, negative social experiences reduced self-control capacity and amplified negative affect and workplace conflict. Contradicting our hypotheses, we found a positive effect of self-control capacity on workplace conflict. Thus, we rejected the hypothesis that there is a positive indirect effect of negative social experiences on workplace conflict via self-control capacity. The corresponding indirect effect via negative affect was not significant. Negative events did not moderate the relationship between negative social experiences and workplace aggression.

**Limitations**

Due to our self-report measurements, common-method bias might have impacted the study variables’ relationships.

**Research/Practical Implications**

Transportation companies need to strengthen the norm of polite behaviour and increase space for people using their services. Organisations should allow employees to commute during off-peak time.

**Originality/Value**

Testing simultaneously three theories (i.e. the strength model of self-control capacity, the model-as-information approach and the displaced-aggression hypothesis), we study the effects of commuting and non-work antecedents of workplace conflict.

1. **Flowing to Work to Flow at Work? The Role of Self-Control in Daily Morning Commute and Motivational Work States**

   Fabiola Gerpott – Technical University of Berlin, DE  
   D. Unger – Norwich Business School, University of East Anglia, UK

**Purpose**

Commuting to work is a daily routine for most people. However, the consequences for work-related motivational states during the day is not well understood. We integrate self-control theory with a self-determination perspective to develop a model that considers both within-person fluctuations and between-person differences. First, drawing from self-control theory, we propose that employees’ daily aversive morning commute negatively affects their daily work engagement through lower levels of daily flow experiences, particularly at days when self-control demands at work are high. Second, adding a self-determination lens, we position
employees’ general basic need satisfaction at work as a buffer in this model, such that the moderated mediation does not occur when employees basic needs are fulfilled.

**Design/Methodology**

We used a diary study with 53 employees across ten work days (N = 412 day-level data points). We measured basic needs satisfaction in a pre-survey, aversive morning commute at the beginning of each work day, self-control demands and flow experiences in the afternoon, and work engagement after arriving at home. Data were analysed using multi-level path analyses.

**Results**

The data provided support for our hypotheses and indicated a three-way interaction effect.

**Research/Practical implications**

We discuss the development of corporate interventions that increase basic needs satisfaction and the advancement of policy recommendations in terms of infrastructure changes that will allow people to more easily flow to work.

**Originality/Value**

We address calls for integrated frameworks combining day-specific fluctuating variables with between-person characteristics to advance theorizing on dynamic motivational states at work that require self-control resources.

1. **The Dynamic Interplay between Emotional Dissonance, Emotional Exhaustion, and Daily Trajectories of Self-Control Depletion: A Latent Growth Modelling Approach**

Anne-K. Konze – Leibniz Research Centre for Working Environment and Human Factors at the Technical University of Dortmund, DE

**Purpose**

Given the importance of successfully exerting volitional self-control in today’s working environments, the current study intends to broaden empirical knowledge on the depletion of the regulatory resource capacity by investigating how ego-depletion unfolds dynamically throughout a workday. By integrating notions of the strength model of self-control (Baumeister et al., 1998) and the resource-based model (Trougakos et al., 2015), this study examines the interplay between day-specific levels and changes of ego-depletion, day-specific emotional dissonance, and person-specific emotional exhaustion as an indicator for chronic regulatory resource depletion.

**Methodology and Results**

A multilevel latent growth analysis conducted with data from a daily diary study (N = 64; 10 days; 4 measurement occasions per day) reveals that levels of ego-depletion increase linearly
in the course of a workday and are adversely affected by day-specific emotional dissonance. Furthermore, emotional exhaustion is shown to relate to heightened values of ego-depletion in the morning.

Limitations
Although a very good daily response rate was obtained, the sample size on the person-level is relatively small (N = 64).

Implications
Practical implications on the scheduling of work tasks are derived. Furthermore, it is discussed how future research could benefit from acknowledging the role of time when studying psychological processes.

Originality
By explicitly integrating the role of time and the strength model of self-control, and by adopting a novel analysis approach, dynamic relations between ego-depletion, emotional dissonance, and emotional exhaustion are hypothesized and examined on multiple levels.

1. The impact of sleep on ego-depletion over the course of the week: Evidence of a curvilinear relationship
Claudia Sacramento – Aston University – Aston Business School, UK
Jana Kühnel – University of Ulm, DE

Purpose
Day-specific sleep has been found to be related to self-regulatory failure and ego depletion (Diestel, Rivkin & Schmidt, 2015; Kühnel, Bledow & Feuerhahn, 2016). However, we know little about how ego-depletion unfolds over the course of the work week, and how sleep impacts this process. We therefore seek to extend current perspectives on ego-depletion and sleep research by considering change trajectories of ego depletion over the course of the week and by examining the role of sleep for these trajectories.

Methodology and Results
Seventy-one employees participated in a diary study over the course of 5 days, resulting in 243 observations. Sleep quality, sleep duration and ego depletion were assessed with established self-report scales at the start of the day. In line with expectations, the trajectory of ego depletion across the work week was modulated by variability in sleep quality. For those who experienced higher variability in sleep quality, ego depletion accumulated over the
course of the week. For those who experienced lower variability in sleep quality, ego depletion declined over the course of the week, speaking for the restorative role of consistent sleep patterns. However, we did not find the same moderating effect for sleep duration.

Limitations

All measures were measured via self-reports.

Research/Practical implications:

Our findings highlight the role of variability in sleep quality on ego-depletion trajectories over the course of the work week.

Originality

This study is the first to examine the impact of sleep for ego-depletion trajectories over the course of the week.

1. The Spillover of Self-Control Depletion between Abusive Leaders and Followers – A Weekly Diary Study

Nishat Babu – Aston University – Aston Business School, UK
Wladislaw Rivkin – Aston University – Aston Business School, UK

Purpose

At present, there is a dearth of research examining the effects of leaders’ ego-depletion on their subsequent treatment of followers (Yam, Keng-Highberger, Klotz, & Reynolds, 2015). Moreover, we are little aware of potential spillover effects of leaders’ ego-depletion on followers’ ego-depletion. Drawing on the limited strength model of self-control (Baumeister, Bratslavsky, Muraven, & Tice, 1998), we suggest that a leader’s ego depletion throughout the week is positively related to weekly abusive behaviours, as leaders are less able to exert self-control to suppress abusive behaviours. In turn, weekly abusive supervision behaviours, require followers to exert self-control thus causing a spillover of ego-depletion from the leader to followers. Finally, we argue that when leaders are higher in trait abusive supervision, this indirect relationship is strengthened.

Methodology and Results

Multilevel mediation analyses with data from a weekly diary study (N = 53; 12 weeks) reveal an indirect effect of leaders’ ego depletion (t) on follower’s ego depletion (t+1), through leaders’ weekly abusive behaviours (t). Moreover, leaders’ trait abusive supervision moderated (reinforced) this mediating relation (p < .10).
Limitations
The present study may be subject to common methods variance problems since both leaders’ and followers’ ego depletion were rated by followers.

Implications
Organizations should focus on replenishing leaders’ self-control resources through regular short breaks to prevent spillover of ego depletion.

Originality
A weekly diary-study was used to explore the antecedents of weekly leader abusive supervision behaviours, as well as the spill over effects for employees.

2. Summary and Discussion

Stefan Diestel – Universität Wuppertal, DE

Dr. Stefan Diestel is a Professor for Work and Organizational Psychology at the University of Wuppertal (Schumpeter School of Business and Economics). In 2011, he received his Ph.D. in Psychology from the Ruhr-University of Bochum (Germany). From 2008 to 2014, he was a research assistant at the Leibniz-Research Centre for Working Environment and Human Factors (Technical University of Dortmund, Germany). Since 2014, he was a lecturer and project manager at the International School of Management (Germany). His research interests include emotional labor, self-control demands at work, burnout experience, age diversity in teams, attitudinal and health-related absenteeism as well as work engagement.

Stefan Diestel will summarize and jointly discuss the findings of each presentation. Moreover, he will provide an outlook of how self-control research may further integrate spillover processes.
1021 - JOB INSECURITY SYMPOSIUM 1: PERFORMANCE EFFECTS OF JOB INSECURITY - WHY, WHEN AND HOW

Eva Selenko¹ & Hans De Witte²,³

¹ School of Business and Economics, Loughborough University, United Kingdom
² Research Group Work, Organizational and Personnel Psychology, KU Leuven, Belgium
³ Optentia Research Focus Area, North-West University, South Africa

State of the Art

Job performance is one of the most debated consequences of job insecurity. Despite much evidence pointing towards a negative effect, we still don’t know why and how job insecurity impacts performance. Also the direction of the relationship is unclear - does job insecurity lead to less performance, or does performance affect levels of job insecurity? And finally - when does job insecurity start having an effect on performance and how can we modify this effect?

New Perspectives/Contributions

The contributions of this symposium will offer new answers to those classic questions. The first two papers by Fontinha et al and Hofer et al introduce new explanations for why job insecurity affects performance, by looking at psychological contract as well as work engagement as explanatory variables. The contribution by Shoss and Carusone focusses on directionality issues – job insecurity affects performance, but as they show also the reverse might be true. In a theoretical contribution Debus et al. look at the ‘when’ question, by outlining potential co-developmental patterns of job insecurity and performance. The last two papers present a fresh perspective on potential moderators: Roll et al explore job crafting as a buffer, while Van Vuuren and Smulders investigate if objective and subjective job insecurity might interact.

Research/Practical Implications

The papers in this symposium show how research on job insecurity and performance can be moved forward, by offering solid new theoretical avenues as well as broadening our needed empirical insights into that topic area.

Why is job insecurity harmful to OCBs? The mediating effects of psychological contract and affective commitment

Rita Fontinha¹ Chul Chung¹ Norifumi Kawai² Ödül Bozkurt² &Motoko Honda-Howard³

¹Henley Business School, University of Reading, United Kingdom
²Department of Business & Management, University of Sussex, United Kingdom
Purpose: Employees in the service sector often face the pressures for outstanding services, while experiencing job insecurity due to the increasing demand for cost-efficient and flexible employment arrangements. Despite the growing scholarly attention paid to the relationship between job insecurity and extra-role behaviours in the context of service work, little is known about the mechanisms underlying the potentially negative relationship between the two.

Design/Methodology: We examine the relationship between perceived job insecurity and organizational citizenship behaviours (OCBs), particularly focusing on the mediating effects of psychological contract fulfilment and affective commitment. Informed by social exchange theory and the reciprocity norm, we test this mediation model among service employees working in a large foreign retailer operating in Japan. The sample was composed by 202 Japanese employees.

Results: Results from structural equation modelling show that psychological contract fulfilment fully mediates the negative association between job insecurity and affective commitment and, in turn, affective commitment fully mediates the positive association between psychological contract fulfilment and OCBs. We also found that affective commitment fully mediates the negative association between job insecurity and OCB.

Limitations: The cross-sectional design, as an impediment for causality testing.

Research/Practical Implications: This study provides relevant information on the relationship between job insecurity and OCBs, by considering the role of social exchange and employee attitudes.

Originality/Value: Previous research has found that job insecurity can simultaneously be seen as a hindrance and a challenge stressor. However, we found that it is largely associated with negative attitudes and behaviours in the Japanese service sector.

Job Insecurity and In-Role Performance: The Mediating Role of Work Engagement

Annabelle Hofer¹, Nele De Cuyper², Hans De Witte²,³ & Daniel Spurk¹

¹ Department of Work and Organizational Psychology, University of Bern, Switzerland
² Research Group Work, Organizational and Personnel Psychology, KU Leuven, Belgium
³ Optentia Research Focus Area, North-West University, South Africa

Purpose The relationship between job insecurity (JI) and performance is a subject of competing predictions (Shoss, 2017). Based on a job preservation motivation view, JI should motivate employees to work harder to secure their jobs (Shoss, 2017). Based on a stress-related view, JI can be seen as a
stressor that results in poor performance (Shoss, 2017). Meta-analyses showed significant negative relationships between JI and performance (e.g., Cheng & Chan, 2008). However, some studies found a non-significant negative (Sverke, Hellgren, & Näswall, 2002; meta-analysis), a positive, or u-shaped relationship. Therefore, the purpose of the present study was to test within a mediation model if work engagement (WE) explains either the job preservation motivation or the stress-related view.

**Design/Methodology/Approach/Intervention** Employees (N = 3.947) from Belgium participated in a longitudinal three-wave survey design. Quantitative JI, WE, and in-role performance (IRP) were measured.

**Results** The results of the mediation model showed a significant negative relationship between JI and WE, a significant positive relationship between WE and IRP, and a significant negative indirect and direct effect between JI and IRP.

**Limitations** The findings should be replicated to achieve a broader generalizability. Additional analyses are needed to investigate the role of JI as challenge versus hindrance stressor.

**Research/Practical implications** The results are supporting the stress-related view on JI and performance.

**Originality/Value** The study confirmed results of prior research (e.g., Wang, Lu, & Siu, 2015). The study highlights the need for a discussion, under which conditions JI might become a challenge stressor (job preservation view).

---

**Working hard or hardly working? Reciprocal relationships between job insecurity and performance**

Mindy Shoss & Nicole Carusone

University of Central Florida, USA

**Purpose:** Little is known about how job insecurity influences performance or whether certain types of performance might in turn attenuate or exacerbate job insecurity. The current study examines potential bidirectional relationships between job insecurity and several dimensions of performance.

**Design/Methodology:** We recruited approximately 400 participants in the United States to complete two surveys approximately three months apart. Surveys asked about job insecurity, work effort, counterproductive work behavior, knowledge hoarding, and impression management. We used cross-lagged panel analyses to test our hypothesis of bidirectional job insecurity-job performance relationships.

**Results:** Results supported the idea that the job insecurity-performance relationship is bidirectional. Job insecurity enhanced negative forms of performance (counterproductive work behavior, knowledge hoarding) and detracted from more positive forms of performance (work effort),
controlling for initial levels of these outcomes. Interestingly, while counterproductive work behavior enhanced subsequent job insecurity, knowledge hoarding reduced subsequent job insecurity.

Limitations: The data is self-report. Further, the sample is limited to participants in the United States able to complete an online survey.

Research/Practical Implications: These findings suggest the existence of a spiral where job insecurity is associated with poorer performance, which then is associated with greater job insecurity. However, knowledge hoarding might help individuals to manage job insecurity, likely at a cost to organizations.

Originality/Value: This study is among the first (a) to consider bi-directional relationships between job insecurity and performance and (b) to take a differentiated view of performance that considers productive, counterproductive, and self-serving acts.

A Matter of Time: Job Insecurity, Job Performance, and the Role of Exposure Time

Maike E. Debus¹, Dana Unger², and Cornelius J. König³

¹University of Zurich, Switzerland
²University of East Anglia, United Kingdom
³Saarbrücken University, Germany

State of the art: Research on the relationship between job insecurity and performance has presented rather inconclusive results. The purpose of this conceptual paper is to offer an additional, more dynamic perspective to think about job insecurity’s effects on performance. We posit that an individual’s exposure time to job insecurity needs to be considered when studying the job insecurity-performance relationship.

New Perspectives/Contributions: Drawing on the challenge-hindrance framework and earlier theorizing about the longitudinal effects of stressors, we propose that individuals’ exposure time to job insecurity affects job performance, and that individuals’ reactions will be dynamic over time. Adopting a person-centered perspective, we suggest that there are five subgroups that differ in their performance patterns over time.

Research implications. We further present potential predictors of subgroup membership and allude to methodological and statistical considerations that need to be taken into account when studying such subgroups. We propose using growth mixture modeling to identify such subgroups. Furthermore, we discuss strengths and limitations of such an approach.

Originality/Value. This paper contributes to the literature by introducing a dynamic perspective to the study of job performance in the context of job insecurity. In doing so, we also hope to stimulate future research in the context of job insecurity and performance, along with a stronger upsurge of person-centered approaches.
Job Insecurity in Higher Education: The Role of Job Crafting

Lara C. Roll¹, Sebastiaan Rothmann¹, and Hans De Witte¹,²

¹Optentia Research Focus Area, North-West University, South Africa
²Research Group Work, Organizational and Personnel Psychology, KU Leuven, Belgium

Purpose. In South Africa, higher education is presently rattled by budget cuts, student protests and generally high unemployment rates in the country. This gives rise to job insecurity among staff members. However, research suggests that employees do not just passively perceive their work environments; they tend to take action to improve their workplace in a process called job crafting. In this research, we examine whether engaging in job crafting behaviour can buffer potentially negative outcomes of job insecurity in terms of (physical and mental) well-being and (in-role and extra-role) performance.

Methodology. Online surveys were collected from 1211 university (academic and support) staff members in South Africa between February and June 2018. To test our hypotheses, we applied bootstrapping analyses using Hayes’ PROCESS macro.

Results. Findings indicated that job crafting moderated the relationship between job insecurity, in- and extra-role performance, as well as physical well-being. No significant effects were found for mental well-being.

Limitations. The cross-sectional study design does not allow us to draw conclusions regarding temporal relationships between variables.

Implications. Our research demonstrates that job crafting can alleviate some of the negative outcomes associated with job insecurity in the higher education sector. For university management, this means that a job crafting intervention could significantly support employees and improve university functioning, which will in turn benefit students.

Originality/Value. This study was conducted at a critical time for the South African higher education sector and is among the first to examine the potential of job crafting behaviour in relation to job insecurity.

Job insecurity has no upside for work performance: Objective and subjective work insecurity and their relationship with work performance

Tinka van Vuuren¹ and Peter Smulders²

¹Open University Netherlands/ Loyalis, The Netherlands
²Netherlands Organisation for Applied Scientific Research, TNO, The Netherlands
**Purpose:** The purpose of this contribution is to demonstrate (a) that objective and subjective insecurity are related with performance and (b) that under some conditions of objective insecurity does subjective insecurity lead to greater reduction of performance.

**Methodology:** In this study we compare more than 80,000 Dutch workers and self-employed that differ objectively in the degree of work security. We assessed in 2014 and 2016 subjective job insecurity and work performance. Demographic and work variables were used as control variables.

**Results:** We found in a representative sample a negative relationship between subjective job insecurity and work performance. But this relationship is moderated by the objective employment status of the workers involved.

**Limitations:** The biggest limitation is the cross-sectional design of our study, which makes it impossible to draw conclusions about causality.

**Practical implications:** The finding that subjective job insecurity goes together with less work performance shows that job insecurity has no upside for the productivity of companies.

**Originality:** The study provides a deeper understanding of the role of the objective employment status of workers in the relationship between subjective job insecurity and performance.
State of the Art: In the 21st century, demographic changes and increasingly complex work tasks have necessitated that organizations rely on teams whose members are more different from each other than ever before. Unfortunately, the research findings regarding workforce diversity have been as varied as the teams themselves: while some studies find positive effects on performance and other job-relevant outcomes, others demonstrate that workforce diversity can have negative effects. The categorization-elaboration model integrates and explains these findings and offers the most comprehensive theoretical view of the effects of diversity in groups to date. As organizations have sought to benefit from the positive effects of workforce diversity while mitigating the detrimental impacts, researchers and practitioners have worked to discover and support strategies and best practices to achieve these goals.

Contribution: While studies examining the link between diversity and performance have most commonly focused on an American context, the topic has become increasingly relevant in Europe in light of political and demographic changes (e.g. Brexit, right-wing populism, the refugee crisis, etc.). This symposium will incorporate a range of perspectives, including considering the salience of individual differences, assessing training effectiveness in diverse groups, and examining the broader organizational context, using both quantitative and qualitative approaches within a shared theoretical framework.

Research Implications: The symposium aims to give an insight into the current state of workforce diversity research in Europe. The contributors intend to highlight key differences between their findings and the predominant North American perspective and offer suggestions for future research directions in a specifically European context.

Nationality versus qualification? A survey experiment on the salience of two diversity dimensions

Franziska J. Kößler (WZB Social Science Center Berlin & Humboldt University of Berlin), Susanne Veit (WZB Social Science Center Berlin), & Annekatrin Hoppe (Humboldt University of Berlin)

Purpose: Team members differ from one another regarding many aspects such as age, ethnicity, and professional qualification. According to the categorization elaboration model, salient differences can reduce group functioning as a consequence of in- and out-group categorizations and intergroup biases. The present survey experiment examines this assumption by investigating the relevance of nationality and professional qualification on hiring preferences in real work teams.

Methodology: In an experimental 3 x 3 design, employees (N = 439) of a German retail store chain received the profile of a fictitious job candidate. These profiles were identical except for job candidates’ nationality (German, Turkish, Russian) and professional qualification (none, unrelated, retail merchant). Participants had to indicate how much they recommended hiring the respective job candidate. As a manipulation check, they wrote down reasons for their decision.

Results: In contrast to our expectation, there was no main effect for nationality, but a significant main effect for professional qualification. Post-hoc comparisons showed that participants rated fictitious job candidates without any professional qualification significantly worse than job candidates with an
unrelated qualification. They rated job candidates qualified as retail merchants more positively than all other candidates.

**Limitations:** We cannot exclude biases in consequence of social desirability.

**Research Implications:** The results suggest that job-related aspects are more salient – even in workplaces where people without professional qualification work often.

**Originality:** The study provides causal evidence on the significance of nationality and qualification as hiring criteria in a real work setting.

**Keeping It Real: How Perceptions of Organizational Authenticity Impact Diversity Management Effectiveness**

Andrew J. Marcinko (Aston Business School)

**Purpose:** The majority of large organizations now undertake some form of Diversity Management (DM), with many dedicating entire teams to recruiting, hiring, and managing diverse employees. But why are similar DM practices effective at certain firms but not at others? This study examines the degree to which employees perceive DM practices to be authentic; that is, do they believe their organization is genuine in its attempts to manage diversity (Cording, Harrison, Hoskisson, & Jonsen, 2014; Windscheid et al. 2016). It explains how these perceptions impact affective commitment within the framework of the Categorization Elaboration Model (Van Knippenberg, De Dreu, & Homan, 2004).

**Methodology:** In an experimental 2x2 factorial design, participants were presented with a diversity webpage from a fictitious university, where the instrumentality (Olsen & Martins, 2012) of the mission statement (i.e. How important diversity is to the organization’s broader goals) and the faculty demographics (representative vs non-representative) were manipulated across four conditions.

**Results:** The results supported the expected moderated-mediation. Perceived organizational authenticity mediated the relationship between diversity and commitment, while there was a significant interaction between diversity and mission statement instrumentality. Participants were indifferent to the instrumentality expressed in the mission statements unless there was a disconnect between the university’s words and its actions.

**Limitations:** External validity is limited by the use of student participants and experimental methodology.

**Implications:** This research empirically demonstrates the importance of an oft-overlooked aspect of DM practices. For practitioners, it highlights the importance of effectively framing DM and approaching it in an authentic manner.

**Value:** This builds on the limited body of research on organizational authenticity in DM to empirically support a moderated mediation model which can guide future research.

**Linking training group diversity and training effectiveness**

Laura E. Creon (SRH Hochschule Berlin) & Carsten C. Schermuly (SRH Hochschule Berlin)
**Purpose:** Expanding the model of training transfer (Baldwin & Ford, 1988), we shed light on the relationship between training group diversity and training effectiveness. We compare objective and subjective diversity measures (diversity faultlines and perceived subgroups) and examine how they relate to training effectiveness (cf. Kirkpatrick, 1967; reactions, learning, behavior, results). Following the Model of Work-Team Learning (Edmondson, 1999), we investigate mediating and moderating mechanisms by looking at psychological safety and the role of trainer diversity beliefs.

**Methodology:** We surveyed German training participants and trainers from a public administration sample. Questionnaires were administered at the end of training sessions of one to two days’ length (t1) and again after two months (t2, training participants only). The final sample consisted of 717 participants in 70 training groups (t1) and 363 participants in 59 training groups (t2) respectively.

**Results:** Results on group level show a negative relationship between perceived subgroups and reactions mediated by psychological safety. We found no relationship between objective diversity and training effectiveness as well as no interaction with trainer diversity beliefs.

**Limitations:** Process variables were collected retrospectively; future research should measure them during the training.

**Implications:** In short training sessions, subjective as opposed to objective diversity seems to be crucial for psychological safety and training effectiveness ratings. Trainers could address the role of perceived subgroups at the beginning of training sessions and foster a group identity.

**Originality:** This study adds to the diversity and training literature comparing subjective and objective diversity in connection with training effectiveness.

---

**How can Technology help in getting Diversity at work to work?**

Lilian Otaye-Ebede (Liverpool John Moores University)

**Purpose:** Organisations across the globe perceive equality, diversity and inclusion (EDI) as an important issue due to fundamental economic, social, and legislative changes nationally and internationally (cf. Nishii & Özbilgin, 2007). Despite the importance, scholars and practitioners still struggle to embed EDI in the workplace. One reason for this is that the conditions for success and failure of EDI initiatives is still yet to be explored (Otaye-Ebede, 2016; Guillaume et al., 2014). The purpose of this study therefore is to explore the role of technology (use and availability) as a tool to foster the successful implementation of EDI initiatives in the workplace.

**Methodology:** Twenty working adults from various occupations in the UK will participate in this study. Semi-structured face-to-face interviews will be used as the primary data collection method and the constant comparative method will be adopted for data analysis.

**Results:** Preliminary results from a pilot study reveals that the availability of technology helps to disseminate relevant information real-time, thereby reducing the number of discrimination incidences experienced by participants. Findings also revealed that technology availability helped in reducing stress at work through creating the opportunity for flexible work, hence, better work/life balance. Technology use on the other hand increased learnability, awareness and accessibility, particularly for individuals with a disability.

**Implications:** This paper will add to the growing body of literature on strategies to get diversity at work to work by introducing technology as one way of embedding EDI successfully into the organisation.

**Limitations:** Limited sample size.
Value: This is one of the first study to include technology in the EDI discourse thereby contributing to the limited body of research proffering solutions to the issues surrounding the failure of EDI initiatives at work.

The discriminatory potential of modern recruitment processes

Esther Kroll (WZB Social Science Center Berlin & Humboldt University of Berlin), Susanne Veit (WZB Social Science Center Berlin), & Matthias Ziegler (Humboldt University of Berlin)

Purpose: Research on labor market discrimination points to robust ethnic discrimination, especially in the pre-selection of personnel. But many companies need to change their recruitment strategies in times of labor shortages. Recruitment trends like CV screening on professional social media (SM), active sourcing, and assigning recruitment to private recruitment agencies might help to find suitable candidates. The question of whether these modern recruitment trends have the potential to drive discriminatory decisions is still an open one.

Methodology: We conducted eight qualitative expert interviews with different types of recruiters. We used a content analysis (Mayring & Fenzl 2014) to examine the interviews.

Results: We found that the recruitment trends active sourcing and recruitment assignment are sustainable for discriminatory pre-selection. Our analysis also identified three different sources of discrimination in personnel pre-selection: the recruiters’ own attitudes towards certain job candidates, the explicit managers’ orders to exclude job candidates with specific personal characteristics, and the recruiters’ impressions regarding the company’s preferred candidates. It seems that the managers’ orders and the recruiters’ impressions are the biggest drivers of discriminatory personnel pre-selection.

Limitations: Our study has a strong focus on private recruitment agencies. Additionally, recruitment environments are changing quickly and are strongly dependent on labor market characteristics.

Implications: Our findings show that current German legislation—for instance, the German Equal Treatment Act (GETA) and the work council’s rights—is not sufficient to protect job candidates from discrimination.

Originality: Our study provides in-depth information about the sensitive topic of discrimination in modern recruitment.
A CLOSER LOOK AT SITUATIONAL JUDGMENT TESTS: NEW DEVELOPMENTS AND INSIGHTS

Name of the proponent (s) of the Symposium: Jan-Philipp Schulz¹, Philipp Schäpers², & Stefan Krumm¹; Discussant: Duncan Jackson³

¹Freie Universität Berlin, Germany
²Singapore Management University, Singapore
³Birkbeck, University of London, UK

State of the Art: Situational Judgment Tests (SJTs) are popular instruments in personnel selection due to their valid prediction of job performance and high face validity. However, recent evidence has raised questions regarding the inner workings of SJTs. For instance, recent findings questioned the importance of situations in SJTs and challenged the common belief whether SJTs really tap into situational judgment. Therefore, more research is needed – not only on the constructs assessed by SJTs but also on how situation descriptions and response formats affect test takers’ response behavior.

New Perspectives/Contributions: This symposium presents novel approaches to SJT research, ranging from their development to an in-depth examination of their functioning. The contributions of this symposium cover several research perspectives and a broad range of different SJTs. Thus, this symposium contributes to an ongoing debate about the psychometric properties and construct validity of an important assessment method.

Research/Practical Implications: The herein presented research provides new aspects to recent SJT theorizing. It contributes to our understanding of what SJTs measure. These insights will help improve SJT development and application.

False Consensus Effects in Situational Judgment Tests

Authors: Janneke K. Oostrom¹, Nils C. Köbis², Richard Ronay¹, & Myckel Cremers³

¹Vrije Universiteit Amsterdam, the Netherlands
²University of Amsterdam, the Netherlands
³Dutch Ministry of Defense, The Hague, the Netherlands
**Purpose:** This study introduces a new SJT response instruction based on a well-known social psychological phenomenon – the false consensus effect. By asking candidates what they think others would do, instead of what they themselves would do, SJTs might allow for an implicit measure of personality constructs that might be less susceptible to faking.

**Design:** In four studies, with field and laboratory data (total $N = 882$), we introduce an alternative SJT response instruction and examine its effects on the SJT’s construct-related validity, fakability, and criterion-related validity.

**Results:** Participants show a false consensus bias when asked what others would do. The SJT based on the false consensus effect turned out to be harder to fake than a would-do SJT, and its scores were meaningfully correlated with conceptually related traits, as well as self-reported and behavioral outcomes. Honesty-Humility and Conscientiousness influence false consensus effects related to deviant behavior and Extraversion influences false consensus effects related to positive behavior.

**Limitations:** Future research should test the criterion-related validity of the false consensus SJT in combination with explicit measures, using actual applicants, and measure actual future (counterproductive) work behaviors.

**Research/Practical Implications:** This approach offers both researchers and HR professionals a promising selection and assessment instrument, that can be used alongside explicit measures of personality constructs.

**Originality/Value:** The present research reveals a novel approach to limiting the potential for faking in selection contexts. Simply rewording SJT instructions might provide a personality measure that is both valid and robust to self-presentational concerns.

**Taking SJTs to the Next Level: Leveraging Unstructured Video Interview Data with AI**

Richard Justenhoven

Aon Assessment Solutions

**Purpose:** SJTs are popular in the applied area of assessment because of their criterion-related validity (Lievens, Peeters, & Schollaert, 2008). However, the answer format presented to candidates is limiting the reaction’s variance, which affects criterion-related validity (Lievens & Sackett, 2006). We want to investigate the degree to which video-based interview processes can be used as a form of construct-driven SJT.
**Approach:** We will outline the usage of various Application Programming Interfaces (APIs), for automated transformation and analysis of video data, creating data output that is usable for automatic SJT scoring.

**Methodology:** For the presented research initiative, there will only be a limited number of APIs used, focusing on the auditive data from the video interview. First step is to convert the audio into text by a Speech-to-Text API. Secondly, Natural Language Classifier APIs are used to classify passages and phrases of the written text into classes.

**Results:** Based on a sample of \((N = 4700)\) we will discuss the application and ambiguous outcome of the process as outlined above. Special focus will be given to the mentioned APIs.

**Implications:** We aim to present this approach to open a wider discussion. There are psychometric hurdles that need to be taken, part of the session will be spend on the current problems of this approach.

**Originality:** To date, there has been very few approaches on how to leverage APIs for automatically scoring unstructured data in a psychometric reliable and valid way. With this submission we aim to further pursue this path.

**Development of a Situational Judgment Test assessing moral judgment and moral behavior**

**Authors:** Magdalena Reineboth\(^1\), Luise Franke-Bartholdt\(^1\), Jürgen Wegge\(^2\), & Anja Strobel\(^1\)

\(^1\)Technische Universität Chemnitz, Germany

\(^2\)Technische Universität Dresden, Germany

**Purpose:** To consider an increasingly important work-related variable in personnel work, we developed a knowledge based SJT to assess moral judgment and behavior in organizations.

**Design:** Out of 48 interviews about morally relevant situations with leaders and employees of the Saxony healthcare sector, 127 item stems were derived. To generate the basis for response options, \(N = 351\) employees and students were asked to describe possible behavioral options for the items presented. Four item sets with such response options were tested in two studies (\(N_{\text{total}} = 746\) employees) concerning their effectiveness. The method used was empirical scoring, and correlations to silence, voice and moral courage served as indicators. Moreover, first validation criteria (job performance and satisfaction) were assessed.
Results: Two of the item sets have already been analyzed resulting in 18 items with four response options each. As expected, all included responses showed small correlations either to voice and moral courage in positive or to silence in negative direction. Further results concerning the other item sets, reliability and first validation evidence for the total score of the resulting SJTs will be presented.

Limitations: Empirical scoring is just one option for testing the effectiveness of response options. The evaluation by subject matter experts could provide different results.

Practical implications: The SJT can be used as meaningful instrument assessing moral judgment and behavior at work.

Value: In complex work-environments, considering moral aspects of a situation becomes more and more important and should thus be integrated into personnel selection decisions.

Is it all in the Eye of the Beholder?
The Importance of Situation Construal for Situational Judgment Test Performance

Authors: Jan-Philipp Schulz¹, Philipp Schäpers², Lena Römer³, Patrick Mussel¹, & Stefan Krumm¹

¹ Freie Universität Berlin, Germany
² Singapore Management University, Singapore
³ Humboldt-Universität zu Berlin, Germany

Purpose: Recent findings challenged the importance of situation descriptions for SJT performance. This research contributes to the ongoing debate, on whether SJTs are situational measures or not, by incorporating findings on person × situation interactions into SJT theory.

Design: Across three studies \(N_{\text{total}} = 1239\), it is tested whether (i) situation construal contributes to responses on SJT items, (ii) situation descriptions and response options of SJTs affect test-takers’ situation construal, and (iii) situation construal adds to SJTs validity.
**Results:** Results show that situation construal significantly contributes to SJT responses, situation descriptions of SJT items only have a negligible effect on situation construal, and situation construal explains variance in relevant criteria above and beyond SJT performance.

**Limitations:** Future research is needed to examine the effect of situation construal for SJTs with different modalities (e.g., video-based SJTs).

**Research/Practical Implications:** Despite recent approaches to re-conceptualize SJTs, our results suggest that SJTs may still be viewed as situational measures. However, situation construal may not be contingent on the availability of situation descriptions. Implications for the development of SJTs are discussed.

**Originality/Value:** This research integrated situation construal into SJT theory and, thus, contributed to a more fine-grained examination of SJTs as situational measures.

---

**Which Kind of Situational Information is Needed to Make Situational Judgment Tests Situational?**

**Authors:** Philipp Schäpers\(^1\), Filip Lievens\(^1\), Jan-Philipp Schulz\(^2\), Julian Schulze\(^2\), Cornelius J. König\(^3\), & Stefan Krumm\(^2\)

\(^1\) Singapore Management University, Singapore

\(^2\) Freie Universität Berlin, Germany

\(^3\) Saarland University, Germany

**Purpose:** Recent findings have questioned the importance of situations in SJTs. Krumm et al. (2015) demonstrated that many SJT items can be solved even when situation descriptions are not presented. However, we currently do not know which kind of situational information is needed to make SJT items context-dependent or –independent. On the basis of trait-activation theory, we tested whether the implementation of trait-relevant cues moderates the context-dependency of SJT items.

**Design/Methodology:** In our study \((N = 431)\), the availability of information in the SJT item stems was manipulated: Participants either received SJT items with (a) situation descriptions including a trait-relevant cue, (b) only the trait-relevant cue but no further situation description, (c) situation descriptions in which the trait-relevant cue was omitted, or (d) without any situation descriptions.
**Results:** We found large differences in performance for SJT items including a trait-relevant cue in comparison to items that included only negligible information or no situation description. Furthermore, we found that omitting stems from SJT items with a trait-relevant cue results in a significantly stronger decrease in item scores than omitting stems from SJT items that do not include a trait-relevant cue.

**Limitations:** We investigated only text-based SJTs. One could suspect that more realistic formats are more affected by the implementation of trait-relevant cues.

**Research/Practical Implications:** We discovered that the implementation of trait-relevant cues in SJT situations was a major factor for item difficulty.

**Originality/Value:** This research contributes to recent theorizing on the context-dependency of SJTs.
Social Media Use in Personnel Selection: New Perspectives and Directions

Irina Gioaba, University of Lausanne

State of the Art. Recent technological advancements have profoundly impacted how management practices currently are carried out, including a variety of Human Resource functions. Indeed, Internet platforms and social media websites, such as Facebook and LinkedIn, have become the main medium through which organizations recruit and select prospective employees. This symposium will showcase new empirical research on the area of social media use in personnel selection.

Contributions. First, Sébastien Fernandez provides empirical evidence for the validity of personality assessments derived from LinkedIn profiles. Then, Julia Levashina discusses the role of normative feedback for enhancing the psychometric properties of LinkedIn assessments and its impact on reducing individual-level differences. Irina Gioaba provides further evidence on the use of social media for making employment decisions by examining age differences in self-presentation on LinkedIn and its impact on job offers. Next, Jennifer Price further explores job seekers’ impression management tactics on Facebook showing that job seekers can and do manipulate the information they post online. Finally, Richard Landers, a well-known expert in the area of new technologies in personnel selection, will serve as the discussant. He will integrate the papers, review their implications, and define areas for future research.

Research/Practical Implications. The present contributions are directed towards understanding the practical implications associated with the use of social media in personnel selection and therefore have the potential to benefit both organizations and individual job applicants.

Preliminary Evidence for the Validity of LinkedIn-Based Personality Information

Sébastien Fernandez, Marie Stöcklin, Lohyd Terrier & Sowon Kim

Ecole hôtelière de Lausanne, HES-SO/University of Applied Sciences Western Switzerland

Purpose: There is a need to find alternatives to self-report personality measures in personnel selection. As many recruiters are already using LinkedIn as a screening method, it is necessary to ascertain that LinkedIn profiles convey accurate personality-related information. The aim of this study is then to determine if LinkedIn profiles contain accurate personality-related information.
**Methodology:** A list of more than 30 cues theoretically related to the Big five dimensions was first established. Two independent coders rated 646 LinkedIn profiles of graduates. Self-reported personality was measured through the IPIP-NEO.

**Results:** Reliability for all the cues was more than satisfactory. Positive and significant correlations were observed between the cues and the personality traits which they were expected to predict. LinkedIn-derived personality scores for agreeableness, conscientiousness, extraversion and openness demonstrated satisfactory convergent and divergent validity with their respective self-reported personality traits.

**Limitations:** First, all the participants in this study come from the same university, which might prevent broader generalizations to other samples. Second, validity of the LinkedIn-derived personality scores was only assessed with a self-report personality questionnaire.

**Research and practical implications:** In the future, it is necessary to test further the validity of personality information derived from LinkedIn profiles (e.g. predictive validity in field settings, construct validity with informant reports) or to determine if other characteristics (such as GMA) can be identified in LinkedIn profiles.

**Originality/value:** This study is the first one conducted on a large sample to show the validity of LinkedIn as a source of information about individuals’ personality.

---

**The Impact of Normative Feedback on the Psychometric Properties of the LinkedIn Assessment**

Julia Levashina¹ and Nicolas Roulin²

¹Kent State University, USA
²Saint Mary’s University, Canada

**Purpose:** Normative feedback (e.g., Schmiege, Klein, & Bryan, 2010) is defined as information regarding raters past rating behavior and similar information about referent others, which allows comparative inferences to be made. Research on normative feedback demonstrates that it can improve psychometric properties of subsequent ratings. Based on 20,000 employment interviews, Hartwell and Campion (2016) demonstrated that lenient and severe interviewers reduced the discrepancy between their ratings and the overall mean rating after getting feedback. Feedback included average ratings for each interviewer and means across all interviewers. This present research
explores normative feedback as a potential enhancement of the psychometric properties of LinkedIn assessments, including interrater agreement and validity.

**Design/method:** 13 MBA students rated 20 LinkedIn profiles each. They then received normative feedback, including their average ratings, the mean overall ratings across all assessors, the average validity of their ratings, and the mean overall validity across all assessors. They subsequently rated 20 different profiles.

**Results:** Findings were mixed. Normative feedback had no impact on variance in ratings, interrater agreement, or adverse impact. Convergent validity decreased for ratings of most skills, but increased for some personality traits (e.g., Conscientiousness) and cognitive ability.

Limitations: Results are based on a small sample of MBA students rating profiles of undergraduate business students.

**Practical implications:** It might be premature to recommend normative feedback to organizations engaged in cyber-vetting.

**Originality/value:** We contribute to the literature on LinkedIn assessment by examining whether normative feedback can reduce individual-level differences in LinkedIn ratings and enhance the psychometric properties of assessments.

---

**Self-presentation and selection outcomes on professional social media: a comparison between older and younger job seekers**

Irina Gioaba¹, Franciska Krings¹, Michèle C. Kaufmann², Sabine Sczesny³, & Leslie Zebrowitz⁴

¹University of Lausanne

²GfK, Germany

³University of Bern

⁴Brandeis University

**Purpose:** The use of social media for employment purposes has become increasingly popular among employers and job seekers alike. However, little is known about how job seekers present themselves in the online environment. Therefore, the purpose of this study is to examine potential differences between older and younger job seekers’ self-presentation on LinkedIn and their impact on employment outcomes (e.g., job offers).
**Design/Methodology:** Data was collected from 227 active LinkedIn users belonging to two age groups: younger (25-30; N= 111, $M_{age} = 27.54$) and older group (45+, N= 116, $M_{age} = 55.29$). Participants provided a series of elements from their LinkedIn profile including their profile picture, profile summary, number of contacts, number of profile visits, and endorsements, which were subsequently coded by two trained raters.

**Results:** Results indicated that older and younger job seekers tend to emphasize different aspects on their LinkedIn profiles. Moreover, we found that older job seekers tend to have more connections, but receive less job offers compared to the younger ones.

**Limitations:** A limitation of this study is that middle aged job seekers were not included.

**Research/Practical Implications:** Our findings suggest that there are differences in how older and younger job seekers present themselves on LinkedIn and that these differences tend to be differentially related to employment outcomes.

**Originality/Value:** This is the first study to show how older and younger job seekers present themselves on social media and adds to the existing literature by identifying specific elements related to LinkedIn users’ employment success.

**How Do Job Seekers Manage Impressions on Facebook?**

Jennifer Price, Vanessa Myers, Alexandra Duval, Shayda Sobhani, & Nicolas Roulin  
Saint Mary’s University, Canada

**Introduction and Purpose:** Facebook has become a popular platform for employers to gather information about job candidates. The Jobvite Recruiter Nation Report (2016) indicates 43% of recruiters use Facebook to assess candidates. The purpose of this study is to examine job seekers’ impression management (IM) tactics on Facebook, what personality traits are associated with IM use, and whether IM can facilitate job search.

**Design/Method:** U.S. residents actively searching for a job were recruited and compensated online through Mechanical Turk. Participants were required to have an active Facebook account. They completed measures of Facebook IM, personality (HEXACO-100), job seeking self-efficacy, and demographic questions.

**Results:** Job seekers engage in IM tactics on Facebook, but they engage more in honest self-promotion than in deceptive or defensive IM. Additionally, participants who have been active on Facebook longer are less likely to engage in deceptive IM. Participants higher on Honesty-Humility were less likely to
engage in IM, while those higher on Extraversion were more likely engage in IM, especially honest tactics. Honest IM was also positively related to job search self-efficacy.

Limitations: Since our study relied on self-reports, participants may have responded in a socially desirable way.

Practical Implications: Our results indicate that job seekers do control and/or manipulate the information they make available to employers on Facebook.

Originality/Value: We empirically examined IM on social media, as described in the framework by Roulin and Levashina (2016), further validated a measure on Facebook IM, and thus contribute to our understanding of online IM (e.g., on Facebook).

Discussant

Richard Landers

University of Minnesota, USA

The discussant, Richard Landers, will provide his scientific expertise in the field of social media use in personnel selection to evaluate the four empirical contributions presented in this symposium and make general recommendations for research and practice.
Session Chairs
Kathrin Reinke, University of Kassel
Katharina Schneider, Technical University Darmstadt

State of the Art
Modern information and communication technologies (ICTs) enable to stay connected anywhere and anytime for work. Research suggests that this involves both beneficial and detrimental effects on employees’ well-being and performance. However, it remains largely unclear under which conditions ICT use affects well-being and performance positively or negatively, and which specific strategies can be used to potentially avoid negative effects while ensuring positive outcomes.

New Perspectives/Contributions
This symposium aims at shedding light on the boundary conditions of the effects of ICT use and related strategies that enable employees to use ICTs in healthy and productive ways. First, a meta-analysis gives an overview on the effects of ICT use after hours on various health-related outcomes. Two papers then shed light on conditions under which ICT use has beneficial or detrimental effects, examining the role of goal attainment and the evaluation of ICT use. The next paper examines strategies of how to deal effectively with work emails, based on a cross-disciplinary systematic literature review. The last two papers explore the value of interventions in the context of ICT use, testing the effects of a supervisor training and data-based individualized recommendations.

Research/Practical Implications
The results shed light on boundary conditions and strategies that may reduce negative effects and foster positive effects of ICT use on well-being and performance. Thereby, the symposium provides fruitful avenues for future research on ICT use as well as specific, differentiated recommendations for practice on how to deal with the double-edged effects of ICT use.

The impact of work-related extended availability on employee health and life-domain-balance - A meta-analysis

Eberhard Thörel, University of Freiburg, Germany
Nina Pauls, University of Freiburg, Germany
Anja S. Göritz, University of Freiburg, Germany
**Purpose**
Modern communication technologies can make working life considerably easier, but also have their drawbacks. Employees are - at least in principle - always available for work and work is always available to them. A recent scoping review (Pangert, Pauls & Schüpbach, 2016) has suggested that this so-called work-related extended availability (WREA; Pangert et al., 2016) negatively affects employee health and life-domain-balance. However, due to its methodology, this review could not answer questions concerning the magnitude of effects or the existence of moderators. Furthermore, a considerable amount of new research has been published since 2016. Building on the review by Pangert et al. (2016), the current work provides a quantitative overview of the relationship between WREA and pertinent criterion constructs.

**Design/Methodology**
A systematic literature search was conducted, identifying 79 publications with k = 77 independent samples (N = 98,145 participants), and a random effects meta-analysis was performed.

**Results**
Significant average correlations between WREA and various health constructs in the small to medium range and a medium size association between WREA and work-to-family conflict were found. Due to the amount of heterogeneity, moderator analyses were conducted and moderators were identified.

**Limitations**
Only English and German articles published in peer-reviewed journals were included.

**Research/Practical Implications**
There is need to develop a standardized measure for WREA. Currently, there is a host of heterogeneous measures tapping various aspects of WREA, but no scale capturing the construct with all its facets.

**Originality/Value**
This study is the first quantitative synthesis of the effects of WREA.

**ICT overload and employee productivity: Buffering effects of goal attainment**
Lenka Duranova, FOM - University of Applied Sciences, Frankfurt, Germany
Sandra Ohly, University of Kassel, Germany

**Purpose**
The development of new technologies leads to growth in information and communication technology (ICT) overload. This study investigates the role of ICT overload for employee productivity. We examine whether the relationship between ICT overload and subjective productivity via unfinished tasks will be moderated by finishing work tasks in leisure time.
Design/Methodology
Using a daily diary study design, data were collected via smartphone application from 103 workers in Germany who completed a general survey and two to three daily surveys over a period of 4 consecutive days (Friday-Monday).

Results
Moderated mediation analysis supported the mediating role of unfinished tasks and the moderating role of goal attainment. The impairing effect of general ICT overload on subjective work productivity on Monday via unfinished tasks on Friday was more pronounced among employees with low finishing work tasks over the weekend by controlling for affectivity, time pressure, and work hours.

Limitations
The constructs were measured with self-report scales.

Research/Practical Implications
Our results emphasize the importance of ICT overload and unfinished tasks as stressors, and the need for developing strategies to prevent and handle them. Future research should shed more light on the circumstances and long-term consequences of goal attainment by working in leisure time.

Originality/Value
This study is one of the few studies in this area testing for positive effects of working in leisure time by ICT use.

Double-edged effects of ICT use: Evaluation of ICT use as an important determinant of positive or negative effects on employee well-being
Kathrin Reinke, University of Kassel, Germany
Sandra Ohly, University of Kassel, Germany

Purpose
Work-related ICT use after hours has both beneficial and detrimental consequences. These mixed findings can be explained by individuals’ evaluation of their ICT use. We thus examine how the evaluation of daily ICT use affects well-being, and explore if this relationship is influenced by situational as well as personal constructs.

Design/Methodology
Data were collected from 82 employees who completed a general survey and two or three daily surveys over five consecutive days (Monday-Friday).

Results
Hierarchical linear modeling showed that the evaluation of daily ICT use has an effect on well-being beyond the quantity of ICT use. Further, positive evaluation was related to goal attainment, and negative evaluation was related to lower goal attainment and higher feelings of overload. Besides, individuals’ general motivation for ICT use (autonomous and controlled) predicted positive and negative evaluations ICT use.
Limitations
Results are based on self-report data.

Research/Practical Implications
Our results suggest that beyond quantity of ICT use, individuals’ daily evaluation of ICT use plays a critical role to explain varying effects on well-being. This finding challenges organizational measures that focus on restricting the quantity of ICT use. Instead, strategies to reduce feelings of overload and to increase autonomous ICT use may be addressed.

Originality/Value
The present study is one of the few considering the role of evaluation of ICT use beyond quantity, and identifies both situational and personal constructs as important antecedents.

How to deal with work email effectively: A systematic review with recommendations
Emma Russell, Kingston University London, UK
Tom Jackson, Loughborough University, UK
Marc Fullman, Kingston University London, UK

Purpose
The abundance of literature from web-sites, email ‘gurus’, and across academic disciplines does not always join up, offering contradictory, and often outdated, findings about how we should deal with our work email. To address these issues, a cross-disciplinary systematic literature review (SLR) was conducted.

Design/Methodology
Using a well-regarded SLR approach, 42 papers from psychology, HCI and management disciplines were synthesized in a 3-stage approach to produce a model of work email effectiveness, sense-checked with N=12 representative interviewees.

Results
Work email actions were related to three categories of well-being and four categories of productivity. Six work email actions were found to be consistently positive for both well-being and productivity, and these formed the basis of eight recommendations provided.

Limitations
The SLR uncovered limitations in the data available, relating to the operationalization of variables, breadth of focus, rigor in design/analysis and over-use of self-report data. Accordingly, we discuss where research efforts can best be focused in the future.

Research/Practical Implications
Our model can be used by researchers and end-users to predict how work email actions will influence well-being and productivity. This is timely given the growing demand for organizations (and even governments) to provide work email policy and guidance.

Originality/Value
This is the first SLR in over 25-years of research into work email behaviors. Our model is the first of its kind, providing both researchers and end-users with evidence-based understanding, along with recommendations for improving work email activity.

**The evil-minded smartphone? The effect of individual interventions for boundary management and availability on employee’s work-life balance, well-being and availability**

Katharina Schneider, Technical University Darmstadt, Germany  
Kathrin Reinke, University of Kassel, Germany  
Ruth Stock, Technical University Darmstadt, Germany

**Purpose**
Recent studies suggest that the use of communication technologies (CTs) involves both advantages and disadvantages for employees’ stress and work-life balance. However, organizations mainly implement universal, inflexible interventions that generally restrict employees’ CT use. This may simultaneously reduce potential positive effects and neglects individual preferences and needs. To address this issue, we conducted an intervention study by giving employees specific recommendations based on data on their individual preferences for CT use and boundary management. We investigate the effect of any individual intervention on employees’ work-life balance and extended work-related availability (EWA).

**Design/Methodology**
We collected data from 102 participants at two times one year apart. After t₁, participants received individual recommendations based on their own data.

**Results**
65% of the participants implemented at least one intervention, mostly regarding boundary management and CT use beside others (e.g., stress management). For participants implementing boundary management interventions, significant improvements in work-life balance and satisfaction with EWA were found, whereas participants who implemented interventions regarding their CT use only improved in satisfaction with EWA. For all, exhaustion was significantly reduced.

**Limitations**
The study design provides no control group.

**Research/Practical Implications**
Results suggest that implementing individual interventions in accordance to employees’ individual preferences may restrict the negative and enhance positive effects of CTs unlike universal, rather inflexible interventions. Thus, organizations should encourage and enable their employees to reflect consciously their preferences and to act on them.

**Originality/Value**
To our knowledge, the present study is the first testing individual interventions according to employees’ individual preferences.

“Dear manager, now I know what you expect”: An intervention to reduce ambiguity about availability expectations
Clara Heissler, University of Kassel, Germany
Sandra Ohly, University of Kassel, Germany

Purpose
Supervisor expectations regarding subordinates’ availability outside of working hours are closely related to well-being and satisfaction with information and communication technology (ICT) use in the team. However, supervisors’ expectations remain ambiguous as they are not clearly communicated. This study evaluates an intervention aiming to support supervisors in clearly communicating their expectations.

Design/Methodology
After investigating the impact of ambiguous expectations in a cross-sectional study, we conducted and evaluated a five-hour intervention. We asked participants’ subordinates (n=31) about the availability expectations they face, their own ambiguity regarding these, and their satisfaction with ICT communication at two timepoints (one week before and six weeks after the intervention).

Results
We find that being confronted with ambiguous availability expectations impacts employee well-being and satisfaction with ICT-communication above and beyond the scope of expectations. After the intervention 45% of subordinates (compared to 13% before) had a tangible agreement regarding availability. Additionally, ambiguity decreased and satisfaction rose significantly.

Limitations
Participation in the training was voluntary and no control group was included.

Research/Practical Implications
The study clarifies the role of supervisors’ expectation concerning ICT use and related well-being. The intervention is a practical option to improve the way ICT use and availability are handled in a work-context.

Originality/Value
When it comes to work-related ICT use few interventions have been evaluated, and most focus on the individual level.
1035 - JOB INSECURITY SYMPOSIUM 3: THE DYNAMICS OF JOB INSECURITY

Symposium chairs: Eva Selenko¹ & Hans De Witte²,³

¹ School of Business and Economics, Loughborough University, United Kingdom
² Research Group Work, Organizational and Personnel Psychology, KU Leuven, Belgium
³ Optentia Research Focus Area, North-West University, South Africa

State of the Art. Job insecurity is a well-known predictor for impaired health and performance outcomes. What is less known is how the effect of job insecurity on those outcomes plays out over time: Is the effect continuously linear? Is it unidirectional or is there a reciprocal relationship? This symposium aims to shed new light on the dynamics underlying job insecurity.

New Perspectives/Contributions: Six pieces of research will tackle the ‘dynamics of job insecurity’ in novel ways: Two papers deal with the reciprocal relationships of job insecurity: Yannick Griep and colleagues explore this for health related outcomes, Kelly Smet and colleagues can show similar reciprocity for work related learning. Two papers look at individual developmental patterns of job insecurity: Anahi Van Hootegem scrutinizes the longitudinal patterns of job insecurity and their effect on work related learning, while leva Urbanavicite and colleagues investigate the co-development of job insecurity and employability. Employability is also the topic of Jasmina Tomas’ contribution, she and her colleagues look at the longitudinal relations between perceived employability and the perception of job insecurity over time. Finally, Chirumbolo, Callea and Urbini suggest a new way of measuring job insecurity, that pays tribute to its multi dimensional nature.

Research/Practical implications: This symposium shows that job insecurity is often the cause but also the consequence of health impairment, reduced performance or employability. In order to fully grasp the complex phenomenon job insecurity, research needs to expand into different developmental patterns, as well as different dimensions of job insecurity.

The Chicken or The Egg: The Role of Absenteeism in the Longitudinal Reverse Relationship Between Job Insecurity and Mental Health Complaints

*Yannick Griep¹,², *Alexandra Lukic¹, Samantha K. Jones¹, Tinne Vander Elst³,⁴, Elfi Baillien⁵, & Hans De Witte³,⁶

¹Department of Psychology, University of Calgary, Canada
²Division of Epidemiology, Stress Research Institute, Stockholm University, Sweden
³Research Group Work, Organisational and Personnel Psychology, KU Leuven, Belgium
⁴IDEWE, External Service for Prevention and Protection at Work, Leuven, Belgium
⁵Work and Organization Studies (WOS), KU Leuven, Belgium
⁶Optentia Research Focus Area, North-West University, South Africa

* Joint first authors
**Purpose.** Although research has demonstrated that job insecurity is associated with mental health problems, far less is known about the reverse relationship, and the mechanisms underlying such a relationship (i.e., absenteeism). Nonetheless, unravelling the mechanisms underlying the longitudinal reciprocal relationship between job insecurity and mental health problems makes a valuable contribution to the literature from a theoretical, practical, and methodological standpoint.

**Design/Methodology.** We estimated an autoregressive mediation model on 3-wave longitudinal data from 1,994 employees.

**Results.** In line with our hypotheses we found longitudinal evidence for a positive association between perceptions of job insecurity and mental health complaints, which in turn were positively related to absenteeism, which in turn were positively related to further perceptions of job insecurity.

**Limitations.** The self-reported nature of the data can potentially introduce social desirability, while the use of time lags may result in recollection bias.

**Research/Practical Implications.** Due to the time-lagged nature of our findings, we were able to make specific suggestions for employees and employers to prevent mental health problems from leading to future perceptions of job insecurity.

**Originality/Value.** Our findings indicated that the relationship between perceptions of job insecurity and mental health complaints is far more complex than a normal causation relationship. Increasing our understanding of this reciprocal relationship sheds light on the mixed results obtained by the limited number of reverse causation job insecurity studies, and opens the possibility for finding effective solutions.

**A within-person examination of the reciprocal relationship between work-related learning and job insecurity**

Kelly Smet¹, Nele De Cuyper¹, Hans De Witte¹², & Eva Kyndt¹

¹ Research Group Work, Organizational and Personnel Psychology, KU Leuven, Belgium
² Optentia Research Focus Area, North-West University, South Africa

**Purpose.** This study investigates the reciprocal relationship between work-related learning (i.e., formal learning, informal learning using personal sources, & informal learning using environmental sources), and both quantitative and qualitative job insecurity. Specifically, we posit that participation in work-related learning reduces feelings of job insecurity, which in turn, promotes participation in work-related learning. This is based on the Conservation of Resources theory, which states that individuals who possess resources are able to protect themselves against resource loss and are more capable of resource gain (i.e., gain spiral).
**Methodology.** A random intercept cross-lagged panel model was applied to test the relationships. The data was collected among public sector employees and consisted of three waves separated by a three-month time lag.

**Results.** At the within-person level, the results demonstrated that formal learning leads to less quantitative and qualitative job insecurity while qualitative job insecurity negatively predicted future formal learning and informal learning using environmental sources.

**Limitations.** Limitations concern the specific sample used and the use of self-reported measurements.

**Research/Practical Implications.** In times of job insecurity, organizations might benefit from investing in formal trainings as these can provide employees with certain certificates which can reduce employees’ feelings of job insecurity and in turn result in more work-related learning.

**Originality/Value.** This study contributes to the literature by providing a better understanding of the intrapersonal processes between work-related learning and job insecurity.

**Longitudinal patterns of quantitative and qualitative job insecurity and their associations with work-related learning outcomes**

Anahi Van Hootegem¹, Irina Nikolova², Hans De Witte¹,³, Eva Kyndt¹, Joris Van Ruysseveldt² & Karen Van Dam²

¹ Research Group Work, Organizational and Personnel Psychology, KU Leuven, Belgium
² Work and organisational psychology, Open Universiteit, Heerlen, The Netherlands
³ Optentia Research Focus Area, North-West University, South Africa

**Purpose.** Previous research has demonstrated that long-term patterns of job insecurity (JI) may differently relate to outcomes. The aim of this study was to identify patterns of JI, taking into account quantitative as well as qualitative JI, and to examine how these relate to work-related learning (WRL).

**Method.** We conducted latent class growth analysis using three-wave data of 1013 Dutch employees. ANCOVAs for repeated measures were used to associate the trajectories to the outcomes.

**Results.** Five patterns of quantitative and qualitative JI were identified: (1) high stable (n = 102), (2) low stable (n = 436), (3) very low stable (n = 148), (4) decreasing (n = 258) and (5) increasing (n = 69). In every class, the change pattern was similar for quantitative and qualitative JI. The trajectories differed in the WRL outcomes that were examined. Those in the high stable JI had lower stable levels of occupational self-efficacy, acquired knowledge and skills, and learning from supervisor and colleagues than those with low stable levels of JI. Additionally, an increase in JI was associated with a decrease in learning from supervisor and colleagues and vice versa.

**Limitations.** Additional measurement points would have allowed for a more refined analysis of JI trajectories.
Implications. The findings indicate that there are distinct trajectories of quantitative and qualitative JI, and that these display a substantial amount of heterogeneity in terms of WRL.

Originality. This study was the first to combine quantitative and qualitative JI trajectories and to link these patterns to WRL outcomes.

Co-development patterns of job insecurity, perceived employability, and career prospects: Findings from a 6-wave follow-up study in Switzerland

Ieva Urbanaviciute¹,², Hans De Witte³⁴, & Jérôme Rossier¹²

¹Swiss National Centre of Competence in Research LIVES, University of Lausanne, Switzerland
²Institute of Psychology, University of Lausanne, Switzerland
³Research Group Work, Organizational and Personnel Psychology, KU Leuven, Belgium
⁴Optentia Research Focus Area, North-West University, South Africa

Purpose: The current study investigated how job insecurity, perceived employability, and career prospects co-develop over a period of five years, and how career adaptability skills together with respondent background characteristics predict their levels and growth rates.

Methodology: The study used a longitudinal dataset collected at the Swiss National Centre of Competence in Research LIVES. Specifically, the data from six yearly measurement occasions were used. The sample consisted of 669 employed adults. Multivariate latent growth modelling was applied to analyze the data.

Results: The findings showed a significant correlation between the levels factors of all three variables. The most salient inverse co-development pattern in terms of the growth rates was that between job insecurity and perceived career prospects. Furthermore, the levels of job insecurity were related to the growth rate of perceived career prospects and vice versa. In the subsequent step, career adaptability facets of concern and control, as well as respondent’s age were found to be the best predictors of the levels and growth rates of job insecurity, employability, and career prospects alike.

Limitations: One limitation is that the study included only the data of those participants who stayed employed throughout the entire study period. Moreover, perceived employability and career prospects were measured with one-item scales.

Originality/Value: The main contribution of our findings is that they provide an insight into the development of job insecurity from a contextualized point of view. The study also suggests the potential role of career adaptability as a resource for coping with labour market precarities.
The effect of co-worker cooperation on job insecurity and perceived employability: A 3-wave longitudinal study

Jasmina Tomas¹, Darja Maslić Seršić¹ and Hans De Witte²,³

¹ Department of Psychology, University of Zagreb, Croatia
² Research Group Work, Organizational and Personnel Psychology, KU Leuven, Belgium
³ Optentia Research Focus Area, North-West University, South Africa

**Purpose.** Job insecurity (JI; perceived threat of involuntary job loss) and perceived employability (PE; perceived probability of obtaining new employment on the internal (PEI) or external labor market (PEE)) have particular resonance in the context of the contemporary labor market: while JI represents a detrimental work stressor, PE is a personal resource that can reduce JI. Despite their well-established relevance, the question on how PEI/PEE can be enhanced and thereby reduce JI is still largely unaddressed. In response, this study departs from Conservation of Resources Theory to propose that cooperation among co-workers (COOP) reduces JI via its positive effects on PEE/PEI.

**Design/Methodology/Approach/Intervention.** To test the hypothesized (partial) mediator model, we conducted a 3-wave cross-lagged panel study among Croatian white-collar employees working in 29 private sector organizations. Employees completed on-line survey three times spaced 6 months apart (N₁ = 2133; N₂ = 1847; N₃ = 1571; N₁+2+3 = 576).

**Results.** The results of the longitudinal structural equation modeling showed that COOP has a positive cross-lagged effect on PEI, but not on PEE. Additionally PEE, but not PEI, had a negative cross-lagged effect on JI. Accordingly, we found no evidence for the hypothesized mediation effects. However, we did find that COOP has a negative direct cross-lagged effect on JI.

**Limitations.** The convenient sample limits the generalizability of findings.

**Research/Practical Implications.** The results shed a light on means to enhance PE and reduce JI.

**Originality/Value.** This study addressed the understudied antecedent of JI and PE that is highly applicable in organizational interventions.

Quantitative, qualitative, affective and cognitive: Which dimensions of job insecurity? Dimensionality, reliability and validity of the Multidimensional Job Insecurity Questionnaire

Antonio Chirumbolo¹, Antonino Callea² & Flavio Urbini²

¹ Sapienza University of Rome, Italy
² LUMSA University of Rome, Italy

**Purpose.** The aim was to develop and test the Multidimensional Job Insecurity Questionnaire (MJIQ) which attempted to integrate different theoretical components of the construct. We referred to the
quantitative vs. qualitative and the affective vs. cognitive distinctions which, both from a theoretical and empirical point of view, are often set apart. Building on existing literature, the 20-items MJIQ was developed in order to include a balanced number of items (five) for each of these four dimensions. Dimensionality, reliability and criterion validity were investigated.

**Methodology.** A sample of 314 employees took part in the study (136 males, 178 females, Mage = 39.98) which filled in a questionnaire including MJIQ and measures of job satisfaction, organizational commitment, turnover intentions and health.

**Results.** An EFA revealed two factors reflecting quantitative job insecurity (affective and cognitive) and qualitative job insecurity (affective and cognitive). These two dimensions showed good reliabilities and meaningful theoretical relationships with other constructs, exhibiting also good criterion validity.

**Implications.** Theoretically, results showed that there are probably two main dimensions, qualitative and quantitative, which subsume the affective and cognitive components. Applied interventions will also benefit of a better measurement in terms of construct and content validity.

**Limitations.** One item is not satisfactory and should be replaced in future research. Factor structure will have to be tested with CFA in an independent sample.

**Originality.** First systematic attempt to integrate, in one balanced measure, different components of job insecurity for a more comprehensive dimensional definition of the construct and its measurement.
WORK ACCOMODATION: THE PERSPECTIVE OF CO-WORKERS AND RECRUITERS

Proponent: Marilena Bertolino, University of Nice-Côte d’Azur (France)

State of Art

Research on employees with disabilities is receiving more and more attention especially during the last decade because they are now more often recognized as a valuable resource in the professional settings (Vornholt, Villotti, Muschalla, Bauer, Colella, Zijlstra, Van Ruitenbeek, Uitdewilligen & Corbière, 2018). Among solutions for promoting inclusion, Work Accommodation is still little used and when applied this practice encounter several obstacles (Nevala et al., 2015) like unacceptance and intergroup conflict (Colella, 2001). Aspects related to work accommodation such as co-workers perceptions and reactions, and recruiters’ point of view will be taken into consideration because little is known how this factors can contribute to a better acceptance of work accommodation for individual in need.

The first study (Pantaleon & Bertolino) will focus on co-workers’ justice and discrimination perceptions about a potential disabled colleague with motor, hearing or psychic impairment. How disabled people are perceived in function of their work accommodation?

The second study (Villotti, Angel, Corbière, & Desmette) investigates the effects of work accommodations devoted to people suffering of burnout on perceived justice, perceived support and wellbeing of co-workers.

Finally, the third study (Angel & Hermal) complements the previous ones analyzing the recruiters’ perspective regarding work accommodation perceived feasibility, negotiation empowerment and acceptance of employers’ demand.

Professor Fred Zijlstra will be the discussant of this symposium.

TITLE: How do I perceive my colleague who benefits of work accommodation for disability? The role of stereotypes, justice and discrimination perceptions

AUTHORS: Nathalie Pantaleon et Marilena Bertolino

University of Nice-Cote d’Azur (France)

PURPOSE: Research on employees with disabilities is receiving more and more attention especially during the last decade because they are now more often recognized as a valuable resource in the professional settings (Vornholt, Villotti, Muschalla, Bauer, Colella, Zijlstra, Van Ruitenbeek, Uitdewilligen & Corbière, 2018). Some studies showed the existence of a perception bias (Rohmer & Louvet, 2006; 2011): the information regarding disability guides the judgment and lead to discrimination practices. The kind of disability adjusts the evaluation.

METHODOLOGY: The aim of this study is to evaluate this phenomenon in the workplace and more specifically in the health context. Participants were 356 nurses (Mage = 38,5; 82% of them were women) who were asked to fill out a survey. We distributed the paper survey to employees randomly, so that the respondent rated either a potential disabled colleague with motor, hearing or psychic impairment. According the experimental condition, the potential
colleague could benefit of work accommodation or not. RESULTS: The analysis of variance showed a quite clear hierarchy between the kind of impairment and the presence (vs absence) of job accommodation for discrimination perceptions, justice perceptions, job access, efficacy and competence. Globally, people with a psychic disability and receiving work accommodation are less well perceived compared to people suffering of hearing impairment without job accommodation.

LIMITATIONS: The sample was composed of nurses; other studies should be conducted in other professional sectors.

PRACTICAL IMPLICATIONS: The results of this study should be taken into consideration from HR management in order to handle the consequences of work accommodation among colleagues.

ORIGINALITY/ VALUE: This study is a contribution to the literature on disability and work accommodation.

Title: How do co-workers perceive work accommodations offered to persons suffering from burnout?

Authors: Villotti P1, Angel V2, Corbière M1,3, Desmette D4

1 Centre de recherche de l’Institut universitaire en santé mentale de Montréal, Montréal, Canada
2 Université de Bordeaux, Bordeaux, France
3 Université du Québec à Montréal, Montréal, Canada
4 Université Catholique de Louvain, Louvain-la-Neuve, Belgium

Purpose: We aimed at learning more about co-workers’ perceptions and reactions toward the implementation of two specific work accommodations (i.e., sharing work tasks and schedule flexibility) devoted to people suffering from burnout.

Methodology: We used a case-scenario approach with three randomized simulations (sharing work tasks, schedule flexibility, no accommodation provided) to investigate the effects of work accommodations devoted to people suffering of burnout on perceived justice, perceived support and wellbeing of co-workers. A total sample of 88 participants took part in the study. Data were collected online.

Results: A one-way between-subjects ANOVA was conducted to compare the effects of the provision of work accommodations on coworkers’ perceptions and wellbeing. Participants in the sharing work tasks condition reported higher scores on the perceived overall support variable, higher scores on the perceived organizational justice variable and lower scores on the emotional exhaustion scale. The relationship between the provision of sharing work tasks and emotional exhaustion was found to be mediated by the perception of overall support and perception of organizational justice. We also observed an increase in the level of perceived organizational support at higher levels of perceived organizational approach toward diversity in the “sharing work tasks” simulation.
Limitations: This preliminary study doesn’t allow us to generalize results.

Practical implications: Learning more about coworkers’ perceptions and reactions is of relevance for organizations in order to develop practices that allow for greater coworker acceptance of accommodating individuals in need.

Originality/Value: Coworkers’ perceptions and reactions toward work accommodations are often neglected in the literature.

Title: Just do it! When perceived feasibility of work accommodation reduces recruiters’ propensity to discriminate and propensity to include.

Authors: Angel & Herman

Purpose

It is noteworthy that after more than fifty years, we failed to eradicate discrimination at work, (Lindsey et al., 2013). Among solutions for promoting inclusion, Work Accommodation (WA) is still under-utilized and encounters several obstacles (Nevala et al., 2015) like unacceptance and intergroup conflicts (Colella, 2001). In this project we suggest that cognitions about WA as part of job analysis are key factors in reducing discrimination during recruitment and selection. Indeed, Ullman and Cohen (2005) observed that running job analysis before selection judgment may reduce bias. Moreover, WA perceived feasibility may influence job analysis (Shaw et al., 2014). Then, we hypothesize that the less recruiters think about WA, the more they are prompted to discriminate and accept discriminative requests from employers. This effect would be mediated by WA perceived feasibility, negotiation empowerment and acceptance of perspective of employers.

Design/Methodology

Belgian recruiters (N=166) from Belgium responded to an online questionnaire.

Results

Using multiple mediated regressions, we confirmed our hypotheses and importance of cognitions about WA to reduce discriminations.

Limitations

Measurement could be refined and experimental design could confirm the causal path. Risk of common method bias.

Practical Implications
Implications for training and support recruiters in mobilization of WA solutions will be discussed.

Originality

Our study suggests that inclusion perspective may reduce discrimination because WA cognitions influence job analysis and empower recruiters as negotiators for diversity inclusiveness.
NEW INSIGHTS ON RECOVERY FROM WORK STRESS

Ulla Kinnunen¹ and Jessica de Bloom¹,²
University of Tampere, Finland¹
University of Groningen, The Netherlands²

State of the Art: Recovery from work demands refers to a process during which depleted resources are replenished. Successful recovery from work is crucial to stay healthy and productive. Although research on recovery has made important progress during the last 10 years, there are still research gaps, which need further attention. In this symposium some of these gaps related to the issues of why, how and when recovery occurs are discussed in five presentations.

New Perspectives/Contributions: In the first presentation, Sabine Sonnentag discusses why recovery is difficult particularly when it is highly needed. In the second presentation by Anja Baethge and her colleagues, recovery from work is approached as a daily physiological strain-recovery process, which is expected to be facilitated by co-worker support. The third presentation by Verena Haun and her colleagues concerns the interplay of recovery occurring during work breaks and after work. In the fourth presentation, Rebecca Brauchli and her colleagues introduce boundary crafting as a strategy to proactively improve recovery. The fifth presentation by Jessica de Bloom and her colleagues introduces an individual intervention aiming to improve recovery with the help of a smartphone application.

Research/Practical Implications: The presentations offer both scientific explanations to some under-examined issues in recovery literature and introduce strategies promoting recovery in practice.

The recovery paradox: Recovery is difficult when it is needed most

Sabine Sonnentag
University of Mannheim, Germany

State of the Art: Numerous studies have demonstrated that job stressors such as time pressure, organizational constraints, and interpersonal conflicts predict impaired individual well-being, both at the day level and over longer periods of time. Recovery processes such as psychological detachment from work during non-work time, physical exercise, and good sleep are associated with positive well-being indicators and have the potential to protect well-being.

New Perspectives/Contributions: Although the experience of job stressors is related to a high need for recovery and calls for effective recovery processes, empirical research points to a puzzle that I call the “recovery paradox”. Recovery processes such as psychological detachment from work during non-work time, physical exercise, sleep, actually are impaired when job stressors are high, i.e., when recovery is highly needed. In this presentation, I will present explanations for this recovery paradox and will discuss moderating factors.
Research/Practical Implications: The recovery-paradox perspective offers new avenues for research on job stress and recovery. In terms of practical implications, this perspective highlights the importance of job design and stress management.

Originality/Value: This presentation offers a new perspective on previously conflicting findings in the job stress and recovery literature.

Co-worker support and its relationship to the strain-recovery cycle of a workday—A diary study on trajectories of heartrate variability during work

Anja Baethge¹, Tim Vahle-Hinz² and Thomas Rigotti¹
Johannes Gutenberg University Mainz, Germany¹
Humboldt University Berlin, Germany²

Purpose: In this study, we investigate autonomic nervous system regulation during a regular workday and how co-worker support relates to this allostatic system. We first examined the trajectory of the heart rate variability as an indicator of autonomic nervous system activation throughout the workday. Further, we proposed that co-worker support would be directly related to the typical autonomic regulation of the workday and facilitate a stable (high)/low (para/)sympathetic activation level during the workday.

Design: We conducted a 5-day daily diary study with 115 employees, measuring their co-worker support at the end of the day and their HRV during work. We examined the effect of stable between-co-worker support on the latent growth curve of heart HRV during work and found evidence for the stabilizing effect of general co-worker support on HRV trajectory.

Results: Employees with higher co-worker support, on average, had a (high/)low, stable (para)sympathetic level during work. Employees with low support showed an (inverted), u-shape trajectory of the (para)sympathetic activation throughout the workday, with (low/)high (para/)sympathetic activation at the beginning and end of the workday and a (maximum/)minimum in the middle of the workday (lunch break time).

Limitations: We have measured co-worker support with only one item.

Research/Practical Implications: Co-worker support facilitates a stable high level of parasympathetic activation, which people with support can only reach during lunch break time.

Originality/Value: We offer initial evidence for a regulating effect of co-worker support on allostasis (in terms of a trajectory) in actual working conditions.
Recovery experiences at work and at home: Compensatory effects

Verena C. Haun, Thomas Rigotti and Virzhiniya Dyulgerova
Johannes Gutenberg-University Mainz, Germany

**Purpose:** For employees with high home demands (e.g., employees with young children) recovery from job stress during non-work time can be difficult. Building on the notion of work-home compensation, we examine if employees with limited recovery experiences during non-work time (psychological detachment from work, relaxation, mastery, control) particularly benefit from recovery experiences at work (psychological detachment from home, relaxation, mastery, control).

**Design:** We conducted two studies to test our hypotheses: (1) Between-person study with two measurement occasions (before and after work) among 185 employees and (2) within-person study among 60 employees across one workweek.

**Results:** While all recovery experiences at work predicted increased feelings of recovery after work in Study 1, control at work was the only significant predictor in Study 2. In both studies, control during non-work time boosted the beneficial effect of control at work on feelings of recovery after work. No interactions were found between relaxation, mastery experiences, and psychological detachment at work and during non-work time, respectively.

**Limitations:** We did not measure relaxation at work in Study 2.

**Practical Implications:** Employees with low control during non-work time (e.g., employed parents) may engage in job crafting to expand their control at work. Supervisors should be aware that granting autonomy is particularly beneficial for employees with family responsibilities.

**Originality/Value:** Predominantly, non-work time has been viewed as opportunity for recovery from job-related stress. We offer a new perspective by investigating work as opportunity for recovery for those with limited recovery opportunities during non-work time.
**Proactively shaping the boundaries between work and private life:**
*The impact of boundary crafting on recovery*

Rebecca Brauchli, Philipp Kerksieck and Georg F. Bauer
University of Zürich, Switzerland

**Purpose:** Changes in the working world challenge employees to act flexibly and individually. People can (pro)actively meet these challenges while staying healthy via (1) job crafting or (2) leisure/off-job crafting. Research should additionally pay attention to proactive shaping of work-life boundaries: (3) Boundary crafting (BC) ties in with job crafting and boundary management. It subsumes proactive and self-determined behaviours. From research on boundary management we know that people rather segment or integrate work and private life. Also, we understand the differential consequences of these strategies. Concerning BC, we are interested to what extent people make sure, for example, to be fully present at work if necessary or to consciously enjoy time with the family.

**Design:** In the 1st study, we developed and validated a scale to measure BC. The 2nd study is longitudinal (3 waves) and cross-cultural. We will examine whether it is beneficial to actively, mindfully shape boundaries to better recover during off-job time.

**Results:** Results from the validation study (n = 311) indicated that boundary crafting and recovery are associated (r = .349; p < .001). Now, we will systematically approach questions regarding causality: Do people recover better from work because they craft their boundaries, OR do they craft their boundaries because they are recovered?

**Limitations:** Even though the study uses different measurement waves, more sophisticated research methods are necessary to fully understand the underlying mechanisms.

**Implications/Value:** Based on our findings, particularly beneficial, health-promoting strategies will be identified and made accessible to the working population.

---

**Learning how to recover from work: Online recovery interventions**

Jessica de Bloom¹,², Dirk Lehr², Christine Syrek³, Ulla Kinnunen⁴, Anniina Virtanen⁴, Alexandra Smith² and Jo Annika Reins²

University of Groningen, The Netherlands¹
Leuphana University Lüneburg, Germany²
University of Applied Sciences Bonn-Rhein-Sieg, Germany³
University of Tampere, Finland⁴

**Purpose:** Many employees face difficulties recovering from work stress during off-job time. We have developed and evaluated an online intervention to help people achieve better recovery.
**Approach:** With the help of a smartphone application grounded in the DRAMMA model (Newman, Tay, & Diener, 2014), we aimed to support employee’s recovery before, during and after vacations. App users engaged in brief recovering daily activities and kept a diary by taking photos or writing notes for later review. We tested the effects of this online intervention on well-being and performance in a randomized controlled trial in Germany (N = 138) and in an intervention study in Finland (N = 76).

**Results:** People with high need for recovery used the app more intensively. Active app users experienced slightly higher levels of detachment, relaxation, autonomy, mastery, meaning and affiliation than passive users or non-users. App use seems to increase and prolong positive effects of recovery episodes on well-being (e.g., evident in lower exhaustion and rumination and higher sleep quality).

**Limitations:** Non-usage attrition is rather high. Furthermore, as this online intervention combined different strategies and tasks to recover from work, it is difficult to disentangle the most important components of the app’s effectiveness.

**Practical implications:** Insights from the first studies will be used to develop another app, which can be used to improve recovery on a day-to-day basis.

**Originality:** Intervention research is rare and urgently needed within the field of recovery to better understand recovery processes and to assist working people in achieving and preserving better occupational health.
State of the Art: Teams are vital for modern organizations and their adoption continues to increase in almost every domain of working life. Because teams combine different resources, they emerge as a key response to the challenges of a complex and ever-changing organizational environment. Although teams have the potential to achieve results that are much more than the sum of individual contributions, sometimes teams are less than the sum of their parts. What distinguishes effective from non-effective teams? What conditions lead to which mechanisms and what mechanisms lead teams towards effectiveness? With this symposium, we aim to contribute towards answering this question.

New Perspectives/Contributions: Considering team effectiveness as a multidimensional construct, this symposium brings together a set of six presentations that are focused on team conditions, processes and states that lead to achieving better team results. By adopting different design and analytical approaches (e.g., intrateam longitudinal approach, cross-lagged design, social network analysis, non-linear analytical methods, structural equation modeling), these presentations try to find ways of achieving the full potential of teams.

Research/Practical Implications: The results of the different studies gathered in this symposium add to our understanding of the role of team inputs (e.g., leadership, the nature of the task) and of team processes and team states (e.g., team cohesion, team learning) in different team outcomes, ranging from well-being to performance. Furthermore, these results offer guidance to organizations on promoting team effectiveness among their teams.

Title: Team learning and members’ satisfaction: An intrateam longitudinal approach

Authors:
Teresa Rebelo\textsuperscript{a}, Cláudia Rocha\textsuperscript{a}, Paulo Renato Lourenço\textsuperscript{a} e Isabel Dimas\textsuperscript{b} \\
\textsuperscript{a} Faculty of Psychology and Education Sciences, University of Coimbra, Portugal \\
\textsuperscript{b} GOVCOPP, ESTGA, University of Aveiro, Portugal
**Purpose:** This study aims to analyze how learning behaviors are adopted by teams over time, as well as the impact that different team learning temporal dynamics have on members’ satisfaction.

**Method:** Data were collected in 24 project teams of engineering and technology undergraduate students. Team learning (through exploring, collective reflection, error management, feedback seeking, and experimenting behaviors) was assessed at the beginning, middle and end of the project, and members’ satisfaction at the end. Data analysis was based on the intrateam longitudinal approach (Li & Roe, 2012). Accordingly, in each team the use of learning behaviors over time was analyzed in direction, ratio and degree of change. ANOVAs were run to examine whether and how different learning temporal patterns affect members’ satisfaction.

**Results:** Different temporal dynamics were found, and a nonlinear trend emerged. The results suggest that teams at half of their allotted time tend to experience a redefinition of their learning, using some learning behaviors more in the first half and others in the second half. It was also found that different temporal patterns of exploring, error management and feedback seeking do not equally impact on members’ satisfaction.

**Limitations:** The major limitation of this study is the sample (size and characteristics), which suggests that further replication is required.

**Implications:** Our study reinforces the importance of the intrateam longitudinal approach because it allows the temporal dynamic nature of team processes and the heterogeneity across teams to be captured.

**Value:** The application of this approach contributes to a thorough understanding of the team learning process and its effects.

**Title:** How much cohesion is necessary for teams to be effective?

**Authors:**
Isabel Dimas, Humberto Rocha, Teresa Rebelo, Paulo Renato Lourenço

a GOVCOPP, ESTGA, University of Aveiro, Portugal
b CeBER, FEUC and INESC-Coimbra, Universidade de Coimbra, Coimbra, Portugal
c FPCEUC and IPCDVS, Universidade de Coimbra, Coimbra, Portugal

**Abstract**

**Purpose:** The level of cohesion of a team has long been considered as a key variable in team functioning. Research on the influence of team cohesion on team effectiveness has produced,
however, contradictory results. In the present study, our purpose is to contribute to clarify
the relationship between team cohesion (task and social) and team effectiveness (i.e., team
process improvement) by adopting a non-linear approach.

**Method:** A quantitative study with a cross-sectional design was conducted. The sample was
composed of 82 teams from 57 Portuguese companies. The relationships between variables
were analyzed through Radial Basis Functions (RBF).

**Results:** The Thin Plate RBF obtained the best Cross Validation Error leading to the best
predictive model. Thin Plate RBF response surface revealed that an increase in either task
cohesion or social cohesion leads to an increase in team effectiveness up to a certain
threshold. The optimal pair of the cohesion values obtained (3.6 social cohesion, 4.5 task
cohesion) showed that higher values of task cohesion are more important than higher values
of social cohesion for an optimal team effectiveness.

**Research Implications:** Our study highlight the importance of using methods beyond the
dominant linear approach, in order to model nonlinear behavior as the one produced by
complex and dynamic systems, such as, teams.

**Originality/Value:** To the best of our knowledge, this is one of the first studies in team
research that uses RBF, a successful nonlinear regression approach with applications in
different areas of research.

**Title:**
How do transformational leaders influence followers’ wellbeing? The mediating role of team
climate for learning and role ambiguity

**Authors:**
Rita Berger\textsuperscript{a}, Maria Aimilia Katsanou\textsuperscript{a}, David Leiva\textsuperscript{a}
\textsuperscript{a}University of Barcelona, Spain

**Abstract**

**Purpose:** Growing responsibility and team work are frequent conditions in an innovative
working environment that can lead to stress and employees’ strain. Research on the role of
leadership and team climate for learning as important variables for well-being is scare.
Therefore, the purpose of this study is to examine how transformational leadership and team
climate for learning may reduce followers’ strain. Using the Job Demands-Resources Model
as a theoretical framework, we propose that the relationship between transformational
leadership and anxiety is mediated by job demands, namely role ambiguity, and job
resources, namely team climate for learning, taking into account their importance for strain.
Methodology: A sample of 501 employees of a German research and development organization participated in a cross-sectional study. The hypothesized multiple mediation model was tested through structural equation modeling.

Results: The results confirmed our hypotheses demonstrating that the relationship between transformational leadership and anxiety is fully mediated by role ambiguity and team climate for learning.

Limitations: regarding the use of a cross-sectional study design and self-reported questionnaires are addressed.

Research/Practical Implications: Our study contributes to the further understanding of the transformational leadership wellbeing relationship and highlights the importance of leadership and team training and awareness as well as work characteristics for employee health.

Originality/Value: To our knowledge this study is one of the first studies that analyzes the role transformational leadership and team climate for learning together in one model.

Title:
Challenges of knowledge work: the impact of transformational leadership and group development in teams dealing with task uncertainty.

Authors:
Jan-Paul Leuteritz a, Rita Berger a
a University of Barcelona, Spain

Abstract

Purpose: Until now, psychological research on the factors that enable team innovation have focused on innovation as an outcome variable. Research till now did not compare teams of knowledge workers, who deal with highly uncertain tasks, and other teams. This research aimed at clarifying the relationships between transformational leadership, group development, task uncertainty, task interdependence, and team effectiveness in diverse teams.

Methodology: We collected questionnaire data from 408 participants working at a German R&D organization, and we aggregated the data to scores of 107 teams. Using structural equation modelling, we tested a model of the relationships between the variables mentioned above.

Results: We found that group development and task uncertainty measurement that refers to unstable demands from outside the team partially mediate the effect of transformational leadership on team effectiveness (p < 0.05). Transformational leaders also reduce unclarity of goals (p < 0.05) but this does not foster team effectiveness.
Limitations include cross-sectional data and a lower than expected variance of task uncertainty in the sample.

Research Implications: Two findings matter at practical and theoretical level: (1) transformational leadership is efficient in research teams through increased group development, and (2) different subordinate types of task uncertainty play different roles in this context.

Originality/Value: The presented work adds a new perspective by operationalizing knowledge work through different subordinate types of task uncertainty, and thus allows to compare effects between different types of teams. This builds a bridge between organizational psychology and innovation research.

Title: Leader’s centrality and perception of team performance: The mediating role of leader satisfaction.

Authors:
Marta P. Alves\textsuperscript{a}, Paulo R. Lourenço\textsuperscript{b} & Isabel D. Dimas\textsuperscript{c}
\textsuperscript{a}Research Center in Business Sciences (NECE-UBI)/Department of Psychology and Education, University of Beira Interior, Covilhã, Portugal
\textsuperscript{b}FPCEUC and IPCDVS, Universidade de Coimbra, Coimbra, Portugal
\textsuperscript{c}GOVCOPP, ESTGA, University of Aveiro, Portugal

Abstract

Purpose: In the present study two different group networks are analyzed: the work-related communication network (i.e., “to whom I provide information and materials necessary to carrying out the work”) and the friendship network (i.e., “with whom I have a close relationship”). The study aims to test two mediating hypotheses where the leader satisfaction with the team is the mediator of the association between the level centrality of the formal leader in the group network and the leader’s perception of group performance.

Methodology: The research included a total of 77 formal leaders of organizational teams from several Portuguese organizations. The majority of the leaders were male (81.6 %) and the average age of the participants was 43.16 years (DP=8.44). Team size ranged from three to ten members (M=5.23; DP=1.88). Degree and betweenness centrality indicators were obtained for both social networks. Team size and team tenure were controlled for all the analysis.

Results: The results partially confirmed the mediating hypotheses. Particularly, (1) the leader satisfaction with the team negatively mediates the association between the level of outdegree centrality of the formal leader in the work-related communication network and the leader’s evaluation of group performance; (2) the leader satisfaction with the team positively mediates the association between the level of betweenness centrality of the formal leader in the friendship network and the leader’s evaluation of group performance.
Research implications: Results are discussed in the context of the relational approach of leadership in the organizational team context in terms of instrumental and expressive relationships.

Acknowledgments: This paper is financed by National Funds through FCT-Fundação para a Ciência e Tecnologia under the project «UID/GES/04630/2013».

Title: The antecedent or consequence role of team engagement: A cross-lagged panel design study.

Author:
Salvatore Zappalà
Department of Psychology, University of Bologna, Italy

Purpose: This study investigates if team engagement is an antecedent or an outcome of variables theoretically located at three level: organizational service climate, ethical leadership and individual work engagement. This contribution used a cross-lagged panel design to observe the reciprocal effect between Team engagement and those three concepts.

Methodology: A survey was run in 2014 and in 2017 in an Italian cooperative providing residential social services. Data were aggregated at the residential unit level (N = 56 centers) and a cross-lagged design was used to examine causal predominance. Spss25 and Mplus 7 were used to investigate model paths.

Results: Analysis shows that global service climate and ethical leadership at Time 1 have a stronger influence on team engagement at Time 2, rather than the opposite. Instead there is no lagged effect between individual and team work engagement across the two waves.

Limitations: Using only two waves and self-report data, and the long timing between the two waves are important limitations of this study.

Research/Practical Implications: Team engagement is an important motivational variable affecting team performance and team satisfaction, but in some studies is considered a predictor and in some others a consequence, or a mediator. This study contributes to distinguish the role that team engagement may have in relation to constructs of different levels.

Originality/value: This study contributes to literature on team engagement, a more recent and less investigated construct. It also uses a two-waves study which allows to compare the effect of team engagement on related constructs.
THE ROLE OF PERSONAL RESOURCES TO FACE CAREER CHANGES

Chairs:
Anita C. Keller and Christopher D. Nye
University of Groningen and Michigan State University

State of the Art
Individuals experience a number of career changes throughout their working lives and effectively navigating these changes can help to facilitate long-term career success. As a result, understanding resources that can facilitate these changes and help individuals to navigate them throughout their careers is particularly important.

New perspectives/contributions
In the first contribution, Nye and colleagues present a study on the relevance of personal resources (e.g., personality, interests), study performance, and person-environment fit for education-to-work transition success (finding employment, perceived fit). In another longitudinal study, Schmitt and Keller focus on changes in the personal resource self-efficacy during the education-to-work transition and reveal differential effects of various coping strategies on development in self-efficacy. In the third contribution, van der Horst and colleagues explore the effectiveness of a career adaptability intervention on employment quality after the education-to-work transition. While the intervention showed positive effects via career adaptability, results regarding optimal intensity are less clear. The last two presentations adopt a critical perspective on the career adaptability concept. First, Haenggli and Hirschi demonstrate in their longitudinal study that motivation and environment factors are more relevant for most indicators of subjective career success than career adaptability, knowledge, and skills. Second, Leong and colleagues argue that the concept of career adaptability needs to be extended by a fifth factor called cooperation.

Research/practical implications
Using different methodological designs (e.g., longitudinal studies, quasi-experiment) across multiple countries, this symposium offers theoretical and empirical advancements to investigate the role of personal resources when dealing with changes in one’s career.

The Effects of Individual Differences and Academic Performance on Post-College Job Offers

Christopher D. Nye, Lauren Collier-Spruel, and Brent Donnellan
Michigan State University

Purpose:
The purpose of the present study was to explore the role of academic performance, personality, and vocational interests as predictors of post-graduation employment and underemployment in a sample of graduating college seniors.

**Method:**
Data were collected from 655 graduating seniors at a large midwestern university in the United States. Participants self-reported personality and vocational interests as well as whether they had a job offer and their perceived fit and qualification for the job. Cumulative GPAs for each student were also obtained from university records.

**Results:**
Results indicated that vocational interest-major fit and the number of job search behaviors were positively related to students’ obtaining job offers after graduation. In addition, we found that interest-major fit and some personality facets were negatively related to underemployment. Finally, results also indicated that academic performance, interest-major fit, and personality were significant predictors of perceived fit with students’ post-graduation job.

**Limitations:**
Although these results indicate that students’ individual characteristics were related to career outcomes, the present study did not examine whether these effects are maintained over time and whether participants stayed in these jobs long-term.

**Research/Practical Limitations:**
These results have important implications for career transitions from college to the workforce and suggest ways to help students find future employment.

**Originality/Value:**
Although past research has demonstrated the relationship between personality, vocational interests, and job search behaviors, they have not examined whether these individual characteristics can predict obtaining employment post-graduation. The present study fills this gap in the literature.

**Changes in self-efficacy during the education-to-work transition: The role of coping strategies in explaining why individuals change differently**

Antje Schmitt and Anita C. Keller
University of Groningen, the Netherlands

**Purpose:**
Perceived self-efficacy refers to people’s competence in dealing effectively with challenges. Previous studies investigated the usefulness of personal resources such as self-efficacy to deal with career transitions. However, important career transitions such as the transition from education to work may also come with instability in these resources. In this study, we
investigate changes in self-efficacy before, during, and after the education-to-work transition and how these changes relate to cognitive-behavioral strategies to deal with the situation.

Design:

Data (N = 694) came from a Swiss panel study focusing on the education-to-work transition. Self-efficacy was measured across nine waves over 14 years. Coping was assessed twice, at baseline and directly after the transition to work.

Results:

Piecewise growth modeling was used to study changes in self-efficacy. The initial level in self-efficacy was positively related to problem-oriented and negatively to emotion-oriented coping. However, for people showing higher levels of problem-oriented coping, self-efficacy decreased, while for those showing higher emotion-focused coping, self-efficacy increased before and during the transition. Self-efficacy change after the transition was not affected by coping.

Limitations:

Results are only generalizable to people transitioning from education to work in Switzerland.

Research/practical implications:

Variability in self-efficacy change during the education-to-work transition is differentially explained by coping strategy use which has implications for the theorizing of the development of self-efficacy.

Originality/Value:

This study adds to previous research by showing that the initial level and the change in self-efficacy before, during, and after the education-to-work transition are affected differently depending on coping strategy use.

Facilitating a successful school-to-work transition: Comparing compact career-construction interventions

Anna C. van der Horst12, Ute-Christine Klehe1, Anne C. M. Coolen2, and Veerle Brenninkmeijer4

1 Justus-Liebig-University Giessen, Germany, 2 eeloo, The Netherlands, 3 Utrecht University, The Netherlands

Purpose:

This study responds to calls for scalable and effective career interventions to help students prepare for the school-to-work transition.

Design/Methodology/Approach/Intervention:

A partly web-based intervention based on career construction theory (Savickas, 2013) aimed to foster students’ career adaptability and career adaptive responses and their subsequent
employment quality. We compared the development of career adaptability and adaptive responses between three intervention groups differing in intensity ($n=48$, $n=304$, $n=42$) and a control group ($n=79$) over three time-points (pre-intervention, post-intervention, six months later).

**Results:**

Repeated ANOVA showed an increase in career adaptability and adaptive responses in the intervention- but not in the control group, which mostly also held for six months. SEM showed that via their enhanced career adaptability, participants of the intervention groups reported better employment quality six months later. Effects of intervention intensity were less clear.

**Limitations:**

We conducted a quasi-, rather than a random experiment and compared the impact of different intervention intensities but not of separate exercises.

**Research/Practical Implications:**

Interventions practicing career adaptive responses indeed lead to students perceiving themselves as more adaptable, showing more adaptive responses even half a year later and finding better quality employment. Also, the study adds to the debate on the effects of intervention intensity (Whiston, 2003, 2017). Practically, the study presents and validates scalable career interventions that facilitate a successful school-to-work transition by training career adaptability and career adaptive responses.

**Originality/Value:**

The interventions employ new technology and are scalable because they require very little trainer investment per student (2-4 hours for 25 students).

---

**Career Adaptability and Subjective Career Success in the Context of a Broader Career Resources Framework**

Madeleine Haenggli and Andreas Hirschi

University of Bern, Switzerland

**Purpose:**

We aim to extend research on career adaptability by investigating the relative importance and incremental utility of career adaptability compared to other types of resources in relation to subjective career success (e.g., recognition, meaningful work, personal life).

**Design:**

We used online questionnaires to collect time-lagged data from 574 Swiss employees at three time points. We tested a time-lagged mediation model to test the relation of the different resources, and relative weights analysis to examine the relative importance of each resource.
Results:
In line with our assumptions, the key resource optimism, but not self-esteem, was significantly positively related to career adaptability and career resources. In turn, these resources – except motivational career resources - were significantly positively related to subjective career success. In addition, the results of the relative weights analyses revealed that each resource explained unique variance in different facets of subjective career success.

Limitations:
We exclusively relied on self-reports and cannot claim causality based on our time-lagged data.

Implications:
The results demonstrate that career adaptability should be conceptualized within a larger network of resources that are relevant for attaining subjective career success. In addition, motivational and environmental career resources may be more important to attain subjective career success than career adaptability resources.

Originality:
The study provides a better understanding of the specific role of career adaptability for subjective career success within a larger nomological net of resources. As such, the study contributes to career construction theory specifically and the understanding of predictors of career success more generally.

Career Adapt-Abilities Scale’s (CAAS-5) predictive and incremental validity with work-related outcomes
Frederick T.L. Leong, Danielle Gardner, Christopher D. Nye, and Joshua Prasad
Michigan State University

Purpose:
Career adaptability, measured using the Career Adapt-Abilities Scale (CAAS), has been conceptualized as consisting of four factors (Concern, Control, Curiosity, and Confidence). Recent research has produced evidence in support of a fifth factor, Cooperation. The current study examines how the CAAS-5 predicts a number of work and life-relevant outcomes.

Methodology:
Data were collected from a large Midwestern university of undergraduates with a minimum of 6 months prior work experience. Of these participants, 108 were removed from the data set due to failure of an attention check. The 407 participants who passed this check were retained, and comprised our final sample.

Results:
Results show that the CAAS-5 is uniquely predictive of subjective wellbeing and job satisfaction over and above general adaptability; however, this was not the case for work engagement. Additionally, using a bifactor model, results suggest that each outcome is best predicted by a unique subset of the CAAS-5 dimensions.

Limitations:
Study limited to Midwest region of the United States

Implications:
In general, our results provided support for the predictive validity of the CAAS-5 in relation to work and life outcomes as well as incremental validity over general adaptability.

By using a bifactor model, results suggest that each outcome is best predicted by a unique subset of the CAAS-5 dimensions which includes the Cooperation dimension omitted from earlier studies.

Originality:
The combination of such results provides evidence for the validity and utility of the CAAS-5, and future research on career adaptability should explore the five-factor structure further.
State of the Art - Since the beginning of the century job crafting receives increasing attention as a valuable alternative to traditional top-down job redesign strategies (Wrzesniewski & Dutton, 2001). As an approach that considers employees as active creators of their job, it is often used as a basis for interventions. These interventions promote employees’ active adjustments to task, relational, or cognitive boundaries of their work often specified in terms of reducing demands and increasing resources (Tims & Bakker, 2010) and are empirically supported as an effective way to improve employee functioning and well-being (Nielsen, 2013).

New Perspectives - Designing and executing job crafting interventions for particular populations could be the answer to a pressing HRM question, i.e. how to design jobs for a more inclusive society. Promoting job crafting might create more opportunities for challenge, growth, and engagement and as such retain vulnerable and valuable workers. Today, certain groups of employees do find their way into a job but often later on report high turnover, downshifting and/or absenteeism rates due to mental or physical fatigue and stress. The symposium is centered around job crafting interventions in specific populations and contexts in need of I/O psychologists’ attention (i.e. young mothers, teachers, academics, elderly & blue-collar workers).

Research/Practical Implications - Job crafting interventions may provide opportunities for employees to “fit” their jobs not only to their strengths and skills but also to their needs and work preferences, all of which today increase along with a progressively more diverse workforce.

Effectiveness of job crafting interventions: a meta-analysis and utility analysis

Bogdan Oprea¹, Liubiţa Barzin², Delia Vîrgă², Dragoş Iliescu¹, Andrei Rusu²  
¹Department of Psychology, University of Bucharest, Romania  
²Department of Psychology, West University of Timișoara, Romania

Purpose - Job crafting (JC) is a form of bottom-up job design in which employees change their job resources and demands out of their own initiative. The purpose of this paper was twofold: (1) firstly, to assess the effectiveness of JC interventions on increasing JC behaviors, work engagement, and job performance; (2) secondly, to estimate the economic value of JC interventions.

Methodology - A random-effects meta-analysis was conducted using the Comprehensive Meta-Analysis 2.0 statistical package. To estimate the financial value of the interventions, we applied utility analysis procedures.

Findings - We found statistically significant effect sizes on overall JC and two of its subcomponents, seeking challenges and reducing demands, on work engagement, and on
contextual performance. Interventions produce increases in task performance only for healthcare employees. The effect of increasing JC behaviors on performance was fully explained by increases in work engagement. Our utility analysis indicated substantial benefits regarding dollar value increases in output, the percentage increase in output, and reduced labor costs for healthcare professionals.

**Limitations** - The low number of studies suggests that high-quality research on JC interventions is scarce. In most studies, job performance was measured using participants’ self-ratings of task performance.

**Practical Implications** - Practitioners can implement JC interventions to increase task performance in healthcare settings and contextual performance in general.

**Value** - It highlights the financial value of proactive behaviors at work. This is an essential step in increasing the credibility of research into proactive behaviors at work and of interventions that stimulate these behaviors.

---

**Can job crafting lower work-home conflict and promote work-home enrichment off fulltime employed mothers via a job crafting micro-intervention?**

Lorenz Verelst, Rein De Cooman, Marijke Verbruggen, Colette Van Laar en Loes Meeusen

KU Leuven

**Purpose** - Women today need to combine multiple social roles, which leads to more and complex work-home interface experiences. Consequently, long-term absenteeism and turnover are relatively high in this specific group of employees. Therefore, the aim of this study is to investigate whether job crafting can promote work-home enrichment and lower work-home conflict of fulltime employed mothers.

**Methodology** - We used a micro-intervention (i.e. a reasonably short-term intervention characterized by self-guidance via mobile communication technology without intensive contact with a coach/trainer) to stimulate job crafting behavior. This micro-intervention was conducted in an experimental field study within an ad random distributed experimental (N = 60) and control group (N = 60). Respondents completed pre- and two or three post-tests (depending on the condition) to measure short and long term effects.

**Results:** Analyses indicate that participating in the micro-intervention fosters job crafting. Job crafting is, in turn, positively related to work-home enrichment and negatively associated with work-home conflict. Further analyzes on the work-home outcomes are currently conducted.

**Limitations** - Additional data are being gathered since this study had a significant drop-out rate (60%).

**Research/Practical implications** - Findings emphasize that a job crafting micro-intervention is a promising tool to trigger beneficial behavioral changes in young mothers. We thus encourage a further inclusion within the domain of I/O psychology.

**Originality/Value** - This research contributes to the literature by using an experimental design, introducing a micro-intervention and by focusing on the specific group of young mothers.
Practicing What we Preach? How Job Crafting Strategies may Support Academics to Thrive

Machteld van den Heuvel\textsuperscript{1}, Bianca Beersma\textsuperscript{2}, Rebecca Fruwert\textsuperscript{3}
\textsuperscript{1}Department of Work and Organizational Psychology, University of Amsterdam, \textsuperscript{2}Department of Organization Sciences, Vrije Universiteit Amsterdam, \textsuperscript{3}Human Resources Advisor, Tate & Lyle, Koog, The Netherlands

**Purpose** - Working in academia holds many opportunities to thrive in terms of autonomy and learning. Indeed, many academics report to be engaged or ‘called’ to their profession. However, work pressure is a growing concern for universities, particularly amongst academic staff. Demands include the teaching-research combination, ‘audit-cultures’ where performance is based on student-evaluations, isolation, and high levels of competition. Top-down demands (e.g. budget cuts) may exacerbate these demands. Although some studies have shown the negative impact of general demands in academic environments, not many studies focus on context-specific demands or how academics may deal with those using strategies such as job crafting. The aim of this presentation is to reflect on the academic working environment and specific job crafting strategies that may help academics to thrive.

**Methods** - A review of existing studies on academics’ demands, resources and crafting strategies will be done. In addition, initial quantitative (N=152) and qualitative data on academics from different fields will be presented, testing relationships between competitive pressures (for funding, promotions and publications) and well-being outcomes (work engagement and distress). Self-reported crafting strategies will be analyzed for key-themes.

**Results** - Based on job demands-resources theory, job crafting theory, initial findings and observations in practice, a theoretical model will be proposed that outlines different crafting strategies for academics, outcomes and explaining mechanisms informing future research.

**Practical implications** - Academics may experiment with proposed strategies to enhance health, well-being and meaning at work.

**Originality** - This study addresses the understudied theme of effective strategies to deal with work pressure in academia.

Cognitive job crafting: A daily diary study

Veerle Brenninkmeijer (presenter) & Jan Fekke Ybema
Dept. of Social Health & Organisational Psychology, Utrecht University, The Netherlands

**Purpose** - This study examined the role of cognitive job crafting, in addition to behavioural forms of job crafting, in contributing to daily work engagement and performance. Cognitive job crafting refers to efforts of workers to view their job as meaningful and as contributing to their (long-term) personal goals. Although the scientific literature initially emphasized the benefits of cognitive job crafting, this topic has received relatively little attention in empirical research.

**Methodology** - We conducted a daily diary study among 149 white-collar employees. Participants filled out a baseline questionnaire and 2 to 5 daily questionnaires. In total, 491 daily questionnaires were available for analysis.

**Findings** - Multilevel analysis showed that after controlling for baseline measures, daily work engagement, task performance and contextual performance were higher on days on which participants used cognitive job crafting. Moreover, for work engagement and task
performance, cognitive job crafting had additional effects over and above behavioural forms of job crafting. The relationships with task performance were partly mediated by work engagement.

Limitations - The design of our study would not allow for a causal interpretation of our findings.

Practical Implications - Organisations may encourage individuals to engage in cognitive job crafting (interventions), in order to foster employee well-being and performance.

Value - Our diary study provides insight into the dynamic associations between cognitive job crafting, work engagement and performance within individuals. It is concluded that cognitive job crafting is a relevant factor that contributes to daily experiences of work engagement and performance.

Wellbeing on the teachers’ desk. Effects of a job crafting intervention to self-manage wellbeing at work.

Arianna Costantini1, Evangelia Demerouti2, Andrea Ceschi1, & Riccardo Sartori1.

1Verona University, Department of Human Sciences, Italy
2Eindhoven University of Technology, The Netherlands

Purpose – While agreement exists around the notion that teachers are one of the most important factors contributing to students’ success, achievement and quality of learning, only limited attention has been paid on how to support teachers’ wellbeing. This study aims to fill this gap by investigating the effects of a job crafting intervention focused on proactive strategies teachers can use on a daily basis to build better habits of work-related wellbeing.

Methodology – This is a quasi-experimental study involving nonrandom assignment to an intervention (N=43) and a control (N=60) group, pre-post, and diary measures. Participants in the intervention group received a training focused on (a) stimulating reflection on behavioral, normative, and control beliefs referred to the self-management of job demands and resources, and (b) self-monitoring, planning, and goal setting techniques.

Results - Analyses indicate that participation in the intervention was associated to higher job crafting behaviors and work engagement. Further multi-level analyses are currently conducted to test the moderating role of social norms on the relationship between intentions to engage in job crafting and subsequent self-reported behaviors.

Limitations – The study relies on self-reported measures of behaviors.

Research/Practical implications - Findings suggest that job crafting interventions entailing reflection on norms and personal beliefs referred to teachers’ proactive self-management of job demands and resources are an effective tool to sustain teachers’ wellbeing.

Originality/Value - This research contributes to the literature by providing evidence from an intervention study to support teachers’ proactive management of their own wellbeing.
Self-administered job crafting intervention among post-retirement workers: Effects on energy levels, person-job fit, and performance

Daphne D. T. F. van der Kruijssen¹, Maria Karanika-Murray², Dorien T. A. M. Kooij¹, and Marianne van Woerkom¹
¹Department of Human Resource Studies, Tilburg University, NL
²Department of Psychology, Nottingham Trent University, UK

Purpose - Previous research has demonstrated the importance of HRM activities for extending working lives. However, the role that older workers themselves may play in this is still under-researched. Following earlier studies that propose that job crafting behaviors help in extending work lives, the purpose of this study was to test the effects of a self-administered intervention on job crafting behaviors (accommodative, developmental, utilization crafting) and, in turn, on energy levels, person-job fit and performance.

Intervention - The effectiveness of this self-administered intervention will be tested using an experimental pretest-posttest design among post-retirement workers (N = 80). During the intervention period (10 days) participants develop and implement their own crafting plan focusing on increasing their job crafting behaviors. Two weeks post-intervention, participants will receive a questionnaire to test the intervention effects.

Limitations - It is possible that this type of intervention is useful with groups other than post-retirement workers, but its effects on other workers remain unclear. Therefore, the intervention should be tested among other vulnerable employee groups.

Implications - A self-administered intervention is a tool that post-retirement workers may use themselves in order to optimize their working conditions and in this way increase their energy levels, person-job fit, and performance thus extending their working lives.

Value - This self-administered intervention can be used to maintain valuable skills and knowledge of post-retirement workers. In addition, this intervention can be used by these employees themselves to promote energy and fit. Hence this intervention is beneficial from an individual, organizational and societal perspective.
WORKPLACE NEGATIVE INTERPERSONAL RELATIONSHIPS: EFFECTS OF INCIVILITY, AGGRESSION AND MISTREATMENT ON EMPLOYEES’ WELL-BEING AND RELATIVE PROTECTIVE FACTORS

Chairs: Valentina Sommovigo\textsuperscript{1,2} and Deirdre O’Shea\textsuperscript{2}

\textsuperscript{1}University of Pavia, Italy
\textsuperscript{2}University of Limerick, Ireland

SYMPOSIUM ABSTRACT/INTEGRATED SUMMARY

State of art:

Workplace incivility, mistreatment and aggression may undermine employees’ well-being and job performance with tangible costs for organizations. Investigating these effects and protective factors is crucial to formulate preventive measures and tailored interventions for victims. This symposium involves four papers which examine these issues within various contexts.

New perspectives/contributions:

The four papers in this symposium contribute to a better understanding of the consequences of negative interpersonal experiences (Sommovigo et al.; Yaranon et al.) and strategies to mitigate these effects (Viotti et al., Di Fabio). The first two papers focus on the impact of workplace mistreatment. The paper by Sommovigo and colleagues reveals that customer mistreatment leads workers to experience negative emotions and cognitive impairment, using an experimental design across two countries. Yaranon and colleagues show the detrimental effects of incivility on healthcare professionals’ well-being and job satisfaction using a longitudinal design. The last two papers concentrate on ways to mitigate these negative effects. The paper by Di Fabio finds that workplace relational civility contributes to both hedonic and eudaimonic well-being. In the final paper, Viotti and colleagues demonstrate the role that prevention climate exerts on workplace violence and its subsequent impact on well-being, again focusing on the healthcare context.

Research/practical implications:

These four papers underline the substantial impact that negative interpersonal encounters in the workplace have on employees’ well-being, showing the importance of promoting workplace relational civility and prevention climate to mitigate some of these effects.
Investigating employees’ emotional and cognitive reactions to customer mistreatment: An experimental cross-national study

Valentina Sommovigo¹ ², Ilaria Setti¹, Deirdre O’Shea², Piergiorgio Argentero¹
¹ University of Pavia, Department of Brain and Behavioural Sciences, Unit of Applied Psychology – Pavia, Italy
² Kemmy Business School, University of Limerick, Limerick, Ireland

ABSTRACT

Purpose. With increasing market competitiveness, companies strive to deliver high-quality customer services. Employee-to-customer incivility erodes the quality of the service provided. The current cross-national study investigated whether negative emotions and cognitive impairment sequentially mediate the relationship between customer mistreatment and employee-to-customer incivility.

Design. 157 Italian and 259 Irish customer-contact employees completed a questionnaire which included an experimental hypothetical task that manipulated misbehaviour levels through scenarios to create three conditions (i.e. incivility, verbal aggression, control). Emotional reactions, cognitive impairment and customer-directed incivility following imagined encounters were investigated. SEM were conducted.

Results. In both nations, customer mistreatment was associated with negative emotions and cognitive impairment. Italian workers reacted directly to negative emotions aroused from aggressive and stressful interactions with customers by engaging in employee-to-customer incivility. Conversely, Irish employees who perceived customer-encounters as highly stressful were likely to experience negative emotions which led to cognitive impairment and, thus, customer-directed incivility.

Limitations. These experimental studies were limited in their generalizability to field settings. Future research should replicate these findings within real workplaces and examine whether cultural dimensions could explain cross-national differences.

Practical implications. Organizations should provide their employees with short breaks after negative customer-encounters and training programs aimed at improving emotion regulation skills and capabilities to remain concentrated on service provision, even in presence of customer mistreatment.
Value. This cross-national research extends incivility research by showing how the customer incivility-employee incivility dynamic plays out through negative emotions and cognitive impairment.

The Impact of Incivility and Workplace Aggression on Healthcare Professionals’ Burnout, Psychological Wellbeing, and Job Satisfaction: A Longitudinal Study

Paolo Barretto Yaranon¹, Valentina Sommovigo¹₂, Deirdre O’Shea¹, Ilaria Setti²
¹ Kemmy Business School, University of Limerick, Limerick, Ireland
² University of Pavia, Department of Brain and Behavioural Sciences, Unit of Applied Psychology – Pavia, Italy

Purpose: The perceived roles of healthcare workers as care providers and the imposed responsibilities and demands, lead to high expectations from their colleagues and their patients, which place them at risk of being exposed to uncivil and aggressive behaviours in their line of work. Guided by the Workplace Violence Model (Gillespie, Gates, Miller, & Howard, 2010), this research aimed to investigate how experiencing incivility and workplace aggression contributes to healthcare employees’ burnout, psychological wellbeing and job satisfaction.

Design/Method: 61 healthcare professionals from both private and public health sectors in Ireland completed questionnaires that measured burnout, psychological wellbeing, and job satisfaction each working week for three consecutive weeks. Exposure to incivility, verbal and physical aggression from co-workers, supervisors, patients, and visitors during their working week were also assessed.

Results: Incivility had a negative impact on the psychological wellbeing and job satisfaction of healthcare employees. No significant interactions were noted between aggressive behaviours and wellbeing measures likely due to its low incidences in comparison to incivility.

Limitations: The small sample size limits generalisability of the results.

Research/Practical Implications: The study has implications for the governing bodies of healthcare organisations and introducing civility trainings into the existing learning and development strategies is recommended.

Originality/Value: This research is distinctive because it assesses the effects of both incivility and aggression on burnout, psychological wellbeing, and job satisfaction of healthcare
workers. Past studies have tended to focus on one or the other and its prevalence in the workplace.

**Workplace Relational Civility for both preventing Workplace Incivility and promoting well-being of workers in a primary prevention perspective**

*Annamaria Di Fabio*¹

¹ Director of the International Research and Intervention Laboratories in “Cross-Cultural Positive Psychology, Prevention, and Sustainability (CroCPosΨP&S)” and “Psychology for Vocational Guidance, Career Counseling and Talents (LabOProCCareer&T)”, Department of Education and Psychology, University of Florence, Italy

**Purpose.** A positive relational environment (Blustein, 2011) represents a fundamental resource for workers’ well-being in the 21st century. In a primary prevention perspective (Di Fabio & Kenny, 2016), Workplace Relational Civility (WRC) and its self-reported mirror measure (Di Fabio & Gori, 2016) were introduced. The present study aimed to: examine the relationships between WRC and well-being (both hedonic and eudaimonic), controlling for the effects of personality traits; analyze the mediating role of WRC in the relationship between personality traits and well-being.

**Design/Methodology.** 209 Italian workers completed a survey which included: the *Big Five Questionnaire* (Caprara et al., 1993), the *Workplace Relational Civility Scale* (Di Fabio & Gori, 2016), the *Positive and Negative Affect Schedule* (Italian validation by Terracciano et al., 2003), the *Satisfaction With Life Scale* (Italian version by Di Fabio & Gori, 2015), the *Meaningful Life Measure* (Italian version by Di Fabio, 2014), the *Flourishing Scale* (Italian version by Di Fabio, 2016). Hierarchical regressions and mediation analyses were conducted.

**Results.** WRC was related to both hedonic and eudaimonic well-being, accounted for a great amount of variance, over and above that explained by personality traits. The mediating role of WRC emerged in the relationship between personality traits and both hedonic and eudaimonic well-being.

**Limitations.** This cross-sectional study used only self-report measures.

**Research/Practical Implications.** WRC could be a promising resource to promote workers’ well-being, opening new research and intervention opportunities.

**Originality/Value.** Adopting a primary prevention perspective, interventions could promote WRC to enhance both well-being and actions and to prevent workplace incivility.
Nurses between the hammer and the anvil: Analyzing the role of the workplace prevention climate in reducing internal and external violence

Sara Viotti¹, Gloria Guidetti¹, Daniela Converso¹
¹University of Turin, Department of Psychology

Purpose. Due to the nature of their work, nurses encounter various circumstances that may jeopardize their health and well-being. Among these risks, the possibility of experiencing workplace violence is particularly prevalent. Workplace violence encompasses both physical and psychological violence and refers to any aggression directed toward a person at work (OSHA, 1996). The International Labor Organization (ILO, 2003) proposed a classification that distinguishes two main types of violence in the workplace: external and internal. External violence takes place between workers and any external person in the workplace. Internal violence takes place between workers, including managers and supervisors. The literature shows that nurses experience both types of violence. The aim of this study was to examine the relationships among internal and external violence, workplace violence prevention climate, exhaustion, and intention to leave in a sample of nurses.

Design/Methodology. Data were collected by a self-report questionnaire involving 313 nurses from two multi-specialist hospitals in Italy. The survey was cross-sectional and non-randomized.

Results. Path analyses showed the presence of the mediating role of internal violence between workplace prevention climate and exhaustion, as well as the mediating function of both types of violence between workplace prevention climate and intention to leave. Moreover, an indirect effect through exhaustion between internal violence and intention to leave was highlighted.

Limitations. 1) the cross-sectional design and 2) the use of self-report measures.

Practical implications. These findings suggested that organizations which invest in preventive measures may reduce incidents of violence and, in turn, prevent negative consequences on worker well-being.
Martin .R. Edwards, Joeri Hofmans, Riccardo Peccei and Karen Pak

State of the Art: “Person-centred” approaches have the potential to lead to new theoretical insights (Zyphur, 2009). This symposium (one of two) presents state-of-the-art discussions and empirical papers exploring person-centred approaches in various spheres of WOP. Person-centred approaches assume heterogeneity in samples/populations and various techniques are used to explore this (e.g. cluster analyses or latent profile/class analyses). These methods help researchers identify different configurations of employee responses across multiple factors/characteristics in tandem; something which variable-centred (regression-based) approaches struggle to do.

New Perspectives/Contributions: The four papers in this symposium contribute to key areas by taking this state-of-the-art person-centred analytic lens. The first presents a convincing case for stepping away from variable centred/nomothetic regression-based approaches; highlighting new ways to approach WOP questions. The second offers a new lens from which to explore holistic profiles of psychological responses to workplace turmoil; identifying profiles of employee responses over time to restructuring/downsizing. The third utilises a multi-level dataset, exploring employee well-being profiles (identified at the individual level based on satisfaction and exhaustion) relate to group-level outcomes (aggregate customer satisfaction). The fourth paper demonstrates the utility of taking a person-centred approach by profiling well-being (e.g. motivation and sickness absence) and adaptive related employee outcomes (engagement and ability) linked to ageing in the work place.

Research/Practical Implications: The novel lens applied with each of these talks in the symposium help demonstrate the utility of applying a person-centred approach to central areas of Work and Organisational Psychology; each paper discusses the practical implications of this application.
Paper 1: The need for an idiographic lens in work and organizational psychology

Joeri Hofmans
Vrije Universiteit Brussel, Belgium

State of the art
Traditionally, work and organizational psychology (WOP) has strongly aligned itself with a nomothetic perspective on science, resulting in a robust engagement with the study of between-person differences. However, a tension remains between the nomothetic perspective and the awareness that many of our behaviors, thoughts and feelings reflect complex dynamic, intra-individual processes that are manifested over time in response to and in interaction with the individual’s environment. Exactly this awareness lies at the core of the idiographic perspective on science, whose aim is not to identify patterns of behaviors, cognitions and affects that describe the average individual; instead, idiographic methods aim at studying and describing these patterns within one individual across a sample of experiences or situations. Hence, the aim of the idiographic approach closely aligns with one of the central goals of WOP, namely, deriving principles of individual, group and organizational behavior and applying this knowledge to the solution of problems at work. Moreover, it is also consistent with interests from practitioners, as interventions typically target changes within an individual. However, due to low statistical power and the limited generalizability of traditional idiographic methods, the popularity of idiographic methods has been limited up until today.

New Perspectives/Contributions: I explain how experience sampling, combined with a series of person-specific and person-centered analytical techniques can be used to examine person-specific and person-centered structures and processes.

Research/Practical Implications & Originality/Value: Using examples from the personality and leadership field, I discuss how WOP can benefit from adopting an idiographic lens.

Paper 2: A person-centered approach to modelling holistic employee reactions during restructure/downsizing.

Edwards, M.R. and Clinton, M.E.
King’s Business School, King’s College London

**Purpose:** We used a person-centered approach to identify holistic profiles of employee responses to an organisational restructure/downsizing over 2 years. We identified profiles based on configurations of anxiety, commitment and work engagement and explored whether early uncertainty demands and support/job-control resources predicted response profile membership. We also explored whether response profile membership predicted procedural justice perceptions later in the process.

**Design/Methodology:** Survey data was collected across three-waves (N=342) with 12 months lag from employees in a UK public-sector non-departmental government body facing fundamental restructure/downsizing.

**Results:** GMM identified 3-classes with a positive-stable coping profile along with two mixed response patterns; labelled as cynics and anxious primary appraisers respectively. Lower levels of (Time-1) perceived uncertainty predicted membership of the stable-coping versus mixed response profiles; this effect fell away once support/job-control resources were included as profile membership predictors. The positive stable coping profile showing higher early levels of these resources and the more positive-stable growth response profile showed higher levels of procedural justice perceptions later in the process (Time 2 & 3).

**Limitations:** Participant-dropout necessitated the use of MAR missing data analyses techniques; because MAR cannot be utilised with the linear and multinomial-logistic regressions, the sample size will vary when exploring correlates of profile membership.

**Implications:** The application of person centred analyses helps demonstrate the heterogeneity and employee responses to downsizing; the profiles help us understand possible types of employee responses through this uncertain and tumultuous period response profiles.

**Originality/Value:** This paper is unique in profiling trajectories of holistic employee responses to downsizing/restructuring.

**Paper 3: Employee well-being profiles and service quality: A unit-level configurational analysis**

**Miriam Benitez¹, Riccardo Peccei², Francisco J. Medina³**

¹Málaga: University; ²King’s College London, ³Seville University

**Purpose:** To enhance theoretical and empirical understanding of the unit-level relationship between employee well-being (job satisfaction and emotional exhaustion) and service quality by (i) introducing the idea of well-being profiles to capture the conjoint effect of satisfaction and exhaustion on service quality, and (ii) adopting a novel configurational approach to
examine the extent to which the distribution of employee well-being profiles in a work group affects the level of service quality provided by the group, as perceived by customers.

**Design/Methodology:** Study is based on combined employee-customer data covering a sample of 396 employees and 1233 customers from 91 restaurant and reception work units in 42 hotels in Spain. Latent profile analysis (LPA) was used to identify distinct individual-level well-being profiles which were then aggregated to the group level to predict group-level service quality as assessed by customers.

**Results:** In line with theoretical expectations, the results showed that work groups with a more positive distribution of well-being profiles (i.e. with a greater proportion of employees with high levels of job satisfaction combined with low levels of emotional exhaustion) significantly outperformed work groups with a less favourable internal distribution of well-being profiles.

**Limitations:** Need to test specific mechanisms through which employee well-being profiles affect service quality.

**Research/Practical Implications:** Importance of considering employee well-being in the round and trying to enhance employee satisfaction while simultaneously reducing exhaustion.

**Originality/Value:** Shows the value of using a configurational/person-centered approach over a variable-centered one for understanding the unit-level relationship between employee well-being and service quality.

**Paper 4: A person-centred approach to identify subgroups of older workers who age successfully at work**

**Kooij¹, T.A.M., Kunst, E.M., Pak¹, K., and Van den Heuvel², S.**

¹Human Resource Studies, Tilburg University; ²TNO

**Purpose:** Although research on older workers treats older workers as a homogeneous group we know from lifespan psychology literature that older adults are a heterogeneous group. Hence, general statements that describe the average trends of older workers as a group provide little knowledge on how older workers can age successfully at work. Therefore, we used a person-centred approach to identify subgroups of older workers based on their (un)successful aging at work trajectories (i.e., trajectories in work outcomes related to the ability and motivation to continue working; work ability, age until you can work, work engagement, and sick leave). We also explored whether these subgroups differ in personal resources.

**Design/Methodology:** We used secondary data of the Study on Transitions in Employment, Ability and Motivation which consists of four measurement moments with one-year time lags (N = 10,215 in this study). We conducted latent profile analyses based on the intercepts and slopes as identified in growth curve analyses to distinguish subgroups of older workers.
**Results:** Our analyses identified three subgroups of older workers: 1) average agers (55% of the sample); 2) successful agers (26% of the sample); and 3) unsuccessful agers (19% of the sample) which differed in the personal resources vitality and mastery.

**Limitations:** We were limited by the variables measured in the existing dataset.

**Implications and originality/Value:** This paper is unique in distinguishing subgroups of older workers which is very important to take into account when developing and implementing interventions to increase successful aging at work.
Noémi Nagy, Jose Navarro, Yvonne van Rossenberg, and Tim Vantilborgh

State of the Art: Person centred procedures can be particularly useful for advancing WOP research: In recognizing the interrelatedness between or among variables as a function of the unobserved heterogeneity of the population we are able to answer novel research questions, provide a more fine-grained understanding of central issues and develop better theories (Wang & Hanges, 2011).

New Perspectives/Contributions: The four papers presented use a person-centred lens to investigate novel research questions: The first paper examines workplace commitment using fuzzy set Qualitative Comparative Analysis (fsQCA) and provides insights into the complex system of employee attitudes and behaviors. The second investigates the interplay of the two central pre-conditions of the “flow experience”: Challenge and skill. The third paper explores the temporal trajectories of trust after a psychological contract breach, contradicts earlier findings and assumptions, and highlights the utility of person-centred investigations. The fourth paper, based on the theory of aged heterogeneity, provides valuable insights into the job crafting behavior of late career employees while challenging the general notion that job crafting simply decreases with age.

Research/Practical Implications: The symposium’s aim is to highlight the opportunities inherent in a “switch of analytical mind sets” by examining patterns of variables rather than only the amount of variance one variable explains in another (Stanley, 2017). The current selection of papers give a taste of the manifold and diverse topics that can be investigated with person-centred analyses and highlight how this perspective may lead to additional theory development and practical insights for WOP research.

Paper 1: We don’t need to commit to perform... It’s in the mix! A configural examination of workplace commitment in contemporary work

Van Rossenberg, Yvonne G.T ¹, Leisching, Alexander ², & Swart, Juani ³

¹ Nijmegen School of Management, Radboud University, Nijmegen, the Netherlands
Purpose. How workplace commitment affects employee behavior is traditionally understood on the basis of social exchange theory, however, fundamental changes in the nature of work weaken the applicability of these social exchange theories. In contemporary work settings, work takes place increasingly outside the boundaries of the organization (Swart and Kinnie, 2014). Interaction and engagement with those parties builds on employees’ capacity to form commitment to multiple foci or targets (Becker, 1992; Klein, Cooper, Molloy and Swanson, 2013). Commitments to multiple targets are often found to combine to influence intentions and behavior (Klein, Becker, and Meyer, 2009; Yalabik, van Rossenberg, Swart and Kinnie, 2015), including work performance.

Design/Methodology. This study examines workplace commitment using a person-centred approach using fuzzy set Qualitative Comparative Analysis (fsQCA).

Results. Findings show, surprisingly, that neither of four foci of commitment nor tenure are necessary conditions for performance. Rather, we find two constellations of sufficient conditions for predicting performance, which show complementary effects between local commitments and substitution effects for commitment crossing organizational boundaries. Further, findings show commitments are core conditions for performance when organizational tenure is low, whereas commitments are peripheral conditions for performance when tenure with a client organization is high.

Implications and Originality/Value. These findings underscore the potential of the configurational approach and fsQCA to provide novel insight into the complex system of employee (commitment) attitudes and behaviors, which is particularly useful for the management of these constellations in contemporary work settings.

Paper 2: Flow experience and the ‘golden rule’ of having a challenge/skills balance: Does it work for everyone?

Navarro, Jose¹, Reuteler, Daniela¹, Ceja, Lucia² & Giovagnoli, Sara³

¹ University of Barcelona, Spain
² IESE-Business School, University of Navarra, Spain
**Purpose.** The present study focuses on flow’s universal pre-condition of balance between challenge and skills. The aims was to better understand this variables interplay exploring its effect on the flow experience using a person-centered approach.

**Design/Methodology.** We collected 6982 registers of 60 employees from different occupations. At intra-individual level, we study the nature of the relationship between challenge and skill using dynamical correlations. Participants were classified in clusters according to these correlations. At inter-individual level, we explored the effect these clusters had on the flow experience applying mean comparisons and examining differences between working and non-working activities.

**Results.** Challenge-skill relationship is not homogeneous across individuals appearing three different patterns: positive (21% of the cases in working activities, 12% in non-working), negative (45%-47%) and non-significant relationship (33%-40%). Positive relationship group showed the higher mean values in flow experiences (76.40 vs 70.81 [not significant group], vs 61.87 [negative relationship]; p < .01), but this only happened in working activities.

**Limitations.** The sample considered showed people with medium-high values of flow, which is not representative.

**Implications.** Due the presence of different patterns, challenge and skills should be considered as independent dimensions. According with the original flow model, a positive relation between challenge and skills explains better the appearance of flow. However, this pattern is the less frequent to find following our results. Additionally, this positive pattern generates flow at work, but not in non-working activities.

**Originality/Value.** To apply a person-centered approach to discover different pattern of relations between challenge and skills.

---

**Paper 3: Trust trajectories following psychological contract breach perceptions: Does everyone recover from breach?**

**Vantilborgh, Tim \(^1\), Griep, Yannick \(^2\)**

\(^1\) Vrije Universiteit Brussel, Belgium

\(^2\) University of Calgary, Canada
**Purpose.** Psychological contract breach has been shown to erode trust. However, little is known about how trust unfolds over time following breach perceptions. Studying these temporal fluctuations matters because it allows us to examine if people recover from breach perceptions or not over time.

**Design/Methodology.** We collected data from 345 people working in a large non-profit organization. Respondents were asked to complete 20 weekly diary surveys. From this sample, we selected respondents ($N=70$) who had experienced a breach, focusing on reported levels of trust during a five-week period following the breach.

**Results.** A latent class growth model with an intercept, slope, quadratic, and cubic term offered the best fit to our data. We found 4 classes of trust trajectories: a stable trust trajectory (83%), a decreasing trust trajectory (10%), an immediate and delayed decrease trajectory (4%), and an immediate and delayed increase trajectory (3%). General perceptions of psychological contract breach prior to ($\chi^2(3)=118.30, p < .001$) and after ($\chi^2(3)=13.75, p = .003$) the trust trajectory were significantly different between these four classes.

**Limitations.** Our results may be specific to our sample and hence replication is required.

**Implications.** We demonstrate that different classes of trust reactions to breach events can be discerned. Thus, not everyone recovers from experiencing breach. Moreover, we show that breach events can have immediate and delayed effects.

**Originality/Value.** Our results suggest that most respondents do not show any temporal trust reactions to perceptions of psychological contract breach, which contradicts earlier findings and assumptions in the literature.

---

**Paper 4: Predictors and consequences of job crafting strategies of older workers:**

*A latent profile analysis*

*Nagy, Noémi* $^1$, *Hirschi, Andreas* $^2$, *Wang, Mo* $^3$

$^1$ *Work- and Organizational Psychology, University of Berne, Switzerland*

$^2$ *Warrington Business School, University of Florida, USA*
**Purpose.** Although previous research has pointed out the utility and importance of job crafting in late career for successful aging at work, meta-analytical evidence suggests that overall, job crafting behavior decreases with age. However, virtually no empirical research exists to inform us about whether, how, and under which circumstances late career employees engage in job crafting.

**Design/Methodology.** The current research investigates job crafting behavior of 231 German late career employees (M = 55.9 years, 50.6% female) from a broad variety of vocations and industries with a 2-week time-lagged design from a person-centered perspective.

**Results.** Building on the theory of aged heterogeneity, we examined the heterogenous usage of job crafting strategies in late career and confirm that older workers use combinations of job crafting behaviors simultaneously, which can be categorized into four distinct profiles: Low crafters, avoidance crafters, approach crafters, and balanced crafters. We moreover confirmed that person- (proactive personality, occupational future time perspective) and context-related variables (autonomy, age-inclusive developmental climate) significantly predicted profile membership. Furthermore, profile membership predicted job satisfaction and retirement intentions two weeks later.

**Limitations.** Self-report data limit the generalizability of the results.

**Implications.** The current research adds valuable insights into the job crafting behavior of late career employees and challenges the general notion that job crafting simply decreases with age.

**Originality/Value.** The current research constitutes an important step in better understanding diverse job crafting strategies of older workers, including their enabling personal and contextual factors and impact on job attitudes.
The Revolution of Video Interviews: Are They Just Hype?

VI-1
Nico Tschöpe, cut-e Group, Germany

State of the Art
Due to globalization and increasing digitization, the traditional recruitment process is changing with increasing distances to overcome. Application processes are rarely taking place exclusively on a local level, while national or international applications are becoming popular. As a result, new recruitment requirements have emerged suggesting the need to develop new assessment methods. Video Interviews could be an answer as they are a convenient and flexible method of conducting structured online job interviews across time and space.

New Perspective
Video Interviews and Video Assessments will be discussed by experienced scientists and practitioners. The aim is to evaluate the future relevance of this promising technology and to outline potential benefits and challenges for the field of recruitment. Davide Cannata (National University of Ireland Galway) will give a brief introduction to Video Interviews. Nico Tschöpe (cut-e Group) will outline a wider scope of application opportunities for Video Assessments. Katharina Lochner (University of Applied Sciences Europe) will talk about Natural Language Processing as a foundation for methods that automatically process speech data. Richard Justenhoven (AON Assessment Solutions) will present a study on candidates’ reactions to their awareness of artificial intelligence ratings. In the last session, the chair will facilitate an open discussion with all experts and the audience.

Implications
With the introduction of Video Interviews, a lot of questions arise in terms of Applicability, Ethics, Psychometrics, Data Security, Legal Issues and GDPR. The symposium will systematically address opportunities and challenges for research and practice.

Asynchronous Video Interviews: What we know and want to know (but we’re afraid to ask)
VI-2
Davide Cannata, National University of Ireland Galway, Ireland

Asynchronous Video Interviews (AVIs) are already widely used in employee selection. Although their practical advantages are well known (Meja and Torres, 2018), they have recently been scrutinized by the scientific community. This presentation aims to summarise what we currently know regarding Video Interviews, including their validity, equivalence with face-to-face interviews, candidate reactions, adverse impact and practitioner reactions. We will draw a conceptual map of state-of-the-art practices by examining the different branches of research on the subject:

- Although many theories and indirect studies suggest that AVIs can predict job performance no single quality study has directly explored this relationship;
- AVI cannot be interchangeably used with other form of remote or face to face interviews because they lack rating equivalency;
• Candidates react more positively to face-to-face interviews than to AVI. However, recruiters tend to use the two assessments at difference stages of the application process and the comparison has questionable value for practice.

The review of the literature reveals that AVIs have high potential and can be a game changer for personnel selection. At the same time, despite a recent surge in the interest for the AVI, the topic is understudied and there is a significant gap between practice and literature. Actions to reduce this gap are proposed within a framework for future research that includes the near-future technological development of the AVI such as the introduction of Artificial Intelligence.

The Future of Video Assessment: Death of Traditional Online Assessment?
VI-3
Nico Tschöpe, cut-e Group Hamburg, Germany

State of the Art
Amongst other technologies, Video Assessments (VAs) can be one of the most far-reaching achievements of digitization for the field of recruitment. Their complementary use of extending well-proven measurement methods promises to be an extensive enhancement of online assessments. Further, their potential use to develop new diagnostic methods reveals a broad range of opportunities and challenges. Even though there are many design- and technical-related applications, several psychometric questions arise.

Approach
This session aims to evaluate the variety of possible applications of VAs within a three-step framework: a) tasks and stimuli, b) appearance, design and implementation and c) collection, processing and analysis of video data. Furthermore, respective research questions will be presented, and corresponding psychometric challenges will be outlined.

New Perspective
At the moment, VAs are mainly used to conduct structured online job interviews in either synchronous or asynchronous formats, which offers a more flexible behavioural assessment of candidates at earlier stages of the recruitment process. However, more extensive applications of VAs are conceivable, such as interactive and video-based assessments, case studies, realistic simulations, assessment monitoring and even artificial intelligence ratings.

Implications
VAs are widely used in practice yet understudied, which indicates the urge to systematically explore a broader scope of VAs and their applicability for recruitment purposes. In practice, the outlined challenges should be considered as design implications for their implementation.

Originality
This session attempts to outline an exploratory framework for VA research.
Language Analysis in Psychometric Assessment

Katharina Lochner, University of Applied Sciences Europe, Germany

In psychology, language has been used to make inferences about personality for many years, such as the lexical approach to creating the Big Five Model (John et al., 1988). Advancements in the field of artificial intelligence and machine learning take this to a new level. For example, IBM's Watson infers personality from written communication (Dietrich, 2015). Thus, can we use language analysis in psychometric assessment?

State of the art

Language use is internally consistent, and differs among people (Boyd & Pennebaker, 2017). However, findings regarding reliability are mixed (Boyd & Pennebaker, 2017; Schwartz et al., 2013). A recent meta-analysis indicates that language is a valid measure of personality (Azucar, Marengo, & Settani, 2018) and, under certain conditions, integrity (Hauch et al., 2015).

New perspectives/contributions

To date, research has not focused on use of language analysis in psychometric assessment. Thus, the paper explores which of the most valid predictors of job performance (general mental ability, integrity, personality) can be assessed using language analysis, as well as its reliability and validity.

Research/practical implications

Language analysis seems to be a promising approach to personality assessment. However, further research needs to establish reliability, validity, and generalizability across different groups. Moreover, research should explore using LinkedIn and video interview data in addition to social media data.

Originality/value

To date, research has focused on using social media posts for predicting personality and other attributes. This paper is the first to explore the opportunities for using language analysis in psychometric assessment.

Rage Against the Machine: Reactions to Artificial Intelligence in Selection Systems

Richard Justenhoven, Aon Assessment Solutions, Germany

Purpose

Organizations are increasingly leveraging technology such as Artificial Intelligence (AI) and machine learning to aid with employee selection decisions. Through complex algorithms, AI can efficiently gather and integrate applicant data to even make hiring decisions. Despite growing interest in using AI to automate personnel decisions, little is known about how job applicants would react to such practices.

Approach

We examined how people react to the use of AI when making employment decisions, as well as the organizational implications of these reactions.
Methodology
We recruited 207 participants for a 2x2 (AI/human-hire/reject) between-subjects design. Participants applied for a job where the hiring decision was solely made by either a human recruiter or an AI. Participants completed several items regarding their reactions to the procedure. We then manipulated the outcome so that the AI or recruiter either did or did not select them for the job they were applying for, after which point, participants completed items regarding their reactions to the decision.

Results
Participants in the AI condition reported significantly less favourable reactions than participants in the human condition. The data suggest that AI usage may evoke more interpersonal concerns than procedural concerns. Participants varied widely in how comfortable they would feel applying to a job where an AI would be used to make the hiring decisions.

Implications
Our findings have important practical implications for organizations that are using AI or considering doing so. For research implications, this study makes several theoretical contributions that will be discussed deeper during the session.
State of the art. Focusing on employee strengths leads to increased levels of work engagement and employee well-being, which in turn reduces absenteeism and turnover costs for the organization. Today, researchers are investigating the underlying processes that help explain the effects of a strength-based approach at work. The aim of this symposium is to discuss evidence from empirical studies from four different countries examining how strength-based approaches may lead to organizational improvement.

New Perspectives/Contributions. This symposium incorporates studies on the social and situational determinants and outcomes of strength use at work. Philippe Dubreuil and Claudia Harzer explore the idea that using different types of strengths has different outcomes, i.e., that some are more important for well-being while others are stronger predictors of performance. Sahar Amoury-Naddaf also investigates the outcomes of different types of strengths, in this instance regarding how they interact with the social environment in schools. Next, Hannah Moore introduces a conceptual model that includes colleague recognition of strengths as a predictor of individual levels of work engagement. Finally, Marianne van Woerkom presents a study examining the impact of a strengths-based approach in the context of performance appraisal interviews.

Research/Practical Implications. Taken together, these studies shed light on the social embeddedness of strength use by suggesting that the application of signature strengths is not only beneficial for the users, but also for others around them. Furthermore, apart from strength use, strength appreciation by others is associated with increased levels of work engagement and with improved relationships in the workplace.
Similarly, we also examined how these variables predict supervisor-rated work performance (i.e., proficiency, adaptation to change and proactivity).

**Design/Methodology.** Our study examined two online samples of German (n = 103) and Canadian (n = 90) workers from a wide variety of professions. Additional participants are expected to complete the study.

**Results.** Preliminary results indicates that teamwork, fairness, social intelligence, perseverance, zest and leadership are the most important predictors of well-being. Similarly, leadership, perseverance, love of learning, fairness and perspective are the most important predictors of work performance. Regarding clusters, results reveal that the application of signature strengths, as well as happiness strengths (i.e., curiosity, zest, love, gratitude, and hope) are both associated with well-being and work performance.

**Limitations.** Our study employed a cross-sectional design which does not allow for any causality attributions.

**Research/Practical implications.** Our results suggest that some character strengths could be better predictors of well-being and performance at work than others.

**Originality/Value.** Our study adds to the existing knowledge by exploring relations between specific sets of character strengths, PERMA dimensions of well-being and supervisor-rated work performance.

---

**Principals’ Strengths Use:**
**Links with Teachers’ and Students Feelings in School**

Sahar Amoury-Naddaf and Shiri Lavy
The University of Haifa, Israel

**Purpose.** Character strengths are positively valued attributes, and their use was hypothesized to affect not only the users, but also others around them, and the organizations in which they dwell. However, these later effects have not been widely examined. The present study aimed to provide initial evidence for such effects, while exploring associations of school principals’ strengths use with teachers’ and students’ feelings.

**Methodology.** We surveyed 69 principals and 374 teachers in their schools, who completed two different self-reports measures of strengths use at work. Teachers also completed measures of sense of meaning at work and performance. Students’ reports of school climate were retrieved from the Ministry of Education records.

**Results.** Principals’ general strengths use was positively associated with school climate, as well as with teachers’ strengths use. Furthermore, principals’ specific use of their intellectual strengths was also positively associated with school climate, their use of gratitude.
was associated with teachers’ performance, and use of perspective (wisdom) was associated with teachers’ sense of meaning at work.

**Limitations.** The study was cross-sectional, conducted in one country (Israel) and comprised a limited number of teachers from each school.

**Research/practical implications.** The findings highlight potential effects of principals’ strengths use on teachers and students, suggesting that it may contribute to teachers’ strengths use and enhance a positive school climate. Furthermore, principals’ use of specific strengths may have additional unique value.

**Originality/value.** The study demonstrates the importance of exploring strengths use effects on others, and developing more complex theoretical models of strengths use effects.

---

**Strength Use and Work Engagement:**
**The Role of Colleague Recognition**

Hannah L. Moore, Arnold B. Bakker, and Heleen van Mierlo
Erasmus University Rotterdam, the Netherlands

**Purpose.** A strong predictor of work engagement is the extent to which people use their personal strengths at work. How much does it matter whether these strengths are recognized by others in the work environment? In this study, we investigated the role that colleague recognition plays in the strength use-work engagement relationship.

**Design/Methodology.** Dutch employees \((N = 447)\) from a broad range of job sectors completed an online survey on strengths, resources, and work engagement. Each participant was asked to solicit one close colleague to participate as well, who was then prompted to indicate to what extent they considered the original participant’s self-reported strengths as being characteristic of the participant – 158 colleagues responded.

**Results.** Our findings showed that the extent to which participants indicated using their self-reported strengths at work did not directly relate to whether those strengths were recognized by a colleague, \(r(158) = .11, \ p = .158\). Nevertheless, colleague recognition of strengths was associated with increased levels of work engagement over and above self-reported strength use, \(t(156) = 14.69, \ p < .001\), which suggests colleague recognition also plays a pertinent role in uncovering the underlying mechanisms of strength-based approaches at work.

**Limitations.** Our design does not allow for causal conclusions.

**Research/Practical Implications.** Focusing on recognition and support of strengths at work reveals fruitful information on how organizations can create environments in which employees reap the most benefits from focusing on their strengths.
**Originality/Value.** Our findings suggest that the social aspect of strengths is an underestimated factor.

**The effect of performance appraisal on the relationship with the supervisor and on motivation to improve**

Marianne van Woerkom, Brigitte Kroon and Rosalie Hutschemaekers

Tilburg University, the Netherlands

**Purpose.** Performance ratings may challenge employees positive self-view. To soften the harmful effects of this threat, employees may withdraw from the relationship with their supervisor by disqualifying their relationship with this person. However, besides the final performance rating, the content of what is discussed in the performance appraisal is also important. We investigated the effect of performance ratings on the relationship with the supervisor and to what extent this relationship might be buffered by a focus on employee strengths during the interview.

**Design/Methodology.** 422 employees of an IT consultancy firm filled out a questionnaire right after their performance appraisal interview. Their performance ratings were obtained from the organizational records.

**Results.** Our findings showed that the official performance rating was positively associated with the quality of the relationship with the supervisor, whereas the discrepancy between the self-rating and the supervisor rating was negatively associated with the relationship with the supervisor. A focus on employee strengths during the appraisal interview turned out to moderate these relationships.

**Limitations.** Our design does not allow for causal conclusions.

**Research/Practical Implications.** Even though the purpose of performance appraisals is to motivate employees for a better performance, performance ratings may harm the relationship between employees and their supervisor. However, appreciating the strengths of the employee in the appraisal interview improves the relationship with the supervisor and prevents harm to the relationship when the performance rating is low.

**Originality/Value.** This is the first study that investigates the effects of a strengths-based approach in the context of performance appraisal.
Chairperson:
Daniela Acquadro Maran, Phd, Assistant Professor, Department of Psychology, Università di Torino, Italy

The aim of this symposium is to illustrate work-related stressors (occupational, organizational, individual) and the related interventions carried out for Police Force that operate in Italy, Greece and Spain.

The distinguishing features of the Police Force are closely linked to the national issues and involve a variety of activities, such as crime prevention and intervention, control and information activities. Police Officers’ work is provided 24 hours a day, 7 days a week. For these workers, stressors include interpersonal conflicts and burdensome workloads. The relationship with the public implies often a physically or psychological risky exposure to traumatic events, to violence and to human suffering. These stressors necessarily affect physical and psychological health and, as a consequence, these workers report a variety of disorders related to work fatigue. A wide range of psychological problems have been identified in this population, especially post-traumatic stress symptomatology, anxiety and depression related to chronic stress, that may lead to long lasting problems to workers’ mental health. The chronic stress condition can cause life-style negative modifications, such as cigarette smoking, eating disorders, alcohol and drug abuse, self-harm thoughts or behaviors. Some conditions of addiction or self-harm may result in suicidal inclination. The coping strategies, if adaptive (the aim of such strategies is to obtain social and family support, by sharing the experience with others), could be a protective factor; otherwise if they are maladaptive (e.g. using self-destructive lifestyle, such as alcohol misuse), they could contribute to increase the stress or make it chronic.

Discussant: Nicola Magnavita (1) and Sergio Garbarino (2,3)

(1) Occupational Health Unit, Department of Woman/Child and Public Health Sciences, Università Cattolica del Sacro Cuore, Rome, Italy.
(2) DINOGMI, University of Genoa, Genoa, Italy.
(3) Ministry of Interior, Italy.

TITLE: SUICIDE IN POLICE OFFICERS
Police officers are probably the occupational group that poses the highest risk to others, because they are armed, active 24 hours a day and essentially everywhere. What’s more, they are under growing pressure during law enforcement and their behavior is increasingly scrutinized by the media.

Nevertheless, in many countries, police officers are not subject to health surveillance, but only to medical examination at recruitment. Their health deteriorates more than that of the general population, and they have an increased risk of post-traumatic stress disorder, chronic job strain, metabolic syndrome and depression. Generally, they do not seek medical or psychiatric help.

Data on suicide in the police force are difficult to obtain. Between 1999 and 2011, there were 137 suicides in the Italian police force, a number almost equal to that of the police officers killed by criminals or who died on duty (143). More than 91% of cases used their service firearm.

Currently in the Italian police force, firearms are withdrawn in every suspected case of impaired mental health, behavioral disorders, alcohol or drug use, and in cases of diagnosed psychiatric illnesses. Workers with severe mental illness, permanently impaired and unfitting for police job, are not fired, but become civil servants. Since police work is conducted for the public, the ethical conflict between public and individual interests must be resolved to protect the former.

Discussant: Eloísa Guerrero-Barona, Phd, Professor Titular, Department of Psychology and Antropology, Universidad de Extremadura, Spain

TITLE: RISK AND PROTECTIVE FACTORS IN LOCAL AND NATIONAL POLICE AT THE CENTER OF EMERGENCIES OF EXTREMADURA

The present work will present a study on risk factors, vulnerability and protection factors in local and national police.

Its first objective was to analyze the sources of stress and investigate if some specific characteristics of the job may have an influence on police officers’ stress and emotional intelligence profiles.

As a second objective we proposed to compare the job as a national or local police officer to other, different jobs, with regards to the impact they might have on stress and emotional intelligence.

To this end, a cross-sectional study was carried out in which the total number of professionals from the 112 Urgency and Emergency Care Center of Extremadura participated. Reliable assessment instruments with adequate psychometric properties were used. Some results show that the highest levels of stress correspond to the group of local police when compared to the rest of the professional categories. However, the emotional intelligence in this group seems not to be affected.

Discussant: Cristina Civilotti, Phd, Clinical Psychologist, Università di Torino, Italy
TITLE: WORK RELATED STRESS AND SUICIDAL RISK IN POLICE OFFICERS: ARE THERE ANY GENDER DIFFERENCES?

Many researches have highlighted a gender difference in stressor and coping strategies in Police Force population. For this reason, there is a need of a comprehensive understanding of both the similarities and the differences between male and female police officers in terms of risk and resilience factors and mechanisms implied in facing stress in order to tailor efficient training courses and stress reduction interventions. Apparently, some stressors are common to both genders, such as the difficulty of working with colleagues due to the lack of cooperation and confidence in their emotional and relational competence (Acquadro Maran, Varetto, Zedda, Franscini, 2014).

Focusing on differences, women perceived the lack of cooperation and professional recognition for their job as a critical element more than men. Moreover, for women the difficulties appear to be mainly associated with perceived problems related to respect for their role and inclusion within the organization. Male patrol police officers activate a wider range of adaptive coping strategies (Active Coping, Planning, Instrumental Support, Positive Reframing, Humor), indicating good ability to reduce the risk of general psychological distress, and which can therefore be regarded as a protective factor against organizational and operational distress. The coping strategies used by female patrol police officers indicate the search for Emotional and Instrumental Support and, as for men, problem-solving abilities are related to good comprehension and a positive critical interpretation of problems. Clinical implications of this perspective will be discussed.

Discussant: Nikos Papanikolaou (1) and Maria Kypriotaki (2)

1) Clinical Psychologist, Psychotherapist, Crete, Greece
2) Assistant Professor of Special Psychopedagogy in Early Childhood, Department of Preschool Education, University of Crete, Greece

TITLE: GREEK POLICE OFFICERS’ PERCEPTIONS, EXPERIENCES AND WORK RELATED STRESS: TWO CASE STUDIES

Police officers’ work is a profession at high risk for work stress (Violanti et al., 2016). The aim of the present qualitative study is to explore Greek police officers’ experiences within family, work and social context as well as work-related stress during the period from their being on duty until today. The participants involved in the present study were a male and a female police officer. Qualitative research project was conducted using a purposing sampling technique and semi-structured interviews (ten interviews) to examine police officers’ experiences through several contexts. The experiences of the police officers included relationships with partner and
children, parents and siblings, as well as relationships and team climate with superiors and colleagues. As police officers’ perceptions and experiences were also considered satisfaction and meaning from life, self-perception and self-efficacy, personal achievement and goal orientation, general health, strengths and difficulties (problems and needs), career development /burnout, psychosocial dimensions of family burden due to work-related stress (depression, anxiety, stress), work-related characteristics (autonomy, significance, work identity), psychological well-being, and coping strategies. Results will be discussed in terms of gender differences and police officers’ worries about their future regarding symptoms of anxiety, depression, social dysfunction, and somatic disturbance related to work. Recommendations for future research will be provided in order to design intervention programs and support police officers in early stages before expressing work-related stress.
DO YOU SEE WHAT I SEE? THE IMPORTANCE OF SELF- AND OTHER PERCEPTIONS AND THEIR IMPACT ON JOB PERFORMANCE

Symposium Chairs. W. N. Yang¹, C. E. Owens²

Discussant. M. Ono²

¹King’s Business School, King’s College London, London, ²Alliance Manchester Business School, University of Manchester, Manchester, United Kingdom

State of the Art. Different perspectives can lead to a different understanding of the same issue, yet not many studies include multiple sources of data when investigating a research question. This symposium brings together a collection of papers that investigate how self and other perceptions affect employee outcomes, especially their job performance.

New Perspectives/Contributions. The symposium includes four studies from diverse disciplines in organisational psychology. The first study investigates whether observer-ratings of facet-level personality offer better predictive validity for performance than self-ratings. Second, the influence of non-teleworkers’ behaviours on teleworking employees’ performance and participation in telework is examined. Next, a meta-analysis is used to explore whether the inconsistent relationship between career plateau and job performance is due to their measurements from different perspectives. Finally, reasons for career plateau are collected from both employees and supervisors, and the incongruence between the two perceptions are investigated to determine whether they have an impact on employee success and performance.

Research/Practical Implications. The symposium offers evidence that data collected from different perspectives make a significant difference to our understanding on the impact of personality, telework and career plateau on employee performance. Managers should therefore be cautious about over-relying on findings that are based on a single source. Scholars in the field of organisational psychology are also encouraged to adopt a more rigorous approach (namely, including multiple sources of data) in addressing their questions of interest. Audience members are encouraged to ask questions and the discussant will facilitate discussion.
Title. When predicting overall job performance, is personality best assessed by the observer?

Authors. C. E. Owens¹, P. Irving¹, S. Clarke¹

¹Alliance Manchester Business School, University of Manchester, Manchester, United Kingdom

Purpose. Historically, other than conscientiousness, personality has evidenced weak predictive validities with job performance. Meta-analytic findings suggest that observer-ratings of personality improve predictive validities, but most research applies this to the broad factor-level. We examined whether this also holds true for personality measured at the narrow facet-level.

Methodology. This study comprised 1,041 participants; 92% were employed in a UK police organisation. Fifty-one personality facets were rated by the self and two work-colleagues while managers provided job performance ratings. We used regression to estimate the effect of each personality facet on overall job performance.

Results. Concurrent validities ranged from -.18 to .42 with self-ratings, and from -.29 to .39 with observer-ratings. This suggests that a single facet of personality can evidence high validity when predicting job performance. When determining which facet is best, researchers should consider who will be the rater.

Limitations. Most participants were employed at a police organisation, thus these results might only be generalisable within police or possibly military organisations within western cultures.

Research/Practical Implications. A broad list of personality facets was identified, along with their individual ability to predict job performance. Results suggest that, with the appropriate rater, only a few facets need to be measured to ensure highly predictive results.

Originality/Value. In contrast to the mounting evidence at the factor level, this study suggests that sometimes self-ratings of personality facets show superior predictive validities over observer-ratings. Further, when using the correct rater, a single personality facet may have a large effect on job performance.
Title. A qualitative analysis of the influence of non-teleworkers’ behaviour on teleworkers’ performance and participation in telework: Insights from within three organisations

Authors. A. Jones¹, J. Walsh¹

¹King’s Business School, King’s College London, London, United Kingdom

Purpose. Little is known about the effect of non-teleworkers’ behaviour on the practice and outcomes of telework. This study aims to address deficiencies in previous research by focusing on the work group and examining the influence of non-teleworkers’ behaviour on teleworking employees’ performance and participation in telework, under different conditions.

Methodology. The research used an evolved grounded theory methodology to analyse data from 103 semi-structured interviews with teleworkers, non-teleworkers and managers in three organisations: a local authority, a telecommunications organisation and a high-technology firm.

Results. Data analysis revealed that non-teleworkers influenced teleworkers’ performance and practice of telework by displaying four types of behaviour, namely, overt-resistance, covert-resistance; indifference and support. Non-teleworkers approach to telework was related to their perceived level of organisational support for telework, the ‘substitutability’ of teleworkers within the office, and the instrumental value of maintaining relationships with teleworkers.

Limitations. Qualitative, interview-based research of this nature is open to criticisms of subjectivity and generalisability. However, the evolved grounded theory approach, inclusion of multiple organisations and large sample of diverse informants where responses were matched where possible, improves rigour and aids transferability to other contexts.

Research/Practical Implications. Recognition of the specific conditions under which teleworking is conducted and inclusion of responses from non-teleworkers and others affected by telework are essential to our understanding of the outcomes and practice of telework.

Originality/Contribution. The findings demonstrate the consequences of non-teleworkers’ behaviour on teleworkers’ performance and participation in telework and provide unique and much-needed insights into the conditions governing these behaviours.
Title. “Says who?” A meta-analysis on the relationship between career plateau and job performance

Author. W. N. Yang

1King’s Business School, King’s College London, London, United Kingdom

Purpose. Career plateau refers to a stage where employees perceive future promotions to be unlikely. The link between career plateau and job performance has not been in agreement over the years. While some studies indicated a negative relationship, others reported a null effect. The study aim is to reconcile these inconsistent findings using meta-analysis and to examine whether the relationship varies according to measurements of career plateau and performance.

Design/Methodology. A systematic search was first performed on business and management databases, followed by data extraction on studies that included the correlation coefficients between the two variables. The process resulted in 18 samples from 13 studies (N = 6,872), which were conducted between 1983 and 2016. A random-effects meta-analysis was then performed.

Results. The relationship between career plateau and job performance varies according to different sources of performance assessment. Career plateau is negatively associated with objectively rated performance (e.g., supervisory ratings or performance indicators) but not with self-assessed performance.

Limitations. Only studies in English were included in the analysis, thus other major studies may have been excluded.

Research/Practical Implications. Reaching a career plateau does affect employee performance although the employees themselves may not be aware of it. Due to these differing views, companies should be more strategic and sensitive in managing plateaued individuals and in helping them maintain productivity.

Originality/Value. To our knowledge, this is the first meta-analysis in the area. It offers preliminary insight into a long-debated question about the strength of a link between career plateau and job performance.
Title. The incongruence of reasons for career plateauing between subordinate and supervisor perceptions

Authors. Y. H. Wang¹, Y. T. Hsu¹, J.C. Huang²

¹Institute of Human Resource Management, National Sun Yat-Sen University, Kaohsiung, Taiwan, ²Department of Business Administration, National Taipei University of Business, Taipei, Taiwan

Purpose. Reasons for career plateauing have been found to affect plateaued employees’ work outcomes, but these reasons are mostly collected only from the employee’s perspective. The study aims are to collect plateau reasons from both the plateaued individual and the supervisors and examine whether the inconsistent attributions between the two parties have an impact on employee career success, turnover intention and job performance. We also explore whether job embeddedness moderates these relationships.

Design/Methodology. Data are collected from full-time employees and their supervisors via an online survey in a Taiwanese manufacturing company. Hierarchical linear regression analyses are used to test the hypotheses.

Results. Data analysis on the first wave of data (N = 250) showed inconsistent attributions in reasons for career plateauing negatively affect employee career success and job performance, regardless of job embeddedness.

Limitations. The study adopts a cross-sectional design at this stage, which is not free from common method variance. Full data collection across two-time points in due course would reduce this bias and allow investigation for the proposed relationship over time.

Research/Practical Implications. Managers should be aware of their subordinates’ career development situations and have good communication with them to reduce the cognitive dissonance and actor-observer bias (Mitchell & Wood, 1980) and to rid the negative work outcomes of plateaued individuals.

Originality/Value. The study provides a new interpretation of supervisor-subordinate inconsistent attributions on plateau reasons and offers insights into the career literature by emphasising its relationship with job embeddedness.
PROMOTING VOICE AND ETHICAL CONDUCT IN ORGANIZATIONS: WHAT SHOULD LEADERS DO AND REFRAIN FROM DOING?

Stefanie Richter & Jürgen Wegge
Technische Universität Dresden, Dresden, Germany

State of the art
Open communication of ideas and concerns as well as ethical conduct of employees are valuable assets in modern organizations. However, contrasting phenomena such as employee silence and moral misconduct demonstrate that employees are still facing several barriers preventing an open discussion. Therefore, it is essential to identify ways to create a work environment that impedes tendencies of looking away and ethical misconduct, and instead fosters employees’ active involvement.

New Perspectives/Contributions
In this regard, the symposium will especially highlight the important impact of leadership and also take into account further organizational features. First, Dick will discuss and contextualize the ambivalent phenomenon of legitimate whistle-blowing. Next, Jurek and Retowski shift the focus to the phenomenon of employees withholding concerns. Their results indicate that the understanding of reasons for silence may differ depending on the role a person holds in the organization. Third, Dilba and colleagues demonstrate reciprocal effects of silence and leader-follower relationship quality. In a similar vein, Di Marco and colleagues also address leadership and add the impact of organizational justice as determinant of workplace incivility and employee wellbeing. Fifth, Richter and colleagues find that employees’ perception of psychological safety and ethical climate are easily damaged by leaders’ showing inconsistent leadership behaviors. Finally, Weber will scrutinize current ethically-oriented forms of organizational climate and leadership by putting them into the context of applied ethical approaches.

Research/Practical Implications
This symposium emphasizes the important role of leadership in promoting voice and ethical conduct. These behaviors are by no means self-propelling and need to be looked at from different angles.

Whistleblowing: a challenge for organizations and organizational research
Michael Dick
Chair for organizational pedagogy, Otto-von-Guericke University Magdeburg, Magdeburg, Germany

State of the Art
As the importance of cultural and moral values rise generally in democratic societies, they bring about increased expectations on companies. Companies shall force and report on
sustainability or diversity for example. On the other hand, global competition puts pressure to reduce time and costs. These conflicting developments rise the likelihood that organizations violate rules, values or ethical norms. Probably, whistleblowing can help to avoid violating practice, or to reduce the severity of its consequences, because they disclose misleading tendencies earlier.

**New Perspectives/Contributions**

Although the phenomenon of whistleblowing is well defined and discussed, empirical research is limited. Moreover, organizational precautions and measures to support it are poorly developed. One reason is the contradictory and ambivalent concept of whistleblowing. The presentation reveals these different notions, i.e.

- Whether the accuse is made internally (to supervisors, workers council, confidential agents) or externally (press, lawyers)
- Whether it is judged from an organizational or from a behavioral perspective
- Whether it is framed as desirable or undesirable behavior

**Research/Practical Implications**

Along paradigmatic cases the presentation makes distinctions between whistleblowing and other positive organizational behaviors (e.g., organizational citizenship behavior) or misbehaviors (e.g., counterproductive behavior). It reveals enabling and inhibiting factors for whistleblowing documented in literature. In consequence, possible measures for organizations and research approaches are proposed.

**Originality/Value**

Organizations might learn how to handle ethical dilemmas, and might be able to develop institutional measures to support legitimate whistleblowing. In research, an orientation on ambivalent, ambiguous and contradictory phenomena can be encouraged.

**Measurement Invariance of the Four Forms of Employee Silence across Gender, Job Positions and Organizations**

Paweł Jurek² & Sylwiusz Retowski²

¹Institute of Psychology, University of Gdansk, Gdansk, Poland
²SWPS University of Social Sciences and Humanities, Warsaw, Poland

**Purpose**

The main aim of this study was to investigate the measurement invariance of the 12-item Four Forms of Employee Silence scale (Knoll & Dick, 2013) across gender, different levels of job positions and organization’s sizes. Organizational silence refers to self-restraint in expressing one’s opinions, beliefs and emotions in reaction to the improper behaviors of others, bad decisions of the supervisors and transgressions of moral principles.

**Design/Methodology**
A total of 2,300 employees filled in the complete the FFES scale. The sample included managers, employees at specialist positions, and employees at entry-level positions. The group consisted of employees of micro, small, medium-sized, and large organizations. We assessed the measurement invariance of the scale across gender, samples from various organizations’ size and different job positions through multigroup confirmatory factor analyses (MGCFA).

Results
We established that the FFES scale displayed scalar invariance across gender, as well four groups of employees working in organizations of various sizes. However, we established that the FFES scale displayed metric (but no scalar) invariance across three groups of employees at different levels of job positions.

Limitations
Further studies to determine the impact of the role in the organization on the measurement of employee attitudes are needed.

Research/Practical Implications
The results indicate that the comparison of the four forms of silence across employees must take into account the role related to the position held. Managers may understand the reasons for organizational silence differently than non-managers.

Originality/Value
The results indicate the importance of measurement invariance across different groups of employees.

What you don’t tell might hurt as well. Reciprocal effects between follower silence and leader-follower relationship quality
Dominik Dilba¹, Michael Knoll¹, & Oliver Weigel²

¹Chemnitz University of Technology, Chemnitz, Germany
²University of Rostock, Rostock, Germany

Purpose
Silence in organizations – the withholding of work-related ideas, questions, and concerns – hampers individual and organizational learning and the detection of inefficient or unethical behavior, and it has recently been linked to impaired well-being. Prior research has shown that positive leader-follower relationships are important for overcoming silence and thus preventing its detrimental effects. We propose that leader-follower relationship quality (operationalized as LMX) can also be a consequence of silence and thus potentially mediate between silence and outcomes such as employee health. We examine whether follower silence and poor leader-follower relationship quality form a downward spiral.

Design
We conducted a three-wave survey study with 303 working adults enrolled in a distance learning psychology course. Questionnaires were submitted online every six weeks.
Results
A random-intercept cross-lagged panel model revealed reciprocal negative effects of silence and LMX; with both effects being roughly equal in size.

Limitations
The data are self-reports and were collected over a relatively short period, with little time for temporal effects to unfold.

Implications
Trusting and supportive relationships potentially decrease silence, but silence equally harms LMX. If this equilibrium is disturbed, either by leader or follower behavior but also by outside factors decreasing LMX or increasing silence, a downward spiral could unfold with detrimental effects.

Originality/Value
This study supports previous research on the antecedents of employee silence while simultaneously offering novel insights about its effects on workplace social relationships. It thus opens new research opportunities on the temporal development of silence and its antecedents and consequences, mediation effects, and feedback loops.

I cannot stay focused! The effect of connecting leadership, incivility and organizational justice on impaired cognitive control

Donatella Di Marco, Silvia Silva, & Ana Margarida Passos

ISCTE – Instituto Universitário de Lisboa, Lisbon, Portugal

Purpose
The goal of this research is to understand the direct and indirect effect (through workplace incivility) of connecting leadership (CL) on workers’ impaired cognitive control (ICC). Moreover, we explore the interaction of CL with organizational justice (OJ) predicting workplace incivility (WI).

Methodology
An online study was carried out in order to explore the moderated mediation described above. Participants were 214 employees, working at different organizations.

Results
Our findings show a significant interaction of CL with OJ predicting WI ($t(209) = 2.20, p<.05$). The relationship between CL and WI is significant at all the levels of the moderator but its magnitude diminishes at higher levels of OJ. Data for the index of moderated mediation demonstrated that the bootstrapped 95% confidence interval for ICC ranges from .005 to .059, indicating a conditional significant indirect effect. The confidence interval for mediation through WI excluded zero at any level of the moderator.

Limitations
The cross-sectional design and common method variance represent the main limitations of this study.

**Research/Practical Implications**

The study contributes to extend the current knowledge on CL, highlighting its negative relationship with WI and ICC. Moreover, it helps to understand the beneficial effects of CL and OJ in reducing WI. At practical level, the study suggests that having a leader that fosters the team spirit, encouraging people to collaborate can have beneficial effect for the organization and for people’s well-being.

**Originality/Value**

This study contributes in understanding factors related with WI and ICC, which have negative consequences for people’s well-being and for organizations.

---

The exception does not always prove the rule:

Even few abusive behaviors undermine the positive effect of authentic leadership on ethical climate and psychological safety

Stefanie Richter\(^1\), Dirk Frömmer\(^1\), Luise Franke-Bartholdt\(^2\), Anja Strobel\(^2\), & Jürgen Wegge\(^1\)

\(^1\)Technische Universität Dresden, Dresden, Germany,\n\(^2\)Chemnitz University of Technology, Chemnitz, Germany

**Purpose**

Leaders have been considered to hold a crucial role in shaping an organizational climate that encourages employees to openly communicate ideas as well as moral concerns. In this respect, research investigated the influence of different leadership concepts, e.g., authentic leadership and abusive supervision, independently from one another. However, scholars have started to address employees’ perceptions of inconsistencies in leaders’ behavior that may also affect the respective consequences. Thus, we propose a positive relationship between authentic leadership and both ethical climate and psychological safety that may be reduced by any perception of abusive supervision.

**Methodology**

We collected data based on a cross sectional multilevel field study using online and paper-pencil surveys in different organizations from the healthcare sector (\(N = 681\) employees).

**Results**

Multilevel analyses revealed a significant positive main effect of authentic leadership on ethical climate and psychological safety. As predicted, abusive supervision significantly moderated these relationships.

**Limitations**

The cross-sectional design does not allow causal inferences. Generalization of results is limited to the healthcare sector.

**Research/Practical Implications**
Our results highlight the relevance of consistency in leaders’ employee-directed behaviors. The beneficial effects of authentic leadership may be easily harmed even by only few incidents that employees perceive as being abusive. Thus, leaders should engage in continuous self-reflection to avoid own misconduct.

Originality/Value
To our knowledge, this study is one of the first empirically examining the interaction of opposing moral leadership styles and thus advancing research on the dynamics of leadership.

Ethically-oriented forms of organizational climate and leadership compared: Conceptual problems and implications for organizational practice

Wolfgang G. Weber

Institute of Psychology, University of Innsbruck, Innsbruck, Austria

State of the Art
The majority of respective quantitative studies indicates significant positive associations between ethically-oriented forms of organizational climate (e.g. ethical work climates, procedural/interactional justice climate, sociomoral climate) and ethically forms of leadership (e.g. ethical, servant, or authentic leadership) with characteristic w&o-psychological outcomes. Though, several theoretical inconsistencies and problems of practical application of forms of ethical climate and leadership are still neglected, in particular concerning business organizations as a field characterized through structural power imbalance, conflicts of interests/values, or differences in social/cultural capital between and among capital owners, entrepreneurs, managers and employees.

New Perspectives/Contributions
Striving to clarify strengths and flaws in the context of w&o-psychology, I will limit the conceptual comparison on some relevant aspects of applied ethics stemming from humanistic approaches (virtue ethics: Fromm, Solomon; Self-Determination theory; deontology/human rights: Kohlberg tradition; ethics of care: Haan, Gillighan; discourse ethics: Habermas, Ulrich)

Several prototypes of the ethically-oriented forms of organizational climate and leadership will be compared concerning criteria like:

- type of underlying ethical theory
- precision vs. vagueness of ethical concepts and their operationalization
- universalism or particularism concerning application scope
- reflexiveness vs. reifications (what is taken for granted, e.g. “organizational reality”, employee rights, “concept of man”)
- purposefulness or instrumentalization of psychological concept application

Research/Practical Implications
The presentation contributes to an enhancement of construct validity of applied ethics concepts and suggests practically-oriented solutions.

**Originality/Value**
According to my knowledge, this is the first conceptual comparison of the mentioned ethically-oriented concepts focused on the specified applied ethical criteria (also following essays by Blickle, Berkel, Cropanzano).
PROACTIVITY AT WORK: DISCLOSING THE ROLE OF EMPLOYEES’ EMOTIONS, AFFECT REGULATION, AND WELL-BEING BEFORE AND AFTER EMPLOYEES’ CHANGE INITIATIVES

Anita Starzyk¹, & Uta K. Bindl²

¹ NEOMA Business School, Rouen, France
² London School of Economics and Political Science, London, United Kingdom

State of the Art. Proactive work behaviours – employees’ actions aimed at bringing work-related improvement – have value for organizations and employees alike. Past research has emphasized the overall importance of emotions and well-being for initiating improvement at work. This symposium aims to further investigate and understand the dynamic role of emotions and well-being, as both antecedents and outcomes of proactivity in organizations.

New Perspectives/Contributions. The five studies in this symposium contribute to a more holistic perspective on proactive work behaviours by focusing on specific episodes of proactive work behaviours, both throughout a day, but also across several months. Furthermore, the studies investigate the relevance of affect regulation and emotions before and after performing proactive work behaviours. Moreover, the studies examine the contingencies (i.e., cultural context, intrinsic motivation) under which proactive work behaviours may be (not) beneficial for employees’ well-being. Our discussant, renowned proactivity expert Sharon Parker, will aid to provide bigger picture insights from across the individual study results.

Practical Implications. This symposium suggests that employees’ successful improvement of affect facilitates proactivity, while negative emotions may be adaptive for coping with resistance in the short-term, but not in the long term. In addition, under specific circumstances, proactive work behaviours can enhance experiences of meaningfulness at work, but may also contribute to work-life conflict.

Managing your feelings to enhance proactivity: The type of affect regulation matters

Uta K. Bindl¹, Sabine Sonnentag², & Sharon K. Parker³

¹ London School of Economics and Political Science, London, United Kingdom
² University of Mannheim, Mannheim, Germany
³ Curtin University, Perth, Australia
Purpose. Organizations benefit from proactive employees who propose or initiate improvements at work. Although a considerable body of research suggests that the way individuals feel is positively associated with proactivity, little is known about why and how individuals regulate their affect to engage in proactivity, including the underlying pathways.

Design. We conducted an episodic-based daily diary study with a mixed sample of employed individuals in Australia (n = 77). Participants completed the survey twice per day (in the morning and afternoon; reflecting conjunctive episodes of performance) for up to ten workdays (k = 770). They reported their types of affect regulation, hedonic and eudaimonic well-being (i.e., ‘positive affect’ and ‘experienced meaningfulness in the job’) and job performance (taking charge vs. overall task performance) for each performance episode.

Results. Multi-level (level 3) path analyses showed that different types of affect regulation (hedonic: ‘feeling better’ versus instrumental: ‘getting ahead’) predicted a change in episodic job performance mainly via increased levels of hedonic versus eudaimonic well-being, respectively. In addition, the eudaimonic well-being-pathway was a stronger predictor of a positive change in taking charge than was hedonic well-being.

Limitations. Future research should include objective data of performance.

Implications. How employees manage their emotions matters for their engagement in proactivity.

Originality/Value. This research advances insights on the role of affect regulation and well-being for proactivity.

Your voice is not needed (or heeded): How employees experience, appraise and manage unfavourable managerial responses to their voice and how they decide to voice again

Anita Starzyk1, Michael. R. Bashshur2, & Ronald Bledow2

1 NEOMA Business School, Rouen, France
2 Singapore Management University, Singapore

Purpose. When employees speak up about with concerns or suggestions at work, managers can respond unfavourably. We aim to understand better what employees feel and think when they face unfavourable responses to their voice. We then identify factors that enable employees to better cope with unfavourable responses and to sustain their future voice motivation.
Approach. We interviewed 24 employees working in various positions and industries about their most recent negative voice events (voice attempts that were responded to unfavourably). The 30-to-60-minute semi-structured interviews were then analysed qualitatively to understand employees’ feelings, thoughts, actions, and voice motivation following those events.

Results. Employees reported between one to three negative voice events (e.g., ambiguous appreciation, devaluation, or lack of implementation). Preliminary results point to several short-term and long-term effects of negative voice events. Experienced feelings included disappointment, annoyance, and insecurity. Some employees reported impaired well-being and performance for up to several days and/or reduced voice motivation for the future. Those negative effects diminished when employees could accept, understand, or successfully resist the unfavourable responses.

Limitations. Employees were all highly educated office workers, and they were reporting events retrospectively.

Implications. Managers who establish trust with employees and give reasonable arguments help improve employee acceptance and comprehension of unfavourable responses. Employees’ ability to regulate emotions, their optimism and confidence facilitated reversals of initial unfavourable responses.

Value. We investigated discrete voice events in depth and focused on changes in employees’ feelings, thoughts, actions, and voice motivation over several months.

Resistance to taking-charge efforts: Impact on change initiators’ emotions and coping behaviours

Mouna El Mansouri¹, & Karoline Strauss¹

¹ ESSEC Business School, Paris, France

Purpose. Building on appraisal theories, we investigate how individuals’ taking charge within organizations (change initiators) experience and react to resistance to their proactive behaviour. We propose that resistance is associated with anger, anxiety, and disgust and that these emotions differentially impact coping behaviors: anger may lead to attack or approach, depending on change initiators’ self-efficacy, anxiety to uncertainty reduction, and disgust to avoidance/exclusion.
Methodology. Using a diary study with event sampling, we asked participants recruited via an online panel during five consecutive days whether they had tried to bring about change at work before displaying event-specific questions.

Results. Preliminary results based on 125 taking-charge events from 83 respondents indicated that anger, anxiety, and disgust follow resistance to change initiatives. Change initiators low in self-efficacy who experienced anger were more likely to engage in attack behaviors compared to those high in self-efficacy. Self-efficacy did not moderate the relationship between anger and approach behaviors. Anxiety was associated with uncertainty reduction behaviors. Disgust was not significantly related to avoidance/exclusion behaviors.

Limitations. Causality cannot be inferred. We relied on self-reports.

Implications. This paper extends the proactivity literature by investigating consequences of resistance on change initiators. These consequences may determine whether change will be successful and whether proactivity is sustainable.

Research implications. Our findings highlight that discrete negative emotions, usually seen as problematic, may be linked to positive outcomes, such as uncertainty reduction and approach behaviors.

When taking charge creates work-life conflict: The role of intrinsic motivation.
Francesco Cangiano¹, Sharon K. Parker², & Kan Ouyang³

¹ University of Western Australia, Perth, Australia
² Curtin University, Perth, Australia
³ Shanghai University of Finance and Economics, Shanghai, China

Purpose. The positive effects proactive behavior on performance and career-related outcomes have been widely established in the literature. Yet, little attention has been paid to the consequences of proactivity for employee well-being and other personal outcomes. In this research, we adopted an intra-individual approach to explore how behaving proactively at work affects employees’ life outside of work. Drawing upon ego depletion theory, we hypothesised that taking charge would increase work-life conflict; however, we expected this effect to occur only when intrinsic motivation is low.
Design. To investigate this, we recruited a sample of managers to participate in an experience sampling study over the course of 5 working days. Participants were instructed to complete short surveys before work, after work and at bedtime.

Results. Findings showed that daily taking charge behavior resulted in greater work-life conflict, but only on days in which employees reported low intrinsic motivation at work. In turn, work-life conflict in the evening was positively associated with feelings of fatigue the following morning.

Limitations/Implications. Our findings indicate that intrinsic motivation is not only a strong motivator of proactivity, but also an important factor to consider when looking at the personal consequences of this way of behaving.

Originality/Value. These findings suggest a number of implications on how proactivity can interfere with employees’ work-life balance, and offer insights on how managers should encourage (if at all) the proactivity of their employees.

Making work meaningful: Proactive work behavior and work meaningfulness in Germany and France

Christopher Schwake\textsuperscript{1}, Doris Fay\textsuperscript{1}, Karoline Strauss\textsuperscript{2}, Tina Urbach\textsuperscript{1}

\textsuperscript{1} University of Potsdam, Potsdam, Germany
\textsuperscript{2} ESSEC Business School, Paris, France

Purpose. The experience of meaning at work is seen as an important aspect of employee psychological well-being. So far, theory and research have focused on task and organizational characteristics to explain the experience of meaningfulness at work. Less is known, however, about what people do at work to experience meaningfulness. Can meaningfulness be fostered through individuals’ work behavior? We hypothesize that proactive work behavior contributes to the experience of meaningfulness. We further expect that this process differs between cultural contexts, and specifically that it will be shaped by how future oriented a culture is. We expect a stronger association between proactive work behavior and work meaningfulness in Germany, a country with a highly future oriented culture, and a weaker association in France, a country with comparatively lower future orientation.

Methodology. We tested our hypotheses in a daily diary study with one daily assessment on four consecutive work days. Data was collected from a German ($n = 152, k = 532$) and a French sample ($n = 200, k = 637$). We applied a multigroup-multilevel structural equation modelling approach, testing the proactivity-meaning linkage at the day-level.
Results. As expected, on the day-level, proactive work behavior was positively associated with meaningfulness at work in Germany, but not in France, and the association differed significantly between the countries.

Limitations. Causality cannot be established.

Research implications. Researchers interested in understanding the experience of meaningful work should also consider work behaviors; but they should also be aware that cultural context may affect this linkage.
State of the Art

Hitherto, research on the meaning of work has typically either compared how the lives of unemployed and employed people differ or asked employed people what they value about employment. Yet, a closer look at underlying psychological processes is needed.

New Perspectives/Contributions

This symposium explores new avenues for research on the meaning of work by focusing on diverse samples and diverse study designs. Meta-analytic findings suggest an enduring negative effect of previously experienced unemployment on mental health. Yet, British time-use data show that despite impaired life satisfaction, unemployed as opposed to employed people experience more enjoyment in their daily lives. According to German data, employment-related peak events might provide less need fulfillment than non-employment-related peak events. Other German data show that not only employment, but also apprenticeships and voluntary work offer opportunities for fulfillment of psychological needs that contribute to well-being. Yet, German data from employees of small and medium-sized enterprises highlight that satisfaction of psychological needs in the workplace not only buffers mental strain, but also fosters job satisfaction. Finally, Swedish interview data highlight how bridge employment helps to adapt to the transition to retirement among nurses by enabling satisfaction of psychological needs.

Research/Practical Implications

This symposium highlights that unemployment can have long-lasting negative effects on mental health, but that working might not be experienced as pleasant as assumed. It unravels aspects of and alternatives to employment which correspond to need fulfillment and well-being and shows how to support people in their transition to retirement.

Scarring effects of unemployment on mental health: Meta-analytic results
Karsten I. Paul¹; Andrea Zechmann¹

¹Friedrich-Alexander University Erlangen-Nuernberg

Purpose

Economists have demonstrated that unemployment has a scarring effect on career-related variables such as income and hierarchical position that persists for several years after re-employment. However, it is unclear whether unemployment has similar long-lasting effects on mental health.
Design/Methodology/Approach/Intervention

Primary studies were searched in several data-banks such as PsycINFO. Study results were integrated via random-effects models.

Results

The meta-analytically derived average correlation between current mental health and the intensity of former unemployment (i.e., length of time spent unemployed or number of unemployment events) was $r = .08$ (95%CI: 0.04–0.12; $k = 7; n = 9.110$). The difference between continuously employed persons and persons who are currently employed, but were formerly unemployed, was $d = 0.25$ (95%CI: 0.15–0.35; $k = 21; n = 12.290$). A moderator test demonstrated that this effect was significantly larger for people with a high intensity of former unemployment ($d = 0.45; 95\% CI: 0.36–0.55; k = 5; n = 2.090$) compared to persons with a low intensity of former unemployment ($d = 0.14; 95\% CI: 0.04–0.23; k = 7; n = 2.148$).

Limitations

The number of eligible studies was comparatively small.

Research/Practical Implications

The results show that unemployment does not only exert an acute effect on mental health, but is associated with impairments that persist after people have found new jobs. Therefore, unemployment poses a threat to public health which is even larger than assumed in the literature.

Originality/Value

The study is the first meta-analysis demonstrating long-lasting effects of unemployment on mental health.

Time-Use, unemployment, and well-being: An empirical analysis using British time-use data
Thi Truong An Hoang¹; Andreas Knabe¹

¹Otto von Guericke University Magdeburg, Germany

Purpose

We analyze how the general life satisfaction and the affective enjoyment experienced during specific activities differ between employed and unemployed people.

Design/Methodology/Approach/Intervention

We use nationally representative data from the UK Time-Use Survey (2014-15), which contains detailed diaries and, for each episode reported in the time-use diary, how much respondents enjoyed their time on a 0-7 scale. We compare how the time-use and enjoyment...
(in specific activities as well as on average over the day) differ between the employed and the unemployed.

**Results**

The unemployed have substantially lower levels of life satisfaction than the employed. The comparisons of enjoyment in different activities reveal that the unemployed feel less enjoyment in most activities than the employed. The employed feel worst when working. Over the entire day, the unemployed are experiencing, on average, even more enjoyment than the employed.

**Limitations**

There is only one question about experienced well-being (“enjoyment”) in each activity, which does not differentiate between positive and negative affect. The data is cross-sectional, thus the results cannot be interpreted causally.

**Research/Practical Implications**

Subjective well-being researchers should more systematically differentiate between the cognitive and affective dimensions of subjective well-being (life satisfaction and experienced enjoyment).

**Originality/Value**

There are only very few studies using time-use data with experienced well-being information to examine the role of unemployment. This is the first study looking at this for the UK.

**Scrupuling peak events: Is employment really a good source for psychological need fulfillment?**

Andrea Zechmann¹; Karsten I. Paul ¹

¹ Chair of Organizational and Social Psychology, Friedrich-Alexander University Erlangen-Nuernberg, Germany

**Purpose**

This study investigated to which extent employment in comparison to other areas of people’s lives provides opportunities for the fulfillment of psychological needs.

**Design/Methodology/Approach/Intervention**

Using a series of convenience samples (N = 39-167), respondents were asked to report the most satisfying employment-related and non-employment-related peak event and indicate how they felt and to which extent psychological needs were fulfilled during each peak event.
Results

Despite variations in instructions (e.g., indicate most satisfying event in last 6 months, in last week, yesterday), the pattern of results was largely the same: During employment-related peak events in comparison to non-employment-related peak events, the needs for competence and power/influence were fulfilled best. During non-employment-related peak events, the needs for relatedness, pleasure/stimulation, physical striving, self-actualization, autonomy, security, and luxury were fulfilled best. Generally, need fulfillment was correlated with positive affect. Only in some cases was positive affect highest in non-employment.

Limitations

Due to the retrospective measurement, retrospective bias might have occurred.

Research/Practical Implications

This research challenges findings from research on unemployment according to which employment fosters mental health because it enables fulfillment of psychological needs. According to our results, the number of needs that can potentially be fulfilled during employment compared to non-employment is limited. This suggests looking more closely into which needs are met during the act of working.

Originality/Value

This study provides further insights into the paradox of work according to which being employed is good for need fulfillment and mental health yet working might be experienced as rather unpleasant.

Less money, equal profit? How volunteering and (continuing) education compare to paid employment in explaining access to Jahoda’s latent benefits of work

Carrie Kovacs1; Barbara Stiglbauer1; Eva Selenko2; Bernad Batinic1

1Johannes Kepler University Linz, Austria
2Loughborough University, UK

Purpose

In her seminal work on unemployment and mental health, Jahoda argued that employment fulfills not only financial but also psychosocial needs (need for time structure, activity, social contact, collective purpose, status/identity). Because of its link with material necessity, she felt employment was uniquely positioned to provide access to these “latent” benefits – unlike unpaid work such as volunteering. The current study examined this claim.

Design/Methodology/Approach/Intervention

In a two-wave online study following 400 German participants over the course of a year, we explored the relationship between employment, volunteer work, participation in (continuing) education, and access to the latent benefits of work.
Results

We found that both hours spent volunteering and hours spent in paid employment (but not education) showed incremental validity in predicting access to the latent benefits at T1. Paid employment predicted access to every latent benefit; the effect of volunteering was limited to collective purpose, social contact and status.

Limitations

No longitudinal effects could be shown, possibly owing to low variation in employment/volunteer status over time.

Research/Practical Implications

Jahoda may have underestimated the impact of unpaid forms of work; nevertheless, our results do not contradict a unique relevance of paid employment to the latent benefits.

Originality/Value

As job insecurity rises and technology reduces direct social interaction at work while increasing flexibility, employment’s ability to fulfill all the psychosocial needs named by Jahoda is likely to decrease. Exploring the effectiveness of additional routes to mental health seems both worthwhile and timely.

Influence of the functions of employment on mental health and job satisfaction among employees in small and medium-sized enterprises

Amanda Voss1; Wolfgang Fischmann1; Hans Drexler1
1 Institute and Policlinic of Occupational, Social, and Environmental Medicine Friedrich-Alexander University Erlangen-Nuernberg, Germany

Purpose

In this study the influence of important functions of employment (i.e., the manifest function, social contact, collective purpose, competence) on mental strain and job satisfaction is examined.

Design/Methodology/Approach/Intervention

Data were collected in a psychosocial risk assessment survey of 12 small and medium-sized enterprises (n = 998).

Results

Regression analysis showed that competence (“development possibilities”, β = 0.38), social contact (“relationship to colleagues”, β = 0.21), and the manifest function (“satisfaction with contractual conditions”, β = 0.19) significantly influenced job satisfaction. Mental strain was negatively associated with satisfaction with contractual conditions (β = -0.38), competence (“meeting own expectations”, β = -0.29), and social contact (“relationship to colleagues”, β =
-0.18). Additional cases, variables, and qualitative questions will be included in further analyses.

Limitations

Due to the cross-sectional design causality cannot be assured. Furthermore, only facets of the functions of employment might have been captured.

Research/Practical Implications

Research on the meaning of work could focus more on how differences in access to the functions of employment affect mental health and job satisfaction of employees. Employers should be aware of the importance of enabling their employees’ access to the functions of employment.

Originality/Value

This study provides new insights about the importance of the functions of employment for avoiding mental strain and fostering job satisfaction among people in stable employment.

I work, therefore I am: The meaning of work and retirement for bridge employees in the Swedish healthcare sector

Marta Sousa-Ribeiro¹; Katinka Knudsen²; Petra Lindfors¹; Magnus Sverke¹

¹Department of Psychology, Stockholm University, Sweden
²Åre Hälsocentral, Sweden

Purpose

This study investigated the transition to retirement, the motivation to work, and experiences of working in bridge employment in a group of retired nursing assistants.

Design/Methodology/Approach/Intervention

The Interpretative Phenomenological Analysis (IPA) approach was used to analyze data from semi-structured interviews with seven retired nursing assistants working at a Swedish hospital.

Results

This presentation focuses on “The meaning of work and retirement”, one of four superordinate themes identified in the participants’ accounts. Full retirement was regarded as “the end of the road”, leading to stagnation in life. In contrast, work was perceived as a booster of physical and mental health. By fulfilling important psychosocial needs (such as providing a sense of purpose and belonging, identity, social contact and nurturing, time structure, a source of activity), bridge employment allowed for a gradual adjustment to retirement, which in turn contributed to well-being.
Limitations

The study is based on a small sample in a specific context, which limits the generalization of the results. However, this homogeneity of the sample allowed for a detailed account of the subjective experiences of a particular group of individuals. Yet, further studies in different occupational groups and organizations are needed.

Research/Practical Implications

This study contributes to a further understanding of issues involved in the adjustment to retirement and what it is that motivates people to continue working as nursing assistants, an important occupation within the healthcare sector.

Originality/Value

This research meets the call for more qualitative research on the meaning of working and retirement specifically for bridge employees.
1154 - WORKING FOR THE GREATER GOOD IN SERVICES: RISKS AND INNOVATION IMPACTS ON EMPLOYEES’ WELLBEING

Chairs:
Salvatore Zappalà, University of Bologna, Italy
Vicente Martínez-Tur, IDOCAL, University of Valencia, Spain

State of the art
Services are more and more required to innovate so that regions and nations can benefit of their transformative capacity (EU – ESIC 2015). At the same time, tertiarisation, the increase of work in service sector, is resulting in an increase of employees’ emotional labour, associated with risk of violence and harassment, and in the high prevalence of psychosocial risks of stress and burnout (EU-OSHA 2016). Based on the positive expectations that “satisfied employees make for satisfied customers” (Bowen & Schneider, 2014) only recently attention has been given to the negative aspects of service jobs, which are able to produce more relevant and impactful psychological phenomena than positive events (Baumeister et al., 2001; Martínez-Tur et al., 2016).

New perspective/contributions
This symposium contributes to the literature by examining the strict intercorrelations among organizational life, employees’ psychological processes related to motivation, burnout or emotion, and employees’ need to continue to provide good services and maintain good work-life balance. Two research studies (Emanuel et al; Rueff) investigate the impact of customer’s aggression and unfriendly behavior on psychological capital and work-life balance, testing if such processes are mediated by employee’s discomfort and perception of health symptoms. Two other studies (Martínez-Tur et al.; Zappalà) focus on employees’ burnout and engagement in relation to service climate and service quality. Finally, Kumbruck discusses the effects of digitalization in health care services on employees’ interaction with patients.

Research/Practical Implications: This symposium offers a rich picture of the difficulties that employees may have when interacting, and taking care, of difficult customers, but also when facing the effects of innovations. Research studies also inform about strategies to manage negative events and innovations in the service sector.
Emotional Labour and Work-Family Conflict in Voice-to-Voice and Face-to-Face Customer Relations: a Multi-group Study in Service Workers

Federica Emanuel**, Lara Colombo*, Chiara Ghislieri*, Claudio Giovanni Cortese*
** Department of Philosophy and Education Science, University of Turin, Turin, Italy
*Department of Psychology, University of Turin, Turin, Italy

Purpose: Professions that involve interaction with customers entail great emotional effort: workers are required to show emotions different from their true feelings and they experience emotional dissonance and verbal aggression from customers. These job demands can generate discomfort, and the effects of emotional labour can “expand” in other life domains. The study investigated whether affective discomfort mediated the relationship among emotional dissonance, customer verbal aggression and work-family conflict (WFC), considering differences between two groups of service workers: call centre agents (voice-to-voice relation with customers) and supermarket cashiers (face-to-face relation with customers).

Design/Methodology/Approach/Intervention: This research involved 951 Italian service workers (507 call centre agents – CA, and 444 supermarket cashiers – SC). Data were collected through a self-report questionnaire; analyses were performed using Spss 25 and Mplus7 for the multi-group structural equation model.

Results: Results shown that emotional dissonance and customer verbal aggression had a positive relationship with WFC, the mediational role of affective discomfort emerged in both groups; different effects of job demands in subsamples appeared.

Limitations: Cross-sectional design and self-report data are the main limitations.

Research/Practical Implications: The study’s findings contributed to both WFC and emotional labour literature, considering the two service jobs. Suggestions for organisations emerged in order to identify practical implications useful to support employees in coping with emotional labour and to promote well-being and work-family balance.

Originality/Value: The results emphasised the importance of considering the characteristics of interaction with customers, differentiating organisational practices on the basis of relation to customers.

Unfriendly customer behaviors and employees’ psychological capital: the role of psychosomatic symptoms and positive humor events at work: A moderated mediation approach

Rita Rueff-Lopes, ESADE Business School, Universitat Ramon Llull, Barcelona, Spain
Ana Junça-Silva, ISCTE-IUL, Lisbon, Portugal
**Purpose:** This study is based on the Affective Events theory and aims to contribute to knowledge advance on the relation between negative events at work and employees’ responses. We hypothesized that exposure to unfriendly customer behaviors would have an impact on psychological capital (Psycap) and examined mediators and moderators that may explain this association. We hypothesized that perceived health symptoms would mediate the link between unfriendly customer behaviors and psychological capital. We also hypothesized a moderated mediation model, in which positive humor events would moderate the mediation model.

**Methodology:** A questionnaire that consisted of socio-demographic data, data on customers’ behavior, humor events, health symptoms and psychological capital was distributed to inbound call-center employees, working in the region of Lisbon, Portugal. A total of 380 full-time workers participated in the study (effective response rate: 74%).

**Results:** Results show that the negative association between unfriendly customer behaviors with psychological capital was due to an increased level of perceived health symptoms. Moreover, positive humor events moderated the link between unfriendly customer behaviors and perceived health symptoms, such that the link was stronger when the frequency of positive humor events was low to moderate.

**Research/Practical Implications:** This study addresses a major gap in the positive psychology literature by attempting to examine why unfriendly customer behaviors relate to decreased psychological capital and what factors influence in this relation. Practical implications are further discussed.

---

**Linear and curvilinear relationships between well-being at work and service quality: an investigation in centers for individuals with intellectual disability**

Vicente Martínez-Tur, Michael Stone, Yolanda Estreder, Carolina Moliner, & Esther Gracia

IDOCAL-University of Valencia

**Purpose:** Our study examined the form of the relationships between employee well-being at work and their self-perception of service quality.

**Design/Methodology/Approach/Intervention:** Linear and nonlinear relationships between wellbeing (burnout and engagement) and service quality (functional and relational service quality) were examined using a sample of workers of centers for individuals with intellectual disability (N=799).

**Results:** In general, positive linear relationships between wellbeing and service quality predominated, with one relevant exception: Cynicism. We observed significant curvilinear links from cynicism to both functional and relational service quality.

**Limitations:** The study had two main limitations that should be considered in further studies: self-report measures and its cross-sectional design.
Research/Practical Implications: Linear and curvilinear relationships describe different mechanisms based on the Conservation of Resources Theory (e.g., Hobfoll et al., 2018). Linear relationships propose a gradual deterioration (improvement) of wellbeing at work, in terms of burnout (engagement), is accompanied by progressive deterioration (improvement) of service quality. By contrast, the curvilinear hypothesis proposes that only very low or very high levels of wellbeing provoke a significant reduction or improvement of service quality, respectively. Linear relationships cannot be generalized to all dimensions of well-being. Cynicism showed a curvilinear form. It was only when participants rating themselves as having very low levels of cynicism did their self-rating of their service quality significantly improve.

Originality/value: Previous research efforts relatively neglected the investigation of curvilinear relationships. This study focused on two competing hypotheses (linear vs. curvilinear) that provide a richer picture of the form of relationships between wellbeing and service quality.

Service climate and employees’ burnout: the mediating role of team engagement across time.

Salvatore Zappalà
Department of Psychology, University of Bologna, Italy

Purpose: This study investigated if service climate increases team work engagement which, in turn, decreases employees’ job burnout.

Design/Methodology/Approach/Intervention: A survey was run in 2014 and in 2017 in an Italian cooperative providing residential social services, and was answered, respectively, by 1268 and 1010 employees. Data were aggregated at the residential unit level (N = 56 centers). A “half-longitudinal mediation” design was used to test mediation. All measures were based on validated scales.

Results: Results show that service climate at T1 has an effect on team engagement at T2; and also that team engagement at T1 has an effect, in particular, on perceived sense of efficacy at T2.

Limitations: A two waves, but not yet a longitudinal, design; the long timing between the two waves, and self-report data, are important limitations.

Research/Practical Implications: Research shows that in-role behavior and customer oriented OCBs mediate the relation between service climate and customers’ satisfaction (Bowen & Schneider, 2014). Here we show that service climate may have an indirect effect on customers’ satisfaction but also on employees’ wellbeing, with the latter impacting on customers’ as well. In addition, employees’ engagement can be both a foundation but also an outcome of service climate.

Originality/Value: The study examines the effects of service climate and team engagement from T1 to T2 and the indirect effect of service climate on burnout.

Digitalization in Health Care and the impacts on the interaction work
Prof. Dr. Christel Kumbruck, University of Applied Sciences Osnabrück

**Purpose:** Digitalization like roboter to lift or feed care receiver or like electronic patient documentation, e.g. on smartphones, changes interaction and communication between care givers and care receivers. From our research projects (Projektgruppe verfassungsverträgliche Technikgestaltung: Mobile information and communication tools in the hospital; Das Ethos fürsorglicher Praxis in der Pflege) shows impacts.

**Design/Methodology/Approach/Intervention:** Qualitative studies (simulation studies; narrative Interviews, observations,) with more than 60 experimentees in different health care institutions.

**Results:** The interaction is mediated by electronic tools. The nurses are confident by the electronic assistance and workload reduction; but they are afraid of more distance in the relationship to the patients, more mixing of private and working time activities or more observation by their superiors. The most critical aspect is seen in the patient documentation.

**Limitations:** These studies are explorative ones. Especially the simulation study is an experimental design.

**Research/Practical Implications:** There is need for more and quantitative studies. The results give a lot of indications that the organizational and political frameworks of health care are important moderators of the impacts of the digitalization in health care.

**Originality/Value:** The studies have an important perspective on the change in the relationship between health care givers and receivers by digitalization – a topic, which concerns everybody.
Proponent:
Luis F. Martinez
Nova School of Business and Economics, Universidade Nova de Lisboa, Portugal

State of the Art
This symposium aims to contribute to the fields of presenteeism and absenteeism literatures by introducing new lines of research. Essentially, several studies enrich the presenteeism and absenteeism state-of-the-art with linkages to other areas of research, such as leadership, performance management, career management, discreet emotions, and job control.

New Perspectives/Contributions
Paper 1 emphasizes the role of supervisors’ behavior and presenteeism strategies on employee productivity. Paper 2 focuses on performance management practices by showing that extreme goal setting increase individual effort, tasks, and time pressure, thus affecting attendance behaviors. Paper 3 shows the relevance of sickness presenteeism in a specific sample of Millennials. Paper 4 provides an interesting perspective by studying attendance attitudes from a scarcely addressed person-centered perspective. Paper 5 contributes with two studies to understand how individual personality traits and leadership characteristics affect emotional exhaustion and presenteeism. Finally, paper 6 highlights the job control may increase sickness presence of vulnerable employees.

Research/Practical Implications
It is vital that organizations help building healthy work environments (e.g., initiatives to prevent emotional exhaustion and morally disengagement behaviors). The findings also contribute to the debate on the consequences of HR practices on employees. Moreover, a person-centered approach might improve understanding of the complexity of attendance. Also, high levels of job control may develop sickness presence causing loss spirals – these may be avoided by investing more on HR initiatives.

Presentation 1
Stay at home or go to work sick? Leaders’ presenteeism and workers emotional and behavioral reactions

Sara L. Lopes ¹, Aristides Ferreira ¹, Rui Prada ²

¹ Business Research Unit, ISCTE – Instituto Universitário de Lisboa, Portugal
² Instituto Superior Técnico, Universidade de Lisboa, Portugal

Purpose:
Supervisors’ behaviors plays a key role on employee productivity. Presenteeism strategies can be adopted by employees and leaders, to the point that presenteeism can be contagious in the workplace. Being present at work despite feeling sick can affect the performance of those who work in close contact with the sick person. The purpose of this study is to examine the relationship between leadership presenteeism and employees presenteeism in four different
types of health conditions. We also intend to develop a new instrument to measure leadership presenteeism.

**Design/Methodology/Approach/Intervention:**
To explore which health conditions most influence leadership presenteeism we conducted a pilot study (N=326).

**Results:**
Results confirm that psychological diseases and contagious diseases have more impact on leadership presenteeism and in individuals’ presenteeism.

**Research/Practical Implications:**
Our findings suggest that individuals feel more uncomfortable to work with people with psychological diseases than with people with physical illness. It is important for organizations to focus on decrease negative attitudes that surround mental illness, to help to build healthy work environments.

**Originality/Value:**
We are currently developing an experimental study where we are manipulating leadership presenteeism using confederates, who act as a sick leader. Participants are asked to work on an interdependent and highly engaging task (build a tower using construction materials). Afterwards, participants complete a survey where they rate their emotional and behavioral reactions and those of each of their team members. Preliminary results are in accordance with the research hypothesis. We will have our final sample until December and by May 2019 we will have new and interesting findings.

**Presentation 2**

The influence of performance management practices on absenteeism and presenteeism

Mariella Miraglia ¹, Gregor Bouville ², Silvia Dello Russo ³

¹ University of Liverpool, UK
² Université Paris Dauphine, France
³ Business Research Unit, ISCTE – Instituto Universitário de Lisboa, Portugal

**Purpose**
By focusing on Performance Management (PM) practices and drawing on the indirect control model (Peters, 2011), the study aims to investigate the influence of the three PM components of goal setting, performance monitoring, and end-of-year appraisal on absenteeism and presenteeism. Moreover, it intends to understand the mechanisms underlying such influence, by testing the role of work intensification. Indeed, extreme goal setting or strict monitoring can increase individual effort, tasks, and time pressure, affecting attendance behaviors.

**Design/Methodology**
A mediating model was tested on a sample of over 11,000 respondents from the French Survey on Working Conditions (2013) through negative binomial structural equation modeling in Mplus.

**Results**
Extreme goal setting and monitoring were positively related to presenteeism both directly and indirectly via work intensification. End-of-year appraisal was negatively related to work intensification and presenteeism, but the latter association was not mediated by work
intensification. The three PM practices did not show any significant associations with absenteeism, neither directly nor indirectly.

**Limitations**
The main limitation pertains to the cross-sectional nature of the study.

**Research/Practical Implications**
The results contribute to the debate on the consequences of HR practices on employees (Guest, 2017), providing some evidence on the conflicting results approach (e.g., Legge, 1995). Moreover, they have clear practical implications for the application of PM tools and practices and their effect on employee wellbeing.

**Originality/Value**
This is among the first studies to uncover the relevance of management practices for attendance behavior, especially for presenteeism that has mainly been studied from an individual-centric perspective.

**Presentation 3**
**Sickness presenteeism and propensity in the future workforce**

Daniela Lohaus ¹, Florian Röser ¹

¹ Department of Social Sciences – Business Psychology, University of Applied Sciences Darmstadt, Germany

**Purpose**
The study investigates sickness presenteeism (SP) rates and propensity, health-and work-related correlates of university students (Millennials/Gen Y) to obtain information about the relevance of SP in the future workforce.

**Design/Methodology**
749 students from German universities rated health- and work-related behavior and perceptions. We analyzed rates, spells, and propensities of presenteeism and absenteeism at school and at work.

**Results**
Presenteeism rates of the complete sample were 64% at school and 60.4% at work. Participants with health impairments showed rates of 87.9% and 87%. Presenteeism propensity among them was 0.67 and 0.68. SP correlated significantly with subjective health. Presenteeism rates were highest for good subjective health in combination with external locus of control.

**Limitations**
The study used self-assessments in a cross-sectional design, which does not allow for causal analyses.

**Research/Practical Implications**
The distinction between complete samples and subsamples of health-impaired subjects is useful to gain insight into the prevalence of SP. The analyses of presenteeism propensity (signifying person’s probability to choose presenteeism instead of absenteeism in case of sickness) is an important complement to SP rates (depending predominantly on individual health). SP rates of the Millennials correspond with previous research on older employees,
while presenteeism propensities are higher. Thus, SP will maintain relevance in the future. Measures of health education are useful to sensitize this generation at an early state.

**Originality/Value**

It is the first study to investigate sickness presenteeism among Millennials. Analyses distinguish between individuals with health problems and those without. The study covers presenteeism rates and propensity.

**Presentation 4**

**Attendance attitudes: A latent profile analysis**

Claus D. Hansen ¹, Ann-Kristina Løkke ², Sascha A. Ruhle ³

¹ Department of Sociology and Social Work, Aalborg University, Denmark
² Department of Management, Aarhus University, Denmark
³ Faculty of Business Administration, University of Duesseldorf, Germany

**Purpose**

Research has gathered increasing knowledge regarding causes explaining presenteeism, such as constraints on absenteeism and work- and person-related factors. However, a person-centered approach regarding individuals’ attendance attitude is currently missing. This study aims at studying attendance attitudes from a person-centered approach.

**Design/Methodology**

Using questionnaires, two random samples of 11.835 members of the Danish work force and a birth cohort study of app. 2.000 young people born in 1983 in a rural county in Denmark were collected. We employ a latent profile analysis (Mplus).

**Results**

We plan to provide insights to the understanding of individual attendance attitudes, and contribute to the understanding of absenteeism and presenteeism. Individuals could be allocated to different profiles, which will then be related to other variables of interest. For example, we expect individuals in a high legitimate profile to show higher sickness absenteeism and lower sickness presenteeism.

**Limitations**

Due to the cross-sectional character of the data the causal inference is impossible. In addition, the generalizability is limited because of the sample characteristics.

**Research/Practical Implications**

Using a person-centered approach might improve understanding of the complexity of attendance. Thereby, we might be able to provide evidence for unexpected findings, such as the role of support in the formation of presenteeism.

**Originality/Value**

This study is the first to consider latent profiles in the field of presenteeism, especially when considering attendance attitudes. By highlighting the heterogeneity of individuals regarding the latent construct of attendance attitudes, it contributes to a deeper understanding of individual differences in attendance behavior.

**Presentation 5**

**Emotions, burnout and presenteeism in the retail sector**
Aristides Ferreira 1, Inês Vieira 1, Carla Gomes da Costa 1

1 Business Research Unit, ISCTE – Instituto Universitário de Lisboa, Portugal

**Purpose**
The current study focuses on the importance of the emotions in the workplace, more specifically in the retail sector. The main goal of this study is to test a moderated mediation model in which the association between Trait Anger and Emotional Exhaustion is accounted for by Leadership Moral Disengagement and conditional upon levels of Surface and Deep Acting. Secondly, from a longitudinal perspective we aim to understand the antecedents of presenteeism in the retail sector.

**Design/Methodology**
The total sample (study 1 and 2) was 312 employees that answered at least one day of the 5 daily questionnaires.

**Results**
In study 1, findings support the indirect effect of Trait Anger on Emotional Exhaustion through Leadership Moral Disengagement is significant when Surface Acting is higher but it is not significant when moderated by Deep Acting. In study 2, two direct antecedents of presenteeism emerged: emotional exhaustion and unethical leadership moral disengagement influence productivity despite illness.

**Limitations**
Study 1 used a cross-sectional self-reported measure. In study 2, individuals did not complete all five daily questionnaires.

**Research/Practical Implications**
The study suggests some initiatives that companies can adapt to prevent Burnout, Emotional Exhaustion and morally disengagement behaviors from supervisors in the workplace.

**Originality/Value**
The inclusion of Moral Disengagement from supervisors and also the daily diary study approach constitutes an advance with important contributions in the presenteeism literature by considering emotions such as trait anger.

**Presentation 6**
**Nonlinear relationships between job control and sickness presence behavior**

Joachim Gerich 1

1 Department of Sociology, Johannes Kepler University, Austria

**Purpose**
Job control (employee’s decision authority regarding timing, location, or method) is typically viewed as a positive resource, supporting employees’ goal attainment, learning, motivation and personal growth. Moreover, previous research has shown some evidence for a weak negative association between job control and sickness presence behavior (SP), defined as attending work while ill. On the contrary, following other theoretical approaches (such as the vitamin model or the ‘entreployee’ concept), it could be assumed that very high levels of job
control may increase SP of vulnerable employees applied as a coping strategy to reduce productivity loss due to sickness.

**Design/Methodology**
Cross sectional survey data gathered from a heterogeneous random sample of 532 employees was used to test the hypothesis of a curvilinear association between job control and SP.

**Results**
A u-shaped curvilinear association between job control an SP days is confirmed, which is amplified for individuals with a higher number of days with sickness.

**Limitations**
Due to the cross-sectional design of the study, causal inference is not possible.

**Research/Practical implications**
Whereas an increase in job control at low levels is associated with reduced SP, high levels of job control are related to an increase of SP. High levels of job control may be a risk factor that causes health related loss spirals for vulnerable employees, who try to substitute sick leave with SP.

**Originality/Value**
Beside other approaches (such as the dual-path model), curvilinearity may explain the ambivalent relationship between job control and SP.
1176 - AGE-RELATED CHANGES IN ORGANIZATIONAL BEHAVIOR? IT MAY DEPEND ON THE CONTEXT AND THE PERSON

Chairs:
Elissa El Khawli & Susan Reh

Discussant:
Anita Keller

University of Groningen, Groningen, the Netherlands

State of the Art: In recent years, work environments have become more age diverse and many countries have increased their retirement age. As such, there has been growing interest in integrating lifespan perspectives into the organizational psychology literature to examine age-related differences and changes in occupational well-being and organizational behavior.

New Perspectives and Contributions: First, using a large-scale longitudinal study, Schéle et al. examine the role of work-related self-efficacy in predicting stability of the working conditions among early career psychologists and social workers over one year. Second, Reh et al. use longitudinal data over ten years to examine the role of emotional work demands in enhancing employees’ emotional functioning over time. Third, El Khawli et al. use latent profile analyses to examine the moderating effect of work characteristic constellations on the relationship between age and well-being. They find that age may have a positive influence on mood only in certain work characteristic constellations. Finally, Fasbender et al. use time-lagged data to examine the relationship between age and work (dis)engagement. They find that experienced gains (e.g., personal growth) are negatively related to late career work disengagement, and this was mediated by psychological capital. They also find that experienced losses (e.g., social loss) are positively associated to late career work disengagement.

Research/Practical Implications: Taken together, the studies adopt a nuanced approach to lifespan-related processes in the work context by highlighting the importance of personal and situational predictors when investigating the influence of lifespan mechanisms on organizational behavior and well-being.

Transitions between work contexts among early career psychologist and social workers – a one year follow-up

Ingrid Schéle 1, Stefan Holmström 1, Esther Hauer2, & Jaco Pienaar3

1 Umeå University, Umeå, Sweden, 2 Uppsala University, Uppsala, Sweden, 3 Stockholm University, Stockholm, Sweden

Our previous research on social workers and psychologists indicated that men were underrepresented in work contexts characterised by high job demands and low resources,
and that work-related self-efficacy correlated positively with intention to leave. Moreover, the JD-R theory stipulates that work-contexts with well-balanced demands and resources facilitate job-crafting.

**Purpose:** We therefore aim to find out if those (women) who had a “bad” start in their profession, and low work-related self-efficacy, remain in “bad” work-contexts.

**Approach:** In 2018 we sent a survey to 5176 newly graduated psychologists and social workers in Sweden, of whom approximately 3800 previously received our 2017 survey. We will again use SLEIPNER 2.0 to conduct a hierarchal cluster analysis based on transition to work-life, perceived influence at work, and professional isolation, and compare the two cluster solutions – including mapping how participants migrate between the 2017 and 2018 clusters.

**Preliminary Results:** In 2017 a satisfactory 8-cluster solution emerged where the two “best” and two “worst” clusters differed on most variables studied, however psychological demands hit the ceiling in all clusters. In the four middle clusters lack of one or two resources seemed to be compensated for by the other(s), as no further inter-cluster differences surfaced. In 2018 we expect most individuals to have transited between clusters of similar compositions.

**Limitations:** All results are based on self-reported survey data.

**Practical implications and originality:** This large scale longitudinal study will put focus on the context rather than the nature of the work of these professionals, opening up for fruitful interventions.

---

**Emotional job demands and adaptation to a critical life event**

*Susan Reh, Cornelia Wieck, & Susanne Scheibe*

University of Groningen, Groningen, The Netherlands

**Purpose:** Getting older often comes with improved emotional well-being, but certainly not for everyone. The question arises which underlying mechanisms influence emotional development across adulthood. This study investigates the relationship between occupational role demands and the long-term adaptation to a critical life event as an indicator of emotion regulation. Research on cognitive aging shows that workers with cognitively demanding jobs show more positive age trajectories of cognitive functioning than workers with less cognitively demanding jobs. We test the related idea that workers with emotionally demanding jobs (relative to emotionally less demanding jobs) will improve their emotion regulation competencies over time, which should be reflected in a better adaption to a critical life event.

**Methodology:** This study uses longitudinal data over ten years from the German Socio-Economic Panel study combined with information from the Occupational Information Network database.
Results: Using multilevel modeling, we analyze the influence of emotional job demands on employees’ ability to recover from a job-unrelated critical life event (death of a parent) as an indirect measure of emotion regulation.

Limitations: Future research could use a more direct measure of emotion regulation.

Implications: Given the large amount of time that adults spent at work, this study sheds light on the question how work experiences shape emotional development across adulthood.

Originality: In contrast to prior research that has primarily illuminated the negative consequences of emotional job demands, our research tests the idea that emotional demands can set employees on more positive trajectories of emotion regulation competencies over time.

Better with age, but not for everyone: Job context moderates age differences in occupational well-being

Elissa El Khawli, Anita C. Keller, & Susanne Scheibe

University of Groningen, Groningen, The Netherlands

Purpose: Research tends to find a positive relationship between worker age and well-being, implying that older workers maintain well-being despite age-related cognitive and physical decline. However, this positive relationship may depend on the work context employees face. Using a person-centered approach, we examined the moderating role of job profiles (constellations of work characteristics) on associations between age and well-being.

Design/Methodology: Employees from diverse occupational sectors (N=1034, mean age = 41.38, average work hours = 39.83) were recruited to participate in an online survey about job characteristics and occupational well-being.

Results: Latent profile analyses revealed four profiles of work characteristics, which we labelled balanced jobs, relaxed jobs, emotionally-demanding jobs, and demanding-resourceful jobs.

Older workers generally reported better occupational well-being than younger workers, yet the magnitude of age differences depended on the job profile. In demanding-resourceful jobs, age was more strongly negatively related with negative affect compared to other profiles. In emotionally-demanding jobs, age was less strongly negatively related to negative affect but more strongly positively related to positive affect compared to other profiles.

Limitations: The study relies on a cross-sectional design using self-report ratings.

Research Implications: Findings suggest that positive age trends in occupational well-being are not identical across different work characteristics constellations. These findings enrich our
understanding of aging at work by highlighting the role job context plays for young and older workers’ well-being.

**Originality and Value:** This study takes a more nuanced perspective on age differences in occupational well-being than earlier research, underscoring the importance of job context.

**Aging experience and late career work (dis)engagement**

Ulrike Fasbender ¹, Gabriela Topa ², Michela Vignoli ³†

¹ Justus-Liebig-University Giessen, Giessen, Germany, ² National Distance Education University (UNED), Madrid, Spain, ³ University of Bologna, Bologna, Italy

†presenting author

**Purpose:** Because of global workforce aging it is important to understand which factors could contribute to maintain older workers’ desire to stay on at work engaged. Accordingly, we investigate the role of aging experience in explaining older workers’ late career work (dis)engagement. Also, we question whether core self-evaluations and psychological capital mediate these relationships.

**Design/Methodology:** We collected time-lagged data using two online questionnaires with a six months’ interval in between. The sample composed of 346 Spanish workers aged 40 to 68 years. We tested our hypotheses with structural equation modelling using MPlus.

**Results:** Results showed that experienced gains (i.e., personal growth and gaining self-knowledge) were negatively related to late career work disengagement, and that these relationships were mediated by psychological capital. Further, experienced losses (i.e., social loss and physical loss) were positively related to late career work disengagement.

**Limitations:** The use self-report measures raises concern about common-method variance. Also the generalizability is limited as we relied on data from a Spanish sample only.

**Research/Practical Implications:** The findings add to our understanding of how older workers’ aging experience can shape their late career (dis)engagement, and show pathways for crafting interventions in order to retain older workers.

**Originality/Value:** Experienced gains and losses were included leading to a more nuanced understanding of how aging experience can explain older workers’ late career work (dis)engagement; results also shed light on the involved processes.
1178 - THE IMPACT OF TASK CHARACTERISTICS AND WORK DESIGN ON TEAM PROCESSES AND OUTCOMES

Michael J. Burtscher¹ & Josette M. P. Gevers²

¹University of Zurich, Switzerland
²Eindhoven University of Technology, the Netherlands

State of the Art: Given the ubiquity of teams in today’s business environment and their crucial role for organizational performance, research has identified a plethora of enabling conditions for effective teamwork. Task characteristics – and work design in general – are considered important antecedents in models of team effectiveness. Yet, few empirical studies have investigated their impact on team processes and outcomes. Against this background, the proposed symposium provides an overview of current developments in this field.

Contribution: The proposed symposium aims to further our understanding of the role of task characteristics and work design for team processes and outcomes. To that end, we present four empirical studies from four different countries, which will be reflected on by a discussant. Burtscher & Hüffmeier illustrate the effects of different incentive schemes on individuals’ willingness to collaborate – a necessary precondition for successful teamwork. Gevers shows how temporal leadership can buffer the negative effects of disturbances on team performance. Hay and colleagues discuss the role of work design in the context of multidisciplinary healthcare teams. Schleu and colleagues demonstrate how perceived indispensability – operationalized via relay positions in track and field – affect performance gains in teams. Finally, Parker, as a discussant, will reflect on the similarities between the studies and highlight their overall contribution.

Research and practical implications: The proposed symposium extends research on teamwork by emphasizing the role of task characteristics and work design. This is important because – as opposed to other antecedents of effective teamwork – they can be more readily targeted by interventions.

Presentation 1

“The negative effects of individualizing incentives on collaboration in scientific teams “

Michael J. Burtscher¹ & Joachim Hüffmeier²

¹University of Zurich, Switzerland
²TU Dortmund University, Germany
**Purpose:** Due to the increasing complexity of research questions, teams have become the prevalent form of work organization in science. Collaboration, however, is often discouraged in science. For example, various tenure-track guidelines explicitly penalize co-authorship and funding criteria stress sole authorships. The goal of the current research is to systematically investigate the impact of such individualizing incentives on individuals’ willingness to collaborate.

**Design/Methodology:** We invited 246 participants in groups of 5-6 persons and asked them to work on several intellectual tasks. Importantly, for each task, participants were free to work on their own or in a team of up to three members. Our design had three incentive conditions: 1) In the “pro collaboration”-condition, participants received identical cash prizes regardless of whether a task was completed alone or in a team; 2) in the “individualizing incentives”-condition, cash prizes for completed tasks were divided by the number of persons involved; and 3) in the control condition, participants received a lump sum.

**Results:** In the “individualizing incentives”-condition, participants were 7 times less likely to collaborate with others. Moreover, participants working on their own tended to choose easier tasks and reported more task-related negative emotions.

**Limitations:** Student sample and specific tasks

**Research/Practical Implications:** In the context of intellectual tasks – i.e., in science – individualizing incentives impede collaboration, lead to a focus on easy tasks, and decrease individual well-being.

**Originality/Value:** This is the first study to demonstrate the negative effects of individualizing incentives on persons’ willingness to collaborate, which constitutes a necessary condition for successful scientific teamwork.

---

**Presentation 2**

**Buffering Deleterious Effects of External Disturbances on Project Outcomes: The Role of Future Focus and Temporal Leadership**

Josette M.P. Gevers

*Eindhoven University of Technology, Eindhoven, the Netherlands*

**Purpose:** The present study addressed to what extent members’ and leaders’ time-related characteristics buffer against deleterious effects of external disturbances on team-level (i.e., team performance) and individual-level (i.e., mental fatigue) project outcomes.

**Design:** The research involved a longitudinal survey research design among 89 respondents of eight Agile Scrum teams. Data was gathered at three time points (i.e., beginning, mid-point, end) during three subsequent sprints, spanning six to nine weeks in total. Multi-level techniques (MLwiN) were used to analyze the nested data.

**Results:** Teams’ future focus attenuated the positive relationship between disturbances and individual level mental fatigue, but had no significant impact on the relationship between disturbances and team
performance. Temporal leadership attenuated the negative relationship between disturbances and team performance as well as the positive relationship between disturbances and mental fatigue.

**Limitations:** The limited sample size and use of self-reports warrants future research with larger samples and more objective measures. Also, extending the longitudinal character of the present study could increase knowledge of the long-term effects of disturbances on team performance and member well-being.

**Research/Practical Implications:** The key to reducing the deleterious impact of external disturbance lies in a proactive attitude toward temporal irregularities among team members as well as team leaders.

**Originality/Value:** Focusing on members’ and leaders’ time-related characteristics this study adds new insight for handling external disturbance in project teams.

**Presentation 3**

**Run for the team: Do effort gains in teams replicate in track and field relays?**

Joyce Elena Schleu,1 Andreas Mojzisch,2 & Joachim Hüffmeier1

1 TU Dortmund University, Germany
2 University of Hildesheim, Germany

**Purpose:** Whereas effort losses in teams (i.e., reduced effort during teamwork compared to individual work) are a well-established finding, only recently researchers have begun to examine effort gains in teams. According to the Collective Effort Model (Karau & Williams, 1993) and prior findings, we predict effort gains in teams, if members perceive (a) their individual contribution to team performance as indispensable and (b) the team performance as instrumental for achieving attractive team outcomes. We investigate whether these findings replicate in 4 × 400 meter track and field relays.

**Design:** First, we surveyed the German 400 meter national squad (N = 23) on expended effort in relay competitions. Next, we analyzed archival data from international competitions. More specifically, we examined within-person performance differences (N = 397) between individual and relay competitions. We operationalized perceived indispensability via relay positions and the instrumentality of team performance for team outcomes via high versus low medal chances.

**Results:** The runners reported effort gains in relay competitions at each relay position. As predicted, we found effort gains only at later relay positions and if the team had a high medal chance.

**Limitations:** The reliability of the results in the low medal chance conditions is limited due to low power in this condition.

**Research/Practical Implications:** Increasing the importance of individual contributions in situations where the team has a chance to achieve attractive outcomes helps to elicit effort gains.
**Originality/Value:** Our results indicate that (i) perceived effort gains match objective performance gains and (ii) effort gains generalize.

**Presentation 4:**

“Surgeons need freedom, but nurses need rules”: How identity shapes the work design of multidisciplinary teams

**Authors:**
Georgia Hay, The University of Western Australia;
Sharon Parker, Curtin University; Australia
Alex Luksyte, The University of Western Australia

**Purpose:** Building on the nascent literature on the antecedents of work design (Parker, Van den Broek, & Holman, 2017), this study aims to explore the role of social identity in shaping how managers make decisions about the work design of multidisciplinary teams. **Methodology:** Here, we use the multiple case study methodology (cf. Maitlis, 2005), analysing semi-structured interview data and archival documents to compare and contrast two separate instances in which the work of multidisciplinary teams was re-designed in the public healthcare domain: (1) in the operating theatre teams of a public hospital ($N_{interviews} = 26$), and (2) in the diagnostic teams involved in the Western Australian Undiagnosed Diseases Program ($N_{interviews} = 28$).

**Results:** We found professional identity – and its associated values, norms, and prototypes – implicitly shaped the decision-making process, sometimes causing inter-individual and intra-individual conflict, and consequently prompting identity work.

**Originality, Implications, & Limitations:** This study, and its unique socio-cognitive approach, will provide an ecologically-grounded foundation for future quantitative research (both field and experimental) into the antecedents of work design, in continuous dialogue with the literature on multidisciplinary teamwork.

**Discussant:** Sharon Parker, Curtin University; Australia
Symposium Proponents
PD Dr. Severin Hornung, Carnegie Mellon University (United States)
PD Dr. Thomas Höge, University of Innsbruck (Austria)

Symposium Discussants
Assistant Prof. Dr. Edina Doci, Vrije Universiteit Amsterdam (The Netherlands)
Prof. Dr. Matthijs Bal, University of Lincoln (United Kingdom)

State of the Art
Flexibility has paradigmatically transformed work and employment, yet its multifaceted implications are hardly understood. Work intensification, erosion of the private person, and harmful psychosocial implications of job insecurity, role conflicts, and precariousness coexist with a “new quality” of work, supporting self-determination, time autonomy, learning, and growth. This rift attests to heterogeneous manifestations, conceptualizations, and implications of flexibility for organizations, individuals, and society. Further, insights are ideologically obfuscated, given that powerful political forces weaponize organizational flexibility to advance neoliberal agendas of individualization, competiveness, and instrumentality.

New Perspectives/Contributions
A domain-integrating life-conduct perspective for studying subjectified flexible work in post-Tayloristic societies is suggested by Höge. Sora provides empirical evidence for negative effects of perceived job insecurity on affective well-being, demonstrating buffering roles of individual and collective self-efficacy. Seubert reports the development and validation of a survey instrument assessing subjective experiences of work-related precariousness. Glaser analyzes tensions, conflicts, and contradictory demands confronting employees and supervisors in flexible work systems, suggesting negotiation of idiosyncratic deals to align diverging interests. Adopting an employee-oriented reconceptualization, Hornung presents the development and testing of a model of proactive work self-redesign. Critical scholars, Doci and Bal, discuss collected contributions in light of their work on neoliberal ideology; open debate follows.

Research/Practical Implications
Theoretical and empirical contributions complement each other towards a coherent fresh perspective on the complex phenomenon and implications of workplace flexibility. We aim to transcend ideological rhetoric in integrating different approaches, developing theory, models, and instruments for future research, stimulating academic and practice-oriented discourses.
1st (Theoretical) Oral Symposium Presentation

Title
Workplace Flexibility and Employee Well-being. Proposing a Life-Conduct Perspective on Subjectified Work

Author
PD Dr. Thomas Hőge, University of Innsbruck (Austria)

State of the Art
Since the 1990ies, a large body of literature has detected fundamental changes in the world of work. In this context, “Flexibilization” functions as an umbrella term for managerial strategies imposing flexibility requirements on employees. Examples are atypical employment arrangements, increased requirements for self-organization, and boundaryless work. Simultaneously, flexibility can be a positive resource for workers, offering increased working time autonomy and task-related control opportunities. This Janus-faced character of flexibility is reflected in ambiguous empirical results concerning its impact on employee health and well-being.

New Perspectives/Contributions
This presentation adopts a Marxist view on workplace flexibility. After reviewing the interdisciplinary literature, a series of own empirical studies on various aspects of workplace flexibility is presented and integrated into a conceptual framework. Flexibilization in post-tayloristic societies is interpreted in terms of subjectified work intensification, work extensification, and shifting risks and responsibilities from management to employees. Based on the reviewed conceptual and empirical work, a domain-integrating life-conduct perspective for psychological research in this “new” flexible, individualized, and subjectified world of work is suggested.

Research/Practical Implications
The proposed framework helps to understand ambiguous results concerning the impact of diverse aspects of workplace flexibility on employee well-being. It may also be useful to empirically disentangle potentially health-supportive dimensions from negative implications and side effects of workplace flexibility.

Originality/Value
The proposed framework integrates psychological and sociological approaches in studying workplace flexibility with concepts from political economics. This integration is intended to inspire, inform, and guide new directions of empirical research on workplace flexibility.
2nd (Empirical) Oral Symposium Presentation

Title
Employment Contract, Job Insecurity, and Employees’ Affective Well-Being: The Role of Self- and Collective Efficacy

Authors
Lecturer Dr. Beatriz Sora, Open University of Catalonia (Spain)
PD Dr. Thomas Höge, University of Innsbruck (Austria)
Associate Prof. Dr. Amparo Caballer, University of Valencia (Spain)
Prof. Dr. Jose Mª Peiró, University of Valencia (Spain)

Purpose
The aim of this study is to analyze the effects of job insecurity, conceptualized as temporary employment contract (objective job insecurity) and personal perception (subjective job insecurity), on affective well-being. Additionally, moderating roles of job self-efficacy and collective efficacy in the relationships between job insecurity and employees’ affective wellbeing are examined.

Design/Methodology/Approach/Intervention
Cross-sectional survey data were collected from N = 1435 employees in 138 organizations from two European countries (i.e., Spain and Austria).

Results
Results showed different effects of job insecurity depending on its conceptualization. Only subjective job insecurity, but not objective contract type related negatively to affective well-being. Moreover, both self- and collective efficacy moderated the job insecurity–affective well-being relationship, attenuating (buffering) the negative effect of perceived job insecurity.

Limitations
Limitations relate to self-report measures and cross-sectional design.

Research/Practical Implications
Our study advances research by showing that different forms of job insecurity elicit different employee reactions and, therefore, must be distinguished in research and practice.

Individual and collective job efficacy were identified as important factors explaining variability in employees’ responses to subjective job insecurity. Human resource professionals can develop their employees’ resilience by providing conditions that build job self-efficacy, such as control, mastery, and growth experiences.

Originality/Value
Research on job insecurity is extensive, yet, so far, has failed to obtain fully consistent results. This study sheds light on a possible cause for this incongruence, providing evidence for differences in employee responses depending on the type of job insecurity as well as presence of individual and contextual buffers.
3rd (Empirical) Oral Symposium Presentation

Title
Beyond Job Insecurity: Concept, Dimensions, and Measurement of Precarious Employment

Authors
Dr. Christian Seubert, University of Innsbruck (Austria)
MSc. Lisa Hopfgartner, University of Innsbruck (Austria)
Prof. Dr. Jürgen Glaser, University of Innsbruck (Austria)

Purpose
The term “precarious employment”, rooted in the sociological literature, has become pervasive in contemporary societal and scientific discourses on workplace flexibility. However, its reception in the field of psychology remains cursory. Further, scholars disagree on the number, importance, and interrelationships of the objective and subjective aspects that define the phenomenon. Drawing on research in sociology, we develop a psychological perspective, conceptualizing, operationalizing, and assessing subjective experiences of precarious employment.

Design/Methodology/Approach/Intervention
Reviewing the literature, we identified a comprehensive five-dimensional conceptualization (reproductive—material, social—communicative, legal—institutional, status and recognition, meaningful—subject-related), based on which we developed a self-report instrument on work-related precariousness that we tested in two validation studies (n=268/216).

Results
With the exception of one dimension, empirical results suggested reliable and valid measurement. Experiences of precarious employment were associated with less organizational citizenship behavior, more workplace deviance, lower psychological well-being, and more somatic complaints. Notably, perceived precarious employment accounted for additional variance above and beyond job insecurity, social support, job rewards, and meaning in work.

Limitations
More diverse samples are needed to further establish the validity of our measure in different contexts; one of the five dimensions needs further revision.

Research/Practical Implications
Suggesting a comprehensive definition and a corresponding methodologically sound measure, we hope to stimulate empirical research on precarious employment and a more informed use of the term in research, practice, and public discourse.

Originality/Value
To our best knowledge, the developed survey instrument is the first to assess subjective experiences of precarious employment as a comprehensive multidimensional concept.
4th (Theoretical) Oral Symposium Presentation

Title
Organizational Tensions, Role Conflicts, and Contradictory Demands in Flexible Work Systems

Authors
Prof. Dr. Jürgen Glaser, University of Innsbruck (Austria)
PD Dr. Severin Hornung, Carnegie Mellon University (United States)
PD Dr. Thomas Höge, University of Innsbruck (Austria)

State of the Art
The spread of flexible work systems, epitomized by continuously changing structures and work anytime/anywhere, intensifies goal conflicts in organizations. In particular, increasing work performance and maintaining employee health are incompatible, if delegated to supervisors and employees without required resources and empowerment to determine situationally adequate ways to define, balance, and pursue associated objectives.

New Perspectives/Contributions
Drawing on different theoretical approaches – paradox theory, role theory, action regulation theory, leadership theory – concepts of organizational tensions, role conflicts, contradictory work demands, and ambivalences in leadership and employee behavior are reviewed and integrated with a focus on performance and health. Top-down work design and ambidextrous leadership are considered insufficient to reconcile contradictory objectives, whereas idiosyncratic deals (i-deals) offer a theoretically promising approach to align diverging interest.

Research/Practical Implications
Traditional divisions of authority, responsibilities, and resources between top-management and supervisors/employees are bound to catalyze role conflicts and contradictory demands. These manifest in paradoxes at different organizational levels, contribute to widespread detrimental phenomena like self-exploitative work behavior, psychomental diseases, and absenteeism or presenteeism. I-deals between supervisors/employees and top managers/supervisors are recommended as secondary elasticities in HR systems to buffer or alleviate tensions.

Originality/Value
Integrating theoretical approaches from a multilevel perspective on organizations, work design, leadership, and work behavior, we develop new theory on tensions, ambivalences, role conflicts, and contradictory demands imposed on supervisors and employees in contemporary flexible work systems. Ways to better align and balance individual and organizational health and performance goals through participatory HR practices, such as i-deals, are suggested.
5th (Empirical) Oral Symposium Presentation

Title
Functional Flexibility from an Employee Perspective: A Tripartite Interaction Model of Work Self-Redesign for Dynamic Organizational Contexts

Authors
PD Dr. Severin Hornung, Carnegie Mellon University (United States)
PD Dr. Thomas Höge, University of Innsbruck (Austria)
Prof. Dr. Denise M. Rousseau, Carnegie Mellon University (United States)

Purpose
Approaching functional flexibility from the individual, we propose a tripartite model of work self-redesign. Drawing on action, activity, and systems theory, we integrate conventional, proactive, and relational perspectives. Accordingly, a) active use of task autonomy, b) self-discretionary (unauthorized) job crafting, and c) negotiation of task-related idiosyncratic deals (i-deals) with superiors synergistically interact in improving person-job fit, predicting individual quality of working life and occupational health.

Design/Methodology/Approach/Intervention
Survey data of N = 279 German-speaking employees were analyzed. Psychometrically robust 4-item scales operationalized task-focused autonomy, crafting, and i-deals. Moderated linear regressions, controlling for gender, age, and additional work characteristics, assessed their main and interactive effects on seven outcomes, reflecting positive work-related states, work-home interactions, and health-impairment.

Results
Consistent beneficial effects emanated from task autonomy, i-deals predicted selected positive indicators. The role of task crafting was unclear, unexpectedly aggravating work-home conflict; yet, 2-way interactions of i-deals and crafting indicated positive combined effects on four outcomes; synergistic 3-way interactions were found for three – affective commitment, meaning of work, and work-home enrichment.

Limitations
Limitations include cross-sectional self-report data, purposive sampling, and exploratory components of this promising preliminary study.

Research/Practical Implications
Results suggest complementarity of task i-deals and crafting, especially in conditions of high autonomy. In isolation, task crafting may resemble subjectified work intensification, driven by over-engagement and self-endangering behavior or dysfunctional coping.

Originality/Value
This is the first study on the interplay of organizationally intended, individually crafted, and interpersonally negotiated modes of personalizing work tasks, offering new insights into how individuals shape their work experience.
MANAGING THE WORK-LIFE INTERFACE: HOW TO CREATE POSITIVE OUTCOMES AND PREVENT ADVERSE EFFECTS

Yanick Provost Savard
Psychology Department, Université de Montréal

State of the Art

Work-related intrusions in other life roles are becoming increasingly common in many occupations. For instance, information and communication technologies (ICT) are a tool contributing to performance at work, but also represent a threat to engagement in other life roles. Besides, heightening work demands can hinder work-life balance. In this symposium, we will cover strategies and mechanisms that foster positive outcomes — namely psychological well-being, performance, work-life balance, and relationship satisfaction — amidst this deleterious context.

New Perspectives/Contributions

Five presentations compose this international symposium. First, Provost Savard will evaluate mechanisms influencing satisfaction spillover between work and family. Second, work-role cross-referencing will be evaluated as a strategy to decrease the adverse effect of work-related intrusions on relationship satisfaction in Schoellbauer’s diary study. The three other presentations will be looking at boundary management strategies, and ICT use outside of work in particular. Senarathne Tennakoon will examine how ICT use can have a downward spiral effect on work-life balance. Mallette will investigate sociodemographic variables that could render segmenting work and home more fruitful. Finally, the effect of ICT use and group norms on the relationship between work-home segmentation and work engagement will be examined by Boudrias.

Research/Practical Implications

This symposium will shed light on new mechanisms that explain the effect of work-life interface management on a diversity of outcomes. Presenters will discuss strategies emanating from their results that could help workers navigate the rough seas of work-life interface.

Work-Family Spillover of Satisfaction: The Contribution of Life Satisfaction, Identity Centrality and Boundary Strength Among Young Workers

Yanick Provost Savard, Véronique Dagenais-Desmarais
Psychology Department, Université de Montréal
The correlates of positive spillover between work and family have been extensively studied, but less attention has been given to internal processes allowing this spillover. The objective of this study is to evaluate a mediator—life satisfaction—and two moderators—identity centrality and boundary strength—that could affect work-family satisfaction spillover. First, bottom-up and top-down theories of life satisfaction suggest spillover could occur through a general perception of life satisfaction. Second, in accordance with the dynamic self-concept theory, we argue that spillover will originate from domains central to one’s identity. Third, how people manage boundaries between work and family could moderate the occurrence of spillover. To test these hypotheses, 6,077 Canadian workers between the ages of 18 and 35 years-old participated in a three-wave self-report longitudinal study. Path analyses support that life satisfaction mediates satisfaction spillover from work to family and from family to work. Two moderation effects were found. Family identity centrality facilitates the generalization of satisfaction from family to life and home boundary strength limits satisfaction spillover from work to family. These results confirm the spillover mediation through life satisfaction and refine theoretical articulations by pointing at distinct conditions under which work-to-family and family-to-work spillovers occur.

Honey, How Was Your Workday? Cross-Role Referencing as a Buffer Between Work-Related Psychological Distraction and Couples’ Daily Relationship Satisfaction

Julia Schoellbauer1, Sara Tement2, Christian Korunka1

1 University of Vienna, Faculty of Psychology, Department of Applied Psychology: Work, Education and Economy, 2 University of Maribor, Faculty of Arts, Department of Psychology

Purpose: Drawing on load theory, intrusions of work during private time with the partner can be regarded as distractors decreasing one’s psychological availability for the partner. This, in turn, is associated with a lower relationship quality as perceived by both partners. We extend this line of research and look into work-role cross-referencing (i.e., referring to one’s role as a worker while engaged in the role as a romantic partner) as possible “communal coping” mechanism weakening this detrimental effect.

Design/Methodology/Approach/Intervention: In order to test our assumptions, we are currently conducting a diary study among dual-earner couples (anticipated N=70). Participants respond to two daily online questionnaires over the course of two workweeks. The actor-partner interdependence mediation model will be utilized to test whether daily psychological availability for the partner mediates the link between work-related intrusions during partner time and relationship satisfaction. Further, we will test whether the negative association between psychological unavailability and relationship satisfaction is weakened by work-role cross-referencing.

Results: At the moment, data is collected to 40 percent. First results support our hypotheses.
Research/Practical Implications: Work-role cross-referencing is a helpful strategy in order to handle or prevent detrimental work-to-nonwork interferences, especially for those workers who cannot or do not want to avoid work intrusions during private time.

Originality/Value: We theoretically underline and extend the research on work intrusions during private time and clarify their short-term impact on relationship quality.

Work ICT Use Beyond Worktime: Can It Lead to Downward Spiraling Effect on Work-Life Balance?

Uthpala Senarathe Tennakoon
Bissett School of Business, Mount Royal University

Enabling individuals to seamlessly traverse across the work and life (nonwork) domains, Information and Communication Technology (ICT) has become an integral tool in our everyday lives. While the literature recognizes the boundary blurring via ICT use, there is still debate about the impact of ICT use on work-life balance (WLB). Using survey data from 423 Canadian professionals, this paper examines the impact of work-related ICT use beyond work times on individual WLB through a multiple mediation model, with across-domain conflict and enrichment as mediators. The paper contributes to the literature by revealing specific multiple mechanisms through which work-related ICT use beyond work times affects WLB. It is argued that increased work-related ICT use beyond work times can create a downward spiral effect on individual WLB, with increased work-to-life conflict resulting in even lesser opportunity to improve WLB via life-to-work enrichment. Based on the findings, recommendations to reduce the adverse ICT impact on WLB are presented for both organizational policy makers and individual employees.

Linking Work-Home Segmentation to Work and Home Performance: A Study of Moderating Analysis

Frédéric Mallette¹, Corinne Beauchemin¹, François Courcy¹, Yanick Provost Savard²

¹Psychology Department, Université de Sherbrooke, ²Psychology Department, Université de Montréal

In 2015, 37% of Canadian families with at least one child age 6 to 17 had two parents working full time (Uppal, 2015). Since work is an important part of people's lives, it is relevant to focus on the factors that can influence work performance, but also home performance. Boundary and border theory claim that keeping family and work separate can help employee well-being (Baltes, Clark, & Chakrabarti, 2010). Individuals are choosing integration or segmentation, so
they can deal with both work and home roles (Ashforth, Kreiner, & Fugate, 2000). In that context, we pose two questions: 1) are segmenters more performant at work and in family? 2) what are the factors that influence this relationship? A sample of 153 Canadian workers completed questionnaires measuring work (Lapointe, 2014) and family performances (Frone, Yardley, & Markel, 1997), segmentation (Hecht & Allen, 2009) and socio-demographic data (number of children, hierarchic level, number of hours worked). Multiple regression moderating analyses haven’t found a significant relationship between work-home segmentation and performance, and no significant moderator. Based on self-efficacy theory (Bandura, 1990), it is possible to postulate that work performance and family performance are too strongly linked for segmentation to have an impact, because individuals can improve their quality of life with both roles as a worker and a parent (Baltes et al., 2010). To better understand work-home conflict and improve well-being, future research should conduct interview to compare the individual’s perception with his family’s and his colleague’s regarding segmentation and performance.

**Understanding the Relationship Between Work/Non-Work Segmentation and Work Engagement: The Contribution of Information and Communication Technology and Group Norms**

Valérie Boudrias¹, Annie Foucreault¹, Marcello Russo², Yanick Provost Savard³

¹Psychology Department, Université du Québec à Montréal (UQAM), ²Management Department, University of Bologna, ³Psychology Department, Université de Montréal

Employees’ preferences for segmentation/integration of the work-home boundaries represents a meaningful goal in people’s lives that is associated with employees’ psychological well-being (Haar et al. 2014). Work engagement being an important indicator of psychological well-being at work (Dagenais-Desmarais & Savoie, 2012), many organizations seek to promote work engagement and to help employees balance work and non-work roles by offering the possibility to work remotely using Information and Communication Technologies (ICTs). However, research has illustrated that ICTs are associated with both positive (e.g., employees are more responsive to work issues; Hurme, 2005) and negative individual outcomes (e.g., lack of psychological detachment from work; Park, Fritz, & Jex, 2011). Furthermore, even if segmentation is usually associated with positive outcomes (e.g., psychological detachment; Park et al., 2011), recent research has shown that segmentation can also lead to negative outcomes (e.g., emotional exhaustion; Foucreault et al. 2016). To resolve these inconsistencies, this study draws on boundary theory (Nippert-Eng, 1996) and examines the relationship between employees’ preferences for segmentation and work engagement through perception of ICT devices. Additionally, the study tested if the indirect relationship between employees’ preferences for segmentation and work engagement via the perception of ICT devices is shaped by their perceptions of group norms in their
organization. Results of mediation and moderated mediation analyses reveal that the indirect relationship between individual preferences for segmentation and work engagement via the perception of ICT devices exists only when perceived group norms of segmentation are prevalent. Implications for theory and practice are discussed.
1205 - IFPOC SYMPOSIUM: ENABLING CONDITIONS AND MECHANISMS FOR POSITIVE CHANGE

Chair: Karen van Dam & Joris van Ruysseveldt, Open University of the Netherlands
Discussant: Karina Nielsen, School of Management, Sheffield University

State of the art
Increased competition, changing markets and innovation are some of the forces requiring organisations to continuously change and develop. As a result, employees experience increased pressures to be adaptable and tolerant of uncertainty, and deal with new or changing work situations. In the past two decades, change researchers have started to investigate employees’ responses to change. Recognizing the crucial role of these responses for successful change implementation, they focused on employees’ resistance to change and the change process characteristics that might fuel these responses. Less attention has been given to positive outcomes of change and the conditions and mechanism that foster these positive outcomes.

New perspective / contributions
Our symposium takes a new and positive perspective toward change by investigating the conditions and mechanisms that may support positive change. The studies emphasize the role of organizational support, learning demands, job resources, affective commitment, and an intervention. As the world of work is constantly changing and employees need to sustain their careers for a longer period of time, it is of crucial importance to better understand the processes that enhance positive change outcomes, and contribute to employee well-being, learning, and performance.

Research / practical implications
This symposium aims to increase our understanding of the conditions and mechanisms involved in positive change processes. Moreover, the findings have practical implications for successful change implementation. Discussant, Karina Nielsen, will reflect on the studies and encourage discussion with the audience.

* International Forum on the Psychology of Organizational Change, has organized two EWAOP small group meetings and several symposia.

Need-Satisfaction is the Key: How Organizational Support Influences Positive Change Attitude during Information Technology Implementation

Katharina S. Schlicher, Rebecca Helling & Günter W. Maier
University of Bielefeld, Industrial- and Organizational Psychology

Purpose
A lack of employee readiness for change is often viewed as the reason why technology implementation projects fail. Organizational support strategies (e.g. top management support, training, or participation) have been identified as ways to support employees during the implementation phase with the goal of rising acceptance levels. Although there is already literature on organizational support strategies, there is a lack of research into the mechanisms by which these strategies affect employees’ attitude to the change process and system.
Method/Design
Via online survey 111 new system users whose workplaces have recently implemented new information technology were questioned about their experiences concerning the design of the implementation process, accessibility of organizational support (top management support, training, participation), self-determination needs fulfillment during the change process, and attitude toward the change and system.

Results
Need for autonomy proved to be the strongest mediator in mediation and structural equation analysis between organizational support strategies and attitude to change and system.

Limitations
The evaluation of further possible mediators is needed to fully understand how information technology implementation projects should be designed to create a smooth transition to the new system.

Implications & Originality/value
For practitioners, the results deliver important insights into the design of a implementation project as the need for autonomy can be addressed in a multitude of organizational actions, e.g. free exploration time with the system, employee participation in the design of the system’s interface or implementation timeline.

Workplace Learning in Times of Organizational Change: The Mediating Role of Learning Demands

Joris Van Ruysseveldt¹, Karen van Dam¹, Hans De Witte² & Irina Nikolova¹

¹Open University of the Netherlands; ²KU Leuven, Belgium

Purpose
Organizational changes advance workplace learning by increasing learning demands, i.e. pressures in the work environment that create the need to develop new work-related competences (NWC). Our study’s objective is, first, to establish which type of organizational change favors NWC development and whether this relationship is mediated by learning demands; and, second, to investigate the moderating role of learning climate and formal training arrangements.

Method
Dutch employees (N = 1711) participated in an online survey. NWC development was measured six months after the occurrence of change events. SEM and moderated hierarchical regression analyses were used.

Results
Workplace learning is most strongly related to ‘qualitative’ types of organizational change (e.g., process innovation), and unrelated to ‘quantitative’ types of change (e.g., restructuring). Learning demands partially mediated this relationship. While a strong learning climate and the presence of formal training arrangements advanced NWC development, only formal training participation moderated the relationship between learning demands and NWC development.

Limitations
Study variables were measured using self-reports.
Research/Practical Implications
Qualitative organizational change fosters workplace learning by creating pressures that encourages workers to continuously develop and improve their knowledge and skills in order to adapt to new work requirements, even in the absence of strong learning supportive arrangements.

Originality/Value
This study deepens our insight into why and how specific organizational change characteristics challenge workers to obtain new work related knowledge and skills. This study expands existing models and frameworks by integrating learning demands as an important driver of workplace learning processes in times of change.

The Role of Job Demands and Resources for Employees’ Health in the Context of Organizational Change.
Alexandra Michel, Anne M. Wöhrmann, Corinna Brauner
Federal Institute for Occupational Safety and Health (BAuA), Dortmund Germany

Purpose
Based on the Healthy Organizational Change Model (HOC, Michel & González-Morales, 2013) this study aims to evaluate how job demands, i.e. organizational restructuring and work intensity, and job resources, i.e. team climate, may affect employees’ health. In addition, the moderating role of self-efficacy as a personal resource will be examined.

Design and Methodology
To test our hypothesis, we use data from approximately 17,000 participants from the Working Time Surveys 2015 (time 1) and 2017 (time 2) of the Federal Institute for Occupational Safety and Health in Germany. Data were collected via computer assisted telephone interviews. The sample consists of employees across all branches and manifold occupations.

Results
We conducted structural equation modelling with Mplus (Maximum likelihood estimation). In line with our hypotheses we find a significant negative relation between organizational restructuring at time 1 and team climate at Time 1 which in turn negatively influences health problems at Time 2. In addition, we find a significant positive relation between organizational restructuring at time 1 and work intensity at Time 1 which in turn positively influences health problems at Time 2. Moreover, the moderating role of self-efficacy will be discussed.

Limitations
Although, the sample is representative for the German working population, it might not be representative for other countries.

Research/Practical Implications
To minimize the detrimental effects of change on health organizations and leaders should give their employees guidance during such a demanding time by reducing workload and promoting team climate.

Originality / Value
This longitudinal study evaluates the role of job demands and resources in the context of organizational with as large sample that is representative for the German working population.
Entrepreneurial Exit as Change: The Psychological Foundations of Exit Processes

Ann-Louise Holten, University of Copenhagen, Department of Psychology
Gregory R. Hancock, University of Maryland, Department of Human Development and Quantitative Methodology
Ellen Mølgaard Korsager, Copenhagen Business School, Department of Management, Politics and Philosophy

Purpose
This study investigates the psychological mechanisms of entrepreneurial exit as an organizational change process, more specifically a work-role change. We investigate the relations among dispositional resistance to change, construal level of exit, and exit capability, hypothesizing that a high level of dispositional resistance will be associated with exit capability – both directly and indirectly as mediated through the construal level of exit.

Design/Methodology/Approach/Intervention
With the intention of increasing owner-managers’ perceived exit capabilities, we develop a tool targeting our mediator, the owner-managers’ construal levels of exit. The assumption is that lower construal levels of exit represent more actionable change. Our tool operates via two mechanisms: (1) to use low level construals as stepping stones for action related to higher level construals, and (2) to lower construal levels for certain aspects of exit, thereby making them more actionable.

Results
During the fall of 2018, the tool will be tested through process and effect evaluation.

Limitations
The self-reported outcome measures represent a potential common source bias. We address this limitation by collecting data from secondary sources.

Research/Practical Implications
Exit is an important and costly change process for all types of entrepreneurs. Little is, however, known about the psychological mechanisms characterizing this particular type of change. Our study will provide both a practical tool and theoretical advances for managing and understanding exit as change.

Originality/Value
The entrepreneurial literature has largely overlooked the psychological mechanisms associated with exit processes. Linking the literature on organizational change with construal level theory offers new theoretical and practical perspectives.
The Mediating Role of Readiness to Change in the Affective Commitment – Effort Intention Relationship: A Three Countries Study.
Salvatore Zappalà*, Andrea Del Rizzo**, Guido Alessandri*** & Davide Bottecchia**
* Department of Psychology, University of Bologna
** Brovedani group
*** Department of Psychology, University of Rome “La Sapienza”

Purpose
This study hypothesizes a positive relation between affective commitment and employees’ effort intention, considered as a job performance’s precursor. It also takes into account readiness to change as a stable attribute of employees. The study investigates: 1) the level of readiness to change of employees working in a multinational company, in three plants located in Italy, Slovakia and Mexico; and 2) if readiness to change mediates the relationship between affective commitment and effort intention. The plants are in countries that differ for legislation, social and economic conditions and we expect differences also in level of the examined variables.

Method
A routinely organizational climate survey was conducted among all the employees of the company, following multiple minor organizational changes. Survey average return rate was 51%, for a total amount of 567 respondents (Italy = 206; Mexico = 252; Slovakia = 109).
We used the 12 items of the Italian version of the Affective Commitment (AC) scale (Meyer & Allen, 1991); the nine items of the Readiness to Change (RtC) dimension of the OCQ (Bouckenooghe et al., 2009) and the three items of Effort Intention (EI) (WOSY, 1992).

Results
AC, RtC and EI were higher in Mexico and lowest in Slovakia, with Italian respondents in the middle. Emotional readiness to change has a stronger partial mediator effect than Intentional and Cognitive RtC, at whole sample and at country level.

Limitations
Cross-sectional study; different response-rates in the three countries.

Originality
Considers EI as a precursor of job performance, and cross-country comparison.
THE ROLE OF GENDER AND INDIVIDUAL DIFFERENCES IN ORGANIZATIONAL LEADERSHIP

Richard C. Thompson

State of the Art

Disparity in the representation of women in senior levels of organizational leadership has been a topic of interest to researchers for many years (Eagly, A. H., & Karau, S. J., 1991, 2002). Badura, Grijalva, Newman, Yan, and Jeon (2018) show that while the gap in representation at higher levels of organizations has decreased over time, a disparity still remains. A variety of individual difference factors may contribute to each dispositions and behaviors that emerge in the unfolding of social roles in organizational settings. For example, Wille, Wiernik, Vergauwe, Vrijdags, and Trbovic (2018) examine how personality from the five factor model perspective may impact the role demands for leaders.

New Perspectives/Contributions

The present symposium will further explore gender differences in leadership from multiple perspectives of personality (based on the MBTI assessment), interpersonal orientations (based on the FIRO-B assessment) interests (based on the Strong Interest Inventory), and emotional intelligence (based on the EQi assessment). Each of these is based on large, diverse samples of employed adults from across North America and Europe.

Research/Practical Implications

Across the different approaches to examining gender differences in this symposium, the results support the findings of Wille et al., and suggest that there are key gender differences between males and females at different levels of the organization. Generally, females at lower levels differ compared to females in senior leadership positions compared to males at similar organizational levels. The results provide some direction for closing the gender gap in senior leadership.

Title:

The Implications of Gender Differences in Decision-Making Style for Organisational Level

Author:

John Hackston, Head of Thought Leadership, OPP Ltd (Presenter)

Purpose:

Women are under-represented at senior levels and are more likely than men to make values-driven, interpersonally-focused decisions (Eagly & Johnson, 1990), which may lead to a perception of lower competence (Gartzia & Baniandres, 2016). This study investigated the relationships between decision-making style, gender and occupational level.

Design/Methodology:

600,859 individuals completed the Myers-Briggs Type Indicator (MBTI) questionnaire as part of development programmes. Those with an MBTI ‘Thinking’ approach prefer making task-
focused decisions using impersonal criteria; those with a ‘Feeling’ approach prefer people-focused, values-driven decisions. It was hypothesised that:

- Women would be more likely than men to prefer the Feeling approach.
- This gender difference would diminish for higher levels within organisations.

Results:

- Women were significantly more likely than men to prefer the Feeling approach.
- Women were significantly under-represented at higher levels, as were all those with Feeling preferences.
- For men, the proportion of those with Feeling preferences varied little between levels. For women, the proportion varied significantly.
- A univariate ANOVA showed both gender and Thinking-Feeling had a significant impact on occupational level, with a significant interaction effect.

Limitations:

This was a correlational rather than a controlled experimental study.

Practical Implications/Value:

The results imply a double standard; demonstrating a preference for Feeling may affect promotion prospects for women, but not men. Organizational psychologists can help to reduce the imbalance by demonstrating the utility of people-focused decisions.

Title:

FIRO, Gender and Level of seniority

Author:

Helen Rayner, Lead Consultant, OPP Ltd

Purpose:

This study examined trends and patterns in European Fundamental Interpersonal Relations Orientation Behaviour (FIRO-B) data spanning nine years. Does personality vary according to gender and occupational seniority? Are FIRO scores consistent across the years?

Design: 61,394 participants completed the FIRO-B (Fundamental Interpersonal Relations Orientation – Behaviour) questionnaire between 2007-2016. Data was analysed using quantitative methods, including ANOVA and Chi-Square. A regression analysis was used to explore consistently of scores.
Limitations: The measure was self-report and the dataset limited to Europe. The sample was biased towards those working in organisations and in leadership positions.

Research/practical implications:
Men were over-represented in senior positions. Women were over represented in junior positions.

There was a positive linear relationship between seniority and Expressed Inclusion, Wanted Inclusion, and Expressed Control, and a linear negative relationship with Wanted Control and Wanted Affection. For Expressed Affection, middle managers had the lowest scores.

Across all seniority levels, men expressed higher control needs than women. Women had greater Wanted Affection needs than men across all seniority levels.

FIRO scores were stable with no significant differences noted between the year respondents took the questionnaire, indicating these aspects of personality appear not to have changed, and response styles were consistent.

Originality/value: To our knowledge this is the first study to answer these questions.

Title:
Gender differences in vocational interests by organizational level

Authors:
Michael Morris, Director, Vocational Interest Research and Data Science, CPP, Inc. (Presenter)
Richard Thompson, Sr. Director, Research, CPP, Inc.

Purpose:
Vocational interests predict career success (Rounds & Su, 2014). The interests of men and women are also known to differ on average (Morris, 2016), and men are overrepresented at higher organizational levels (Hoobler, Lemmon, & Wayne, 2011). This research examines the “gender diagnosticity” (GD; Lippa, 2005) of interests by organizational level.

Design/Methodology:
We used a large sample of students (N=865,899) to build a GD equation with logistic regression. Gender was the dependent variable and thirty basic interest scales from the Strong Interest Inventory assessment were predictors. We applied this equation to a large sample of employed adults (N = 285,581), and examined the pattern of GD scores for men and women at different organizational levels.

Results:
Gender differences in GD were very large across all organizational levels, but tended to be relatively smaller at higher levels. GD scores for females increased (i.e., became more masculine) consistently at higher levels of management, but male scores did not.

Limitations:
All data were convenience samples.

**Practical Implications/Values:**

These results suggest that women with more masculine vocational interests will find it easier to reach higher organizational levels than women with more feminine vocational interests.

**Originality/Value:**

This study uses a highly regarded interest assessment, large samples, and a statistical approach designed to maximize differences to get the sharpest possible view of interest level changes by organizational level.

**Title:**

Gender Differences in Resilience, Social and Emotional Intelligence in Leadership

**Authors:**

Dr. Steven Stein, Founder, MHS Assessments (Presenter)

Hazel Wheldon, CEO, MHS Assessments

Jonathan Stermac, Manager, Research & Development, MHS Assessments

**Purpose**

Social and emotional intelligence, along with resilience competencies provide an illuminating window into the culture of gender within corporate structures. Insight into these areas, pulled from applied studies and large international datasets helps to understand the individual differences that exist at various levels inside organizations. Individual contributors and leaders place value on different competencies, suggesting that there may be a preference for the traditional leadership style of one gender over the other.

**Design/Methodology/Approach/Intervention**

Individual contributors identified the leadership competencies that were the most important to them. Their responses were compared to the competencies existing managers and leaders felt were important. Key leadership competencies can be mapped and measured using emotional intelligence, which can help predict leadership success and derailment (Stein et al., 2009).

**Results**

The differences presented in this research suggest that leaders and individual contributors disagree on whether a more traditionally feminine or masculine leadership style is the more effective strategy in organizations. These gender differences are also evident in resilience at varying levels of organizations.

**Limitations**

Data was collected from a convenience sample using self-report assessments.
Research/Practical Implications

Similar to the study conducted by Wille and colleagues (2018), this research is based on a large normative sample, and reveals different patterns of resilience between men and women as they advance in their organization.

Originality/Value

The study shows that there are differences and similarities in emotional intelligence among men and women and demonstrates the impact those differences have when participating in 360 evaluations.

Title:

Personality Characteristics of Female Executives: A Replication and Extension

Authors:

Yang Yang, Research Scientist, China Select

Justin Arneson, Senior Research Scientist, CPP, Inc. (Presenter)

Purpose:

Several competing theories have painted a murky picture of the expected traits of effective female executives. One line of inquiry that has the potential to shed light on how women leaders might be identified, developed, and promoted concerns the characteristics of women already in positions of leadership, how they differ from their male counterparts, and how they differ from women in non-leadership roles.

Design:

Respondents included 46,714 full-time employees who completed the CPI 260 assessment. The twelve representative countries were chosen for inclusion if they contained at least ten respondents in each of the four comparison groups.

Results:

Results supported a gender-invariant role demand perspective of female leadership: Small gender differences in leadership-relevant traits were observed between men and women leaders. Hierarchical comparisons demonstrated that women exhibited more agentic characteristics differentiating executives from non-executives than men.

Limitations:

Relatively smaller sample sizes for some countries limits the generalizeability of results in those countries.

Implications:
The results of this study may be used by organizations to better identify and develop female leaders in their organizations. Further, the consistency of the results across countries suggest that such programs that are proven effective in one country are likely to be effective in others.

**Originality/Value:**

This study replicates and significantly extends a study conducted by Wille, Wiernik, Vergauwe, Vrijdags, & Trbovic (2018). Value is added through the inclusion of several additional countries and moderator analyses not considered in the original study, with implications for the significance and generalizeability of the original findings.
CAREER CALLING IN THE WORKPLACE: GOOD FOR WHAT, FOR WHOM, AND IN WHICH CONDITIONS?

Proponent. Anna Dalla Rosa, University of Padua, Italy

Symposium chair. Anna Dalla Rosa

State of the Art. People who perceive a calling feel their job as a meaningful passion that contributes to the greater good and help to derive a sense of purpose. Despite the fast accumulation of research, we still have a fragmented understanding of the conditions under which the presence of a calling leads to positive or negative outcomes for the individual and for organizations.

New Perspectives/Contributions. This symposium offers multiple original contributions and an innovative perspective on the positive and negative effects of work as a calling. Hirschi et al. demonstrated that calling relates with work-nonwork enrichment and conflict through positive affect at work and workaholism. Cai et al. suggest that the direction of calling’s effect on task performance and withdrawal behaviors depends on the congruence between having a calling and living it out. The research conducted by Goštautaitė et al. enlightens the importance of social worth in explaining the relationship between calling and burnout in healthcare professionals. Clinton et al. observed that the self-sacrifice associated with the pursuit of a calling enables higher individual achievement but also emotional exhaustion. The last two contributions suggest that calling is a positive resource for individuals looking for a new job (Dalla Rosa et al.), but that the impossibility to live or find a calling at work leads to career dissatisfaction and voluntary turnover (Weisman).

Research/Practical Implications. The symposium will contribute to increase knowledge on career calling and will provide valuable insights for practitioners by giving advices on how to support the healthy pursuit of a calling in the workplace.

Title. Calling as a Double-Edged Sword for Work-Nonwork Enrichment and Conflict Among Older Workers

Authors. Andreas Hirschi¹, Anita C. Keller², Daniel M. Spurk¹

¹ University of Bern
Purpose. Calling is linked to various positive outcomes but the potential negative effects of callings have not received comparable attention. Moreover, research neglected how callings affect the work-nonwork interface. We presumed that calling can increase as well as deplete personal resources at work, which in turn promote work-nonwork enrichment as well as conflict.

Design/Methodology/Approach/Intervention. We sampled 599 older employees, aged between 50 and 60 years, by examining within-individual changes in presence of calling, positive affect at work, workaholism, work-nonwork enrichment, and work-nonwork conflict over a period of one year with two measurement points.

Results. An increase in presence of calling was positively related to increased levels of positive affect at work which in turn was positively related to increased work-nonwork enrichment. However, an increase in presence of calling was also positively related to increased workaholism which was positively related to increased work-nonwork conflict.

Limitations. This study examined parallel change processes with self-reports. No causal inferences are possible and common method bias might be an issue.

Research/Practical Implications. The study suggests that presence of calling is meaningfully related to the work-nonwork interface among older workers in both positive and negative ways.

Originality/Value. This is the first study to our knowledge that examined calling in the context of the work-nonwork interface.

Title. (In)Congruence of Perceiving And Living A Calling And Employee Work Outcomes: A Moderated Mediation Examination

Authors. Wenjing Cai\(^1\), Jingzhou Pan\(^2\), and Evgenia I. Lysova\(^1\)

\(^1\) Department of Management and Organisation, Vrije Universiteit Amsterdam, Amsterdam, the Netherlands

\(^2\) College of Management and Economics, Tianjin University, Tianjin, China
Purpose. This study examined how the (in)congruence between perceiving and living a calling relates to employees’ behavioral outcomes (i.e., task performance, and withdraw behavior) via career goal discrepancy and how this relationship is moderated by employee resilience.

Design/Methodology/Approach/Intervention. Data were collected from 280 employees and their leaders in China at three points in time. Polynomial regression with response surface analysis was used to test hypotheses.

Results. The congruence of perceiving and living a calling negatively related to career goal discrepancy, which in turn influenced employees task performance negatively and withdraw behavior positively. Specifically, when perceiving a calling was higher than his/her living a calling as compared to perceiving a calling was lower than his/her living a calling, career goal discrepancy increased, and then task performance decreased and withdraw behaviors increased. Furthermore, the indirect effects of the (in)congruence on task performance and withdrawal behavior were conditional on employee resilience in that the indirect effects were weaker under conditions of high resilience.

Limitations. The data was collected from various industries; thus, the question arises to what extent the findings are generalizable.

Research/Practical Implications. The results enrich our understanding of how and when the congruence and incongruence of perceiving and living a calling may lead to various behavioral outcomes among employees.

Originality/Value. We utilized self-regulation theory (SRT) as an overall framework to study the complex effects of (in)congruence between perceiving and living a calling. This contributes to research on how and when (in)congruence between perceiving and living a calling leads to positive or negative behavioral outcomes at work.

Title. Calling and Burnout across the Life span of Healthcare Professionals: The Role of Social Worth

Authors. Bernadeta Goštautaitė¹, Ilona Bučiūnienė¹, Ryan D. Duffy², Haram Kim²

¹ ISM University of Management and Economics, Lithuania
² University of Florida, USA
Purpose. The current study aims to investigate social worth as an underlying mechanism through which calling relates to burnout and to reveal how these relations change over the working life-span.

Design/Methodology/Approach/Intervention. To test the proposed relations, we used survey data of 551 healthcare professional (nurses and physicians) with a wide age range (between 22 and 80 years) working full time in several hospitals in Lithuania.

Results. Supporting our hypotheses, the findings suggest that calling and social worth are negatively associated with burnout, that calling is positive associated with social worth, and that social worth mediates the relation between calling and burnout. Further, the indirect effect of calling on burnout via social worth is stronger for mature employees than for junior employees.

Limitations. The findings are limited to one specific industry. Future studies using longitudinal samples are needed to show an intra-individual change over time.

Research/Practical Implications. Theoretically, our study explains the relationship between calling and burnout. Practically, it implies a recommendation for individuals and organizations to support job crafting to search for a calling and maintain placement strategies that support calling-oriented careers. Additionally, organizations should provide their employees with opportunities to receive social appreciation.

Originality/Value. By providing insight into the hitherto divergent relationship between calling and burnout and exploring social worth as the mediator and age as the moderator this study broadens the understanding of calling construct and provides guideline for future studies.

Title. Self-Sacrifice and Calling

Authors. Michael E. Clinton1, Neil Conway2, Jane Sturges1, Alison McFarland1

1 King’s Business School, King’s College London, UK
2 School of Management, Royal Holloway, University of London, UK

Purpose. This research examines self-sacrifice by workers who view their work as a calling, where we might expect the role of self-sacrifice to be particularly salient (Bunderson & Thompson, 2009; Dobrow & Tosti-Kharas, 2011). In particular, daily self-sacrifice is examined
as a mechanism through which callings can become ‘double-edged swords’ (Clinton, Conway & Sturges, 2016); offering a means for a person to service their calling, but at a cost to the self. Beyond building on work in the calling literature, the research draws on quest for personal significance theory (Kruglanski et al, 2009) to further examine how daily self-sacrifice may also represent an attempt to overcome low self-esteem and generate work meaning.

**Design/Methodology/Approach/Intervention.** Twice-daily diary data over seven days with a linked background survey from over 100 church workers is analysed.

**Results.** Findings reveal that intense callings are associated with greater perceived need to make sacrifices at the between-person level, which is then predict daily sacrifice frequency. At the within-person level, low self-esteem in the morning predicts greater daily sacrifices. Daily sacrifices are then positively related to outcomes of calling fulfilment and emotional exhaustion, despite these outcomes being negatively related to each other. Indirect effects, with self-sacrifice as a mediator, are significant at both within- and between-person levels.

**Limitations.** Reliance on self-report data.

**Research/Practical Implications.** The study articulates the role of self-sacrifice in callings, with both trait and state antecedents.

**Originality/Value.** It contributes to debates about whether self-sacrifice within callings enables higher achievement or reflects an unhealthy pursuit of calling.

Title. Career calling and job search behaviors: The moderating effect of optimism, self-esteem, and perseverance.

Authors. Anna Dalla Rosa¹, Michelangelo Vianello¹, Elisa Maria Galliani¹, Ryan D. Duffy²

¹ University of Padua, Italy
² University of Florida, USA

**Purpose.** The goal of this study was to examine the effects of calling on job search behaviors and the conditions that moderate them.

**Design/Methodology/Approach/Intervention.** A sample of 315 unemployed job seekers filled out a paper survey.
Results. Calling increases job search clarity and fosters the intensity of job seeking activity. The positive effect of calling on job search behaviors is stronger when job seekers have low-to-average levels of self-esteem, optimism and perseverance.

Limitations. We did not assess the effect of financial hardship on calling and job search behaviors. Future studies should adopt a longitudinal design to understand the role of calling over the full job search process.

Research/Practical Implications. These findings provide useful information for counsellor and career guidance practices with unemployed adults. Calling is an important personal resource for people looking for a job that can help them acting effectively when low levels of optimism, self-esteem and perseverance would hinder their job seeking efforts.

Originality/Value. One previous study found that individuals who are motivated to pursue their calling are more likely to proactively search for a new job (Duffy, Bott, Allan, & Autin, 2015). The current study adds new evidence by demonstrating that calling fosters individuals’ clarity about the type of career they want to pursue and that the effect of calling is stronger when the other individuals’ resources, such as optimism, perseverance, and self-esteem, are low.

Title. Paths to Voluntary Occupational Turnover: A Calling Perspective

Authors. Hannah Weisman, PhD Student in Management, London School of Economics

Purpose. The purpose of this study was to build theory on the process of leaving an occupational path (i.e., “taking a leap”) to pursue a calling.

Design/Methodology/Approach/Intervention. This is a longitudinal, qualitative study drawing on semi-structured interviews with 65 individuals linked to an online community for occupational leavers. Interviews were conducted in three rounds over an 18-month period.

Results. This study establishes a model of leaping to pursue a calling. The model unfolds along two paths: one for individuals leaping to answer a calling, and another for individuals leaping to discover a calling. While both types of individuals share the ultimate goal of realizing called selves, their leaps involve different identity struggles and responses.
Limitations. Most interview subjects came from the United States. Future research is necessary to understand cross-cultural differences in the process of leaping to pursue a calling.

Research/Practical Implications. Popular culture often conveys the message that people should find and answer their callings. Yet, little research has explored the process by which people leap from unfulfilling occupations to pursue their callings. This study contributes to calling research, as well as occupational turnover and identity research, by clarifying this process.

Originality/Value. This study takes advantage of an extreme research context and unique longitudinal design to explore a common real-world phenomenon that is understudied in calling research. This study also contributes to identity and turnover research through a novel, calling lens.
Proponent:
Aristides I. Ferreira
Business Research Unit, ISCTE – Instituto Universitário de Lisboa, Portugal

State of the Art
This symposium seeks to address the presenteeism and absenteeism phenomenon in different countries and sectors. The literature emphasizes the need to extend presenteeism to other strategic sectors such as the tourism and hospitality as well the public vs. private and gender differences. Moreover, we aim to bring additional contributions to the well-established theories of JD-R, social capital and social exchanges theories, as well as the moral outrage theory.

New Perspectives/Contributions
Paper 1 investigates sickness presence, health and work-related factors among female and male managers in Swedish public and private organizations. Paper 2 focuses on job stress, distributive justice and presenteeism among Chinese healthcare workers. Paper 3 addresses how presenteeism climate explains the antecedents of emotional exhaustion and work engagement in the hospitality industry. Paper 4 studies the impact of presenteeism on team dynamics and customer satisfaction. Paper 5 highlights that the negative effects of presenteeism on customer ratings are stronger when supervisor pressure is high. Lastly, paper 6 identifies profiles of individuals based on their levels of absenteeism and presenteeism and examines the association of such profiles with well-established correlates of working while ill.

Research/Practical Implications
Sickness presence could lead to high organizational costs. Variables such as the context (public vs. private) and the specific sector of the work environment play a pivotal role in explaining the consequences of sickness presence. Also, the presenteeism phenomenon could be considerably country-specific. Supervisors behavior and service management strategies should be adapted to help managing presenteeism. Moreover, analyzing presentees’ profiles might offer insights for absence management in organizations.

Presentation 1
Sickness presence among Swedish female and male managers

Stig Vinberg 1

1 Department of Health Sciences, Mid Sweden University, Sweden

Purpose
The study investigates sickness presence, health and work-related factors among female and male managers in Swedish public and private organizations. Research indicate that managers have demanding and conflicting psychosocial working conditions and low replace ability, which may contribute to ill health and high sickness presence.

Design/Methodology
The data consists of questionnaire answers from 1173 managers (50% women, 50% men) at different Swedish workplaces. The data makes it possible to compare managers at public and private workplaces and different workplace sizes.

Results
The managers express high job satisfaction – 86% of public sector managers and 78% of private sector managers. However, 78% of male managers and 81% of female managers report sickness presence with different time lengths. In addition, the results indicate differences in sickness presence related to manager positions and workplace sizes.

Limitations
The study used self-assessments in a cross-sectional design, which does not allow for causal analyses. However, the data covers different workplaces in different Swedish regions.

Research/Practical Implications
In politically ruled public sector organizations, the lack of clarity surrounding a manager’s role, responsibility, and decision latitude may create conflicting demands that contribute to high levels of job strain and stress. Based on these facts, it is of relevance to contribute to knowledge about differences concerning sickness presence among different manager groups. Based on the results, practical implications at a societal and organizational level will be presented.

Originality/Value
This research focus is of importance due to that research shows relations between managers and employees health and working conditions.

Presentation 2

Job stress and presenteeism among healthcare workers in China: The mediating role of distributive justice

Tianan Yang 1,2, Run Lei 1,2, Xuan Jin 1,2, Yangyang Sun 1,2, Jianwei Deng 1,2

1 School of Management and Economics, Beijing Institute of Technology, China
2 Sustainable Development Research Institute for Economy and Society of Beijing, China

Purpose
To investigate the mediating effects of distributive justice in Chinese medical reform, we assessed the association between job stress, distributive justice and presenteeism among Chinese healthcare workers.

Design/Methodology
We surveyed 1542 healthcare workers from 64 hospitals in 28 Chinese cities of primary, secondary, and tertiary hospitals in Western, Central, and Eastern China in 2018. SEM was used to examine relationships between job stress, distributive justice, and presenteeism. The mediating effect of distributive justice on the association between job stress and presenteeism was also examined.

Results
Distributive justice was directly inversely associated with presenteeism. Hindrance stress was significantly positively associated with presenteeism, but the path from challenge stress to presenteeism was not significant. The correlation between challenge stress and hindrance
stress was significant. Challenge stress and hindrance stress were significantly inversely associated with distributive justice.

Limitations
This use of a self-assessment scale for healthcare workers is complicated by the fact that workers have different intrinsic evaluation criteria. Further objective data should be taken into account to validate the subjective measures. Also, this cross-sectional study limits the generalization of our conclusions. Further cohort survey should be considered to validate our conclusions.

Research/Practical Implications
Chinese healthcare workers are becoming more important to policy-makers in the Healthy China 2030 blueprint, while they were exposed to extremely high job stress and poor distributive justice. Distributive justice among Chinese healthcare workers indicates improve the performance in Chinese public hospitals through effective challenge stress and reducing hindrance stress.

Originality/Value
This study confirmed the importance of distributive justice in promoting Chinese medical reform through reducing presenteeism among Chinese healthcare workers.

Presentation 3
Presenteeism climate and job demands-resources: A diary study in the hospitality industry

Luis F. Martinez, Ana Catarina A. Correia Leal, Aristides I. Ferreira, José Corrêa de Oliveira

1 Nova School of Business and Economics, Universidade Nova de Lisboa, Portugal
2 Business Research Unit, ISCTE – Instituto Universitário de Lisboa, Portugal

Purpose
This study aims to contribute to the job demands-resources (JD-R) literature by explaining how social capital and social exchanges theories explain the antecedents of emotional exhaustion and work engagement in the hospitality industry.

Design/Methodology
We gathered 72 participants (56.9%) females from different hotels in Lisbon who filled self-reported questionnaires for five daily diaries (resulting in a total of 360 observations). HLM statistical procedures were used to analyze data.

Results
Daily support received from colleagues mediates the relationship between daily support received by the supervisor and daily work engagement. Also, this mediation is moderated upon different levels of presenteeism climate. Moreover, presenteeism climate mediates the positive relationship between the display rules in the interaction with customers and daily emotional exhaustion.

Limitations
The use of self-reported measures. Diary study with only five days measuring one moment per day in a few hotels. Generalizability to other cultural backgrounds may be problematic.
Research/Practical Implications
This study reinforces the need to effectively train employees in the hospitality sector in order to develop soft skills and emotional intelligence. This would result in better display rules competences and climates of enhanced social exchange.

Originality/Value
Previous studies reinforce the need to focus on presenteeism climate and, more specifically, on the role for the JD-R literature and social exchanges theories in the hospitality and tourism literature. Taking the advantage of a robust methodology (i.e., daily diary studies), we assess how different paths explain burnout and work engagement among employees considering the variance at both the within and between-subject levels of analysis.

Presentation 4
Discrimination in hotels: The effects of employees’ sickness on customer loyalty and positive word of mouth

Ana Catarina A. Correia Leal¹, Aristides I. Ferreira¹

¹ Business Research Unit, ISCTE – Instituto Universitário de Lisboa, Portugal

Purpose
Although presenteeism prevails across different job sectors, few studies have focused on how it affects the hospitality sector. HR is frequently seen as one of the most significant assets of hospitality organizations, which reinforces the importance of studying this sector’s workforce. Undeniably, issues regarding tourist employment such as working conditions are key challenges to management teams. It is also known that hospitality cultures promote SP behaviors. Indeed, employees’ sickness may affect not only their performance but also their coworkers by impacting team’s dynamics and customer satisfaction.

Design/Methodology
Our study follows a quasi-experimental approach to investigate how the presence of a sick employee impacts on customers’ fear of contagion and consequently on customer loyalty (i.e., rebook intentions) and positive word of mouth (i.e., recommendation intentions). Data was collected from 581 participants.

Results
When hospitality employees show sickness symptoms, customers show less recommendation and rebook intentions towards their companies compared to when employees don’t show any sickness symptoms.

Limitations
Despite the quasi-experimental approach, the study used self-reported measures.

Research/Practical Implications
Our study is one of the first to investigate the association between presenteeism and customer loyalty and shows that SP in the hospitality industry has a potential negative impact on customer loyalty, and consequently on companies’ profitability.

Originality/Value
This research is expected to make a theoretical contribution to SP literature, highlighting its effects in the hospitality sector and a practical contribution by showing that SP when correctly managed can be turned into an organizational advantage.
Presentation 5
Effects of employees’ sickness presence on customer satisfaction

Carolin Dietz 1

1 Department of Work and Organizational Psychology, Leipzig University, Germany

Purpose
Employees’ sickness presence may have a variety of detrimental effects, such as productivity loss, future sickness absence, or infection of colleagues. In the service sector, sickness presence may additionally be a risk factor in terms of customer satisfaction. Based on disease-avoidance theory, we hypothesized that sickness presence of employees has a negative effect on customer ratings of service quality and satisfaction. Additionally, based on moral outrage theory, external factors fostering sickness presence could moderate these effects. Specifically, we hypothesized that the negative effects of sickness presence on customer ratings are stronger when supervisor pressure is high (versus low).

Design/Methodology
In two experimental vignette methodology studies, data were obtained from N = 266 (Experiment 1) and N = 439 (Experiment 2) employees. Data were analyzed using two-way and repeated measures ANOVAs.

Results
Sickness presence had negative effects on customer ratings in both experiments. In Experiment 1, supervisor pressure had a negative effect on customer ratings, whereas this was not the case in Experiment 2. However, we found the expected interaction of sickness presence and supervisor pressure in both experiments. Customer ratings were lowest when both sickness presence and supervisor pressure were high.

Limitations
The experimental design may lack of realism and generalizability.

Research/Practical Implications
In terms of practical implications, sickness presence may not only have individual but also high organizational costs especially when external factors foster sickness presence. Supervisors and service management should consider this in absence management and service management strategies.

Originality/Value
The present research applies social psychological theories to the practical field of service management.

Presentation 6
Combining absenteeism and presenteeism: A person-centred approach

Mariella Miraglia 1, Pietro Menatta 2, Laura Borgogni 2

1 University of Liverpool, UK
2 Sapienza University of Rome, Italy
Purpose
Despite starting evidence showing a positive relationship between absenteeism and presenteeism (Miraglia & Johns, 2016), the two attendance behaviors have been primarily investigated separately. We aim to fill this gap by identifying profiles of individuals based on their levels of absenteeism and presenteeism. Furthermore, we are interested in examining the association of such profiles with well-established correlates of working while ill, including productivity loss and subsequent attendance behavior.

Design/Methodology
Employees’ responses (N = 506) to a self-report questionnaire were matched with record-based absence data at Time 1 as well as productivity loss and subsequent absenteeism and presenteeism at Time 2. Latent profile analysis (LPA) was used to identify attendance profiles, and ANOVA was employed to explore initial differences among profiles with regard to individual characteristics, employee attitudes, and outcomes.

Results
The optimal LPA model for the sample indicated three profiles. Significance differences among profiles emerged with regard to individual characteristics (e.g., Psychological Capital), perceptions of the supervisor and colleagues, employee attitudes (e.g., work engagement), and future absenteeism and presenteeism.

Limitations
We could not control for the individual health status. Moreover, correlates of profiles were investigated cross-sectionally.

Research/Practical Implications
The study contributes to the relatively-recent presenteeism literature by analyzing presentees’ profiles. It also offers insights for absence management in organizations, by showing how individuals may substitute absenteeism with presenteeism and the factors able to exacerbate such tendency.

Originality/Value
To our knowledge, this is the first study using a person-centred approach to understand the interplay between absenteeism and presenteeism.
1281 - COUNTERINTUITIVE JUSTICE DYNAMICS

Proponent: Dr. Marion Fortin, Professor in Human Resource Management at the University of Toulouse

Discussant: Dr. Jonathan Crawshaw, Senior Lecturer in Human Resource Management and Organisational Behaviour at Aston Business School

The participants of the below papers work in organizations in Canada, France, Germany, and the UK.

Integrated Summary of Overall Symposium

State of the Art
Central effects of established justice dimensions have been investigated in hundreds of studies, and several main and interaction justice effects have been supported by meta-analyses. It seems that “Organizational Justice Comes of Age” (Graso and Grover, 2017. Will inertia ensue?

New Perspectives/Contributions
The present symposium consists of four empirical papers illustrating that the field of justice is still full of surprises. The papers draw on different methods (grounded theory approach, multi-level analyses, and survey data) to illustrate how justice may lead to counterintuitive effects as we consider new perspectives, new contexts, or new dependent variables. Zwank and Diehl’s study suggest that justice motives from the perspective of decision makers may not resemble what we have learned from research on motives of bystanders and recipients. El Akremi, Manville and Mignonac present data suggesting that “too much justice” may have negative effects on musculoskeletal disorders, via the mediating effect of work engagement. In a similar vein, Patel suggests that “more justice” is not always better – presenting data in the context of expatriation experiences that suggests an unusual interaction, whereby lower interpersonal justice may improve knowledge transfers. Finally, Bell and Khoury illustrate that compensatory effects between different levels that may seem intuitive may not in fact exist.

Research/Practical Implications
We hope that the surprising findings presented in this symposium will spark a debate with the audience and will encourage researchers to continue researching the fascinating social dynamics of justice, in different contexts and from different perspectives.

Structured summaries of paper presentations:

Paper 1
Fairness in disguise:
Motives and strategies of fair managerial decision-making

Julia Zwank EBS Business School, Department of Management and Economics, Rheingaustrasse 1, 65375 Oestrich-Winkel, Germany

Marjo-Ritta Diehl, EBS Business School, Department of Management and Economics, Rheingaustrasse 1, 65375 Oestrich-Winkel, Germany

Purpose
Although a small number of studies have begun to examine the actor’s perspective in organizational justice literature, our understanding of why and how managers fulfill or violate the principles of organizational justice remains underdeveloped. Therefore, the purpose of this study is to examine managerial motives and strategies for dealing with justice when making tough decisions. We specifically ask the following two research questions: what motivates managers to consider organizational justice in their decision-making?; and how do managers include fairness considerations into their decision-making in the context of organizational transformation?

Methodology
We interviewed thirty-three managers in a German branch of a global financial institution in the winter 2017. The interviews lasted from 40 to 70 minutes and were transcribed. Our analysis followed grounded theory approach.

Results
We identified three motives for considering justice in managerial decisions: 1) personal needs; 2) economic necessity and 3) altruism. Of these, only altruism concerned the wellbeing of others (an other-directed motive) whereas personal needs and economic necessity were self-directed motives. Our analysis further indicated the existence of four strategies of dealing with justice considerations and at times conflicting justice motives in decision-making: 1) reflection loops; 2) dialogue; 3) role-separation and 4) equity.

Limitations
Our research is based on a small sample and a cross-sectional design.

Research/Practical Implications
Our study points to what we refer to as fairness ‘as a disguise’, due to the predominance of self-directed motives in considering and dealing with justice.

Originality
We provide a novel actor perspective and advance understanding of justice from the under-researched managerial perspective.

Paper 2
Can workplace justice backfire? The indirect effect of justice on musculoskeletal disorders through work engagement
Assâad El Akremi, Caroline Manville, and Karim Mignonac
University of Toulouse Capitole, France
Purpose
The association between justice perceptions and musculoskeletal disorders (MSDs) has received limited attention, and the mechanisms through which justice perceptions affect MSDs are not adequately understood. Moreover, besides the implicit assumption according to which “the more justice the better”, we may consider how and when justice can backfire. In line with the “too-much-of-a-good-thing” effect, the purpose of this study is to show that
organizational justice may contribute to the development of MSDs through the mediating effect of work engagement.

**Design and Methods**
We used data from a multilevel field study of 171 employees in 21 work units. MSDs were assessed using a medical examination.

**Results**
Our results show that distributive, procedural, interpersonal, and informational dimensions of justice are positively and indirectly related to MSDs through the mediating effect of work engagement. The results also show a curvilinear effect of work engagement on MSDs.

**Limitations**
We used medical examination to assess MSDs, but relied on self-reports to assess other constructs, raising potential concerns for CMV bias.

**Research and Practical implications**
This study shows that organizational justice can indirectly backfire and may contribute to the development of MSDs, through the mediating effect of work engagement. Indeed, high engagement does not come without its costs.

**Originality**
This study shows the complexity of these underlying mechanisms and the need to investigate interactive and curvilinear effects.

---

**Paper 3**

**Why too much justice is not a good thing?**
Dr. Charmi Patel, Associate Professor in IHRM, Henley Business School, University of Reading, Whiteknights, RG6 6UD, Berkshire, United Kingdom

**Purpose**
Research on multinational corporation (MNC) knowledge transfer has argued continuously for the behavior of knowledge senders (i.e. expatriates) to be a determinant of knowledge transfer. Using the lens of fairness heuristic theory this study examines the effect of complementary or compensatory justice components on the knowledge transfer behaviour as well as host peer satisfaction of cross-border expatriates.

**Methodology**
A quantitative survey was administered to 365 expatriates from 25 MNCs living/working in 8 different countries.

Results
It was found that INT-J (interactional) and INF-J (informational) were revealed as two critical boundary conditions influencing DJ (distributive). Extra-role knowledge transfer behaviors (EKTB) and subsequently host peer satisfaction (HPS), were higher when DJ was higher than INT-J, and when INF-J was higher than DJ. Further it was found that EKTB and HPS increase sharply when they move from high INT-J and low DJ to high DJ and low INT-J, suggesting that higher DJ than INT-J may lead to beneficial subsidiary outcomes, than vice versa.

Limitations
The generalizability of the results to non-expatriate settings remains uncertain. Also given, its cross-sectional research design, one cannot draw conclusions about the direction of relationships.

Research/Practical Implications
To comprehensively understand workplace fairness, we need to take into account interactions between justice components.

Originality
Two high justice components unlike what past research has suggested are not always a good thing since individuals use their feelings as information to form judgments about how to respond to the environment. Therefore, if they have confidence that high fair treatment will be received in the future, they will restrict maximum efforts for now.

Paper 4
Organizational Dehumanization at Nested and Encompassing Group Levels: A Test of Compensatory v. Source Effects of Organizational Justice and Perceived Collective Continuity

Chris Bell, Schulich School of Business, York University, Toronto, Canada
Careen Khoury, Habitus Consulting Collective, Calgary, Alberta, Canada

Purpose.
Internecine conflict and uncertainty can alienate and dehumanize group members. Organizational justice reduces dehumanization by countering fears of exploitation or exclusion. Collective continuity reduces dehumanization by affirming norms and values. Groups are often nested, allowing the existential threat of dehumanization at one level to promote stronger identification with and response to justice and collective continuity at another level.

**Design/Methodology /Approach/Intervention.**
We measured organizational justice and dehumanization in a first survey study with undergraduate business students, at a time when contract teachers were threatening to strike. The contentious labour disruption then interfered with both fall and winter terms. After classes resumed we implemented the second survey, measuring perceived collective continuity.

**Results.**
Organizational justice interacted with perceived collective continuity to dehumanization, but only when all variables referenced the same group level, or in other words came from the same source. There was no support for justice and collective continuity at the encompassing group level compensating for subgroup dehumanization, or that the subgroup provided a ‘safe haven’ for dehumanization at the encompassing group level.

**Limitations.**
The survey sampled only students, had a cross-sectional design, and assessed variables through self-report.

**Research/Practical Implications.**
Group based judgments at nested or encompassing levels are discrete even though the groups share social, physical, and temporal space.

**Originality/Value.**
This research extends our understanding of uncertainty effects, nested and encompassing identities, source of justice, and group characteristics.
**State of the Art:** Self-Determination Theory (SDT) argues that not only the quantity (i.e., *how much*) of motivation matters, but also its quality (i.e., *which type*): Employees increasingly feel and perform better when they a) internalise the reasons for engaging in an activity, ranging from amotivation over external, introjected and identified motivation to intrinsic motivation, b) don’t pursue materialism and c) feel satisfied in their basic needs. SDT was introduced in the context of work via the seminal article of Gagné and Deci (2005) about two decades ago. Leading academic databases evidence that research on the different types of motivation is on the rise in the context of work. However, despite its increasing impact and popularity, several concerns and potential limitations of the current body of research come to the fore.

**New Perspectives/Contributions:** This symposium contributes to the development of SDT both theoretically and methodologically through six presentations spanning three continents: While Parker et al. and Hewett shed a more nuanced light on the integration process using experimental and qualitative research, Van den Broeck et al. summarizes the existing evidence using a meta-analysis, challenging the assumption that external and introjected motivation would be detrimental. Howard et al. furthermore draw on a large body of quantitative results to provide insights in the optimal scoring method of the different types of motivation, whereas Van der Vaart et al. point at the importance of profile analysis studying the unemployed. Reyes et al. provide unique evidence for the relationship between materialism and need satisfaction at work. The discussion will be led by Marylène Gagné, one of the leading authors in the field.

**Research/Practical Implications:** This symposium offers a more detailed and nuanced view on the quality of motivation as outlined in SDT and its implications for practice.

**Moving beyond undermining:**

**Effects of pay choice and pay attributions on motivation and performance.**

Stacey Parker, School of Psychology, University of Queensland, Australia

Rebecca Hewett, Rotterdam School of Management, Erasmus University;
Purpose: Despite decades of debate, we know little about when and why performance-based pay (PBP) can be effective versus ineffective. We investigate whether employees’ pay preferences and attributions of the intent behind pay practices inform motivational and performance outcomes. We expected that regardless of the pay scheme (fixed or PBP), individuals will attribute the scheme to negative intentions if it does not meet their choice, resulting in lower quality motivation and performance. Conversely, when the scheme does match their preference, intent will be attributed more positively and result in more quality motivation and performance.

Design: \( N = 204 \) university students participated in a 2 (Pay Choice: fixed vs performance-based) x 2 (Pay Allocation: fixed vs performance-based) between-participants experiment. Attributions were measured after assignment to condition (i.e., to a pay scheme that was their choice or not). Motivation was measured and performance coded after the work simulation.

Results: ANOVAs and conditional indirect effects mostly supported the predictions: Individuals made positive attributions of intent when the pay scheme matched their choice, regardless of the type of scheme. This had implications for the quality of their motivation, and performance outcomes.

Limitations: Generalizability is limited, as the study involved a work simulation with students.

Research/Practical Implications: This research contributes to the theoretical development of self-determination theory by considering autonomy (i.e., choice) and the sensemaking processes involved in attributions of pay practices.

Originality/Value: We move beyond whether PBP is motivational in itself, to focus on the motivational outcomes of the extent to which individuals’ preferences for pay allocation are met.

Crafting the internalization of work motivation
Rebecca Hewett; Rotterdam School of Management, Erasmus University

Purpose: Motivation which has been internalized into the self, becoming congruent with one’s values or beliefs, is an important predictor of both wellbeing and work performance, particularly when tasks themselves are not intrinsically interesting. While prior research has explored when internalization occurs, we do not know how it occurs. This paper aims to elaborate the theory of motivation internalization set out by SDT.

Design: Semi-structured interviews with 39 employees in two UK charities. Interviews focused on critical incidents of motivated behaviour at work.
Results: Following an initial evaluation, individuals undertake a process of reflection and cognitive reframing, through which they internalize their motivation for work tasks. Internalization was found to occur through three processes; focusing on development, prosocial values, or opportunity enhancement.

Limitations: The sampling strategy was designed to capture extreme cases, but may limit generalizability.

Research/Practical Implications: These insights elaborate the theory of motivation internalization outlined within SDT, recognizing the inherently proactive nature of this cognitive process. As well as theoretical elaboration, this research has practical implications for how individuals can proactively internalize their motivation; the role of self-reflection is particularly important as it can be developed by individuals and facilitated by organizations.

Originality/Value: Despite the importance of internalization as a motivational process, we know nothing about how individuals internalize their motivation. This research is important as the first to explore how motivation internalization occurs, recognizing the proactive role which individuals play, which is necessary for the theoretical development of SDT.

A Meta-analysis of Different Types of Extrinsic Work Motivation
Anja Van den Broeck, Work and Organisational Studies, KU Leuven, Belgium
Optentia Research Focus Area, North-West University, South Africa
Joshua Howard, School of Psychology, University of Western Australia, Australia
Hannes Leroy, Rotterdam School of Management, Erasmus University, Belgium
Marylène Gagné, Business School, Curtin University, Australia

Purpose: Intrinsic motivation is considered to lead to more beneficial outcomes than extrinsic motivation. Yet, work is not all fun, and very few jobs include only interesting and enjoyable tasks, leaving the burning question of how to optimally motivate employees. Self-determination theory advances the existence of different types of extrinsic motivation, i.e., external to introjected and identified motivation. Yet, exactly how these types of motivation yield different implications for employee well-being and performance remains unclear.

Design/Methodology: We conducted a meta-analysis summarizing 125 studies providing 139 samples.

Results: Identified motivation relates about as strongly to employee outcomes as intrinsic motivation, suggesting that both types of motivation are equally beneficial. Introjection has a janus-face in relating both positive and negative optimal employee functioning. External motivation contributed to some
extend to employee behavior, but yielded high well-being costs. Lacking any type of motivation (i.e. amotivation) only had detrimental implications.

Limitations: The quality of the findings are directly linked to the quality of the primary studies, which rely mostly on cross-section and self-reported data.

Research/Practical Implications: These results clarify and nuance the previous assumptions about the different types of motivation as formulated in Self-determination theory and suggest that employees can be motivated best when pointed at the value and meaning of their work.

Originality/Value: Research on SDT is booming, yet the theoretical assumptions may not yet be clear. By meta-analyzing the existing evidence, we provide pathways for future research and theory development.

An Empirical Comparison of Motivation Scoring Methods within Self-Determination Theory: The Case for Relative Weights

Joshua L. Howard¹, Marylène Gagné²,³, Anja Van den Broeck⁴,⁵, Frédéric Guay⁶, Nikos Chatzisarantis², Nikos Ntoumanis², & Luc G. Pelletier⁷

¹Monash University, ²Curtin University, ³University of Western Australia, ⁴KU Leuven, ⁵North-West University, ⁶Université Laval, ⁷University of Ottawa

Purpose: Self-determination Theory differentiates various types of motivation, each having different consequences for outcomes. However, no agreement exists on how motivation measures are used, with numerous different scoring methods practiced. This study empirically tests these competing methods and highlights implications of each. Relative weights analysis (RWA) is introduced as an auxiliary procedure to maximize information obtained from regression-based analyses and overcome limitations of multidimensional constructs.

Design: Within each of six datasets, motivation is modelled in several different ways according to common practices in the literature, and these solutions regressed upon a range of outcomes, allowing comparison of predictive capability.

Results: Results show that methods modelling motivation subscales predicted 30-40% more variance in outcomes than simplified methods (e.g. high-order models & single score indices). Additionally, RWA demonstrates how to correct for errors associated with correlated predictors, thereby estimating more accurately the unique contribution of each predictor.

Limitations: Using factor scores diverges from standard application of these method, likely overestimating the effectiveness of non-model based methods.
**Research/Practical Implications:** Results indicate using all subscales maximizes the amount of construct-relevant information captured, as evidenced by increased predictive capability, and therefore indicates this method should be the primary method adopted in research. The addition of RWA will further increase the amount of interpretable information derived from regression-based analyses.

**Originality/Value:** We provide novel yet comprehensive evidence testing different commonly used models of SDT motivation, and indicate the superiority of multidimensional methods.

---

**Happily Re-employed**  
**A Prospective Study Based on Motivational Profiles**  
Leoni van der Vaart*, Anja Van den Broeck**  
*Optentia Research Focus Area, North-West University, South Africa  
**Research Centre for Work and Organisation Studies, KU Leuven, Belgium

**Purpose:** Following Self-Determination Theory, the unemployed are said to differ in job search motivation, which may range from intrinsic to identified, introjected and external. The former yields beneficial outcomes, while the latter is detrimental. Past research highlighted the importance in considering profile compositions based on these types of motivation. The first aim of this study was to examine profiles of job search motivation among unemployed individuals. Second, we aimed to explore the relation between the profiles and whether people found re-employment as well as the quality of this re-employment.

**Design/Methodology:** A quantitative, survey design was used to collect data from 135 unemployed individuals in Belgium across two waves.

**Results:** Cluster analysis highlighted four distinct motivational profiles: i.e. the autonomous, the controlled, the highly motivated and the lowly motivated. Although no differences were found between the four groups and re-employment one year later, there were significant differences between the groups in relation to quality of re-employment: The autonomously motivated group reported less role conflict and burnout but more autonomy and engagement than the than the controlled group. The highly and lowly motivated groups scored in between.

**Limitations:** Unfortunately, the data are self-reported in nature.

**Research/Practical Implications:** The study contributes to the literature on unemployment by investigating the quality of motivation (to search for a job) and its associated outcomes from a person-centred perspective. The findings can be used to tailor interventions to particular types of unemployed.
The prospective link between materialism, gratitude and need satisfaction at work
Valentina Reyes\textsuperscript{1}, Marcos Gómez\textsuperscript{1}, Wenceslao Unanue\textsuperscript{1}
\textsuperscript{1}Universidad Adolfo Ibáñez, Santiago, Chile

\textbf{Purpose:} Self-determination theory has consistently shown that materialism is associated with lower need satisfaction in several domains. However, only a few cross-sectional studies have explored this association in the workplace. In addition, the underlying psychological processes explaining this relationship are not clear enough. Therefore, we extended previous workplace literature by (1) testing a bi-directional prospective negative link between materialism and need satisfaction and (2) exploring the mediational role of gratitude.

\textbf{Design/Methodology:} Among a large sample of Chilean workers ($N = 725$), we used a three-wave cross-lagged design with one month between each wave.

\textbf{Results:} First, we found that materialism and need satisfaction reciprocally predict each other over time. In other words, we found that higher materialism prospectively predicts lower need satisfaction and vice-versa. Second, we found that gratitude mediates the link from materialism to need satisfaction as well as the link from need satisfaction to materialism.

\textbf{Limitations:} We used self-report measures, a short period of time.

\textbf{Research/Practical Implications:} We show that pursuing materialism values reduces gratitude, which in turns decreases need satisfaction, leading back to a decrease in gratitude and an increase in materialism. This process would start a vicious circle for employee’s well-being and companies’ results.

\textbf{Originality/Value:} We show for the first time that (1) the link between materialism and BNS may be bi-directional and (2) gratitude mediates the process in both directions.
SAFETY AT WORK: RESEARCH DEVELOPMENTS IN PSYCHOLOGICAL HEALTH AND SAFETY CLIMATE FROM A SOCIAL-EXCHANGE AND WORK-VALUE PERSPECTIVE

Proponent:
Dr Matteo Curcuruto*, Senior Researcher in Human Factors & Safety (Chair; Organizer)
School of Social Sciences, Leeds Beckett University (United Kingdom)

Co-chair:
Dr Jim Morgan*, Principal Lecturer in Human Factors & Ergonomics
School of Social Sciences, Leeds Beckett University (United Kingdom)

Discussant:
Prof Sharon Clarke, Professor of Organizational Psychology
Alliance Manchester Business School, University of Manchester

Symposium integrated summary
Safety at work: Research developments in psychological health and safety climate from a social-exchange and work-value perspective

Proponent: Dr Matteo Curcuruto, Senior Researcher in Human Factors & Safety
Leeds School of Social Sciences, Leeds Beckett University (United Kingdom)

State of Art. Workplace safety is a collective product derived from the interaction of multiple factors, including individuals’ attitudes and behaviours, group dynamics, and organizational values. In recent years, a relatively novel research trend has put a significant emphasis on the relevance of the social-exchange paradigm to understand the social dynamics supporting the promotion of workplace safety. In organizations characterized by a positive safety climate - where employees perceive a genuine support for health and safety - is highly likely that workers develop positive feelings and obligations to reciprocate this safety-specific organizational support.

New perspectives and contributions. The symposium extends our knowledge on social-exchange and its influence on workplace sustanability. The contribution by Laurent et al. investigates two psychosocial mechanisms - instrumental and obligation - and their effects on participation. Morgan and colleagues illustrate two supervision actions – communication and monitoring – and their influence on psychological health and safety. Brondino’s contribution focuses on the importance of leader-member-exchange for the congruence of safety perceptions. Da Silva presents intervention-research exploring the effects of safety training on the perception of values and workers’ involvement. Turner and colleagues
investigate the role of work centrality in the relationship between injury experiences and mental health.

**Research and practical contributions.** The symposium extends our understanding of the benefits of positive social interactions for a broader set of psychological health and safety outcomes, beyond higher levels of safe work conduct. The five papers entail practical implications to support interventions at group level for constructively managing safety and psychological health.

The relationships between perceived organizational support and safety participation: social exchange processes

Julie Laurent*, Nik Chmiel** & Isabelle Hansez*

*Universities of Liège, BE 1; ** University of Chichester

**Purpose.** We examined how instrumental and obligation processes explain the relationship between perceived organizational support (POS) and safety participation (SP). Since SP is discretionary, employees can use it to reciprocate the support they receive from the organization. Reciprocation is a key element involved in social exchanges, and previous research has used social exchange theory to understand the relationship between beneficial leader-member exchanges and discretionary safety activities (Hofmann et al., 2003), and between POS and organizational commitment (Rhoades & Eisenberger, 2002).

**Methodology.** To verify our hypotheses, we tested a Structural Equation Model (SEM) with MPlus on a sample of 536 workers from a Belgian public company.

**Results.** Results showed that perceived management commitment to safety and safety-specific trust in the supervisor interact in explaining SP (instrumental processes) and that felt obligation mediated the relationship between POS and SP, directly and indirectly through safety citizenship role definitions (obligation processes). A key finding is that felt obligation did not mediate the relationship between POS and SP through job engagement, suggesting that the motivational aspects of job engagement are separable from exchange processes.

**Limitations.** Limitations are the use of single-source and self-reported data and the cross-sectional nature of the study.

**Research/Practical Implications.** An important implication for companies comes from the powerful role played by managers: building trusting relationship and encouraging managers to show support to their employees in a context where safety is important are keys to achieve SP.

**Originality/Value.** This study contributes to extend our understanding about the different social-exchange process (instrumentality; obligation).
The direct and indirect influence of Organisational Safety Climate (OSC) on safety and health outcomes for UK rail workers: The mediating role of Supervisor Safety Monitoring (SSM) and Supervisor Safety Communication (SSC)

James I. Morgan*, Matteo Curcuruto*, Raj Kandola*, & Mark A. Griffin**

*Leeds School of Social Sciences, Leeds Beckett University, UK
** Curtin Business School, Curtin University, Perth, Australia

Purpose. Despite a downward trend in injury rates, accident occurrence in the UK rail industry remains an ongoing issue. Safety climate is recognised as a likely source of further safety improvements, however there is limited research evidence due to a lack of measurement validation and standardization in this domain. Using a recently validated tool, the present study assessed the influence of a multilevel safety climate model on organisational, group, and individual level safety and health outcomes. Specifically, we were interested in the influence of Organisational Safety Climate (OSC) mediated by Supervisor Safety Climate (SSC) and Supervisor Safety Monitoring (SSM).

Methodology. 528 workers from a UK infrastructure maintenance organisation completed a questionnaire containing a validated multilevel measure of safety climate and measures of safety and health outcomes.

Results. Regression and mediation analyses revealed that OSC had a strong direct influence on all outcomes (except job control). Furthermore, OSC and SSC mediated these relationships in distinct ways.

Limitations. The study is limited by the use of a questionnaire, which may result in common method bias.

Research/Practical Implications. The study extends knowledge on the multidimensional nature of Safety Climate, in particular the role of specific supervisor behaviour. There are practical advantages for managers and practitioners, for instance, to identify where intervention programs might be targeted.

Originality/Value. This study builds on the first safety climate validation conducted in the UK rail industry. We contribute to a better understanding of the role of distinct supervisor safety behaviors (communication; monitoring).

Supervisor and Coworkers Safety Climate Agreements as Mediators of the Leader-Member Exchange and Safety Behaviors Relationship

Margherita Brondino, Andrea Bazzoli, & Margherita Pasini

Department of Human Sciences, University of Verona, Verona, Italy

Purpose: Leadership affects safety outcomes and is an antecedent of safety climate (SC) Leader–member exchange theory (LMX) has been linked to safety behaviours: The quality of
relationships between subordinates and their supervisors predicted injuries, through the mediating effect of certain SC dimensions. This work aims to verify whether leader-members agreement on SC mediates the LMX safety behaviours relationship.

**Methodology:** SC (SSC and CSC), LMX, and Safety behaviours were measured on a sample of 508 blue-collars in manufacturing sector. SC was also measured on their supervisors. The agreement degree was computed as the absolute difference between supervisors’ and their workers’ SC scores. The relationships were tested through a series of path analyses.

**Results:** Findings showed that LMX level affects agreement on SSC. Agreement on SSC and CSC differently mediates the relationship between LMX and safety outcomes.

**Limitations:** The present study has two main limitations. First, it is cross-sectional, so causal links may not be inferred; second, all data are self-report.

**Research/Practical Implications:** Our results show that high quality relationships between group members and their supervisors is related to a high level of agreement on the SSC, which in turn enhance participatory safety behaviours. These results may help understanding mechanisms underlying safety behaviours, contributing to the success of safety programs.

**Originality/Value.** The research evidences how LMX affects the agreement of supervisors’ and workers’ perceptions of safety climate. The study also explores the mediating role of this agreement degree in the relationship between LMX and safety behaviours.

---

**Safety Training positive spin-off effects on safety climate and workers satisfaction with safety**

*Sílvia A. Silva*

Instituto Universitário de Lisboa (ISCTE-IUL), Business Research Unit (BRU-IUL), Lisboa, Portugal

**Purpose.** Safety training is crucial for acquiring safety knowledge, developing competencies and changing behaviors. The present a study aimed to analyze changes in safety climate and workers safety satisfaction after a safety-training program. The training program focused an Emergency plan and learning what to do in an emergency. Therefore, the change in the safety climate and in the workers safety satisfaction was not an aim or expected.

**Methodology.** In a private non-profit institution, 300 workers participated in the training and answered a survey in two different moments. The safety climate was assessed 15 days before the training (time 1) and assessed again six months later (time 2). The survey included safety climate dimensions, e.g. Safety as an Organizational Value and Workers Safety Involvement and Workers Satisfaction with Safety.

**Results.** Results of paired T-test analysis show statistical significant differences, higher perception of safety as an organizational value (t=-11.41, p<.001), higher involvement of the workers in safety issues (t=-12.78, p<.001) and higher satisfaction with safety (t=-20.01, p<.001).
Limitations. The single source, the variables measurement only with a survey and the very specific organizational context represent the main limitations of this study.

Research/Practical Implications. The study contributes to extend the current knowledge on Safety Training. At practical level, the study suggests that safety training programs, that contribute for increased competencies and knowledge transference, may have positive impacts broader than the specific goals of the training.

Originality/Value. This study contributes in understanding safety-training outcomes that surpass the specificity of a safety-training program.

Young Workers’ Experiences of Occupational Injuries and Mental Health: The Role of Work Centrality

Name and affiliation of the authors
Nick Turner, University of Calgary; Sean Tucker, University of Regina; Steve Granger, University of Calgary; Connie Deng, University of Sheffield; E. Kevin Kelloway, Saint Mary’s University; Simon Pek, University of Victoria.

Purpose
The purpose of this study is to explore the relationship between young workers’ experience of occupational injuries—both their direct experience of occupational injuries and vicarious experience of injuries through parents’ occupational injuries—and young workers’ mental health. We explore the moderating role of young workers’ work centrality in this relationship. We hypothesized that when work is a central value to young workers’ self-concepts (i.e., high work centrality), the relationship between directly- and indirectly-experienced injuries and mental health will be mitigated.

Design/Methodology/Approach/Intervention
1,937 employed participants (M age = 12.83 years; SD = 2.47; 51.5% male) from several Canadian provinces voluntarily responded to a short survey (to be completed in 60 seconds) before taking PS Challenge for Teens, an on-line occupational safety module used in secondary schools designed to raise awareness about young workers’ rights and responsibilities and workplace hazards.

Results
The relationship between vicarious experience of work injuries and young worker mental health is weaker for male young workers for whom work plays a more central role in their identity. This same moderating relationship does not hold for female young workers.

Limitations
The data set is cross-sectional and scales are abbreviated given the very short survey.

Research/Practical Implications
The research elucidates the vicarious nature of work injuries (parents’ work injuries) on young workers’ mental health.

**Originality/Value**
We explore the relationship between the experiences of work injuries on young workers’ mental health, and illustrate how, for young males, the perceptions of the importance of work mitigates the negative relationship.
FACILITATING MULTITEAM SYSTEM COLLABORATION IN HIGH-STAKES ENVIRONMENTS

Co-Chairs:
Dorothy R. Carter & Leslie A. DeChurch
The University of Georgia, Northwestern University

Discussant:
Stephen J. Zaccaro
George Mason University

Many of the most ambitious and challenging objectives in public and private sector organizations, such as sending a team of humans to explore deep-space destinations like Mars, represent superordinate goals that demand coordination and collaboration across complex and cross-functional ‘Multiteam Systems’ (MTSs) comprised of multiple groups or teams with different backgrounds, areas of expertise, and access to resources (Mathieu, Marks, & Zaccaro, 2001; Zaccaro, Marks, & DeChurch, 2012). Unfortunately, given substantial barriers to interteam collaboration (e.g., geographic distance, differences in norms, goals, areas of expertise), MTSs often struggle to develop and maintain the patterns of collaboration and coordination processes that are needed to achieve shared superordinate goals (Shuffler & Carter, 2018). The three papers in this symposium identify critical phenomena that facilitate multiteam performance in high-stakes contexts. The first paper delves into the history of multiteam collaboration within the Mission Control Center at the United States’ National Aeronautics and Space Administration (NASA) in order to point a path forward for future space exploration. The second paper develops and evaluates a novel experiential learning activity for training multiteam leadership. The third paper leverages an agent-based modeling (ABM) approach combined with virtual experimentation to understand the impact of communication delays and extended periods of isolation on the collaboration processes in spaceflight multiteam systems. Our discussant, Professor Stephen Zaccaro—an expert on leadership and MTS functioning—will lead a conversation about practical interventions for facilitating intrateam and interteam collaboration in MTSs.

Learning from the Past to Advance the Future: The Evolution of NASA’s Mission Control Center Multiteam System

Dorothy R. Carter, Jacob G. Pendergraft, Sarena Tseng, Lauren B. Landon, Kelley J. Slack, Marissa Shuffler
The University of Georgia, KBRWyle, Clemson University
Interviews with personnel at the United States’ National Aeronautics and Space Administration (NASA) reveal that key superordinate spaceflight goals, such as sending a team of astronauts to Mars, will require effective patterns of coordination and collaboration processes to arise across a complex multiteam system (MTS) comprised of a spaceflight crew and numerous ‘front room’ and ‘backroom’ teams at Mission Control Centers (MCCs) on Earth. To better address the future challenges of deepspace exploration, this paper delves into the history of the multiteam collaboration at NASA’s MCC with the recognition that developing and implementing organizational interventions often requires a deep understanding of the specific histories and norms of the organizations in question. Using archival resources internal and external to NASA pertaining, we find that NASA’s history encompassed three primary eras: (1) an era of Early Exploration (including the Mercury, Gemini, and Apollo Programs), (2) an era of Experimentation (Space Shuttle and Spacelab missions), and (3) an era of Habitation (ShuttleMir missions and the International Space Station (ISS)). Each era was characterized by distinct sets of challenges for multiteam collaboration. The lessons of these eras will need to be brought to bear on the challenges of LDEMs in areas of communication, coordination, and technical expertise that will push the limits of NASA’s capabilities as humanity moves into this next frontier.

Learning to Lead Multiteam Systems

Ashley Niler¹, Jacob Pendergraft², Lindsay Larson¹, Dorothy Carter², & Leslie DeChurch¹
¹Northwestern University, ²University of Georgia

Multiteam system (MTS) collaboration necessitates that leaders promote positive working relations both within as well as across component teams. Despite the crucial role of leadership for MTS performance, research has not demonstrated how to develop the skills and abilities leaders need in MTS contexts. We created an experiential activity called Project RED to teach MTS leadership skills and evaluated this activity during a 3-hour workshop on multiteam leadership. At the beginning of the workshop, participants (N = 196 individuals) were randomly assigned to 3-person teams; then each team was assigned to a 4-team MTS (N = 16 MTSs). Participants were told that the overarching superordinate goal of their MTS was to determine a location on Mars to build a well to sustain a human colony. However, materials were designed to create substantial variability across participants and teams with regard to their actual priorities. Instructional materials trained participants to better understand and navigate the collaboration challenges of MTSs, such as managing negotiation processes between teams with differing priorities and perspectives. We measured participants’ prioritization of the superordinate goal three times: after each person worked individually, with their team, and as an MTS. Results indicate that priorities evolved over time—all participants were more likely to prioritize the superordinate goal after working as a system. Beyond the classroom, this intervention—the first of its kind—can be used to train leaders of real-world MTSs, including emergency response teams and tech teams, among others, in the challenges of MTSs to improve relations, and thus, performance.
Leveraging Simulations to Improve the Functioning of Multiteam Systems

Alina Lungeanu, Patrick Park, Leslie DeChurch, & Noshir Contractor
Northwestern University

The size, scope, and dispersion of teams working in multiteam systems (MTSs) make them difficult to study. Previous research investigates MTSs in a variety of settings, with the aim of understanding the factors driving coordinated performance between teams. A recurrent theme in this work is that many of the same factors that make strong teams can undermine the coordination between teams. Whereas the complexity of MTSs poses a challenge to observational research, it poses an even greater challenge for research identifying causes and enabling conditions that contribute to MTS effectiveness. In this paper, we demonstrate the ways in which computational modeling can advance the study of MTSs, using the Mission to Mars as an exemplar. We develop a model of task behavior in MTSs that is contextualized in space exploration: a 4-member space crew must solve a complex problem while working with four disciplinary teams in Mission Control (8-members). We parameterize the model based on NASA space analog crews, and use the resulting model to conduct “what if” experiments testing the effects of factors like extended isolation, communication delays between teams, and social network density on task behavior. Virtual experiments on 3000 synthetic, 12-agent MTSs suggest propositions in need of future research: (1) communication delays may prompt individuals to avoid collaboration in favor of solo work, (2) extended isolation and social networks may affect how individuals experience communication delays, such that isolating contexts and/or dense networks may mitigate the collaboration aversion resulting from communication delays.
ANALYZING VIRTUAL TEAM EFFECTIVENESS. IMPLICATIONS FOR LEADERSHIP, TEAM PROCESSES AND INFORMATION-TECHNOLOGY SUPPORT

Chair Conny H. Antoni, University of Trier

State of the Art. Virtual teams (VT) have become more and more common. VT allow members to collaborate across different locations using information communication technology (ICT). Teams vary in terms virtuality. Recent meta-analytic studies have shown that VT and face-to-face teams differ, particularly trust matters more for the effectiveness of VT. Other consequences of VT characteristics, such as varying degrees of geographic dispersion, team mobility, degrees and types of technology usage, for team processes and team effectiveness are still discussed.

Contributions. Presenting research from laboratory experiments, field and organizational case studies this international symposium deals with the question how VT characteristics influence VT processes and effectiveness. These studies address (1) whether team virtuality moderates the indirect relationship between team composition and performance via team cohesion; (2) whether different shared mental models (team-, task-, temporal- and ICT-use) have different multi-level-effects on VT processes and performance; (3) how feedback by the team leader influences team adaptation depending on the degree of virtual communication; (4) whether virtual reality environments offer advantages compared to traditional video-conferences in ICT mediated collaboration; (5) whether team members can compensate leaner communication media by changing their communication behavior; (6) how an integrative theoretical framework for e-collaboration can be used to enable VT to e-collaborate.

Implications. Study findings advance theory development and give advice for the management of and the collaboration in VT, and the use and support of ICT.

The effects of team personality composition in virtual teams

Julia E. Hoch, California State University, Northridge
James H. Dulebohn, Michigan State University

Purpose. This study examines the role of team member perception of internal locus of control on team performance and effectiveness in virtual teams, as well as the moderating role of team virtuality and the mediating role of team cohesion. Precisely, we expect a positive association between the team-level aggregate of internal locus of control and virtual team performance. Further, we posit that the association between team composition and team performance is explained by task and person-oriented team cohesion. Lastly, it is our expectation that the role of team virtuality will moderate these associations, in such that first, the association between team composition and team cohesion is weaker the more virtual the teams are; however, the association between team cohesion and virtual team performance is expected to be stronger in the more virtual teams than in less virtual teams.
**Design.** We examine our hypotheses in a quantitative field study of 100 virtual teams, comprising each, team member, team leader and external managers, as well as objective indicators.

**Results.** Preliminary results from hierarchical linear regression analyses provide support for most of our expectations, in that the association between team composition and team performance is indirectly explained through team cohesion, which tends to be furthermore moderated by the effects of team virtuality.

**Implications.** Results are discussed with regard to implications for theory development and the management of virtual teams in organizations.

**Effects of Shared Mental Models (SMM) on Virtual Team (VT)-Coordination and VT-Performance**

Rebecca Müller, Valeria Bernardy, Anna T. Röltgen, Conny H. Antoni, University of Trier

**Purpose:** The positive impact of SMM on team processes and performance have been frequently confirmed and validated. Researcher advice to analyze multiple types of SMM using hierarchical multilevel modeling (HLM). Nevertheless, most of the conducted studies have neither differentiated between the content of SMM nor used HLM. Hence, this study aims at differentiating the multi-level-effects of team-, task-, temporal- and ICT-(information and communication technology)-use-SMM on VT-performance mediated by VT-coordination.

**Design:** In a cross-sectional field study 126 employees working in 26 virtual IT project teams of two German IT-companies participated in this questionnaire study.

**Results:** HLM shows that task- and team-SMM explain significant variance of VT-performance (model 1). Including temporal-SMM explains additional variance, however, team-SMM becomes non-significant (model 2). Including ICT-use-SMM (model 3) does not explain additional variance. Additionally, model fit of model 3 is worse than of model 2. Including VT-coordination to model 2, HLM indicates that the VT-performance effect of task-SMM is fully and that of temporal-SMM is partly mediated by VT-coordination processes (model 4). Model 4 best represents the data.

**Limitations:** Due to the cross-sectional design and mono-method design causal inferences cannot be made.

**Implications.** Longitudinal studies exploring the differential mediating effects of temporal- and task-SMM on VT-performance via ICT mediated VTC seem to be promising. Temporal- and task-SMM seem to be more crucial for improving VT-performance and VT-coordination than team- and ICT-use-SMM.

**Originality.** This study shows the differential relations between different SMM, VT-coordination and VT-performance.

**Leading virtually. Absence makes adaptation grow fonder?**

Ana Margarida Graça, Henley Business School, University of Reading, UK

Patrícia L. Costa, UCP - Católica Lisbon School of Business & Economics, Lisbon, Portugal
Purpose. The aim of this study was to understand how the feedback given by the leader, and its degree of virtual communication with the team influences team adaptation, when teams invest in action processes differently.

Design. Data was collected from 33 teams (N = 147 individuals) from different occupations via a questionnaire, and a three-way moderation was conducted.

Results. The highest levels of team adaptation were found in situations of high action processes, compared with situations of low levels of action processes. This is particularly true when these teams high on action processes also interact face to face with their leader in situations of low provision of feedback. However, in situations of high levels of feedback, the adaptation of teams with high values of action processes seems to gain from lower levels of face to face interaction with the leader. The opposite is true for teams with low action processes

Limitations. This was a cross sectional study. We have only included one leadership function.

Practical Implications. Adapting to new situations may sometimes require teams to adapt by taking charge of what happens, and requesting lower levels of feedback from the leader. What is more, interacting face to face may be more time consuming, and therefore less adequate for sharing large amounts of information, in these situations.

Originality. To our knowledge, the amount of face to face interaction with the team’s leader has not been studied as a moderator of existing relationships between functional leadership’s specific roles and team outcomes.

Chances and challenges of virtual reality for collaboration at work

Miriam Höddinghaus & Guido Hertel, University of Muenster

Abstract

Purpose. We examined potential benefits of virtual reality (VR) in the context of collaboration among virtual workers. Drawing upon theories from human-computer-interaction literature and psychology, we expect VR to offer advantages over traditional communication media. Specifically, we assume that collaborating in VR enhances well-being, supports the development of trust in the supervisor, and facilitates performance. Further, we propose that affective (social presence) and motivational (work engagement) mechanisms underlie the relationships between media type and the tested outcomes.

Design. We use an experimental design, in which participants communicate through one of the following three ways with a confederate leader. (a) face-to-face, (b) desktop video conference, or (c) virtual reality environment.

Results. The study is preregistered as an as-predicted registration within the Open Science Framework, and data collection is planned to be finalized in November 2018 (N = 210).

Limitations. The external validity of the present study is limited in its ability to generalize to real organizational settings (student sample, hypothetical situation).

Implications. By testing VR against a traditional communication medium and actual face-to-face communication, our study identifies both chances and challenges of using new technologies for collaboration. Thus, the findings can help organizations in choosing the right tools to guarantee virtual team effectiveness.
Originality. Our study complements existing literature by focusing on an emerging technology, whose use is increasing in various areas of today’s economy. In doing so, we provide valuable solutions to overcome challenges of virtual work.

The medium does not have to be the message. How compensatory adaptation can increase virtual team performance

Lisa Handke, Eva-Maria Schulte, & Simone Kauffeld, University of Braunschweig

Purpose. Performance losses in virtual teams have largely been attributed to computer-mediated communication. However, as posited by theories such as channel expansion and compensatory adaptation, individuals learn to de- and encode messages sent via leaner media, thus changing their subjective richness. As empirical evidence supporting the compensatory principle is still rare, this contribution aims to conceptualize communication in virtual teams as a dynamic construct, dependent less on physical media properties, but rather on appropriation.

Design. Presenting multilevel data from two different studies, we analyze how team members compensate for physically leaner media by changing their communication behavior. While study 1 (N = 34 teams) employs a longitudinal design to model the influence of compensatory adaptation on team performance in project teams in the field, study 2 (N = 32 groups) zooms in on micro-level compensation processes displayed in an experimental context with varying media conditions.

Results. Study 1 shows a positive relationship between media compensation and team performance, increasing over time. Study 2 shows adversary effects of contribution length on team performance for virtual vs. face-to-face teams, explained via perceived communication intensity.

Limitations. Both samples consist of students, thus limiting the generalizability.

Implications. We consider this contribution to strengthen and extend compensatory adaptation theory by providing tangible empirical evidence both in the field as well as the laboratory at different levels of granularity.

Originality. In analyzing compensatory adaptation, we contribute towards a dynamic person-task-technology fit perspective, where media use and effects are seen as a function of media appropriation.
Supporting virtual teams with collaborative software – Need of an integrated framework

Stefan Klötzer, Margarete Boos, Georg-August-University of Goettingen

**Purpose.** Collaborative software is increasingly being used to support virtual teamwork (e-collaboration). High expectations regarding enhanced team effectiveness by the use of collaborative software (e.g. web-conferencing, virtual task-boards, wikis) is often contrasted with socio-technical difficulties that impede virtual teamwork. Besides technical problems (interfaces, bandwidth, rights management) it is especially the lack of knowledge or clear responsibilities and the uncertainty about how to beneficially implement these tools into the work processes of teams. We want to address the topic from an organisational design perspective and focus on the activities that are necessary to implement and run collaborative work systems in companies.

**Design.** We build our concept on current literature and data (status-quo analysis / expert interviews) from the CollaboTeam-Project (www.collaboteam.de) to provide an integrative framework that helps practitioners to assist their virtual teams. By presenting case studies of two IT companies, we compare different institutionalised support concepts for virtual teams and their individual roles / activities.

**Results/Implications.** Our approach takes different phases of e-collaboration into account and links it to support activities. Our quantitative and qualitative findings support the practical use of the framework.

**Originality.**

We provide an integrative framework for e-collaboration that addresses the difficulties outlined above by focusing on socio-technical requirements that enable virtual teams to e-collaborate. Our framework includes the three levels Strategy & Change, Support for Collaboration and Technology and matches corresponding courses of action with each level.
1327 - MULTIPLE EFFECTS OF RESOURCE-ORIENTED INTERVENTIONS AT WORK

Alexandra Michel
1Federal Institute for Occupational Safety and Health, Germany

Symposium Abstract

State of the Art

Psychological resources at work help employees to experience work in a more meaningful way. Introducing resource-oriented interventions to the work context facilitates the development and maintenance of such resources (e.g. Michel, O’Shea & Hoppe, 2015). In this symposium, we introduce five papers evaluating a variety of resource-oriented interventions enhancing various psychological resources across a variety of contexts. Moreover, the papers evaluate intervention effectiveness on both health related and work related outcomes.

New Perspectives/Contributions

The six papers to be presented in this symposium examine effects of resource-oriented interventions at work using mostly online tools (see Kosenkranius et al., for an exception). These interventions focus on job crafting (Kosenkranius et al.; O’Shea et al.), (mindfulness) emotion-regulation (Leonard et al., Molina et al.), life-balance (Seiferling et al.) and physical activities (Lennefer et al.). Thereby, they aim to improve prosocial motivation and behaviours (O’Shea et al.), job performance (Kosenkranius et al.), wellbeing (Kosenkrabius et al.; Lennefer et al., Molina et al.), life-balance satisfaction and self-efficacy (Seiferling et al.), physical activity (Lennefer et al.), and to reduce workload (Molina et al.).

Research/Practical Implications

These five papers underline that focussing on resource-oriented interventions is a fruitful avenue to promote employees’ well-being and performance among other outcomes.

The impact of a relational job crafting intervention on prosocial motivation and behaviours: A randomised controlled trial.

Deirdre O’Shea1, Agustin Molina2, Sarah-Jane Cullinane3, Laura Lynch4, Katie Rowland5 & Claire Cooke6

1University of Limerick, Ireland
2Pontificia Universidad Catolica de Chile, Chile
3Trinity College Dublin, Ireland
Abstract

Purpose
Using the interpersonal sensemaking model, we developed a daily relational job crafting intervention which encouraged participants to pay attention to positive relational cues and reappraise negative relational cues. We hypothesised that the intervention would lead to enhanced work meaning, trust in others and greater perceived prosocial impact.

Design & Methodology.
We used a cluster randomised control cross-over design to test our intervention. 95 participants were assigned to the experimental (N = 48) or control groups (N = 47), and completed daily morning and evening surveys for 4 weeks. The experimental group received training in the intervention and were sent intervention instructions with their morning and evening surveys for the first two weeks. Following this, the control group were trained in the intervention and completed it for two weeks.

Results
Multi-level structural equation modelling was used to assess a parallel mediation model specified at daily and person levels. Results demonstrated that condition predicted meaning and trust which in turn influenced prosocial motivations but not prosocial behaviours.

Limitations
All data were self-report.

Research/Practical Implications
This intervention demonstrates the relevance of interpersonal sensemaking processes in the translation of relational job crafting to prosocial motivations. Practically, it is a simple intervention which can influence employees’ perspective of the social work environment and facilitate prosocial motivations.

Originality/Value
Social relationships have been acknowledged as a key resource for employee well-being. However, little research to date has examined the relational component of job crafting as an intervention, nor the mechanisms through which such interventions operate.
Hybrid Crafting Intervention: Effects on Psychological Need Satisfaction, Well-Being and Job Performance

Merly Kosenkranus1, Jessica de Bloom1,2, Floor Rink1
1University of Groningen, Groningen, Netherlands, 2University of Tampere, Tampere, Finland

Abstract

Purpose.
Demographic and economic changes have led to an aging workforce and prolonged work careers. Employees dealing with job demands such as high workload and permeable work-life boundaries could benefit from bottom-up well-being approaches such as crafting. Crafting is defined as proactively adjusting one’s work and off-job activities to satisfy psychological needs. This research program proposes that job and off-job crafting can enhance well-being and job performance, provided that they are combined successfully.

Methodology.
We will design and implement a hybrid job- and off-job crafting intervention among older Finnish employees. Participants will take part in a crafting workshop and develop an individual crafting plan for the following four-week intervention period. A smartphone app will support participants by presenting them with “Daily’s”, short daily activities stimulating crafting behaviors. In a randomized controlled trial with a waitlist-control group, the intervention will be evaluated.

Results.
We expect that crafting can be stimulated with the intervention, and can particularly increase well-being and performance during and after the intervention if employees use both job and off-job crafting (compared to baseline and to the control group).

Limitations.
As the intervention includes several on- and offline components, it may be difficult to establish which components are most effective.

Practical Implications.
Brief and accessible crafting interventions could help employees, who need additional resources at work and at home for dealing with stressors to retain high well-being and job performance.

Value.
Besides the potential well-being benefits for employees, crafting may also offer considerable performance outcome benefits for employers.
The effects of a mindful-emotion regulation intervention on daily workload: A cluster RCT design

Agustin Molina¹, Deirdre O’Shea², M.Gloria Gonzalez-Morales³, Alexandra Michel⁴, Annekatrin Hoppe⁵ & Anna Steidle⁶

¹ Pontificia Universidad Catolica de Chile, Chile
² University of Limerick, Ireland
³ University of Guelph, Canada
⁴ Baua Institute, Germany
⁵ Humboldt University Berlin, Germany
⁶ HS Ludwigsberg, Germany

Abstract

Purpose
Drawing on a mindful-emotion regulation model, we examined the daily effects of a four-week mindful-emotion regulation (MER) intervention, compared to a savoring-nature (SN; placebo control) intervention. We hypothesised that the MER intervention would reduce negative affect post-intervention and moderate its effect on daily perceived workload. We also examined the moderated relationship (by intervention) from morning fatigue to post-intervention negative affect.

Design & Methodology
We collected data in an Irish public organization following a cluster RCT design. We used Mlmed to test a multilevel moderated mediation model (923 daily observations, 146 participants) where morning fatigue (T1) was the independent variable, post-intervention negative affect (T2) the mediator, and evening workload (T3) the outcome. Both paths were moderated by type of intervention.

Results
The effects of the SN intervention were limited to buffering the positive effect of morning fatigue (T1) on post-intervention negative affect (T2). The MER intervention presented a direct negative effect on negative affect (T2). The positive relationship between negative affect (T2) and workload (T3) became negative for the participants in the MER intervention. The indirect effect of morning fatigue (T1) on workload (T3) through negative affect (T2) was negatively moderated by the MER intervention.

Limitations
We used a stringent comparison group by comparing the MER intervention to a SN intervention (all SN components were included in MER).

Research/Practical Implications
MER interventions can reduce daily negative affect and lessen its effects on the perception of daily workload.

**Originality/Value**

Our findings highlight the complexity of the daily effects of MER interventions.

---

**Emotion Savvy: Emotional resources in your smartphone**

Leonard, C. M., Pogrebtsova, E., Cherry, K., Lumley, M. N., Gonzales-Morales, M. G.

University of Guelph

**Abstract**

**Purpose**

Evidence suggests that training designed to improve emotion regulation ability using theoretically-based exercises can prevent physical and psychological illness, as well as increase subjective well-being and performance in diverse applied settings (Carl et al., 2013; Gross, 2015). Emotion Savvy is a smartphone application developed by Organizational and Positive Psychology researchers to train users emotional awareness and regulation skills. Delivery of the training through a smartphone app allows us to implement and study important aspects such as dosage, frequency of training of preferred exercises, identification of emotions to regulate, and match between desired/adaptive emotion and emotion regulation activity, among others.

Combining several evidence-based positive psychology exercises (e.g., mindfulness, gratitude), the intervention is hypothesized to increase participants’ ability to regulate their emotions and improve mental well-being.

**Design & Methodology**

Using a waitlist control design, university students were recruited to take part in the 10-day intervention. Daily event sampling was used to determine whether the effects of the intervention on well-being outcomes are a result of gradual increases in emotion regulation ability. As well, guided interviews with participants seek to understand users’ experiences of the intervention.

**Results**

As data collection is being finalized, qualitative and quantitative results will be presented to assess user experiences with Emotion Savvy and the effectiveness of smartphone-based emotion regulation interventions.

**Limitations**

Participants were assigned to conditions non-randomly.

**Research/Practical Implications**
Findings will inform theory on the effectiveness of emotion regulation training and help guide future smartphone-based positive psychology interventions.

**Originality/Value**

May provide evidence for the use of multicompetent smartphone-based interventions in training employees' emotion regulation ability and supporting positive occupational well-being.

---

**Balance your life – effects of a modular online intervention to promote life-balance**

Nadine Seiferling, Simone Brandstädter, Angelika Reddig and Karlheinz Sonntag

Heidelberg University

**Abstract**

**Purpose:**

Mobility and flexibility characterize today's workplaces and modern technology enables us to work anywhere and anytime and to be permanently available. These trends hold various opportunities and chances but also challenges for today's employees. Blurred boundaries between different life domains may lead to conflicts between those domains and impair well-being. Therefore, boundary management and segmentation strategies are important abilities. Accordingly, some companies offer life-balance trainings to support their employees' boundary management.

**Design & Methodology**

Due to the limited resources of small and medium enterprises (SMEs), they often cannot afford such cost- and time-intensive interventions. Therefore, we developed a resource-oriented online training to promote boundary management strategies according to individual segmentation preferences. Aim of the intervention was to increase participants' life-balance self-efficacy and life-balance satisfaction. In the course of the intervention, participants chose one of three modules (mindfulness, social networks, goal-setting) and were invited to take part in a short refresher training. To test the efficacy of the intervention, we used a waitlist-control-group design (N=82) including pre and post questionnaires.

**Results**

Compared with the control group, participants of the experimental group reported higher levels of satisfaction with life-balance and stronger life-balance self-efficacy. No differential effects were found for the three modules, however.

**Limitations**

Due to the small sample size and the non-randomized design, the generalizability of the results is restricted.

**Research/Practical Implications**

The intervention is a promising approach to foster participants' life balance.

**Originality/Value**
The modular training can especially be of use for employees in SMEs with limited resources.

Increasing Employees’ Work-Related Well-Being and Physical Health through a Technology-Based Physical Activity Intervention: A Randomized Intervention-Control Group Study

Thomas Lennefer¹, Annekatrin Hoppe¹, Elisa Lopper¹ & Amelie Wiedemann²

¹Humboldt University of Berlin, Berlin
²DearEmployee GmbH, Berlin

Abstract

Purpose
Although activity trackers increasingly gain popularity, little is known whether this new technology qualifies to improve employees’ health. This study aimed to evaluate the effect of a workplace intervention applying activity trackers (behavioral approach) combined with an online-coach (cognitive approach) on work-related well-being (e.g. burnout) and physical health (e.g. Body-Mass-Index).

Design & Methodology
To test for intervention effects 116 employees at high risk recruited at one large enterprise in Germany were randomly assigned to an intervention group (n = 59) and a control group (n= 57). Intervention effects were assessed one month, three months and one year after the intervention.

Results
Analysis of variance for repeated measures revealed no intervention effects for work-related well-being. We could find a significant increase in health perception and a significant decrease in Body-Mass-Index for the intervention group. These effects were stable overtime: three months after the intervention for health perception and one year after the intervention for Body-Mass-Index.

Limitations
We had a selective dropout of employees with higher health impairments leading to a relatively small sample to investigate long term effects.

Research/Practical Implications
Our study shows that a cognitive-behavioral intervention with activity trackers increases physical health over time, but was not effective in enhancing work-related well-being.

Originality/Value
The findings highlight the potential for using activity trackers for worksite health promotion programs. 
Integrated summary of the symposium

State of the Art. Job crafting – a process where employees self-initiate sculpting and altering their jobs and work experiences in personally meaningful ways – has recently gained intensive research (Lichtenthaler & Fishbach, 2018; Rudolph et al., 2017). While job crafting is focused on employees initiating changes that impact their own job design, the focus of crafting has been extended to also include crafting work/non-work boundaries, crafting one’s mental states, crafting in interdependent settings and career crafting. This symposium crosses international and scientific borders to share recent, innovative knowledge that will enrich current crafting research.

Contributions. The symposium includes five papers that each offer a novel perspective towards crafting and their outcomes. First, Mäkikangas (Finland) investigates and compares two existing theoretical operationalizations of job crafting and their divergent validity among managers (n = 419). Second, Op den Kamp and colleagues (The Netherlands) share a study on the way individuals proactively manage their vitality to enhance optimal functioning. Third, Fong and colleagues (The Netherlands) report the results of a dyadic supervisor-employee study and a scenario study examining how others react to job crafting. Fourth, Kerksieck and colleagues (Switzerland) present a novel concept and scale of work-non-work boundary crafting that describes how employees safeguard and regulate the borders between work and non-work. Finally, a study by Tims and Akkermans (The Netherlands) seeks to deepen the understanding of career crafting.

Research/Practical Implications. The aim of this symposium is to increase understanding of how employees can proactively tailor their work, safeguard work/non-work boundaries and create a fulfilling career.

To craft a job, but in what way? Comparison of the existing job crafting scales

Anne Mäkikangas

Faculty of Social Sciences (Psychology), University of Tampere, Finland

Abstract

Purpose. There are currently two contrasting models that explain how employees engage in job crafting. Wrzesniewski and Dutton’s (2001) original theoretical model posits that job crafting can occur via three different strategies: task, relational, and cognitive crafting. Tims and her colleagues (2012) have suggested an alternative approach. They defined crafting as changes that employees make in their job demands and job resources. The purpose of this study is to test and compare these two approaches to job crafting by testing their psychometric properties and divergent validity.
Design. Study participants were Finnish managers \((n = 419)\) who filled in both the Job Crafting Scale (Tims et al., 2012) and the Job Crafting Questionnaire (Slemp & Vella-Brodrick, 2013). Confirmatory factor analysis was used as a main method of analysis.

Results. Both scales yielded acceptable fit with the data and constituted distinct constructs, although some high correlations were found between the scales. Reliabilities of both scales were somewhat low: .68-.74 for the JCS and .66-76 for the JCQ. Managers who increased their challenging job demands, structural job resources, and cognitive crafting reported highest work engagement and person-job fit.

Limitations. A cross-sectional study increases the likelihood of common-method variance.

Practical implications. Both investigated scales are useful tools for assessing job crafting among Finnish managers. It is possible to increase employees’ work engagement and person-job fit by supporting promotion-focused and cognitive crafting.

Originality. The study provided novel evidence on clarifying the associations between two operationalizations of job crafting.

Creating A Creative State of Mind: The Link Between Daily Proactive Vitality Management, Mindfulness, and Creativity

Emma M. Op den Kamp\(^1\), Maria Tims\(^2\), Arnold B. Bakker\(^1\), & Evangelia Demerouti\(^3\)

\(^1\)Erasmus University Rotterdam, the Netherlands

\(^2\)Free University Amsterdam, the Netherlands

\(^3\)Eindhoven University of Technology, the Netherlands

Abstract

Purpose. Building on proactive motivation theory, we argue that employees may use proactive vitality management (PVM) to make themselves more creative. We zoom in on this process by examining the role of mindfulness as an underlying mechanism in the PVM-creativity link.

Methodology. In two daily diary studies, employees from the US \((N = 133, n = 521)\) and Germany \((N = 62, n = 232)\) reported on their use of PVM and experienced states of mindfulness for five consecutive days. Additionally, participants completed a daily creativity test (brainstorm task) in Study 1, while supervisors rated participants' daily creative work performance in Study 2.

Results. In both studies, multilevel analyses showed that daily PVM is positively related to creative performance through daily states of mindfulness.

Limitations. Our design is not experimental, so we cannot infer causality from our findings. Moreover, we focus solely on the role of mindfulness in the PVM-creativity link, and did not examine the role of other potentially relevant cognitive states.
**Research/Practical Implications.** Employees aiming to promote their own creative performance may want to adopt a proactive approach regarding their levels of vitality. Future research may build further on our findings and investigate the conditions that may facilitate or inhibit this valuable process.

**Originality/Value.** This is one of the first studies to regard individuals as proactive agents in the creative process. Moreover, our methodology advances previous studies on the mindfulness-creativity link, which are often cross-sectional in nature, and mostly involve student samples and/or self-report measures of creativity.

**Supervisors’ reactions to contraction job crafting: The role of political skill**

Christine Y.M. Fong, Maria Tims, & Svetlana N. Khapova

Vrije Universiteit Amsterdam, School of Business and Economics, The Netherlands

**Abstract**

**Purpose.** Contraction job crafting refers to employees proactively changing work boundaries by reducing tasks and/or interactions with others. Although contraction job crafting may help employees to address work demands, if noticed by others, specifically supervisors, it may lead to a negative supervisor-employee relationship. This study aims to test the visibility of contraction job crafting and the impact of supervisor-perceived contraction job crafting on the supervisor-employee relationship.

**Methods.** A dyadic supervisor-employee study ($N = 141$ dyads) and a scenario experiment ($N = 143$) were conducted.

**Results.** The dyadic study showed that supervisors indeed notice their employees’ contraction job crafting, and when supervisors noticed this behavior, employees perceived higher levels of social undermining and received lower social support from supervisors. This relationship was moderated by employee political skill, such that high contraction job crafting in combination with high political skill resulted in less negative outcomes because supervisors were less aware of their employees’ contraction job crafting. The scenario study experimentally replicated the relation between observed contraction job crafting and relationship outcomes.

**Limitations.** Causal inferences cannot be drawn with the cross-sectional design in the dyadic study but we compensate this partly with the scenario study.

**Implications.** Our findings introduce the supervisor perspective to the job crafting literature and highlight a skill that employees can develop to reduce the negative impact that contraction job crafting may have on their relationship with their supervisor.

**Boundary crafting: A new scale and its relations with health parameters**

Philipp Kerksieck, Rebecca Brauchli, & Georg F. Bauer

Division of Public and Organizational Health/ Center of Salutogenesis; Epidemiology, Biostatistics, and Prevention Institute University of Zurich, Switzerland
Abstract

**Purpose.** Modern working life has become more flexible, individualized, complex, and demanding. The challenge and the possibility for shaping, integrating or balancing work and private life has massively arisen. Thus, we need to understand how employees actively craft the boundaries between their work and private life. Moreover, the salutogenic, health-related outcomes that result from Boundary Crafting (BC) are of crucial interest.

**Design.** In a previous study we developed and validated an instrument to measure BC. BC is the proactive design and configuration of boundaries between work and private life according to needs and standards of the respective employee.

**Method.** The present study is longitudinal (3 waves) and cross-cultural. This study will provide insights on the mechanisms of BC, e.g. as adaptive strategies to stressful work/life circumstances and their association with health-related outcomes. Results from this longitudinal study will be presented at the conference.

**Results.** Building on this new scale, we will analyze patterns of BC and their impact on health outcomes. Preliminary results from the validation study ($n = 311$) indicate that BC is correlated to mental well-being (Warwick Edinburgh Mental Wellbeing Scale * non-work BC $r = .300$ / work BC $r = .293$, $p < .01$).

**Limitations.** This study relies on self-reported data. In further steps, psychometrical data and biopsychological parameters could be inked to BC behaviors.

**Implications/Value** This study will allow for drawing conclusions for particularly beneficial, salutogenic strategies for crafting an increasingly flexible working life.

---

**From job crafting to career crafting**

Maria Tims & Jos Akkermans

Vrije Universiteit Amsterdam, School of Business and Economics, The Netherlands

Abstract

**Purpose.** Individuals can proactively craft their careers by shaping both their individual jobs and the series of jobs or roles that comprise their career journeys. We illustrate how being proactive with regard to one’s career (i.e., career crafting) may help individuals to better navigate their career. Career crafting is defined as proactive behaviors that individuals perform to self-manage their career, and which are aimed at attaining optimal person-career fit. More specifically, two aspects of career crafting emerged from the literature on career self-management, career competencies, and job crafting that may define career crafting: a cognitive component (reflecting on one’s career) and a behavioral component (taking proactive action).

**Methodology.** We created a new scale to measure career crafting and tested the factor structure and validity of these items in several cross-sectional samples (total N = 1200 employees).
Results. Career crafting is measured with eight items, of which four items assess proactive career reflection and four items assess proactive career construction. These two dimensions could be separated from career self-management, career competencies and job crafting. Moreover, while controlling for the presence of organizational initiatives to enhance career management (e.g., being given challenging tasks or important information about job opportunities), career crafting also positively related to internal and external employability.

Limitations. The studies reported here are cross-sectional.

Originality/Value. A successful and fulfilling career depends on many factors. By also taking into account what an individual can do, we gain more insights into how they can achieve a career they find fulfilling.
1343 - THE MERITS AND PARADOXES OF FLEXIBLE WORK (PART II/II)

Christian Korunka* & Bettina Kubicek**

*University of Vienna, Austria
**University of Graz, Austria

Discussant: Evangelia Demerouti, Eindhoven University of Technology, NL

State of the Art

Flexible work defined as (1) flexibility in time and (2) flexibility in working locations, (3) supported by information and communication technologies (ICT), is spreading rapidly. Current Eurofund/ILO data categorize 10% to 35% of the European workplaces as highly flexible. Empirical studies so far confirm both positive and negative effects of flexible working on the quality of working life of the employees. The concept of organizational paradoxes, but also the integration of effects outside work may help to explain such differences.

New Perspectives/Contributions

The symposium brings together an international group of researchers dealing with diverse aspects of flexible work and their role on quality of working life. Four studies deal with flexibility in office work, both within the offices (Korunka et al., ter Hoeven et al., Uhlig et al.), and in blended work settings (Wörtler et al.). Agile working is investigated as a new form of organizational flexibility (Knecht & Krause). Two studies examine the effects of flexible work across work boundaries (smartphone use in the evening: Binnewies et al.; work-life conflict: Mellner). One large study analyzes effects of work flexibility on well-being in the US: Ray & Pana-Cryan).

Research/Practical Implications

Combining and integrating the different approaches to the investigation of flexible work as an important current trend in work organization may help to better understand this new phenomenon. The studies show that personal preferences and the organizational context matter for positive and/or negative outcomes of flexible work.

Moving into a flexible office: (I) The role of leadership and organizational culture

Christian Korunka*, Lars Uhlig*, Bettina Kubicek**

*University of Vienna, Austria
**University of Graz, Austria

Purpose
Flexible offices are a current trend in today’s organizations. Supported by information and communication technologies employees are offered flexible use of time and locations within the office building. Empirical studies show both increases and decreases of quality of working life in such office concepts. Organizational paradoxes, like the autonomy paradox, may help to explain such contradictory results.

**Design**
This study is designed as a comprehensive longitudinal study accompanying the move into a new flexible office. The new office consists of different work zones. Measurements were taken before the move into the new building (t1), two months after the move (t2) and about 8 months after the move (t3).

**Results**
Up to 497 employees participated at each of the measurements. 238 cases were available for longitudinal analyses. The move into the flexible office was accompanied by significant increases in flexible use of work locations. Quality of working life diminished at t2 and improved slightly again at t3. Improvements were observed only for managers. Perceptions of high organizational trust at t1 as the most important predictor of change management were accompanied by improvements in quality of working life.

**Limitations**
Data were collected in a longitudinal design, but the data stem only from one specific case.

**Research/Practical Implications**
Contradictory results related to the implementation of flexible offices may be explained both by aspects of organizational change culture (organizational trust) and different effects for employees and managers.

**Originality/Value**
This is one of the few longitudinal studies dealing with flexible offices.

**Moving into a flexible office: (II) Effects on job stressors and employee motivation**
Lars Uhlig*, Bettina Kubicek** & Christian Korunka*

*University of Vienna, Austria
**University of Graz, Austria

**Purpose**
More and more organizations are switching to flexible office designs in order to adapt to the requirements of flexible work organization and to save costs. However, flexible offices have been found to produce more distractions for employees. Distractions can be a source of stress and hinder employees to concentrate. As a result, flexible offices hold the potential to weaken employee engagement.
Design

We conducted a three-wave longitudinal study accompanying the move of a large Austrian company into a new flexible office. Measurements were taken two months before the move (T1), two months after the move (T2) and 8 months after the move (T3). Up to 497 persons participated in each wave.

Results

In order to capture the changes of distractions and engagement we analyzed the data using latent change score modelling. Distractions increased significantly at T2 and stayed at a stable high level at T3. Positive changes in distractions from T1 to T2 predicted simultaneous negative changes in engagement but subsequent positive changes in engagement from T2 to T3. These results suggest that the increase in distractions after the move first led to a decrease in engagement which later got reversed, possibly due to adaptation processes.

Limitations

The single group design limits the generalization of results. Further, all constructs were measured using self-reported data.

Originality

Using latent change score modelling our study is the first to investigate how changes during a move to a flexible office affect simultaneous and subsequent changes in employee engagement.

“IF YOU EXPERIENCE NOISE, YOU JUST HAVEN’T PLANNED YOUR WORK WELL”: INDIVIDUALIZATION AND REGULATION WITHIN A FLEXIBLE WORK DESIGN.

Claartje L. ter Hoeven*, Eva van Gemert** & Caryn E. Medved***

*The Amsterdam School of Communication Research ASCoR, University of Amsterdam
**Department of Sociology, Erasmus University Rotterdam
***Department of Communication Studies, Baruch College

Purpose

This study investigates the spatial dimension of flexible work designs (FWDs) by mapping the experiences of employees as they try to acclimate to open-plan offices and drop-in desks.

Method

23 in-depth interviews were conducted with employees of an international construction company (here: CONSTRUCT)

Results

Findings show the interaction between occupational context and personal preferences in employees’ FWD experiences. Employees’ differential success in adapting to FWD also exemplifies what we term the flexibility paradox: While FWDs ostensibly allow for employees’ freedom to choose when, where and how to work, these workplace structures paradoxically
impose a surprising level of rigidity – a rigidity, perhaps, that results from the unquestioned use and valorization of the flexible knowledge worker as the model for the design of flexibility in the workplace.

Limitations
Our single-organization case study method provides the perspectives only of employees at CONSTRUCT and their perspectives at only one point in time in the adaptation of FWDs.

Practical Implications
We encourage human resource professionals and managers to design and implement FWDs by keeping in mind there exists a variety of employee needs and preferences; design for flexible flexibility.

We demonstrate how FWDs govern employee conduct by prescribing a specific way of working understood as ‘flexible’ while delegitimizing others. By exploring occupational status in relation to boundary management strategies, we differentiate among four employee categories. All personnel must perform within the FWD, although it seems designed for knowledge workers. Employees cope with the resulting FWD tensions through the individualization of the problems and their solutions.

The importance of employees’ job-related psychological needs for blended working
Burkhard Wörtler*, Nico W. Van Yperen*, Kiki M. M. De Jonge*, Eric F. Rietzschel*
*Department of Psychology, University of Groningen, Groningen, the Netherlands

Purpose
The opportunity to seamlessly blend on-site and off-site working (i.e., blended working) is enabled by the availability of continuously improving ICTs that provide employees with almost constant access to job-relevant information and coworkers. The aim of our research was to examine when blended working is likely to entail desirable outcomes by focusing on the role of employees’ job-related psychological needs.

Design/Methodology
We conducted two independent cross-sectional survey studies. We recruited a sample of 348 and 657 employees for the first and second study, respectively.

Results
In the first study, we found that employees low in need for relatedness and structure, and high in need for autonomy, tend to perceive blended working to be effective for them. In the second study, we obtained evidence that the perceived opportunity for blended working can maintain employees’ intrinsic work motivation when quantitative job demands are high, given that employees have a strong job-related need for autonomy.
Limitations
The design of both studies denied conclusions about causal relations between the variables.

Research/Practical Implications
Our findings contribute to the literature by highlighting the importance of fit between work context and employees’ psychological needs. We recommend to practitioners in organizations to consider employees’ psychological needs to decide for whom blended working is likely to be advantageous, rather than adopting a ‘one-size-fits-all approach’ by offering the opportunity for blended working to the entire workforce.

Originality/Value
We provide evidence that blended working may be a contemporary resource for employees, yet individual differences in job-related psychological needs are likely to influence its usefulness.

The association of agile methods, team processes and engagement
Michaela Knecht, Marcel Baumgartner, Andreas Krause, Jonas Mumenthaler, Ariane Vetter & Albert Vollmer
University of Applied Sciences Northwestern Switzerland FHNW, School of Applied Psychology

Purpose
Agile working is becoming more and more prevalent. Agile working is highly flexible. Agile teams do not follow a long-term project schedule but they plan step-by-step and decide continuously what delivers most values to the customer or user. Agile teams use several different methods to implement agile working. In the current study, we focus on the agile methods iterations and retrospective meetings. An iteration is a short two to four weeks single development cycle, where a team finishes several tasks (in the software context a running software). In retrospective meetings, teams reflect and analyze their way of work. Aim of the current study is to assess association between agile methods, team processes and engagement of the employees.

Design/Methodology
The sample consists of N = 148 employees nested in 33 teams, working as software developer in three Swiss companies, mostly males (87%). Multi-level regression analyses will be conducted to assess the relations for individuals and teams.

Results
First results show a positive association between agile methods and several team processes such as team autonomy, team job crafting, or team resilience. Furthermore, there is a positive relationship between agile methods and engagement. Data analysis is still ongoing.
Limitations
It is a cross-sectional study with a sample of only software developer.

Research/Practical Implication
The study suggests positive effects of agile methods on team processes that go along with higher engagement.

Originality/Value
This study adds to the small empirical database on the IO-psychological aspects of effects of agile practices.

Is every smartphone use in the evening detrimental? The role of different smartphone activities for employees recovery and well-being
Carmen Binnewies, Kristin Holtrup & Suzana Milicevic
University of Muenster, Muenster, Germany

Purpose
The goal of our study was to examine the daily use of different smartphone activities during leisure evening time for employees’ recovery and well-being. Based on the study of Sonnentag (2001) distinguishing different leisure time activities, we examined the role of work-related, private-duty, health-related, social and amusement smartphone activities for employees’ recovery experiences (psychological detachment, relaxation) and affective well-being in the evening. We assumed detrimental effects of work-related and private-duty smartphone activities and beneficial effects of health-related, social and amusement activities for recovery experiences and affective well-being.

Design/Methodology
We conducted a 5-day diary study with a mixed sample of 77 employees (providing data of 297 days).

Results
Results of hierarchical linear modelling showed that work-related smartphone activities were detrimental for psychological detachment and relaxation in the evening and for negative affect and work-family conflict. Social and amusement smartphone activities were positive for psychological detachment but showed no relations with affective well-being. Health-related smartphone activities did not show the expected relations. Additionally, we found some relationships contrary to our hypotheses, e.g. negative relationships between work-related and private-duty smartphone activities with fatigue.

Limitations
Despite our diary design and focus on within-person processes we cannot draw conclusions about causality.

Research/Practical Implications
Results show that simple implications to not use your smartphone are not reflecting more complex pattern which activities are useful or detrimental for different outcomes.

**Originality/Value**

Our study is one of the few studying the use of specific smartphone activities during evening leisure time.

**Individual Perceptions of Boundary Control Mitigate the Effect of (in) Congruence Between Workers’ Preferred Work/Non-Work Boundaries and their Enacted Boundary Management on Work-Life Conflict**

Christin Mellner*, Pascale Peters** & Susanna Toivanen***

*Stockholm University, Sweden
**Radboud University, Nijmegen, Netherlands
***Stockholm University/Karolinska Institutet, Stockholm, Sweden

**Purpose**

Rapid development of boundary-transcending ICTs have led to more flexible forms of work organization, marking a fundamental shift in the flexibility and permeability of employees’ work-nonwork boundaries. This study investigates the inter-relationships between employees’ boundary management types, representing boundary (in)congruence between their preferred and enacted boundary management, and work-life conflict, and the potential moderating role of perceived boundary control herein.

**Design/Methodology**

Data comprised 3,154 Swedish professional workers in different occupations within both the public and private sector. Correlations, t-tests, Chi square tests and univariate general linear model analyses (ANCOVA) were performed.

**Findings**

Enacted integration as well as boundary incongruence were both positively associated with work-life-conflict. Moreover, incongruence accompanied by a high degree of enacted integration increased work-life conflict. Finally, boundary control mitigated work-life conflict. This was especially the case among employees preferring segmentation but enacting integration, i.e., boundary incongruence, but also among employees both preferring and enacting integration, i.e., boundary congruence.

**Practical implications**

This study provides new and valuable knowledge on different boundary management types, reflecting boundary (in)congruence, that are associated with increased work-life conflict depending on the specific type of (in)congruence in question, and the role of boundary control herein as an important factor to combat work-life conflict. This kind of knowledge is of high relevance in contemporary working life characterized by an ever-increased blurring of work-
nonwork boundaries. Organizations play an important role in creating new legitimate beliefs and as such, leisure norms could be implemented that promote employees’ boundary control, and subsequent reduced work-life conflict.

**Work flexibility and well-being across work arrangements in the US**

Tapas K Ray* & Rene Pana-Cryan*

*NIOSH/CDC; Washington DC, USA

**Purpose**

We assessed the prevalence of work flexibility by work arrangement type among US workers during 2002-2014. We further investigated whether work flexibility was associated with work related well-being – job satisfaction, job stress, and health related quality of life.

**Design/Methodology**

We used data from the Quality of Work life (QWL) module of the General Social Survey (GSS). We analyzed pooled cross sectional data from 2002, 2006, 2010, and 2014 (weighted sample of 5911 observations). To understand work flexibility, we used the following variables: 1) Work schedule; 2) Telework; 3) Ability to take time off work for non-work matters; 4) Work demands; 5) Productivity-conducive work conditions; 6) Opportunity to develop special abilities; 7) Availability of help and equipment at work; and 8) Freedom to decide. We assessed the effect of work arrangement on work flexibility and the association between work flexibility and work related well-being.

**Findings**

Overall work flexibility changed minimally during 2002-2014 in the US, although some individual flexibility variables followed cyclical trends. Work arrangement was an important determinant of work flexibility. After controlling for demographics and overall health status, work flexibility was positively associated with well-being.

**Practical Implications**

The study demonstrated the importance of work flexibility for well-being and provided valuable information about flexibility by work arrangement type.

**Originality/Value**

As far as we know, this is the first study on this topic in the US context. Our findings are relevant for stakeholders, including policy makers.
State of the Art
Return to work (RTW) procedures and practices are essential components of the work environment, as they help individuals to stay employed. However, the solutions to assist workers when they return to work, at times, may not reflect necessarily what is pertinent for workers in accommodating their return to the workplace or ensuring that they remain in their previous or adjusted jobs. It is essential therefore that any such procedures and practices meet the needs of those individuals who may have to step away from the workplace due to ill health and would need a facilitated return.

New Perspectives/Contributions
The papers in this symposium present new processes to facilitate more effective RTW practices. They are based on structured research conducted within academic settings that have then been translated into practical ways of improving RTW procedures and practices. They show the effectiveness of the academic/practitioner connection to provide frameworks to support the workplace.

Research/Practical Implications
Overall, the research followed multi-disciplinary and multi-method approaches to design appropriate return to work practices that allow workers a successful re-entry into the workplace. It is accepted that individuals benefit more from returning to work, than remaining on long-term sickness absence to manage their disorder or from removing themselves entirely from the workplace. This symposium assesses the issues that are relevant to RTW solutions; proposes new ways to support workers; and encourages discussions on what organisations have found useful, and what is needed to ensure that workers truly benefit from such programmes.

Dr. Roxane L. Gervais, Independent Practitioner

Title of paper
Fitness and return to work: Looking at the evidence

State of the Art
Sickness absence remains a major concern for many organisations as work-related accidents and ill-health impact directly on employees and can incur indirect costs: e.g. staff substitution/replacement staff; lost productivity; reduced quality of service. Due to these costs, employees may feel obligated to return to work from sickness absence before they are fully recovered.

New Perspectives/Contributions
This present study explores the reasons employees return to work following periods of sickness absence before they are fully recovered. There is evidence to suggest that ‘wellness’
may not be the main driver prompting a return to the workplace when individuals experience ill-health.

**Research/Practical Implications**
The results support previous research where employees may at times use presenteeism (coming to work ill or when not fully recovered) rather than absenteeism as a way to cope with ill-health. Such practices may lead to negative consequences for organisations, such as reduced productivity.

**Originality/Value**
This paper explores various options that employees have used to allow them to return to work. One such factor is adjustment latitude (Johansson, Lundberg & Lundberg, 2006), which has been found to influence return to work, and which organisations may wish to explore. While presenteeism may not be the most desirable and effective option for organisations, the concept of adjustment latitude may assist individuals and organisations to arrive at an acceptable working situation.

**Title of paper**
Resources enabling sustainable return to work for workers with CMDs

CMDs such as depression, anxiety disorders and stress present a major problem in the OECD countries resulting in long-term sickness absence (OECD, 2015). Relapse post return presents a major challenge. Recurrent sickness absence spells due to CMDs often last longer than the first and frequent periods are related to increased risk of work disability (Koopmans et al., 2011).

Current research on return to work for employees with common mental disorders suffers from two limitations: First, research mostly focuses on the absence period ignoring the resources which may facilitate sustainable return to work, i.e. employees continuing to work and thrive at work post return. Second, research tends to view the work and non-work domains separately and fails to consider the interaction of resources at the individual, group, leader and organisational levels. In this presentation, we present an integrated, multi-disciplinary framework and a preliminary definition of sustainable return to work. Based on current occupational (health) psychology theory and existing research on return to work, we developed ten propositions for the resources in and outside work, which may promote sustainable return to work. In addition to the individual, group, leader, and organisational levels, we also argue for the importance of the overarching context, i.e. the societal context and the culture and legislation that may promote sustainable return to work. Our framework raises new questions that need to be addressed to enhance our understanding of how key stakeholders can support employees with common mental health disorders staying and thriving at work.

**Title of paper**
Turning research into practice: An evaluation of mental health return to work guidance and recommendations to improve practice

Common mental health conditions such as stress, anxiety and depression affects one in six employees in the UK. Research has helped to inform our understanding of the facilitators and barriers to maintaining and returning to work following mental ill health, however the UK is not alone in experiencing high rates of short and long-term absence due to mental ill health. Timely, reliable and easy to access guidance is vital if employers and employees are to put research into practice. This paper evaluates existing return to work guidance using an evidence based approach in order to understand where guidance may be strengthened to support employers and employees better in managing the return to work process. Available guidance was identified through three sources: interviews with a multi-disciplinary group of experts, a comprehensive online search, and interviews with employers and employees. A hybrid evaluation framework was developed (Eysenbach et al., 2002; McMillan et al., 2016) to assess technical quality, design criteria, readability, accuracy, completeness, and the potential to result in behaviour change. Guidance material was evaluated by two members of the research team and qualitative comments were gathered. Practitioner, employee and employer interviewers enabled an exploration of the usability of guidance and user needs. Findings indicate that current guidance is largely process orientated and may benefit from the inclusion of materials to encourage behaviour change. Furthermore, tailored, adaptive guidance is lacking. Findings will be discussed in relation to current research and recommendations for practice will be outlined.

**Title of paper**
How are workplace well-being strategies addressing mental health at work?

Background: Many OECD countries are facing a significant mental health challenge at work. In the UK, 1.6 workers report experiencing a mental health issue at work (OECD, 2015). There is growing recognition in academic research and at the national level that organisations need to take a strategic and integrated approach to workers’ health and well-being. Whilst there has been an increase in the number of employers introducing well-being strategies, the contextual drivers for these strategies and to what extent they are designed to support good mental health has not been examined in detail.

Method: This study adopted a behavioural perspective and using the ground theory approach, interviewed those employers with a formal or informal well-being strategy to explore the purpose of the strategy, its values and principles and its translation into practice. Employers were also asked specific questions on how managed those with poor mental health, particularly during sickness absence, at the point of returning to work and post return to work. Managers from 18 organisations of varying size, sector and location took part in qualitative interviews.
Results: The purpose of wellbeing strategy for many employers were to reduce sickness absence and/or to improve their corporate image, and/or a genuine concern for mental health. The well-being strategies were the key drivers for the re-emergence of soft skills training for leaders in managing health and well-being in general; and in supporting a worker with poor mental health. The presentation will discuss the details of these well-being strategies.

Return-to-Work for People with Moderate and Severe Mental Health Conditions

State of the Art
It is estimated that mental ill-health costs the UK economy £70 billion per year through lost productivity, social benefits and health care. Engagement in ‘meaningful activity’, including paid employment, has long been a part of therapy for people with long-term mental ill health. People with severe and enduring mental health problems who are also working have fewer and shorter hospital admissions (Burns et al, 2009; Catty et al, 2008) and less outpatients service use (Bush et al, 2009).

New Perspectives/Contributions
Individual placement and support (IPS) is now widely used to help people with severe and enduring mental health problems to return to work. IPS emphasises rapid return to competitive work after episodes of mental illness through the provision of ongoing in-work support from specialist employment advisors. Evaluation of IPS through RCTs have shown higher rates of employment through IPS than other interventions (Luciano et al. 2014).

Research/Practical Implications
This paper will review the latest evidence on the effectiveness of Individual Placement and Support (IPS) and some of the psychological theories underpinning the approach. It will explore the implications for organisations and managers, and how in-work support can be provided to employees to promote job retention.

Originality/Value
Although IPS demonstrates effectiveness at securing job starts, there are challenges in achieving for ongoing job retention. This paper will discuss some of these challenges and the implications for future research and interventions.
POSITIVE RESOURCES TO FACE THE CHALLENGES OF CURRENT WORLD OF WORK

Proponent: Annamaria Di Fabio (University of Florence, Italy)

Co-chairs: Gabriela Topa Cantisano (UNED, Madrid, Spain)

Discussant: Marco Depolo (Alma Mater Studiorum, University of Bologna, Italy)

State of the Art

The 21st century is characterized by continuous change, globalization, and instability in the labor market. In a positive preventive perspective it is essential to develop positive resources to face the current challenges (Blustein, Kenny, Di Fabio, & Guichard, 2018; Peiró, 2017).

New Perspectives/Contributions

This symposium includes five contributions.

The first contribution by Topa and Puigmitja aims to test with Spanish workers the cross-cultural validity of the Intrapreneurial Self-Capital Scale (ISC, Di Fabio, 2014) as a core of intrapreneurial positive resources to face the challenges of the 21st century.

The second contribution by Di Fabio examines the relationships of Intrapreneurial Self-Capital (ISC, Di Fabio, 2014) with acceptance of change, employability and hedonic and eudaimonic well-being in Italian workers.

The third contribution by Butucescu, Zanfirescu, and Iliescu investigates the relationship between job crafting, strengths use and contextual performance while considering the role of personality with public healthcare and mental care professionals.

The fourth contribution by Lo Presti, Molino, Emanuel, Landolfi, and Ghislieri examines the intermediate role of work-family balance (WFB), considering WF-organizational support, WF-enrichment and WF-conflict as predictors, and family-life satisfaction of dual-income families' both partners as final outcomes.

The fifth contribution by Mazzetti, Derous, Guglielmi, and Depolo investigates the role of crafting strategies and career competencies within the association between boundaryless career orientation and job insecurity.

Research/Practical Implications

New research and interventions for promoting positive resources to help people and organizations to face more successfully the challenging environment of current world of work.
1) Title: Intrapreneurial Self-Capital Scale in Spain: A key resource for career development

Gabriela Topa* & Irene Puigmitja*

*National Distance Education University, Madrid, Spain

Abstract

**Purpose.** Career development can be defined as a process where people take different choices and decisions related to their employment, and profession. During the precedent decades, the main approach was that organizations directed the career development of their employees. But recently, the protean career approach highlighted that the individual could decide his/her own career direction. And, Intrapreneurial Self-Capital could be considered a key variable for career development. Hence, the current contribution aims to test the cross-cultural validity of the Intrapreneurial Self-Capital Scale in Spain. **Design/Methodology.** Two studies with Spanish workers have been conducted: first a cross sectional study (N=270) and a second two wave study (N=191). **Results.** Descriptive statistics and AFC confirmed the factor structure of the Italian version. Main conclusions support that the instrument showed adequate psychometric properties. In the second study, nested models have been tested and the ISC at time 1 and time 2 significantly predicted job satisfaction and Flourishing at Time 1 and time 2. **Limitations.** The use of self-report measures and the cross-sectional design of the first study raises concerns about common-method variance. **Research/Practical Implications.** The findings add to our understanding of the role of ISC on workers’ career development and resources at work. **Originality/Value.** New research and interventions for promoting positive resources to face the challenges of current world of work.

**Keywords:** Intrapreneurial Self-Capital; positive resources; workers, organizations.

2) The contribution of Intrapreneurial Self-Capital in acceptance of change, employability and well-being

Annamaria Di Fabio*, Mirko Duradoni**

* Director of the International Research and Intervention Laboratories in “Cross-Cultural Positive Psychology, Prevention, and Sustainability (CroCPsΨP&S)” and “Psychology for Vocational Guidance, Career Counseling and Talents (LabOProCCareer&T)”, Department of Education and Psychology, University of Florence, Italy

** Department of Information Engineering, University of Florence, Italy
Abstract

**Purpose.** In the 21st century, Intrapreneurial Self-Capital (ISC, Di Fabio, 2014) represents a core of intrapreneurial positive resources to face challenges and transitions. This study aims: to examine the relationships of ISC with acceptance of change, employability, well-being (both hedonic and eudaimonic), controlling for the effects of personality; to analyze the mediation role of ISC in the relationship between personality traits and acceptance of change, employability, well-being. **Design/Methodology.** One hundred and ninety-eight Italian workers were administered the Big Five Questionnaire (BFQ, Caprara, Barbaranelli, & Borgogni, 1993), the Intrapreneurial Self-Capital Scale (ISC, Di Fabio, 2014), the Acceptance of Change Scale (ACS, Di Fabio & Gori, 2016), the Dispositional Measure of Employability (DME; Italian version Di Fabio & Bucci, 2017), the Positive and Negative Affect Schedule (PANAS; Italian version Terracciano, McCrae, & Costa, 2003), the Satisfaction With Life Scale (SWLS; Italian version Di Fabio & Gori, 2015), the Meaningful Life Measure (Italian version Di Fabio, 2016), the Flourishing Scale (Italian version Di Fabio, 2014). Hierarchical regressions and mediation analyses were effected. **Results.** ISC added significant incremental variance beyond that accounted for by personality traits in relation to acceptance of change, employability, well-being (both hedonic and eudaimonic). The mediation role of ISC emerged in the relationship between personality traits and acceptance of change, employability, well-being. **Limitations.** Self-report measures, cross-sectional design. **Research/Practical Implications.** ISC could be a promising resource, opening new research and intervention opportunities in a primary preventive perspective. **Originality/Value.** New research and interventions for promoting ISC enhancing acceptance of change, employability, well-being.

Keywords: Intrapreneurial Self-Capital; acceptance of change, hedonic well-being; eudaimonic well-being; primary prevention perspective; workers.

3) The whys and wherefores of going the extra-mile as health workers

Andreea Butucescu*, Serban Zanfirescu*, Dragos Iliescu*

*Department of Psychology, University of Bucharest, Romania

Abstract

**Purpose.** Based on the Job Demands-Resources model, the present study investigates the relationship between job crafting, strengths use and contextual performance while considering the role of personality traits (conscientiousness and openness). **Design/Methodology.** The study was based on a sample of public healthcare (dentists) and mental care professionals (psychiatrists). **Results.** Results
indicate that both personality traits predict increased levels of job crafting. Crafting partially motivates individuals to build on their strengths in order to generate contextual performance. Limitations. Self-report measures, cross-sectional design. Research/Practical Implications. Theoretical and practical contributions are being discussed alongside limitations and future prospects. Originality/Values. New research and intervention to build strengths for better performance.

Keywords: contextual performance; public health workers; job crafting; personality; strengths use.

4) Feeling balanced and satisfied in dual-income couples between crossover and spillover effects

Alessandro Lo Presti*, Monica Molino**, Federica Emanuel***, Alfonso Landolfi*, and Chiara Ghislieri**

* University of Campania “Luigi Vanvitelli”, Psychology Department, Caserta, Italy
** University of Turin, Psychology Department, Turin, Italy
*** University of Turin, Department of Philosophy and Education Science, Turin, Italy

Abstract

Purpose. Dual-income families are challenged by several issues in the context of conciliation between the working environment and the family context. This calls for a better comprehension of the organizational and family dynamics and the role of individuals. This study, consistently with spillover and crossover hypotheses, aimed at examining the intermediate role of work-family balance (WFB), linking on one side work-family organizational support (WFOS), work-family enrichment (WFE) and conflict (WFC) as predictors, and on the other hand family-life satisfaction of dual-income families’ both partners as final outcomes. Design/Methodology. We sampled 390 double-income couples; partners individually filled-in a questionnaire. Analyses were conducted through SPSS 24 and Lisrel 9.3 for the structural equation model (SEM). Results. SEM results \[\chi^2(127)=383.63, \text{CFI}=.96, \text{GFI}=.90, \text{SRMR}=.05, \text{RMSEA}=.07\] showed that WFB was negatively predicted by WFC and positively predicted by WFE. Furthermore, WFOS positively predicted WFE, which also mediated its effect on WFB. Finally, crossover and spillover effects were also confirmed, given that positive associations between WFB and family-life satisfaction of both partners were found. Limitation. Cross-sectional design, self-report data and the convenience sampling procedure are the main limitations. Research/Practical Implications. Implications for future research and organizational interventions emerged. In particular, all those interventions in the workplace that could improve WFB, also through organizational support, and which would lead to greater satisfaction in family life. Originality/Value. This study contributes to the literature on work-life interface investigating the association between WFE, WFC and WFB in relation to satisfaction for family life using spillover and crossover theories.
Keywords: work-family conflict; work-family enrichment; work-family balance; family-life satisfaction; spillover; crossover.

5) Boundaryless career orientation and career competencies as strategic resources to tackle job insecurity

Greta Mazzetti*, Eva Derous**, Dina Guglielmi*, & Marco Depolo***

* Department of Education Studies, University of Bologna, Via Filippo Re, 6, 40126 Bologna, Italy.
** Department of Personnel Management, Work, and Organizational Psychology, Ghent University, Dunantlaan, 2, 9000 Ghent, Belgium.
*** Alma Mater Studiorum, University of Bologna, Italy

Abstract

Purpose. The aim of the current study was to investigate the role played by job crafting strategies and career competencies (i.e., knowing why, knowing how, and knowing whom) within the association between boundaryless career orientation and the perceived level of job insecurity. Design/Methodology. The sample consisted of N=491 Italian employees working in different organizations and occupational sectors. Most of them were women (57%) and the mean age was 34.31 years (SD = 8.55). Most of the sample had a permanent job (72.6%) and worked full-time (79%). Results. Our analyses revealed that different career competencies and the strategies of job crafting aimed at fostering employees' resources are significantly associated to employees' perceived job insecurity and could enhance the relationship between a boundaryless career orientation and a lower perception of insecurity. Limitations. The study was characterized by an imbalance between participants with temporary and permanent employment (respectively, 28.7% and 71.3% of participants). Moreover, the study was based on a cross-sectional research design, which prevents us from establishing the direction of the causal chain that links boundaryless career orientation, job crafting, career competencies and job insecurity. Research/Practical implications. The obtained results provided support for the hypothesized relevance of training interventions focusing on the enhancement of a boundaryless perspective and job crafting strategies among HR best practices. Originality/value. This study emphasized the crucial role played by boundaryless career orientation in order to efficiently face an unpredictable labour market, where job stability and ascendant traditional career paths cannot be taken for granted.

Keywords: boundaryless career orientation; job crafting strategies; career competencies; job insecurity.
1363 - EMOTIONS IN THE WORKPLACE

Proponent: Dragos Iliescu (University of Bucharest, Romania)

Co-chairs: & Annamaria Di Fabio (University of Florence, Italy)

Discussant: Dina Guglielmi (Alma Mater Studiorum, University of Bologna, Italy)

State of the Art

In the literature a growing interest emerged in relation to the contribution of emotions in organizational contexts (Ashkanasy & Dorris, 2017; Ashkanasy, Humphrey, & Huy, 2017; Di Fabio & Saklofske, 2018; Peiró, Ayala, Tordera, Lorente, & Rodríguez, 2014). Emotions are fundamental components of working life and it appears essential to examine their role in relation to different organizational variables.

New Perspectives/Contributions

This symposium is focused on emotions in the workplace and it includes four contributions.

The first contribution by Pérez Rodríguez and Topa aims to examine whether emotions played a role as mediators in the relationship between organisational justice perceptions and work stress.

The second contribution by Ispas and Ilescu aims to analyse whether gender moderates the relationship between job authority and depression both with general-population and workers in a telecommunications company.

The third contribution by Zito, Cortese, and Colombo is relative to the construct of flow at work as a resource to reach well-being for nurses.

The fourth contribution by Di Fabio aims to examine the relationships between trait emotional intelligence and the Human Capital Sustainability Leadership (Di Fabio & Peiró, 2018), a new XXI century leadership higher order construct for organizations and human resources management.

Research/Practical Implications

New research and interventions relative to emotions in the workplace in a preventive perspective to both promote well-being and reducing risks for workers.

1) Organisational justice and work stress: the mediating role of negative, but not positive, emotions

Vanesa Pérez Rodríguez* & Gabriela Topa*

* UNED, Department of Social and Organizational Psychology, Madrid, Spain
Abstract

Purpose. Organisational justice involves employees’ perceptions of the fairness of resource allocation in an organisation. The negative emotional impact of justice perceptions leads to an attitudinal and behavioural response by employees that can seriously affect the effectiveness of the organisation. From organisational psychology, an attempt has been made to explain the possible relationship between inequity and well-being, conceptualizing organisational justice as part of the stress phenomenon. The purpose of this study was to examine whether emotions played a role as mediators in the relationship between organisational justice perceptions and work stress. Design/Methodology. A cross-sectional study has been conducted with a sample \((N = 465)\) of employees who work in different Spanish organisations. Results. Findings indicated that emotions mediated the relationship between employees’ justice perceptions and work stress. The mediation models of organisational justice perceptions (distributive, procedural and interactional) and work stress mediated by emotions were quite similar. In all three cases, the mediated role was explained by a greater frequency of negative emotions. Limitations. The use of self-report measures and the cross-sectional design of the first study raises concerns about common-method variance. Research/Practical Implications. The findings add to our understanding of the role of workers’ emotions on their personal well-being. Originality/Value. New research and interventions for reducing work stress, underlining the contribution of emotions.

Keywords: organizational justice; work stress; positive emotions; negative emotions.

2) Is Gender a Moderator between Job Authority and Depression?

Simona Ispas* & Dragos Iliescu*

* Department of Psychology, University of Bucharest, Romania

Abstract

Purpose. This study analyzes whether gender moderates the relationship between job authority and depression. Design/Methodology. This survey-based cross-sectional study included measures for job authority, depression and gender, and analyzed the responses of employees from two samples – a heterogenous general-population sample and a homogeneous sample collected in a telecommunications company. Results. The results showed that employees’ gender did not moderate the relationship between job authority and depression in the heterogenous sample but was a moderator for the employees of the telecommunications company. More precisely, women with high job authority in the second sample reported more depression, while men with high job authority
reported less depressive symptoms. **Limitations.** Self-report measures, cross-sectional design. **Research/Practical Implications.** Possible explanations for these findings are discussed, opening new research and practical perspectives. **Originality/Value.** New research in organizational contexts regarding the relationship between job authority and depression and possible mediators.

**Keywords:** job authority; burnout; depression; gender differences; occupational health

3) Flow at work and resources: a possibility to reach well-being at work

Margherita Zito*, Claudio Giovanni Cortese**, Lara Colombo**

* Department of Business, Law, Economics and Consumer Behaviour "Carlo A. Ricciardi", Università IULM

** Department of Psychology, University of Turin

**Abstract**

**Purpose.** Nursing profession has often been detected in the light of negative outcomes, but it is important to consider the positive aspects enhancing well-being, health and performance. This study considers flow at work (FaW), an optimal experience for individuals and organizations generating motivation and well-being. **Design/Methodology.** Relations between job resources (JR), FaW, and personal resources (PR) are detected, and their relations with positive/negative emotions at work. 520 Italian nurses completed a questionnaire measuring: supervisors’ support, job autonomy (JR); job competencies, self-efficacy at work (PR); FaW; positive and negative emotions at work. Data analysis performed a structural equations model. **Results.** JR are positively associated with FaW, which is positively associated with PR. Moreover, JR are positively associated with PR through FaW, and JR and FaW are positively associated with positive emotions. **Limitations.** Use of a self-report questionnaire and a cross-sectional research design. **Research/Practical Implications.** Understanding the role of FaW in the nursing context, which is highly demanding, is crucial to promote motivation and a quality of working life within employees engaged in assistance and caring tasks. The relation between variables and well-being/discomfort, highlights the importance of promoting FaW, supporting resources that nurture positive experiences at work. **Originality/Value.** This study considered, in the explanation of well-being and discomfort at work, not only aspects related to the organizational context (JR), but also personal aspects (PR). Indeed, model results showed the absence of a direct relationship between JR and PR, and highlighted the importance of creating the conditions to experience FaW.

**Keywords:** Flow at work; resources of workers; well-being.
4) Beyond personality traits: Emotional intelligence for Human Capital Sustainability Leadership

Annamaria Di Fabio*

* Director of the International Research and Intervention Laboratories in “Cross-Cultural Positive Psychology, Prevention, and Sustainability (CroCPsΨP&S)” and “Psychology for Vocational Guidance, Career Counseling and Talents (LabOProCCareer&T)”, Department of Education and Psychology, University of Florence, Italy

Abstract

Purpose. The recent economic crisis threatens the quality of working life (Blustein, Kenny, Di Fabio, & Guichard, 2018; Peiró, 2017). In this scenario, according to the sustainable development goals (United Nations, 2018), the issues of sustainability and sustainable development (Di Fabio, 2017a, 2017b) have become urgent also for human resources in organizations. The Human Capital Sustainability Leadership (Di Fabio & Peiró, 2018) is a new high order construct to answer to these challenges. Emotional intelligence (EI) is a promising variable in organizational contexts (Ashkanasy & Dorris, 2017) since it can be increased through specific training (Di Fabio & Kenny, 2011). The present study aims: to examine the relationships between trait EI and HCSL, controlling for the effects of personality; to analyze the mediation role of trait EI in the relationship between personality and HCSL.

Design/Methodology. One hundred sixty seven Italian leaders were administered Big Five Questionnaire (Caprara, Barbaranelli, & Borgogni, 1993), Trait Emotional Intelligence Questionnaire Short Form (Italian version Di Fabio & Palazzeschi, 2011), Human Capital Sustainability Leadership Scale (Di Fabio & Peiró, 2018). Hierarchical regressions and mediation analyses were effected.

Results. Results showed that trait EI added significant incremental variance beyond personality in relation to HCSL. The mediation role of trait EI emerged in the relationship between personality and HCSL.

Limitations. Self-report measures, cross-sectional design.

Research/Practical Implications. Trait EI could be a promising resource for HCSL in a primary preventive perspective. Originality/Value. New research and interventions for promoting HCSL, underlining the contribution of emotional intelligence.

Keywords: Human Capital Sustainability Leadership; trait emotional intelligence; primary prevention perspective; emotions in the workplace.
1365 - RETURN TO WORK AFTER A SICKNESS ABSENCE: FROM THEORIES TO PRACTICAL WAYS

PROPOSERS:
Massimo Miglioretti¹ & Marc Corbière²,³

CO-CHAIRS:
Massimo Miglioretti¹ & Marc Corbière²,³
¹ Università degli Studi di Milano-Bicocca, Milano, Italia
² Centre de recherche de l’Institut universitaire en santé mentale de Montréal, Montréal, Canada
³ Université du Québec à Montréal, Montréal, Canada

STATE OF THE ART:
Sickness absence in the workplace is a prevalent problem causing important human and financial costs. As a process, return to work (RTW) involves a series of interactions and interventions enacted by multiple stakeholders (e.g., health professionals, HR, managers) using multiple tools. In this way, RTW after a sickness absence evolved from a medical perspective to the adoption of the biopsychosocial approach, with the ultimate goal of avoiding eventual relapses.

NEW PERSPECTIVES/CONTRIBUTIONS:
The aim of this symposium is to focus on a sustainable RTW for diverse populations experiencing sickness absence. The first two communications present literature reviews on psychological and organizational risk factors. These contributions aim to emerge common factors and tools regardless of the disease. The following three communications will present the validation of practical tools evaluating the workers’ perceptions in regard to RTW barriers and their self-efficacy to overcome them, as well as work accommodations. These three contributions are illustrated by workers having specific characteristics (e.g., age) and experiencing different types of impairments (e.g., common mental disorder, musculoskeletal disorders, breast cancer and cardiovascular disease). The last communication is to describe how, within a return to work program implemented in the workplace, tools can be used by health professionals or staff from human resources in order to facilitate a sustainable RTW.

RESEARCH/PRACTICAL IMPLICATIONS:
The symposium identify variables and questionnaires that can be used with different diseases and RTW phases so that comparisons between RTW for diverse populations experiencing sickness absence will be possible.

TITLE:
Individual psychological factors and tools related to RTW after a sick-leave due to musculoskeletal and common mental disorders: A literature review.

AUTHORS:
Gragnano A¹, Villotti P², Larivière C³, Negrini A³, Corbière M²,⁴
¹ Università degli Studi di Milano-Bicocca, Milano, Italia
² Centre de recherche de l’Institut universitaire en santé mentale de Montréal, Montréal, Canada
³ Institut de recherche Robert-Sauvé en santé et en sécurité du travail, Montréal, Canada
⁴ Institut de recherche de l’Institut universitaire en santé mentale de Montréal, Montréal, Canada
PURPOSE:
The individual psychological factors are fundamental in the return to work (RTW) process after sickness absence. However, the large heterogeneity in the identification and measurement of these factors makes it difficult to choose, i.e., which one to measure and with which questionnaire. The present study aimed at identifying the psychological factors predictive of RTW among workers with musculoskeletal (MSD) and common mental disorders (CMD) and then at categorizing and evaluating the questionnaires used to measure these factors.

METHODOLOGY:
We conducted a systematic literature search on PubMed, WebOfScience, PsycINFO, and grey literature from 1997 to 2018 for peer-reviewed, quantitative, cohort studies investigating predictors of RTW after MSD or CMD. All validated questionnaires used to measure the psychological factors were retained, and their psychometric information and clinical properties were described.

RESULTS:
Of 456 unique records, eighty (80) met eligibility criteria. RTW self-efficacy, RTW expectation, and Work-ability are individual psychological predictors of RTW, common for both populations. Other psychological factors emerged as RTW predictors for one of the two populations only. Psychometric and clinical properties of the tools are presented.

LIMITS:
Only workers on sick leave due to CMD and MSD were considered.

PRACTICAL IMPLICATIONS:
The identification and description of psychological factors help practitioners in deciding which questionnaire to use considering their clinical needs.

ORIGINALITY/VALUE:
The study provides a restricted set of high-quality questionnaires. Their use would promote results’ comparisons and theoretical advancement in occupational rehabilitation.

TITLE:
A literature review and tools appraisal of organizational factors associated with return to work in workers on sick leave due to musculoskeletal and common mental disorders.

AUTHORS:
Villotti P1, Gragnano A2, Dionne CE3, Larivière C4, Negrini A4, Corbière M1,5
1 Centre de recherche de l’Institut universitaire en santé mentale de Montréal, Montréal, Canada
2 Università degli Studi di Milano-Bicocca, Milano, Italia
3 Université Laval, Québec, Canada
4 Institut de recherche Robert-Sauvé en santé et en sécurité du travail, Montréal, Canada
5 Université du Québec à Montréal, Montréal, Canada
PURPOSE:
Among factors that can facilitate or hinder the return to work (RTW) after mental or physical disability leaves, those related to organizational aspects are the ones more neglected in the literature. The objective of this study was to catalogue the questionnaires used to measured organizational factors predictive of RTW among workers with musculoskeletal (MSD) and common mental disorders (CMD) to determine high-quality tools for each factor.

METHODOLOGY:
A systematic literature search on PubMed, Web of Science and PsycINFO library databases and grey literature was made. First, the list of organizational factors predictive of RTW for the two populations considered was retained. Second, the questionnaires used to measure these factors were recorded. Third, we looked in the scientific literature for studies validating these questionnaires. Psychometric properties and clinical characteristics were considered.

RESULTS:
Among all organizational factors identified, perceived organizational injustice was the only common predictive risk factor for both populations. The Return-to-work Obstacles and Self-efficacy Scale (ROSES) was the best associated tool to measure this factor. Other risk/protective factors, and associated tools, specifically targeting either people with MSD or CMD were analysed and will be discussed during the presentation.

LIMITATIONS:
We only focused on people with MSD and CMD. Only tools available in English or French were considered.

PRACTICAL IMPLICATIONS:
The identified tools can be used in everyday clinical practice and/or research.

ORIGINALITY/VALUE:
Researchers and clinicians are often uncertain of which tools to use to measure variables. We provided an evaluation of the tools measuring predictive RTW factors in people with CMD and MSD.

TITLE:
Perceived Return-to-Work Obstacles and Self-Efficacy for Overcoming Barriers in Workers Suffering from physical and mental impairments

AUTHORS:
Corbière M1,2, Negrini A3, Lachance J-P1,2, Olivares S2, Mazaniello M2
1Université du Québec à Montréal, Montréal, Canada
2Centre de recherche de l’Institut universitaire en santé mentale de Montréal, Montréal, Canada
3Institut de recherche Robert-Sauvé en santé et en sécurité du travail, Montréal, Canada

PURPOSE:
Common mental disorders (CMDs, e.g., depression), musculoskeletal disorders (MSDs, e.g., chronic pain) and breast cancer (BC), lead the list of causes for work absence in several
countries. Current research is starting to look at workers on sick leave as a single population, regardless of the nature of the disease. The purpose of this study is to report the validation of the Return to Work Obstacles and Self-Efficacy Scale (ROSES) for people with MSDs, CMDs, and BC, based on the work disability paradigm.

METHODOLOGY:
From a prospective design (6-month follow-up), the ROSES’ reliability and validity were investigated in three Canadian samples of workers on sick leave due to MSDs (n = 206), CMDs (n = 157), and BC (n = 145).

RESULTS:
Exploratory and confirmatory factor analyses revealed that 46 items spread out on 10 conceptual dimensions (e.g., fears of a relapse, job demands), with satisfactory alpha coefficients for all subscales. Finally, several dimensions of ROSES predict the participant’s RTW within 6 months for MSDs (e.g., job demands), CMDs (e.g., difficult relation with the immediate supervisor), and BC (e.g., cognitive difficulties) even when adjusted by several variables (e.g., age, severity of symptoms).

LIMITATIONS:
The ROSES provides no information about the sustainability of the RTW.

PRACTICAL IMPLICATIONS:
Clinically speaking, as the 10 dimensions of this tool cross-cut several populations, health professionals should find the ROSES easy to use.

ORIGINALITY/VALUE:
The ROSES is pertinent because it systematically measures both the worker’s perception of obstacles and his self-efficacy beliefs about overcoming them.

TITLE:
**Validation of the Italian cardiovascular version of the Return to Work Obstacles and Self-Efficacy Scale**

Miglioretti M¹, Gragnano A¹, Negrini A², Corbiere M³,⁴
¹ Università degli Studi di Milano-Bicocca, Milan, Italy
² Institut de recherche Robert-Sauvé en santé et en sécurité du travail, Montréal, Canada
³ Université du Québec à Montréal, Montréal, Canada
⁴ Centre de recherche de l’Institut universitaire en santé mentale de Montréal, Montréal, Canada

PURPOSE:
The Return to Work Obstacles and Self-Efficacy Scale (ROSES) has been designed to be equally usable across populations of workers affected by different diseases. Up today, ROSES has been validated with workers with common mental disorders and musculoskeletal disorders.
and in the French language. The study aims to report the validation of the Italian version of ROSES with workers affected by cardiovascular diseases (CVD).

METHODOLOGY:
We investigated ROSES-CVD’ reliability and validity in an Italian sample of workers on sick leave due to CVD (n = 141) with a prospective design (6-month follow-up, n = 89).

RESULTS:
Confirmatory analyses substantially replicated the original structure of the questionnaire, and satisfactory alpha coefficients were obtained for all subscales. Regression analyses, controlled sociodemographic factors, showed that the subscales cognitive difficulties (b=21.9, p=.045), difficult relation with coworkers (b=48.2, p=.013), difficult work/life balance (b=35.9, p=.018), and loss of motivation to return to work (b=35.7, p=.001) were significant predictors of time to RTW.

LIMITATION:
It was not possible to estimate the ability of ROSES-CVD to predict RTW (yes/no) at six months because there were only 9 out of 89 workers that did not RTW at follow-up.

PRACTICAL IMPLICATION:
The study results suggest ROSES is usable in the Italian context and with workers with CVD.

ORIGINALITY/VALUE:
Besides the clinical utility of the ROSES-CVD, it represents the first example of an instrument in the field of RTW that has been consistently tested across diseases and countries.
during their RTW process. The questionnaire ACC45+ composed of 47 questions spread out into 10 subscales emerged from the content analysis. Phase2: 60 older workers answered to the ACC45+ indicating if the accommodation was implemented during the RTW. Nvivo11 and SPSS24 were used.

RESULTS:
The accommodations reported as frequently implemented (≥70%) were: Have a gradual RTW plan; Access to an Employee Assistance Program; Receive family’s support; Be followed by a clinician; Take time for himself after work. Participants were enough satisfied about the implemented accommodations. The relationship between the ACC45+ and the sustainable RTW will be discussed in the symposium.

LIMITATIONS:
The sample size is small. The questionnaire is only in French.

PRACTICAL IMPLICATIONS:
Once validated, it can be used by rehabilitation stakeholders to identify which accommodations facilitate a sustainable RTW for older workers.

ORIGINALITY/VALUE:
It will be the first questionnaire to identify the levers to prevent recurrences and, consequently, to promote the older workers’ staying at work after the RTW.

TITLE:
Utilization of validated tools to identify obstacles and work accommodations within a sustainable Return-to-Work (RTW) program for employees on sick leave due to common mental disorders (CMDs)

AUTHORS:
Mazaniello M1, Corbière M1,2, Lachance J-P1,2, Guay S1,3, Panaccio A4, Lecomte T1,3
1Centre de recherche de l’Institut universitaire en santé mentale de Montréal, Montréal, Canada
2Université du Québec à Montréal, Montréal, Canada
3Université de Montréal, Montréal, Canada
4Concordia University, Montréal, Canada

PURPOSE:
Both identification of the perceived obstacles to return-to-work (RTW) and work accommodations are central in the RTW process of employees on sick leave due to CMDs. For a successful RTW, these assessments are included in a timely manner by the healthcare providers (e.g., occupational therapists) together with the identified stakeholders (e.g., managers) to ensure the implementation of the associated actions.

METHODOLOGY:
The assessment of the utilization of the Return-to-Work Obstacles and Self-Efficacy Scale (ROSES) and the Work Accommodations and Natural Support Scale (WANSS) is based on two participatory research projects. These projects involved 26 qualitative interviews with
stakeholders involved in the RTW process. The interviews were transcribed verbatim and analyzed using thematic analysis.

RESULTS:
The thematic analyses highlighted three phases and 11 steps of the RTW process. Throughout the latter, we identified milestones for the utilization of the ROSES (to identify risk factors in phases 1 and 2) and the WANSS (to identify and prepare work accommodations implementation in phases 2 and 3).

LIMITATIONS:
Additional tools could be used for facilitating the RTW process.

PRACTICAL IMPLICATIONS:
A sustainable RTW program that integrates validated tools (e.g., ROSES, WANSS) can be implemented to allow targeted stakeholders to monitor, assess, and follow up with the organizational and individual factors regarding sick-listed employees’ recovery process as well as the sustainability of their RTW.

ORIGINALITY/VALUE:
The timely utilization of the ROSES and WANSS within a RTW program considers the health, organizational, legal and individual perspectives that come into play for a sustainable RTW.
Chair/Convener: Rainer Kurz, Cubiks UK

This symposium features a collection of presentations discussing empirical cross-validation work – increasingly a ‘Hot Topic’ given the rise of Artificial Intelligence (AI) and associated People Analytics. All papers build on the ground-breaking ‘Great 8 Competencies’ proposed by Kurz & Bartam (2002) that integrate personality, ability and competency theory.

Paper 1 outlines a six-factor model that is simpler than the Great 8 but adds sophistication to the Five Factor Model of personality through Need for Achievement. The components of the Silzer & Church (2008) model of potential were mapped and each factor subdivided into three aligned personality facet – competency dimension pairs. The four areas in the Dries & Pepermans (2012) potential model were then mapped resulting in sound observed validities for five language groups.

Paper 2 outlines cross-validation across three samples at four different levels. The 12-section level constitutes an extension of the Great 8 Competencies with four additional constructs that are compounds of paired-up Great 8 factors that in turn determine the 4-cluster level. The paper concludes that the 12 Section level appears most appropriate for cross-validation work.

Paper 3 applies the personality-competency mapping methodology of Bartram (2005) and Saville, Maclver & Kurz (2009) to a different personality predictor model. Observed validities reach comparable levels to prior Great 8 research.

Paper 4 applies the Big 5+1 research model developed by Kurz (2015) in a single company cross-validation study. Observed validity increased substantially suggesting robustness of prediction alongside company culture specific moderators.

Prof Stephen Woods, lead author of the landmark Woods & Anderson (2016) article on the ‘Periodic Table of Personality’ will act as the Discussant.

Paper 1: Personality predictors of potential across languages and cultures
Rainer Kurz and David Lawton, Cubiks, UK

Submission Abstract – 250 words max

This paper outlines the development and validation of a self-report solution designed to assess potential.

During the development of an updated personality questionnaire 929 individuals completed the questionnaire and a self-assessment on 50 competency items grouped into 22 competencies. Everyone was rated by at least two external raters on the same items.

As a first step a joint predictor-criterion model was created based on the Big 5 personality factors and Need for Achievement. This was mapped to the central components of the Silzer & Church (2009) model identified by Lawton (2012).

In a second step 18 predictor facets and corresponding criterion items were identified to provide more succinct measures. This model was used to drive recruitment and development solutions for entry-level roles.
In the light of the Schwartz (1992) universal values circumplex the four areas in the Dries & Pepermans (2012) model were mapped with three competencies each and corresponding personality dimensions identified.

Across the total group the observed validity was .309** with correlations of .320** for Scandinavian (N=235), .412** for Dutch (N=229), .336** for French (N=214), .127* for Finnish (N=181) and .343** for Anglo-Germanic (N=70) language completions. Validities were higher for managerial than for non-managerial groups. The highest point to point validities were found for Reach (.440**) followed by Flex (.317**), Bridge (.287**) and Grasp (.169**).

The results suggest that stable and sizeable relationships exist between the personality composite and external ratings of performance.

Further research should cross-validate these findings especially through longitudinal studies that use career advancement criteria.

Paper 2: Optimising the Validity in Forecasting High Potential at Work

Lauren Jeffery-Smith & Rab Maclver, Saville Assessment, UK

Submission Abstract

This paper will explore the cross-validation of forecasts of potential across three studies. The studies involved 393, 622 and 369 individuals with self-report personality questionnaire scores and independent ratings of ‘Demonstrating Potential’.

The forecasts were created at four scale levels from the personality questionnaire: 108 facets, 36 dimensions, 12 sections and four clusters. Different algorithms to predict potential were developed for each scale level based on the correlational data in each single study, and the results cross-validated into the other samples.

The equations for each level significantly predicted ‘Demonstrating Potential’ in all studies. The forecasts were similar at the different scale levels. While more detailed scales are useful for prediction of individual competencies, this finding suggests the additional effort involved with ranking 108 facets or 36 dimensions to predict overall potential offers little value over the simpler task of ranking the 12 sections. The four clusters (which most closely align to the Big 5) are not optimal for the forecasting of potential, as some correlations were significantly lower than for other levels.

The correlations for the three sets of algorithms to forecast potential across the samples ranged from .19 to .34 (.31 to .55 corrected). The significant and substantial correlations of the algorithms created in one sample and applied to other samples provides clear evidence for the generalisability of this method of creating weightings based on ranking correlations which forecast ‘Demonstrating Potential’.

Paper 3: Cross-Validation of Great 8 Competencies with Lumina Spark 24 Qualities

Stewart Desson, Lumina Learning, UK

Submission Abstract – 250 words max

This paper cross-validates the Great 8 Competencies (Kurz & Bartram, 2002) with the 24 Qualities measured in the Lumina Spark questionnaire.

In line with the methodology of Bartram (2005) composite predictors were calculated with an integer weight of 2 for the most relevant scale and a weight of 1 for two other scales. In the light of the Project Epsom co-validation study (Saville, Maclver & Kurz, 2009) mapping of 16PF overlap was permitted for the single weight scales.

375 professionals completed a 4-factor version of Lumina Spark personality model (this excluded the Neuroticism factor) and received rating on 8 items representing the Great Eight model of performance (Kurz, 2003). In the light of the data and prior mappings the predictor weights were set using 17 qualities with no quality used more than twice.

Observed validities for Great 8 predictor-criterion pairs were all statistically significant ranging from .20 to .34 with an average of .29. The composite Great 8 total correlated .27.

The ‘Adapting to Demands’ composite correlated .28 with its criterion counterpart even though no direct measures of Emotional Stability were available. The heterogenous predictor composite was with r= .29 the most valid Great 8 predictor of the criterion total.

The Great 8 Total predicted all criterion areas apart from ‘Respective People’ which in turn was most highly correlated (.32) with its own predictor and negatively (-.23) with Driving Performance.

The study successfully cross-validated the Great 8 methodology with a different tool. Further cross-validation is required with independent data sets.

Paper 4: Cross-validating Success Factors - Aligning Personality and Competency Assessment & Theory

Pauliina Jussila, Cubiks Finland

Submission Abstract – 250 words max

This paper is concerned with a theory-based model of success factors that achieved an observed validity of .231 (N=929) in an international study (Kurz, 2015) and its cross-validation in a single company. The model synthesises the Five Factor Model of personality and the Great 8 competencies (Kurz & Bartram, 2002) into a six-factor model nested under the Three Effectiveness Factors found by Kurz, Maclver & Saville (2009).

In the cross-validation study 109 employees of a HR Consultancy completed the same self-report personality questionnaire with 31 psychometric scales and a 360-feedback tool measuring 22 competencies. At least one external rater nominated by the participant completed a review rating on the competency measure.

The average observed validity was .236 across the six factors, .263 across Enterprising, Excelling and Engaging higher-order constructs and .392 for that total sum of scores. In a regression model where the theory-based unit weight composite predictor forms the first block the use of the forward method
identified only two additional scales that if negatively weighted would result in $R=.490$ whereas ‘enter’ results in $R=.638$ probably resulting in extreme over-fitting that would collapse in cross-validation.

Whereas in cross-validation some degree of shrinkage is to be expected this study found a marked validity increase. The results are discussed with view to company culture in the light of Social Psychology theories. They demonstrate that personality composite predictors can cross-validate well.

People Analytics algorithm could increase validity through a-theoretical statistical optimisation but must be subjected to sense checks and cross-validation.
Workers can experience over-activation when they are not able to fully recover to baseline levels. Over-activation can result in sleep problems, and physical and mental health complaints. Already, research has shown the importance of recovery processes, using Conservation of Resources Theory (Hobfoll, 1989) and the Effort-Recovery Model (Meijman & Mulder, 1998) as theoretical frameworks. While these frameworks focus on the role of (de)activation, they overlook the importance of employees’ body-mind integration and the techniques for accomplishing this.

New perspective / contributions

Our symposium takes a new and inspiring perspective toward recovery and employee well-being by explaining the role of Body-Mind Integration techniques. Since Descartes statement ‘cogito ergo sum’, the Western world has believed that mind and body are separate entities. Recent neuroscientific research (Damascio, 1994) has proven that this is not the case, showing that body and mind are an integrated whole. Most people are not aware of this integration. While they possibly realize that their stomach aches are the result of stress-related thoughts, they do not know that bodily states can heavily influence the contents and processes of the brain.

Practical implications

This symposium focuses on several body-related techniques to reach body-mind integration, deactivate, and increase well-being. We will explain how these techniques can help to fully recover from physical and mental arousal from work, and involve the audience by practicing techniques that can be easily used at work and at home.
discuss the importance of physical exercise (i.e., muscle training) in relation to work ability and cognitive functioning at work (Aalbers et al., 2015).

Methodology
Based on a literature overview and empirical results of a 2-wave panel study among 65plus Dutch bridge workers (N=228 workers), the relations between physical exercise (especially muscle training), work ability and cognitive functioning was examined.

Results
Both the results of the literature overview as well as the bridge workers’ longitudinal survey data reveal significant positive relations between work ability and cognitive functioning at work, and positive moderating effects of exercise in the aforementioned relations.

Research/practical implications
Based on the results of the literature overview and the panel bridge workers, I will discuss the theoretical as well as practical implications of the results found and present a research agenda for body and mind integrated interventions at work. Furthermore, we will practice with relevant muscle training exercises in beautiful Italy.

Originality/Value
Considering the ageing workforce and the need to prolong our working lives, we need more insights into evidence-based interventions that integrate body and mind perspectives to promote successful aging at work. This study is one of the first studies to investigate the effects of physical exercise (i.e., muscle training, aerobics) in relation to work ability as well as cognitive functioning of bridge workers. In this presentation we will see the results of aforementioned research, but also practice muscle training together. See how fit you really are.

2. Qigong at Work: Where East Meets West
Karen van Dam
Open University of the Netherlands

State of the Art
Qigong is part of Traditional Chinese Medicine (TMC) and aims to balance body and mind. The roots of Qigong lie in China, where Confucian and Daoist scholars (500-400 B.C.) noted that one must learn to balance and relax one’s thoughts and emotions to avoid illness (Yang, 1997). In the Western world, Qigong is best known for its slow and coordinated movements. According to TCM, these movements will help regulate one’s ‘qi’, or life energy, through the body to improve the health and harmony of mind and body. During the practice of Qigong, one’s breathing, attention and movement are aligned. As such, Qigong is sometimes considered Mindfulness in movement (although there are many important differences).

New perspectives / contributions
Qigong has many positive outcomes on health and wellness. In both patient groups and healthy individuals, Qigong has been shown to improve psychological well-being, quality of life, immune function, balance and related risk-factors, and bone density (Jahnke et al., 2010).
As such, Qigong offers a validated way to reduce the physical and mental activation that results from a person's work. While recent research has demonstrated how important it is to take short breaks at work, there is still little attention for Qigong exercises as a means to recover at work.

**Practical Implications**
In this presentation, we will explain and practice several Qigong exercises. These movements can be used at work (and at home) to recover from (hormonal) activation, ‘empty’ one’s head, and restore the body-mind balance.

### 3. “Whistle while you work" - Music, work and well-being

Hylco Nijp

HAN University of Applied Sciences, the Netherlands

**State of the art**

Work can be hard and life can be cruel – but fortunately there is music to cheer us up or to drag us through. Even if we have everything we wish for, music may still add a few notes of inspiration. But what are the processes whereby music helps to alleviate stress and stimulate well-being? And how may this help you to boost your concentration and performance?

**New perspectives / contributions**

The effects of music on the human psyche has long been a topic of investigation. In this workshop, we summarize some of this knowledge. First, we aim to explain some effects of music on the working of your body and mind. Second such knowledge will be applied to the work context: how can music be used to improve work productivity while simultaneously upholding employee health?

**Practical Implications**

Whereas for many occupations work becomes more and more intense, music is also available to many. Applying knowledge about music to buffer against deleterious effects of work strain of prolonged work effort may help employees to maintain positive health and to Various ways in which music can contribute to improved well-being at work will be discussed, as well as ways whereby knowledge can be applied in the workplace.
1449 - DEVELOPMENT AND CHANGE IN PERSONALITY, VOCATIONAL INTERESTS, AND IDENTITY AT WORK: EXPLORING THE INTERPLAY OF PERSON AND WORK CRITERIA

Chair: Stephen A. Woods, University of Surrey.

State of the Art

In the study of personality in organizations, psychologists have typically assumed that traits are stable and static, and exert effects on work outcomes. Yet there is now compelling evidence that personality continues to develop throughout life, challenging this assumption. Work is an important driver of this development, with features of work exerting a reciprocal effect on how traits change.

New Perspectives/Contributions

This symposium will explore what we know about the emerging area of personality development and change at work, and extend this line of research to encompass development in vocational interests, and work identity. Specifically, contributions in the symposium articulate new theoretical mechanisms of personality change, examine the impact of job transition, job insecurity and vocational interest development.

Research/Practical Implications

A dynamic developmental perspective on traits and individual differences opens up a rich new line of research on the reciprocal interplay of person factors and work outcomes. There are also important implications for how psychologists use concepts of personality and related constructs to select, assess, measure, develop, research and understand people through the course of their working lives.

A Demands-Affordance TrAnsactional (DATA) Model of Personality Development at Work

Stephen A. Woods\textsuperscript{a}, Bart Wille\textsuperscript{b}, Chiahuei Wu\textsuperscript{c}, Filip Lievens\textsuperscript{b}, Filip De Fruyt\textsuperscript{b}

\textsuperscript{a}University of Surrey, UK.

\textsuperscript{b}Ghent University, Belgium.

\textsuperscript{c}Durham University, UK.

State of the Art

Although personality is often assumed to be stable and static, studies have shown that personality can change, even in adulthood (see Lodi-Smith & Roberts, 2007; Roberts & Mroczek, 2008, for reviews; Roberts, Walton, & Viechtbauer, 2006). Work is an important driver of this development, with features of work exerting a reciprocal effect on how traits change.
New Perspectives/Contributions

This paper outlines the Demands-Affordances TrAnsactional (DATA) model of personality development at work. This DATA model clarifies how personality-related behavior at work is called upon by work demands at four different levels (vocation, job, organization and group) and proposes Person-Environment (PE) fit as the main guiding mechanism for personality trait change at work.

Research/Practical Implications

The DATA model has important implications for future research on the development of traits at work, highlighting key work and organizational factors, the effect of which on personality, we know little about. It also serves as a conceptual framework for such work.

Originality/Value

The DATA model addresses a key gap in the emergent research on personality development at work, namely the need for an explanatory framework of the mechanisms through which affects personality through the life-course.

Do Interests Change over Time?: A 22-Year Longitudinal Study of Stability and Change in Vocational Interests at Work

Bart Wille
Ghent University, Belgium

Christopher D. Nye
Michigan State University, USA

Filip De Fruyt,
Ghent University, Belgium

PURPOSE

Vocational interests have a long and successful history in vocational psychology and organizational behavior. The purpose of this contribution is to add a new dimension to this research by testing and explaining long-term change in interests over time.

DESIGN/METHODOLOGY/APPROACH/INTERVENTION

Data are used from a longitudinal cohort study in which college alumni are followed across two decades. Vocational interests and occupational characteristics are assessed at career start, 15 years
later, and another seven years later. Rank-order stabilities and mean-level changes in interests and occupations are investigated and reciprocal relationships between these variables are modelled using latent change score models.

RESULTS

Our results highlight that vocational interests are characterized by long-term stability, but that there is also room for change. We found more evidence that interests predict changes in occupational characteristics than the other way around. Further, changes in interest fit were correlated with changes in job satisfaction over the same time intervals.

LIMITATIONS

Our sample consisted of highly educated college alumni from one educational institution in Belgium, which limits the generalizability of our results.

RESEARCH/PRACTICAL IMPLICATIONS

These findings illustrate that studying antecedents and consequences of changes in vocational interests might be a promising area of future research.

ORIGINALITY/VALUE

Research on vocational interests typically treats these vocational interests as fixed and unchangeable. In line with recent work on personality development at work, the current study is one of the first to explicitly investigate long-term development in interest dimensions and how this is influenced by occupational characteristics.

Investigating the time-bound effects of job insecurity on identity in a person-centred approach

Eva Selenko1, Anne Mäkikangas2 & Hans De Witte3

1 School of Business and Economics, Loughborough university, United Kingdom
2 University of Tampere, Finland
3 Research Group Work, Organizational and Personnel Psychology, KU Leuven, Belgium and Optentia Research Focus Area, North-West University, South Africa

Purpose

Many people find themselves in increasingly insecure job situations, but still very little is known on how these job situations affect identity over time. Starting from the premise that work is an important part of people’s selves, this study adopts a person-centered approach to find out how people react
that are exposed to different levels of job insecurity over time – will their identity as working persons deteriorate over time, or will it recover?

**Design/Methodology**

A 4-wave online panel survey among 1,001 British employees served as the data to test the assumptions.

**Results**

A Latent Profile Analysis was carried out to establish different trajectories of job insecurity and identity. A 7-profile solution showed that there was great stability in job insecurity and in identity over time. Only people whose job insecurity changed over time, starting from very high levels of job insecurity, dropping and then returning to those levels, reported a gradual decrease of their identity over time.

**Limitations**

This is the first study of its kind, a replication study is needed to check the robustness of the 7 profile solution and the relationships.

**Research implications**

The finding shows that it is not just the level of job insecurity but mostly its volatility that is responsible for its negative effect on identity.

**Originality/Value**

The presented study not only confirms the negative relationship between job insecurity and identity, but also shows that changes in identity were more likely when people experienced very high and volatile levels of job insecurity.

**New Job, New You: Personality Change in the Workplace Following Job Transition**

*Hannah Collis* & *Stephen A. Woods*

*University of Surrey, UK.

**Purpose:**

This study explored personality change following job transition, hypothesising that fit will moderate the relationship and change would impact both work and personal outcomes.
Design / Methodology / Approach:
A longitudinal, within-subjects design was employed, with 97 participants completing the study (61.86% retention). Participants completed online measures of personality, job satisfaction, fit and perceived stress at two time points, within 6 months of a job transition.

Results:
Significant personality change was found, with large effect sizes (>0.8). Fit was only found to moderate change in conscientiousness. Stress was identified to be a predictor for change for openness ($R^2 = .08$), intellectual curiosity ($R^2 = .07$), creative imagination ($R^2 = .09$) and responsibility ($R^2 = .12$). In regards to outcomes of personality change, openness change was correlated with lower job satisfaction at time two ($r = .25$), and higher stress at time two was correlated with change in productiveness ($r = .27$), responsibility ($r = .28$) and assertiveness ($r = .28$).

Limitations:
Job demands wasn’t measured, which may have indicated a directional nature of trait change. Additionally, only utilising two time points limits the identification of fundamental trait change as a response to job transition.

Research / Practical Implications:
These findings expanded knowledge of personality change as a response to workplace events, and how this experience impacts work and personal outcomes. Furthermore, theoretical contributions to the personality change literature are explored.

Originality / Value:
This paper presents a novel finding of personality change over a short time period within occupational settings, which has only previously been documented within intervention studies.
Tine Köhler, University of Melbourne (submitter)
Invited session for the Alliance of Organizational Psychology (AOP)

**State of the Art**

The rise in international teamwork research has mirrored the increased use of multicultural, and often globally dispersed, teams in organizations. Much of this research has examined how international teams perform in comparison to domestic and more traditional teams, when conflict arises, how trust is established, and generally how traditional concepts of teamwork apply in this setting.

**New perspectives and contributions**

The current symposium and research incubator aims to move beyond simply viewing international teamwork as an extension of teamwork in international settings. Rather, we embrace the setting of multicultural, globally dispersed, technologically mediated, and contextually dependent work and explore its implications for teamwork and team member interaction.

This invited session is structured differently than normal symposia for EAWOP. Presenters will give 5-8 min overviews of big challenges and big opportunities for international teamwork research and practice that have emerged from their own research (see abstracts below). Then we will engage audience members in an interactive research incubator in which we will discuss crucial avenues for future research and researcher/practitioner collaborations. We aim to drive international teamwork research and practice forward by building a community of interest among EAWOP’s membership.

**Research and practical implications**

This session is highly relevant for researchers and practitioners. It provides an overview of past research and a clear message of the direction future work will need to take. In collaboration with our academic and practitioner audience, we will create future avenues for research and practice that are imminently actionable.
Typological theorizing as an avenue to advance the field of multicultural teamwork
Sebastian Reiche, IESE Business School, Spain

State of the Art

Typologies are means for generating theoretically meaningful categories (Doty & Glick, 1994) and recent work has developed typologies to identify conceptual categories for the experience of global work (Shaffer et al., 2012), differentiate global leadership roles (Reiche et al., 2017), and derive identity configurations of multicultural team members (Lee et al., 2018). Such typologies may be either conceptually or empirically generated.

New Perspectives and Contributions

In the current presentation, I envision the value of typological theorizing for advancing research in multicultural teamwork. An important advantage of typological over traditional theorizing is that it explicitly allows for equifinality, i.e., the modeling of alternative patterns through which constructs can influence a particular outcome rather than specifying relationships between independent and dependent variables (Doty & Glick, 1994). For example, this would allow matching macro factors in the team environment to the design of multicultural teamwork. Given the growing fragmentation of different forms of multicultural teamwork and the resulting differences in their qualitative experience, it is also important to establish meaningful theoretical categories that scholars can use to compile their empirical samples and compare and contrast research findings.

Research and practical implications

The current presentation will discuss big challenges with existing theorizing on international teamwork and outline big opportunities in the use of typological theorizing. Typological theorizing offers an opportunity to reconceptualize future research avenues.

References

State of the Art

International teamwork in project-based organizations (e.g., consultancies, engineering companies, air transport, or the military, to name a few) requires complex levels of coordination and communication to lead to successful performance, team functioning, and team member well-being. Previous research has shown that communication and coordination expectations differ across cultures creating different cultural norms for appropriate behaviors (e.g., Gibson & Gibbs, 2006; Gibson & Vermeulen, 2003; Köhler, 2009; Köhler & Berry, 2008; Köhler, Cramton, & Hinds, 2012).

New Perspectives and Contributions

Norms are highly useful to better understand and improve international teamwork, yet they have been largely understudied in favor of more distant concepts such as cultural values (e.g., Leung & Morris, 2005). Norms exert direct pressure to elicit certain behaviors and to curb others. Studying cultural norms as a challenge to successful international teamwork is vital. At the same time, an examination of the creation of team norms to create successful international teamwork will illuminate a way forward.

Research and practical implications

The current presentation will offer cultural norms as a crucial concept for future research and practice to better understand the big challenges revolving around communication and coordination conflicts that exist in international teamwork. Furthermore, it will highlight the utility of team norms for creating structure to facilitate international team functioning.

References

Teams as complex behavioral systems

Nale Lehmann-Willenbrock, University of Hamburg, Germany

State of the Art

Teams have become an important organizing principle for organizations around the globe. As many employees work in some kind of team setting, most of their experiences and workplace behaviors are embedded in a team context and should be studied as they occur within team interaction processes. Yet, understanding the complex social dynamics underlying phenomena such as team collaboration, team affective experiences, and team performance remains a research challenge and requires a fine-grained behavioral lens.

New Perspectives and Contributions

While an increasing number of studies have made important steps in this direction in recent years (for an overview, see Lehmann-Willenbrock & Allen, 2018), there is still a host of opportunities for future research that pays closer attention to the moment-to-moment shifts and temporal dynamics at the behavioral level of team interactions that are at the core of team functioning. This talk will focus on evidence from real team meetings to highlight advances in understanding team processes such as the emergence of good and bad team mood, the impact of humor on team performance, and the resolution of disagreement during team meeting interactions.

Research and practical implications

The current presentation will highlight implications big opportunities for team research in under-researched team environments such as agile team interactions and the intersection of team processes and leadership influence.

References

Multicultural richness as asset - Talk does not reflect the walk
Sonja A. Sackmann, EZO Institute for Developing Viable Organizations, Germany

State of the Art
With globalization, many firms have become increasingly inter- and multinational. As a result, workforces have also become more international and multi-cultural within the boundaries of organizations or even in a specific location. Given the complexity of many tasks, projects are staffed with people from different functional, regional, national, generational and gender backgrounds following Ashby’s law of requisite variety. This cybernetic law implies that complex problems can only be met and solved with an adequate degree of variety.

**New Perspectives and Contributions**

Tapping the potential of multi-cultural teams needed for creative and innovative problem solving requires, however, at least three prerequisites. It requires time to learn about the cultural specifics and differences potentially available in a given multi-cultural team; it requires time and adequate skills for constructive communication processes between people who are not all native English speakers, and it requires time and skills to resolve communication problems (e.g., DiStefano & Maznewski, 2000; Phillips & Sackmann, 2002; Primecz, Romani & Sackmann, 2011). Despite many talks about the value and richness offered by multi-cultural teams, these prerequisites frequently are not met in teams and organizations working under time pressure to reach their set deadlines. Hence, the potential offered by multi-cultural teams is not tapped in practice despite all the talk.

**Research and Practical Implications**

This presentation will highlight the gap between espoused theory and theory-in-use augmented by the challenges of time pressures on multicultural teamwork. It will further highlight opportunities for future research and practice regarding this gap and the influence of perceived time pressures on successful multicultural teamwork.

**Employee engagement in global virtual teamwork**

Niina Nurmi, Aalto University, Finland

**State of the Art**

Digitalization and interconnectedness have rapidly changed the nature of work (Barley & Kunda, 2001) and global virtual teams have become commonplace (Hinds, Liu & Lyon, 2012). Recent evidence shows, however, that leadership has not kept up with this development and
85% of full-time employees worldwide are disengaged and less likely to be productive (Gallup, 2017).

**New Perspectives and Contributions**

In the current presentation, I discuss the challenges of and opportunities for engaging employees in global virtual teamwork. A vast majority of research on global teamwork focuses on the struggles for workers as they navigate geographic, cultural, language, and time zone differences. Recent research suggests, however, that global virtual teamwork can be more learning-promoting and more engaging than working locally, despite or perhaps because of the challenges inherent in it (Nurmi & Hinds, 2016). Nevertheless, many leaders are clueless about how to inspire and engage employees who are based in different locations, work at different times, and rarely meet each other (Gilson et al., 2015). Therefore, more research is needed to update our understanding of how to lead and design work for global virtual teams.

**Research and practical implications**

This presentation will discuss big challenges of the existing work design theories (e.g., Bakker & Demerouti, 2007; Hackman & Oldham, 1980) that are largely derived from traditional work contexts and outline big research opportunities in global work design.

Symposium Title:
The Effects of Fit and Fitting In: Feeling Good, Doing Good, and Doing Well?

Proponents of the Symposium:
Co-Chairs
Serena Wee – University of Western Australia, Australia
Christopher D. Nye – Michigan State University, United States of America

Participants
Anu Bharadwaj – University of Western Australia, Australia
Christine Soo – University of Western Australia, Australia
Christopher D. Nye – Michigan State University, United States of America
Djurre Holtrop – University of Western Australia, Australia
Gina Chatellier – University of Western Australia, Australia
James Rounds – University of Illinois, United States of America
Joshua J. Prasad – Michigan State University, United States of America
Marylène Gagné – Curtin University, Australia
Patrick D. Dunlop – Curtin University, Australia
Serena Wee – University of Western Australia, Australia
Sharon K. Parker – Curtin University, Australia

State of the Art:
Person-environment fit theory provides one of the most influential guiding frameworks for explaining people’s thoughts, feelings and actions in organizations (Kristof-Brown & Billsberry, 2013). Its fundamental tenet is that the compatibility between the characteristics of an individual and his/her environment results in positive outcomes such as engagement, satisfaction, and good performance.

New Perspective/Contributions:
The purpose of this symposium is to present four studies based on different theoretical perspectives and conceptualisations of person-environment fit to (a) show its importance in predicting important work and school outcomes, and (b) evaluate what can be learned from different ways of approaching the study of fit. This symposium includes two papers exploring person-role fit in the relatively understudied volunteering context—where individuals give freely of their time and effort (Holtrop, Gagné, Dunlop, & Soo; Chatellier, Dunlop & Gagné), two papers aimed explicitly at testing Barrick, Mount, and Li’s (2013) recently proposed Theory of Purposeful Work Behaviour (Chatellier et al.; Bharadwaj, Wee, Dunlop, & Parker), and two papers investigating the mechanisms through which fit impacts work and school outcomes (Bharadwaj et al.; Nye, Prasad, & Rounds).

Research/Practical Implications:
By applying the concept of fit to understudied contexts (e.g., volunteer organisations), and examining the mechanisms through which fit operates, the studies presented in this
symposium advance our understanding of when and how fit explains work and school related outcomes (e.g., engagement, satisfaction, and performance).

**When a Volunteer Fits: Motivational Effects through the Self-Determination Theory**

Djurre Holtrop  
*University of Western Australia*

Marylène Gagné and Patrick D. Dunlop  
*Curtin University*

Christine Soo  
*University of Western Australia*

**Purpose:**
Volunteers give their time freely, in contrast to employees who also work for financial reasons. Therefore, feelings of fit may be even more important to retain volunteers than for employees. Yet, fit has scarcely been investigated in volunteers. Using a two-wave survey study, we investigated the consequences of complementary (i.e., demands-ability and needs-supplies) volunteer fit through the lens of the Self-Determination Theory. Specifically, we investigated the effect of fit on volunteer retention through changes in need satisfaction (feeling related, competent, and autonomous) and motivation (amotivation, extrinsic, and autonomous).

**Design:**
One year apart, 612 volunteers completed two largely identical surveys. These surveys included adapted measures of 1) demands-abilities and needs-supplies fit, 2) psychological need satisfaction, 3) volunteer motivation, and 4) intentions to keep volunteering.

**Results:**
Overall, using regression and relative weight analyses, the results showed that increases in demands-abilities ($R^2=.03$) and need-supplies ($R^2=.02$) fit both led to small increases in need satisfaction. Next, increases in need satisfaction were related to decreases in amotivation ($R^2=.05$), no change in extrinsic motivation ($R^2=.01$), and increases in autonomous motivation ($R^2=.04$). Finally, increases in motivation we barely related to intentions to remain a volunteer (respectively $R^2=.05$, .01, and .02).

**Limitations/Implications:**
The present study indicates that changes in volunteers’ demands-abilities and need-supplies fit lead to very small changes in important individual and organisational outcomes. Therefore, improving fit may not be an effective way to improve volunteer retention. Future research could study volunteer fit with motivation frameworks that are specific to volunteers, such as the ‘volunteer functions’. 

Gina Chatellier
*University of Western Australia*

Patrick D. Dunlop and Marylène Gagné
*Curtin University*

**Purpose:**
The theory of purposeful work behaviour (TPWB) posits that work characteristics interact with people’s personal agendas, determined by their personalities, to determine their experiences of meaningfulness at work. In so doing, TPWB proposes distinct relationships between specific personality traits and specific work characteristics in the prediction of experienced meaningfulness. This study aimed to test whether the predicted personality and work characteristic interactions from the TPWB hold in a volunteering setting, where meaningfulness is likely to be critical to retention.

**Design:**
The theory was tested by means of a two-wave design. The sample consisted of 394 volunteers who completed demographic questions and the BFI-2 personality scale as part of a larger project and completed surveys at two subsequent time points. Participants were asked about the work characteristics of their volunteer roles through the Work Design Questionnaire at wave 1 and person-job fit with their volunteer role at both waves. A moderated regression was conducted to determine the interactive effects of personality and work characteristics on person-job fit.

**Results:**
Within this sample, very few of the predicted personality-work characteristic interactions were significant.

**Limitations:**
Range restriction in the sample is possible, as personality is a known predictor of the willingness to volunteer.

**Research/Practical implications:**
It may be that the TPWB does not apply in volunteer settings, future research is needed to determine whether a different theory is better suited for volunteer populations.

**Originality/Value:**
This theory has not yet been tested in a volunteer population.
Person-Job Fit in the Theory of Purposeful Work Behaviour: Testing a Moderated Mediation Model

Anu Bharadwaj and Serena Wee
University of Western Australia

Patrick D. Dunlop and Sharon K. Parker
Curtin University

Purpose:
Recently, Barrick, Mount, and Li (2013) developed a theoretical model to describe the joint and interactive effects of personality traits and job characteristics on work outcomes (e.g., job satisfaction). A central tenet of the theory is that person-job fit—i.e., concordance between personality traits and job characteristics—results in experienced meaningfulness at work, which in turn influences work outcomes. The current study provides an empirical test of core portions of the theory, using an alternative, well-validated, model of personality: the HEXACO (Lee & Ashton, 2004).

Design:
Participants (N = 394) were working adults from a variety of different occupations who were part of a larger, longitudinal sample. They completed the HEXACO personality assessment, the Work Design Questionnaire (Morgeson & Humphreys, 2006), and they also indicated their perceived job-fit and satisfaction with the job.

Results:
The moderating effect of job characteristics on the relationship between personality traits and perceived person-job fit was statistically significant in each of the nine focal tests. Although person-job fit was positively related to job satisfaction in eight of the nine focal tests, none of the proposed indirect effects of the personality × job characteristic interactions on job satisfaction were supported.

Limitations:
Potential limitations include common method variance, and a cross-sectional sample.

Research /Practical Implications:
The present study provided only partial support for Barrick et al's (2013) proposed model.

Originality/Value:
This study provides a first attempt to test Barrick et al's, (2013) model using the HEXACO model of personality.
The Validity and Incremental Validity of Interest Fit: A Mediated Model of Academic Performance

Christopher D. Nye and Joshua J. Prasad
*Michigan State University*

James Rounds
*University of Illinois*

**Purpose:**
The purpose of this study was to examine the mediating effects of motivation, attendance, and satisfaction on the relationships between vocational interests and both academic performance and intent to leave.

**Method:**
The data for this study were obtained from a sample of 383 college students. Vocational interests were assessed at Time 1, the mediators were assessed weekly over 5 weeks during an academic semester, intent to leave was assessed one week after the final weekly survey, and course grades were obtained from university records at the end of the semester.

**Results:**
Results showed that interest fit predicted academic performance above and beyond both cognitive ability and conscientiousness. In addition, satisfaction, motivation, and attendance mediated the interest fit—performance relationship while only satisfaction mediated the relationship between interest fit and intent to leave.

**Limitations:**
This study was limited by the fact that we only had intent to leave rather than actual turnover. As such, although a student may intend to leave, this may or may not translate into actual behaviour.

**Research/Practical Limitations:**
This study suggests that helping students to find a major that they are interested in can influence their motivation and satisfaction, both of which will also affect their academic performance.

**Originality/Value:**
Although past research has demonstrated the relationship between interests and performance, these studies have not elaborated on the mechanisms for these effects. The present study clarifies these mechanisms and demonstrates that interests predict motivation.

In 1973 McClelland argued in the American Psychologists that in predicting individual job performance organisations should assess competencies rather than cognitive ability or personality. Prior to this early proponents of Assessment Centres had been defining facets or dimensions of measurement. In 1982 Boyatzis published “The competent manager” and argued for development of competency models to capture the characteristics of a person which result in superior job performance. Since then the use of competency models in all aspects of HR has grown exponentially and yet there is little academic research on competencies or competency models. It is difficult to find agreed definitions of competencies and recent research (Hoffman et al, 2015, Jackson et al, 2016) has failed to find any substantial competency related variance in measures such as assessment centre ratings and 360 degree ratings.

The purpose of this symposium is to consider place of competency models in evidence based practice, what they can contribute to selecting, managing and developing individuals, what are the implications of the research findings and to foster a discussion between academics and practitioners to develop a common understanding. Presenters include both experienced practitioners and academics involved in looking at the measurement properties of competencies.

Paper 1: Using Competencies to promote better HR practice.

Helping clients understand what good performance in a role looks like and what factors underpin it is critical to my work as a practitioner. Selecting the right candidate for a job; helping individuals understand their strengths and weaknesses and using this information to develop and improve their performance; identifying future leaders; in general leadership models form the basis of critical leadership decisions. A competency model can encapsulate the capacities required to perform well and well written they can do so in a language that is accessible to managers and individual employees. Most organizations have implemented a leadership model to manage their leadership talent.

But some current strategies fail to take into account the new work environment and the dramatic variability in leadership positions. As a result, they do not allow organizations to: ■ Match leaders to contexts in which they will be successful, ■ Place leaders into roles that will develop them for the challenges they’ll face in the future, or ■ Manage portfolios of leadership talent against current and future business needs.
This presentation will discuss ways models can address contextual complexity using real life examples of models that have helped promote better ways of working. An organisational wide competency model might express some common values – but probably does not capture specific performance requirements for roles. The difference between models which foster a common language stakeholders can use to identify, evaluate, promote and develop better performance and models which do not fulfil these purposes will be discussed.

Title Paper 2: Is it Time to Ring the HR Alarm Bells? The Growing Evidence that Competencies Cannot Be Measured

Competences and competency frameworks play a vital role in key organizational processes such as staff selection, development, training, and appraisal. Here various methods (e.g. interviews, assessment centres, 360 degree appraisals) are used to measure competencies so that appropriate decisions can be made in relation to, for example, which applicants to appoint, how much particular employees should be financially rewarded, who should be promoted, and the areas in which people require further training.

The use of such techniques is based on the assumption that they measure competencies with a reasonable degree of reliability. Surprisingly however, until recently no research has directly assessed the extent to which competencies are reliably measured. The research reported here addresses this issue by examining the extent to which competencies contribute reliability to their associated measures in organizations when best-practice assessment techniques are adopted. The research focusses on the assessment of competences in well-designed situational judgment tests, assessment centres, and 360-degree appraisals.

Several large datasets containing rating ‘real-life’ data derived from “best practice” assessment centres, situational judgments test applications, and 360-degree appraisals were obtained from several organizations in South Korea and the UK. The rating data relating to each was then analysed using a G (generalizability) theory approach.

Our findings suggest that competencies contributed no appreciable variance to measurement reliability in any of the three techniques. That competences do not contribute to reliable assessment even in very well designed and administered systems is clearly a matter of substantial concern, and has very considerable practical significance.

Presenting Author:
Chris Dewberry
Department of Organizational Psychology
In a typical assessment centre (AC), tasks or exercises (exercises in used inclusively here to include tests, presentations and structured interviews) are chosen or created to provide assessors with the opportunity to rate a specified set of competencies. These competencies will have been identified through job analysis as being essential or highly desirable for the job in question. Best practice would limit the number of competencies being assessed in any one exercise to three or four and limit the total across exercises to half a dozen or so. The number of exercises would be determined by the need to have at least two exercises provide data on each competency.

Research has tended to show good criterion-related validity for exercises but poorer construct-related validity for competencies. In this paper it is argued that this is only to be expected given the different nature of competencies and exercises. Competences have been defined as “collections of behaviours that are instrumental in the delivery of desired results”. Within the AC, raters are directly assessing the ‘desired results’ but are having to make inferences about the instrumentality of the underlying competencies. Exercise performance is directly observed by assessors and can be rated as such. Competencies must be inferred from the behaviour and hence are assessed indirectly. It is not surprising if we find that someone who has done well on an exercise is given high ratings on all the component competencies while someone who has done less well is given lower ratings.
THE ANTECEDENTS OF JOB DESIGN: A MULTILEVEL PERSPECTIVE

Anja Van den Broeck1,2, Daniela Andrei3 Maria Tims4,
1Work and Organisational Studies, KU Leuven, Belgium
Optentia Research Focus Area, North-West University, South Africa
3Curtin University, Faculty of Business and Law, Future of Work Institute, Australia
4School of Business and Economics, Vrije Universiteit Amsterdam, the Netherlands

State of the Art: To date, the literature on job design has settled on the job characteristics and processes that improve employee well-being, attitudes and performance. Yet, poorly designed jobs remain surprisingly prevalent. To overcome this issue, Parker et al. (2017) called for a focus on the antecedents of work design, shaping top down and bottom up job design processes.

New Perspectives/Contributions: This symposium contributes to the development of the literature on the antecedents of job design –both theoretically and methodologically—through six presentations using (longitudinal) survey and experimental designs from scholars across Europe and Australia: Starting from an individual approach this symposium highlights how employee personality impacts their job design and vice versa. One level up, it evidences that e.g. managers may particularly support employees’ seeking additional challenges and resources, which benefit others. Managers themselves design motivational jobs particularly for those to whom they feel close versus more distant; particularly managers’ personal characteristics and organisational context fosters such behaviour. At the organisational level, an innovative strategy may equally associate with more motivational jobs, while hierarchy and disruptive regulations may lead away from such job designs. Finally based on a review of the literature, future researchers are warned to take into account temporal dynamics to successfully study the antecedents of work design. The concluding discussion will be led by Sharon Parker, one of the leading authors in the field.

Research/Practical Implications: This symposium highlights the importance of a person-oriented perspective on job design and the value of studying the antecedents of job design in order to improve work.

Job design and the Big-5 personality traits: Testing agentic, situationist and reciprocal relationships across a twenty year period

David Holman & David Hughes
University of Manchester

Purpose: Understanding the relationship between the individual and work environment is a core concern of organizational research but few studies have examined longitudinal relationships between
the Big-5 personality traits and job design (i.e., job discretion, workload). We develop and test a theoretically-driven model that hypothesises agentic transactions (effect of personality on job design), situationist transactions (effect of job design on personality) and reciprocal transactions (e.g., personality affects job design, which then leads to a change in personality).

Methodology: We conduct a latent change score analysis of data drawn from the Midlife in the United States (MIDUS) study of aging that included a survey administered to adults three times over 20 years.

Results: Our findings show strongest support for situationist effects of workload on personality development, specifically openness, extraversion and agreeableness. There was no support for situationist effects of job discretion on personality, agentic effects of personality on job design, or reciprocal effects.

Limitations: We didn’t address moderators or mechanisms of situationist and agentic transactions.

Research Implications: The study indicates need for a better understanding of the exact processes through which transactions between personality and job design occur and differences in the temporal evolution of transactions.

Originality: This is the first study to test Big-5/job design transactions over longer time periods (twenty years) using truly longitudinal data (i.e., both variables assessed at three time points).

When do others support employee job crafting: A job design simulation task

Maria Tims¹, Daniela Andrei², Lucinda Iles³, and Sharon K. Parker²

¹Vrije Universiteit Amsterdam, School of Business and Economics, the Netherlands
²Curtin University, Faculty of Business and Law, Future of Work Institute, Australia
³University of Western Australia, School of Psychological Science, Australia

Purpose/relevance: As job crafting research has been primarily focused on what impact job crafting can have on individual outcomes, we argue that it is important to also consider under which conditions others (such as supervisors) support job crafting and why.

Design: Testing our idea in an experimental setting, we recruited participants via Amazon Mechanical Turk (N = 285). Participants first completed a job design simulation task in which they were asked to design a fulltime job for a research assistant by choosing four out of 12 possible additional tasks. Following this job design task, participants were informed that the research assistant had been working in the role for two months when they overhear that he/she had decided to make some changes to his/her job. Participants were randomly allocated to one of five experimental conditions (reflecting four types of job crafting and a control condition). After that, they filled in a short survey.

Results: As expected, those in the decreasing demands condition reported significantly lower support for this behavior compared to those in the other conditions (increasing social and structural resources and challenging demands). The relationship between increasing social resources and increasing challenging demands and support for crafting could be explained by participants’ perceptions that the
job crafter was other-oriented (i.e., focused on benefitting others/the organization). No support was found for the idea that attribution of a self-oriented motive to the job crafter would result in lower support.

**Limitations:** The study needs to be replicated among managers.

---

**The influence of psychological distance on work design behaviour**

J. H. Hodge¹, D. Andrei², F. E. Klonek²

¹University of Western Australia, Perth, Australia, ²Curtin University, Perth, Australia

**Purpose.** Based on the wealth of research suggesting jobs with enriched work designs (i.e., jobs with high autonomy, variety, significance, etc.) enhance work motivation and performance, this research contributes to a better understanding of factors that foster enriched work design behaviours (i.e., decisions made by stakeholders in the local context that shape the job design of others). Based on Construal Level Theory, we hypothesize that psychological distance between job designer and job incumbents is negatively related to enriching task allocation (i.e., deciding to allocate more tasks with enriched work characteristics to a job).

**Design/Methodology.** We designed a vignette study to measure work design strategies in a sample of 207 participants recruited via Mturk. In the between-person experiment, we varied three levels of psychological distance between designer and job incumbent (no, low, and high psychological distance). We used multiple regression to test our hypothesis.

**Results.** Preliminary results support the basic assumptions of our model; allocation of low-skill tasks is positively associated with psychological distance, and allocation of high-skill tasks is negatively associated with psychological distance.

**Limitations.** Noted limitations of vignette studies include realism and generalizability.

**Research/practical implications.** Our results may hold valuable insights for the practice of work design in contexts with a high degree of psychological distance (i.e., distributed teams, crowdsourcing).

**Originality/Value.** Research on individual level antecedents to work design is rare, and to our knowledge, this is the first study that investigates the influence of psychological distance on work design behaviour.
What Predicts Top Down Job Design Behaviors: A Focus on Managers
Anja Van den Broeck, KU Leuven, Belgium and North-West University

**Purpose:** Jobs that have high levels of social support, opportunities for skill use and autonomy have been clearly linked to employee well-being, attitudes and behaviour. Such motivational jobs may arise from bottom up initiatives such as the crafting of job resources or the negotiation of task ideals. Although such employee-led initiatives are argued to be complementary to top down job design initiated by management, surprisingly little is known about how managers design jobs. In this study we examine whether individual (i.e., age, gender and education), job related (i.e., job resources) and organizational level (i.e., organizational values) associate with managers developing motivational jobs, which in turn should lead to employee experiences about the motivational quality of their job.

**Design:** We collected cross-sectional data among 233 first line managers. To assess manager’s job design behaviours, we asked managers to complete a scenario in which they added four task to the job of fictitious employee, allowing for variety and social support, and determine its degree of autonomy.

**Results:** Preliminary results show that women and older managers design jobs with more variety and social support, but do not provide more autonomy. One’s own job design was relevant in predicting autonomy, while organizational values of respect and integrity proved to be the strongest predictor of job design behaviours as they positively predicted designing jobs with variety and social support, and providing autonomy.

**Limitations:** In this research, we could not integrate the perspective of the employee.

**Research/Practical Implications & Originality/Value:** Our study is among the first to provide insight in the top down processes of job design, enabling organizational interventions at the level of the managers to improve employee job design.

Organizational level antecedents of high-quality work design
Daniela M. Andrei1, Ramon Wenzel2, and Sharon K. Parker1
1Curtin University, Future of Work Institute
2University of Western Australia

**Purpose/relevance:** Despite the well-documented positive effects of enriched work designs for both employees and organizations, many low-quality work designs continue to exist, indicating an insufficient understanding of the actual drivers of work design. Emerging research is mainly focusing on local job designers, but we argue that organizational level factors such as organizational strategy,
practices, operational uncertainty and organizational design elements can play an important role in shaping overall quality of employee work design.

**Design/Methodology:** Survey data was collected from N=3830 employees (70% females; Mage=46.01, SD=13.23) working in the Not for Profit (NFP) sector in Australia, as part of a wider research initiative. **Results:** Results indicate that organizations operating prospector strategies (strongly focused on innovation and market exploration) foster better work design compared to more reactive strategic patterns. Moreover, the level of formalization and total number of hierarchical levels are associated with lower quality work design. However, a closer examination reveals that the level of formalization is not conducive to poorer work design in itself, but only when rules and regulations aren’t actually efficient and disrupt work. **Limitations:** This study is cross-sectional and relies mostly on self-report. **Theoretical and Practical Implications:** This research has both theoretical and practical implications, as organizational level drivers are rarely addressed and theorized, and therefore there is little guidance around how organizational characteristics can be structured to foster good work design and associated productivity and wellbeing outcomes. **Originality/Value:** This study represents one of the very few systematic investigations into the organizational antecedents of work design.

**Antecedents of job design: Integrating Multiple levels and Long and Short-run Dynamics**

Kevin Daniels, University of East Anglia, UK
Despoina Xanthopoulou, Aristotle University of Thessaloniki, Greece
Ana Sanz-Vergel, University of East Anglia, UK

**State of the Art:** In this conceptual and methodological review, we start by explaining why and how the study of temporal dynamics of relationships between antecedents of job design, job design itself, and well-being adds value to more static approaches. We also highlight the importance of multiple levels of influence in the study of job design vs. single-level analysis. **New Perspectives/Contributions:** We propose that temporality can be observed at several, interrelated levels of analysis that are characterized by different levels of dynamism. For instance, we explain how socio-economic changes at the macro (i.e., societal)-level of analysis that occur over longer periods of time may cause changes in job design (meso-level), that in turn, explain dynamic changes in well-being (micro-level). We offer insight into the study of antecedents of job design by providing a conceptual framework that highlights the role of temporality, while taking into account different levels of analyses.
Research Implications: We discuss methodological approaches (e.g., shortitudinal studies, growth curve modelling) that allow capturing temporal effects of different duration. We also consider simulation methodologies that could provide a means of synthesising results over multiple levels of analyses from studies that consider only one or two levels of analyses.

Originality/Value: Our originality comes from developing theoretical and methodological approaches to the study of job design, by integrating information from multiple levels of analysis.
1518 - LINKING FAMILY SUPPORTIVE SUPERVISOR BEHAVIOURS (FSSB) TO EMPLOYEE CONTEXTS AND OUTCOMES

Symposium chair: Ciara Kelly
a Sheffield University Management School, United Kingdom
Discussant: Marcello Russo
b University of Bologna, Italy

State of the Art
FSSB is a key mechanism which helps employees successfully manage potentially conflicting home and work demands. The pace of research in this area is increasing but we still lack important understanding of the antecedents of FSSB and longitudinal evidence of the outcomes and mechanisms linked to FSSB.

New Perspectives/Contributions
This symposium addresses a range of gaps in our knowledge regarding the antecedents of FSSB and the mechanisms through which it can impact work and home outcomes. In our first paper Marescaux and colleagues explore the impact of the congruity of the employee and supervisor perceptions of FSSB, bringing to light the importance of relative perceptions of FSSB on employee outcomes. Our following papers use matched supervisor-subordinate data and longitudinal data, respectively, to explore the role i-deals play as a linking mechanism between FSSB and employee and organisational outcomes. Finally, in response to a call for increased focus on the antecedents of FSSB, our fourth paper examines whether the level of family related motivation of supervisors links to FSSB and thus to employee performance.

Research/Practical Implications
This symposium helps to expand our knowledge of the nomological network surrounding FSSB – using novel theoretical and methodological approaches. The practical implications include improving employee well-being and performance via the careful support of FSSB in supervisors, with a knowledge of how the organizational and relational context may impact the effectiveness of FSSB. Our discussant, Marcello Russo, will provide additional insights in order to help attendees and authors to map further implications and future research resulting from our findings.

When employees and supervisors (do not) see eye to eye on family supervisor behaviors: The role of segmentation preference and work-family culture

Authors: Elise Marescaux; Yasin Rofcanin; Mireia Las Heras; Remus Ilies
a IESEG Business School
Purpose: Building on work family boundary theory, this study explores the mechanisms and boundary conditions of how (dis)agreement in employee-supervisor perceptions of FSSBs relate to intrinsic motivation and turnover intentions of employees. We integrate the role of work-family culture and segmentation preference as boundary conditions to delineate these associations.

Design/Methodology/Approach/Intervention: We use matched employee–supervisor data collected from full-time employees working in El Salvador.

Results: Using polynomial regression analyses, results of a matched data set including supervisors and their subordinates, collected in El Salvador, partially supported our hypotheses and revealed unique patterns.

Limitations: Cross-sectionality is a limitation of the study.

Research/Practical Implications: Helping employees juggle work and family responsibilities is key for managers and organizations in a time of harsh competition, time pressure and increasing employee turnover. In that regard, "family supportive supervisor behaviors" (FSSBs) contribute to this need. Yet, employees and supervisors do not necessarily see eye to eye when it comes to the FSSBs exhibited by the supervisor, which can influence their effectiveness.

Originality/Value: This study contributes to research on FSSBs, by a) demonstrating the importance of employees and supervisors seeing eye to eye in relation to FSSBs as a driver of intrinsic motivation and turnover intention and b) exploring two boundary conditions that amplify the effectiveness of FSSBs.

Demonstrating the context dependent effects of the positive relationship between FSSB and flexibility i-deals

Ciara M. Kelly a, Mareia Las Heras b, Yasin Rofcanin c, Chidiebere Ogbonnaya d, María José Bosch Kreis e and Elise Marescaux f

a Sheffield University Management School, UK
b IESE Business School, Spain
c School of Management, University of Bath, UK
d University of Sussex
e ESE Business School, Chile
f IESEG School of Management, France

Purpose

As the needs of organizations and employees become more complex, requests for flexible work practices have become more commonplace. One way to achieve this flexibility is by
negotiating individualized schedule and time deals (i.e., flexibility i-deals). While research on i-deals has been growing recently, less attention has been paid to flexibility i-deals. In this research, we aim to explore the nomological network of flexibility i-deals. Drawing on COR theory and the W-HR model, we propose that flexibility i-deals are a mechanism through which family supportive supervisor behaviors (FSSBs) relate positively to family performance, and negatively to deviant work behaviors.

**Design/Methodology**
We collected multi-source data from within Chile and Columbia and tested our hypotheses using structural equation modelling. The final sample includes 94 managers and 512 subordinates.

**Results**
Our results supported the mediating role of i-deals and highlighted the importance of boundary conditions in the relationship between FSSBs, i-deals and employee outcomes. Specifically, we found that in most cases family friendly environment and prosocial motivation moderated the indirect effects of FSSBs on employee outcomes.

**Limitations**
Our data collection was multisource but cross-sectional.

**Research/Practical Implications**
We contribute to research on flexibility ideals by emphasizing the enabling role of line managers through their FSSBs, the importance of organizational context and the role of an individual characteristic in materializing and sustaining these deals.

**Originality/Value**
From a FSSB perspective, this research contributes to a nascent body of research exploring the contextually dependent outcomes of these supervisor behaviors.

**Supporting proactively embedded employees; The role of Family Supportive Supervisor Behavior (FSSB) in shaping differential employee outcomes via idiosyncratic (i-deals) deals and fit**

Ciara M. Kelly a, Mareia Las Heras b, Yasin Rofcanin c, María José Bosch Kreis d

a Sheffield University Management School, UK
b IESE Business School, Spain
c School of Management, University of Bath, UK
d ESE Business School, Chile

**Purpose**
In this longitudinal study we examine how FSSB is linked to two seemingly disparate constructs - employee embeddedness, a concept which potentially denotes inertia within a
role, and proactive skill development, an agentic and energized behavior. Using COR theory we hypothesise that the relationship between FSSB and these differential outcomes is partially explained by FSSB’s positive links to i-deals and employee fit.

**Design/Methodology**
We tested our hypotheses on data from 153 individuals in employment, who completed survey measures taken weekly over 3 weeks.

**Results**
Using path analysis, we found our hypotheses were partially supported, with developmental i-deals and fit mediating the link between FSSB and both DVs, embeddedness and proactive skill development. However contrary to our expectations we found no evidence that flexibility i-deals acted as a mediator for the effects of FSSB.

**Limitations**
Our conclusions could be strengthened by additional data sources, such as supervisor ratings.

**Research/Practical Implications**
Our study indicates that family supportive behaviours do not just link to work-life balance related outcomes. They may also support individually negotiated employee development and improved fit. Through these mechanisms organisations can support proactive skill development without fear of increasing turnover, as the same mechanisms support embeddedness.

**Originality/Value**
FSSB literature is predominantly cross-sectional, and so the longitudinal nature of our data is a strength of our study. Our findings indicate that fit and i-deals are important mechanisms linking FSSBs to outcomes which are of benefit to both individual employees and organizations.

**Family Motivation of Supervisors: Exploring the Impact on Subordinates' Work Performance via FSSBs and Work-Family Balance Satisfaction**

**Authors:** Didem Taser Erdogan a, Maria Jose Bosch b; Yasin Rofcanin c; Jakob Stollberger d; Mireia Las Heras e

a King’s College London
b ESE Business School
c University of Bath
d University of Aston
e IESE Business School

**Purpose:** Informed by prosocial motivation and work-family border theories, we investigate the association between family motivation of supervisors and FSSBs, and how the latter mediates the association between supervisors' family motivation and subordinates’ work performance. Furthermore, we examine the role of supervisors' satisfaction with their work-
family balance as a contextual variable influencing our proposed associations.

**Design/Methodology/Approach/Intervention:** We use matched supervisor-subordinate data from an organization in Chile (196 subordinates, 75 supervisors).

**Results:** Our findings revealed that supervisor family motivation relate to subordinate work performance via FSSBs. Moreover, this positive association is moderated by supervisors' satisfaction with their work-family balance, such that the mediation of FSSBs is stronger for supervisors who are not satisfied with their work-family balance.

**Limitations:** Cross-sectionality is a limitation of the study.

**Originality/Value:** Family supportive supervisor behaviors (FSSB) have emerged as a powerful resource of informal support for the well-being and development of employees. However, research to date offers limited insight into the antecedents and underlying processes that may trigger FSSBs. This study contributes to understanding of the broader context in which FSSBs unfold.
1537 - HEALTHY HEALTHCARE WORKERS: PSYCHOSOCIAL WORKING CONDITIONS, HEALTH, QUALITY OF CARE, RETENTION AND SUCCESS FACTORS OF INTERVENTIONS

Title and name of the proponent(s) of the Symposium: Georg Bauer, MD, DrPH, Head of the Division of Public and Organizational Health / Center of Salutogenesis, Epidemiology, Biostatistics, and Prevention Institute, University of Zurich, Switzerland

State of the Art: It has been well established that physicians and nurses experience considerable strain at work related to high workloads, emotional demands and understaffing. At the same time, healthcare organizations are struggling to attract and retain qualified staff.

New Perspectives/Contributions: Our symposium adds to the existing body of knowledge by addressing a range of issues relevant to understanding work stress and health in healthcare staff. The first three presentations examine the work-related health in physicians. One looks at the prevalence of burnout in physicians and the contributing factors as well as differences between medical specialties (Lucia Prihodova). Next, findings related to personal and organizational factors associated with presenteeism as well as consequences for the physicians themselves and their quality of care are presented (Lise Tevik Løvseth). This is followed by an examination of the relationship between psychosocial working conditions, burnout, depression and the intention to retire early (Kevin RH Teoh). We then turn our focus to nursing staff and provide a review of their occupation-specific job demands and resources (Sylvia Broetje). The final presentation shows that organizational health interventions in nursing wards can have differential effects on direct and indirect participants and presents factors contributing to these differences (Anja Lehmann).

Research/Practical Implications:

This symposium illuminates specific workplace aspects that are contributing to health-related and motivational outcomes in healthcare staff and intervention effectiveness. Thereby, our symposium presents applicable insight for the development of evidence-based interventions aimed at improving outcomes on both the individual and organizational level.

Workplace and personal wellbeing factors associated with burnout in Irish hospital doctors - specialties comparison.

Lucia Prihodova¹, Gillian Walsh¹,², Blánaid Hayes³,⁴

¹Research Department, Royal College of Physicians of Ireland, Dublin, Ireland;
²Business School, Dublin City University, Dublin, Ireland;
Purpose: In Ireland, the financial, organisational and personnel constraints imposed by recession translated into greater work volume and a challenging training and working environment for healthcare professionals. This study explored the prevalence and factors associated with burnout in doctors in different hospital specialties in Ireland.

Methodology: 1749 hospital doctors (RR = 55.3%) provided their age, sex, average working hours and completed the Workability Scale, the Depression, Anxiety and Stress Scale (DASS 21), the Effort Reward Imbalance (ERI) questionnaire and the Maslach Burnout Inventory (MBI). Binary logistic regression was performed to identify factors associated with burnout.

Results: Almost one third (30.6%) of all doctors were identified as burned out. Younger age, male sex, greater work stress (ERI), overcommitment (ERI), workability, stress (DASS 21) were significantly associated with burnout and explained 36.2% of the variance. The highest rates of burnout were observed in emergency medicine (58.8%) and lowest in pathology (19.4%). There was some variance among the specialities in factors associated with burnout.

Limitations: Cross-sectional design.

Research/Practical Implications: With almost one third of Irish hospital doctors meeting the criteria for burnout, this study provides insight into factors that need to be considered at all levels – from medical schools to the employer in order to improve the working environment, wellbeing and retention of staff.

Originality: First national study in Ireland, utilising representative samples of hospital doctors across specialties working in single healthcare system.

The spiralling effect of organizational, personal and cultural factors on sickness presenteeism among Norwegian hospital physicians

Lise Tevik Løvseth1,2, Fay Giaever2, Ingrid Steen Rostad2, Sylvi Thun2, Annet deLange3 and the HOUPE study project group4.
Purpose: Despite persistent high prevalence of presenteeism among physicians, we lack knowledge on what causes this behaviour and how this affects quality of health care. The current project investigates the prevalence, the relationship between correlates of presenteeism and the effect on physicians and their patients.

Design: Samples of 1) 3 500 physicians in four countries (2005), and 2) 6 500 physicians from five countries participating in the HOUPE study (2012) completed a survey that included measurements on psychosocial working conditions, burnout, psychological health and presenteeism, and 3) in-depth interviews with 21 physicians at a Norwegian university hospital.

Results: Presenteeism was prevalent among physicians in all countries (75-80%). There was a spiralling effect of positive and negative influential personal and organizational factors as well as factors in the professional culture, which simultaneously contributed to presenteeism. Presenteeism affected both the physician and the quality of health care.

Limitations: Prospective study.

Implications: The study contributes to an in depth knowledge on the positive and negative antecedents that can explain the persistent high prevalence of physicians that attend work when sick and effects of this behaviour on physicians and their patients.

Originality: The study underlines the inherent complexity of the causal chain of events affecting presenteeism among physicians. The study shows that it is not a matter of reducing sickness presence per se, but focusing on the overall health and well-being of physicians through identifying when sickness presence is called for, how it can be arranged and when it should be avoided.

Linking the psychosocial working conditions, burnout, psychological morbidity symptoms and early retirement intentions in UK hospital consultants

Kevin RH Teoh¹, Atir Khan², Saiful Islam³, Juliet Hassard⁴
Purpose: This study aimed to test the direct effect of hospital consultants’ psychosocial working conditions on their self-reported psychological morbidity symptoms and early retirement intentions, with burnout as a proposed mediator within these relationships.

Design: 593 NHS hospital consultants completed an online survey measuring psychosocial working conditions (work-related pressure & job autonomy), psychological morbidity (emotional exhaustion, depersonalisation, depressive symptoms, & anxiety symptoms), and early retirement intention.

Results: We found high prevalence rates for emotional exhaustion (38.7%), depersonalisation (20.7%), anxiety symptoms (43.1%) and depressive symptoms (36.1%). Job autonomy had negative direct effects on consultants’ anxiety and depressive symptoms, and their intention to retire early. Both emotional exhaustion and depersonalisation mediated the relationships that work-related pressure and job autonomy had with psychological morbidities. Only emotional exhaustion mediated the relationships where early retirement intention was the outcome.

Limitations: In addition to this cross-sectional study drawing on self-reported data, we do not know how many consultants received survey invites and are unable to determine the response rate.

Implications: Failure to adapt working conditions and proactively manage burnout could lead to more symptoms of psychological morbidity in consultants, as well as facilitating early retirement intention. This places additional demands on the NHS as consultants potentially become patients while also presenting a significant loss of skill, knowledge and experience to the NHS.

Originality: Few studies have examined psychosocial working conditions and psychological morbidity among hospital consultants. Where burnout has been examined, little evidence is available on its subsequent impact on doctors’ mental health or retirement intentions.

The key job resources and demands of nurses and their translation into interventions

Sylvia Broetje, Gregor J. Jenny, Georg F. Bauer
Purpose: The Job Demands-Resources (JD-R) model has been established as a framework to study and address work-related health as well as work engagement, however current findings are poorly integrated and as a result difficult to apply. Our aim is to identify the key job resources and demands of nursing staff by integrating findings from previously published review studies along the lines of the JD-R model.

Methodology: The databases MEDLINE, PsychINFO and CINAHL were searched for review papers published between 1990 and 2017 that examined the antecedents of the following work-related outcomes in samples of nursing staff: engagement, job satisfaction, motivation, enjoyment, commitment, work ability, nurse retention, exhaustion, health complaints, burnout, strain, stress, turnover and attrition. Relevant antecedents identified in these reviews will be integrated into the JD-R model using inductive analysis.

Results: Preliminary results indicate that – compared to other occupations - work-life interference, leadership style and values represent particularly critical workplace demands and resources in nurses. The final results will be presented at the symposium and the translation of these findings into interventions on the team level will be discussed.

Limitations: By including only reviews in our study, we may have missed resources or demands that have not yet been included in a review paper.

Implications: Understanding the core job resources and demands allows the development of more targeted interventions aimed at improving health-related and motivational outcomes in nurses.

Originality: This is the first study to integrate job demands and resources of nursing across a broad range of different outcomes.

Assessment of differential intervention effects for direct and indirect participants in an organizational health intervention implemented in healthcare

Anja Lehmann¹, Rebecca Brauchli¹ & Georg F. Bauer¹

¹ Division of Public and Organizational Health / Center of Salutogenesis Epidemiology, Biostatistics, and Prevention Institute, University of Zurich, Switzerland
Purpose: While implementing participation in an organizational health intervention (OHI), the formation of a group of representatives responsible for developing and realizing action plans is a common approach. This study aimed to compare changes in intervention outcomes between employees who are directly involved in intervention decision making (direct participants [DPs]) and the remaining employees (indirect participants [IPs]) in a mixed-method design of an OHI.

Design: Data from a lean healthcare intervention implemented in 29 nursing wards was used. Quantitative surveys were collected at two time points (follow up after six months), and focus group discussions were conducted during the follow-up phase.

Results: The results showed that DPs generally experienced improvements in intervention outcomes. For IPs, overall there was no positive change or even a deterioration in intervention outcomes. Further sub-group analyses, however, illustrated that some IPs were also able to benefit from the intervention. Qualitative focus group data gave insights on beneficial and less beneficial transfer process mechanisms between DPs and IPs which could explain these differential effects in the IPs.

Limitations: A second follow up after 12 and third follow up after 36 months would have been desirable to explore whether the results remained stable over time.

Implications/Value: This study highlights the importance of considering the forms and quality of participation in OHIs. The comparison between DPs and IPs offers insights into social transfer as a key aspect of the change process leading to positive intervention effects for whole teams.
Situational Judgment Tests (SJTs) are an assessment method requiring one’s response to a series of challenging scenarios. SJTs can measure different constructs, contain various design features, and are used for different purposes across disciplines and countries by both practitioners and researchers. This symposium of five presentations reflects this diversity, underlining the importance of interdisciplinary awareness of SJT research to further the field. Schmid, Knipfer, and Peus provide a theoretical perspective of an evidence-based SJT used for leadership development. SJTs can also be used for selection into education programs, in which various SJT design features can be explored.

Gentil, Moldzio, Reiner, and Felfe outline, from a practitioner’s perspective, how an SJT on Agreeableness can be used to predict leader success, using a German sample. De Leng, Steigers-Jager, Born, and Themmen compare response instructions (should do vs would do) and response option formats (multiple choice vs Likert) for applications to a Dutch medical education program. Furthermore, Kim and Klassen compare other response option formats (i.e., ranking, pick three, and Likert) for applications to a British teacher education program. Felfe, Krumm, Schäpers, and Kaminski examine another SJT design feature; namely, how instructions (faking vs non-faking) and item stems (with vs without) can influence participants’ social desirable responding patterns. Sharing interdisciplinary and cross-cultural findings can benefit society by enhancing the theoretical- and empirical-evidence base for fair, reliable, and valid SJT assessments.

Using SJTs in leadership training:
Individualized feedback and role play for impactful leadership development

Ellen Schmid, Kristin Knipfer & Claudia Peus
Technische Universität München (TUM School of Management), Germany

State of the Art: The Full Range of Leadership Model (Bass & Avolio, 1990) is the most researched leadership framework to date. Based on this theoretical model, Braun, Peus, Weisweiler, & Frey (2013) have developed a situational judgment test (SJT) that has been used extensively and successfully across contexts as a leadership assessment tool. The utility of the SJT for leadership development has not been explored so far.

New Perspectives/Contributions: We present a theoretical perspective of an evidence-based leadership training based on the SJT by Braun et al. (2013). In our leadership development approach, we use the feedback from the SJT as a major catalyst of leaders’ learning (e.g., Sparr, Knipfer, & Willems, 2017). Additionally, we developed role plays based on the empirically validated and prototypical leadership situations of the SJT to foster leaders’ experiential learning (Schmid & Peus, 2018).
Research/Practical Implications: We designed an online survey based on the SJT by Braun et al. (2013), where participants can rate their own leadership behaviors and ask their team members to rate them, too. In our training sessions, we conduct role plays based on the SJT to engage leaders in prototypical leadership challenges, to let them experiment with different behaviors, and to foster reflection of their leadership practice (Schmid & Knipfer, 2016).

Originality/Value: This is a promising example of how SJTs can be used not only for leadership assessment but also for leadership training. We conclude that an SJT is most impactful when integrated in a comprehensive leadership development approach.

May the situation be with you:
Is Agreeableness a major predictor for leader potential in different situations?

Alina Gentil¹, Thomas Moldzio¹, Anabell Reiner² & Jörg Felfe²

¹Moldzio & Partner – Institut für Personalauswahl (Institute for Personnel Selection), Germany
²Helmut-Schmidt-Universität – Universität der Bundeswehr Hamburg, Germany

Purpose: Many studies have demonstrated the important role of Big Five personality domains (particularly conscientiousness) in predicting job performance and leader success (e.g., Barrick, Mount & Judge, 2001; Bono & Judge, 2004). Although these meta-analyses have found inconsistent findings for agreeableness, they did not consider how situational factors and individuals’ motivations could impact on the relationships with the criteria. The aim of this study was to examine how these factors could moderate the relationship between agreeableness and leader potential.

Design: In a field-study within real assessments (N = 115 leaders), the relationship form between leader potential and two aspects of agreeableness (compassion and politeness) was explored. Furthermore, the situational context (personnel selection or professional development) and the basic motive affiliation were analyzed with a moderated mediation analysis.

Results: There was a U-shaped relationship between compassion and leader potential. Additionally, the basic motive affiliation suppressed the effect of compassion on leader potential, but only within the personnel selection situational context.

Limitations: Field-studies allow no causal interpretation and the current (sub)samples were small and preselected, which limit the external validity of the findings.

Research implications: We plan to conduct an experiment (vignette-study) to further explore the role of agreeableness and address the limitations of a field study.

Originality/Value: There is evidence that there can be "too much of a good thing". That is, being empathic is beneficial only to a certain extent and there is a need to not strive for acceptance by others, previous studies have not explicitly explored.
Influence of response instructions and response format on applicant perceptions of a Situational Judgement Test for medical school selection

Wendy E. de Leng¹, Karen M. Stegers-Jager¹, Marise Ph. Born² & Axel P.N. Themmen¹

¹Institute of Medical Education Research Rotterdam, Erasmus MC, the Netherlands
²Institute of Psychology, Erasmus University Rotterdam, the Netherlands

Purpose: The study examined the influence of two Situational Judgement Test (SJT) design features – response instructions and response format – on applicant perceptions. Additionally, we investigated demographic subgroup differences in applicant perceptions of an SJT.

Design: Medical school applicants (N=372) responded to an online survey on applicant perceptions, including a description and two example items of an SJT. Respondents randomly received one of four SJT versions (should do-rating, should do-pick-one, would do-rating, would do-pick-one). They rated overall favorability and items on five procedural justice factors. Additionally, applicant perceptions were compared for subgroups based on gender, ethnic background and first-generation university status.

Results: Applicants rated would-do instructions as easier to cheat than should-do instructions. Rating formats received more favorable judgements than pick-one formats on applicant differentiation, study-relatedness, chance to perform and ease-of-cheating. No significant main effects for demographic subgroups on applicant perceptions were found, but significant interaction effects showed that certain subgroups had more pronounced preferences for certain SJT design features. Certain SJT design features may improve applicant perceptions, due to the promotion of procedural justice factors.

Limitations: Applicant perceptions were based on only two example SJT items and that only a limited number of procedural justice factors were included.

Implications: Using design features that increase the SJT’s attractiveness for minority applicants may reduce adverse impact.

Originality: The present study contributes to previous research by examining the influence of response instructions and the interaction between design features and demographic subgroups on applicant perceptions.

Which response option format in Situational Judgment Tests is best? Evidence from UK teacher education program applicants

Lisa Kim, Erik Sengewald, and Rob Klassen
University of York, UK
Purpose: Situational Judgment Tests (SJT) are increasingly being used in various contexts and purposes, including in selecting individuals into teacher education programs. However, the format in which the response options should be presented to participants has not been thoroughly explored in the past.

Design: Accordingly, we use a between-subject design to compare the structural validity and the criterion-related validity for four types of response formats: ranking, pick best three, pick the least, and rating (Likert). Our participants \((N = 1205)\) were individuals applying for an initial teacher education program in the UK who completed an SJT measuring three groups of non-cognitive characteristics (Empathy and Communication, Organization and Planning, and Adaptability and Resilience).

Results: Results on the comparative psychometric properties of these response formats indicate that rating may be a superior SJT response format than the other response formats.

Limitations: The participants were majority white female in their 20s or 30s. Although this kind of demographic is representative of the teacher education students in the UK, external validity of its findings to the wider teaching force may be limited.

Research Implications: We recommend that researchers and practitioners consider developing and using SJTs that use a rating response format, although further validation in other contexts and for other purposes may be necessary.

Value: This study provides direct comparative evidence, not previously available, that a rating response format are helpful in SJT construction and use.

The meaning of social desirability of response options in SJTs

Jörg Felfe\(^1\), Stefan Krumm\(^2\), Philipp Schäpers\(^2\) & Katarina Kaminski\(^1\)

\(^1\)Helmut-Schmidt-Universität, UniBw Hamburg
\(^2\)Freie Universität Berlin, Germany

Purpose: Currently there is a debate, if SJTs are as situational as they are supposed to. Non-situational cues within the response options may influence participants to responding in a more socially desirable way and explain SJT performance. We conducted three studies to test this hypothesis. In the first study, we examined the role of social desirability of response options for performance in SJTs. In the second study, we analyzed if participants tended to respond in a more socially desirable way under a faking instruction condition compared to a non-faking instruction condition. In the third study, we examined if participants tended to respond in a more socially desirable way if there were no item stems compared to if there were item stems.

Method: In study one \((N = 132)\), answer alternatives were presented in a randomized order and rated with regard to desirability. In studies two \((N = 135)\) and three \((N = 95)\), we conducted between subject
designs to compare responding under different conditions (fake vs no fake, and with stem vs without stems).

Results: Study one revealed that response options varied with regards to their desirability, but desirability-based response-profile prototypes were poorly related with SJT performance. In study two, responding was somewhat related to desirable responding profile prototypes, but there were no performance differences between the two instruction conditions, indicating that faking did not enhance desirable responding. Study three showed that performance suffered when stems were missing and that participants were more orientated to desirability.

Limitations: Results were obtained on the basis of one specific test.

Implications: When constructing SJTs, one should be aware of and control for potential effects of social desirability of response options.

Originality: To our knowledge, this is the first series of studies to systematically examine the influence of desirability of response options.
Title and Name of the Proponent(s) of the Symposium

Tom Hopton, MA Hons (Oxon.), CPsychol, MBPsS, Principal Consultant @ Saville Assessment
Rab Maclver, BSc., MSc., CPsychol, R&D Director @ Saville Assessment
Professor Hennie Kriek, PhD., CEO @ TTS-Top Talent Solutions
Lauren Jeffery-Smith, MSc., Wave Portfolio Manager @ Saville Assessment
Elisabeth Brummer, MSc., Assessment Lead Western Europe @ Willis Towers Watson

State of the Art

This symposium explores how the latest technologies and psychometric scoring approaches can be used to power ever-more valuable insights, increasingly drawing upon different combinations of assessments and data-driven algorithms.

Through a range of research and live data sets ranging from less than n=50 up to n=100,000 we explore real-world applications and implications of the latest technologies and scoring methodologies. We also provide a new synthesis of relevant psychometric theory and data approaches and raise questions about the state-of-the-art in the broader context of contemporary business activities such as business intelligence, data analytics and dashboarding.

New Perspectives/Contributions

We focus on new scoring approaches, theories and technologies with real-world applications – and provide examples of how practitioners can leverage such developments.

We discuss how the latest technologies and approaches to psychometric data now make it possible to provide unprecedented insights. Such insights include increasing the fairness of assessments, providing group-level data overviews, producing new combinations of assessment scores and the ethical and practical implications of artificial intelligence.

As a group of experienced practitioners from different global organizations ourselves, we believe we are well-placed to provide practitioner insight and to pose provocative questions about the state-of-the-art of psychometric scoring and reporting.

Research/Practical Implications

- We explore and demonstrate how the latest technologies and scoring approaches allow users of psychometrics to work better.
- We encourage practitioners to go beyond traditional psychometric approaches.
- We raise provocative questions about the future of psychometric scoring and reporting – including the potential benefits and risks of artificial intelligence.

PAPER 1: History & Advances in Group-Level Psychometric Data
Title, Name & Affiliation of The Author

Tom Hopton, MA Hons (Oxon.), CPsychol, MBPsS, Principal Consultant @ Saville Assessment

State of the Art

Technology has advanced immeasurably in recent years and it is now possible to produce group-level psychometric outputs and assessment combinations which simply weren’t achievable even comparatively recently. For example, group-level data can now be leveraged in real-time to assist with such activities as deploying the most appropriate benchmarks or evaluating the fairness of a testing process.

There are different approaches from which researchers and practitioners are approaching group-level “big data”. It seems like an eminently appropriate time to discuss consolidating these approaches to help people gain maximum insight from big data.

New Perspectives/Contributions

A brief synopsis of psychometric trait scores at the individual- and group-level is provided before we demonstrate how, using real-world data sets, valuable insights can be gained. For example, we explore how real-time overviews of various assessment data sets, ranging from n=10 to samples containing thousands of data points, can be used to carry out such activities as exploring performance distributions, considering the appropriateness of benchmarks used and in setting decision-making cut-scores.

Research/Practical Implications

Such group-level data outputs raise important questions for I/O psychology, including ethical questions (e.g. what kinds of data should be available to whom, and when?) and practical questions (e.g. how can I/O psychologists best leverage these insights to help people at work?)

Originality/Value

In addition to synthesizing a range of existing and disparate research in a new way, we’ll draw on real-life datasets to demonstrate some new ways in which the latest technologies can be leveraged to optimally display scores dynamically and in real-time at the group/combined-level.

PAPER 2: Insightful Group Reporting of Type, Trait and Algorithmic Data

Title, Name & Affiliation of The Author

Rab MacIver, BSc., MSc., CPsychol, R&D Director @ Saville Assessment
State of the Art

This paper explores the challenges of presenting multi-scale group performance overviews from psychometric assessments. In particular, the paper focuses on what information it is appropriate to provide at a group-level to summarise assessment results on both multi-scale trait and type models. How best to provide test users with valid and useful actionable insights (MacIver, Anderson, Costa & Evers, 2014) is also discussed.

New Perspectives/Contributions

We focus on the design of technology which allows for group feedback of multi-scale type and trait scores as well as scores derived from data-driven algorithms. The paper compares and contrasts two approaches to online group overviews, using real-life samples of up to n=50, which generalise across trait and type psychometric models with different numbers of scales and scale levels.

Research/Practical Implications

The development of group outputs raises important questions for I/O psychology in terms of using individual psychometric data to inform interventions at the team and organisational level. It raises new questions related to validity research as well as inferences and decisions made based on group psychometric data.

Originality/Value

The paper demonstrates how modern online interactive technology can be used by I/O practitioners to deliver new psychological interventions at the team or organisational level. We raise insightful questions about the future potential for leveraging larger data sets to optimize decision-making and utility.

PAPER 3: Integrated Reporting: Trends and Developments

Title, name and affiliation of authors

Professor Hennie Kriek, PhD., CEO @ TTS-Top Talent Solutions
Sebastian Clifton, MCom, Research Consultant @ TTS-Top Talent Solutions

State of the Art

An individual’s capability to perform competently in the workplace and contribute to organization effectiveness is, to a considerable extent, a function of their personal attributes. These include, broadly speaking, 1) foundational, 2) backward-looking and 3) forward-looking factors, which are to form the core of any organization’s capability and assessment model. Integrating assessments into this model will provide an assortment of astute individual-level scores. The true utility of these scores, however, lie in their amalgamation and presentation. Employing latest approaches, theories and technologies enables the combination and
reporting of assessment scores in an integrated, simplified and user-friendly manner that
provide comprehensive overviews and empowers informed talent decisions – which, in turn,
powers valuable group-level insights.

New Perspectives/Contributions

Competencies – as an integral part of people management and organization effectiveness –
will be briefly discussed. Attention will be given to their relevance in the Fourth Industrial
Revolution. A capability and assessment model that is centred around the three
documented factors for competency assessment will be presented. The focus will then be
on approaches, theories and technologies for the combination of assessment scores in an
integrated overview report for better talent decision-making.

Research/Practical Implications

Enhance the judgement and decision-making of the users of individual-level assessment data
through the utilization of technology, data visualization and integrated reporting.

Originality/Value

This paper will demonstrate, in a practical manner, integrated reporting that employs latest
approaches, theories and technologies, which will provide pertinent considerations for I/O
Psychology at present and in moving forward.

Reference

PAPER 4: Exploring the Fairness of Data-Driven Algorithms Across 23 Countries

Lauren Jeffery-Smith, MSc., Wave Portfolio Manager @ Saville Assessment
Anna Mitchener, MSc., Product Manager @ Saville Assessment

This paper explores the fairness of data-driven algorithms developed to predict behavioural
competencies, work roles and the Big Five. Gender group differences are explored across
countries.

There is a wealth of existing research focusing on international gender differences on Big Five
measures (e.g. Costa, Terracciano & McCrae, 2001; Schmitt et al., 2017). This research builds
on previous research by investigating cross-cultural gender trends in algorithms that forecast
both behavioural competencies and work roles, the latter being a model aligned to the Great
Eight model (Kurz & Bartram, 2002) and the Belbin Team Roles model (1996).

A sample of exactly 100,000 individuals was selected from a test publisher’s assessment data
base. The sample completed an established and well-validated personality questionnaire
which provides outputs against both trait and type models. Comparisons between
geographical regions and 23 countries (which have at least 200 in each gender sample) were explored using Cohen’s d effect size.

The implications of this research are discussed in terms of gender diversity in the workplace, as well as diversity of working styles within teams. The optimal use of data-driven algorithms which reduce group differences to maximise fairness is also discussed.

Based on this research, we will finish with a discussion on the potential applications of different types of algorithms used to predict individual competencies, broader work roles and overall performance and potential.

PAPER 5: Robotising Humanity, Artificial Intelligence and Psychometric Assessment

Title, Name & Affiliation of The Author

Elisabeth Brummer, MSc Occupational Psychology, Associate @ Willis Towers Watson

State of the Art

The Fourth Industrial Revolution and the associated rise of Artificial Intelligence (AI) have the potential to significantly impact on humanity, including how individuals are assessed at work. Data scientists are in high demand and many people are looking for new and innovative ways to predict performance at work. The opportunities for the use of AI seem virtually endless.

However, your AI is only as good as the data put in - and that’s where problems can arise. Data need to be fair, unbiased, objective and related to factors that actually matter to workplace performance.

The use of AI should also be considered in an ethical manner, where the success profiles created don’t discriminate between different groups and should improve diversity in the workplace.

New Perspectives/Contributions

We start with a brief overview of AI and its relationship to psychometric assessment. We then consider critical issues such as: (1) ensuring that data underpinning AI methods are demonstrably linked to workplace performance, i.e. proven behaviours which underpin effectiveness; (2) avoiding risks of reduced diversity from over-use of “success profiles” which are based on narrow templates of desirable characteristics.

Research/Practical Implications

The use of AI raises important questions around diversity and inclusivity (e.g., how to avoid cloning characteristics) and practical implications, including how to optimally use data for objective decision-making.
Originality/Value

The prolific growth of AI in workplace assessments makes this a very relevant topic; as psychologists we need to ensure any approaches we employ are ethical and describe differences between individuals which are measurably important to workplace performance.
Chair: Francisco J. Gracia (IDOCAL, University of Valencia, Spain)

Discussant: Markus Schöbel (University of Bassel, Switzerland)

State of the Art: Mindful organizing is defined as the collective capacity to anticipate unexpected events and to contain these unexpected events once they arise (Weick et al., 1999). Recent literature has paid close attention to mindful organizing as being responsible for reliable and safe performance in high hazard industries, such as nuclear power plants, hospitals, etc. (Sutcliffe et al., 2016; Vogus and Sutcliffe 2012; Weick et al. 1999; Weick and Sutcliffe, 2007, 2015). Despite this relevance, Sutcliffe et al. (2016) recently revealed in a review paper that (1) empirical research about mindful organizing is still very scarce; (2) qualitative research and case studies are dominant; (3) there are almost no studies about predictors of mindful organizing; and (4) there is almost no research showing a supposed relationship with safety performance.

New Perspectives/Contributions: Through three field quantitative studies and one laboratory study we will contribute to increase knowledge about predictors and outcomes of mindful organizing. With a longitudinal design, empirical evidence was obtained about the role of employees’ participation and critical upward communication to develop mindful organizing (Renecle). Furthermore, empirical evidence was obtained of the relationship between mindful organizing and performance (Magnano, Senturk) and other outcomes, such as work engagement and safety patient (García), psychological climate, exit and neglect (Magnano), job satisfaction (Renecle), and turnover intention (Magnano, Renecle).

Research/Practical Implications: Companies can benefit of implementing mindful organizing to improve safety performance and other outcomes. Companies should stimulate employees’ participation and good communication practices to develop mindful organizing.

Beyond Reliability: Collective Mindfulness and Team Performance

Melike Senturk, University of Edinburgh (UK)
Nick Oliver, University of Edinburgh (UK)
Kristina Potocnik, University of Edinburgh (UK)
Tom Calvard, University of Edinburgh (UK)
Maurizio Tomasella, University of Edinburgh (UK)

Purpose

Collective mindfulness is a central feature of high-reliability organizations (HROs) that are able to operate complex, hazardous technologies under unforgiving conditions with remarkably low error rates. With this study, we aim to understand whether collective mindfulness also offers benefits to organizations that operate in less extreme conditions.

Design/Methodology

We have collected data from 68 teams of 547 post-graduate business students who worked on a business simulation over approximately six weeks. The exercise requires strategy formulation, planning, organization, and system design and culminates in a half-day trading period during which teams must physically produce products under turbulent, competitive conditions. Post-simulation questionnaires and objective performance measures are used to collect data.

Results

The results show strong, significant relationships between collective mindfulness and performance. Collective mindfulness is particularly significant to the performance of teams pursuing ambitious, high-risk strategies, suggesting that mindfulness is most valuable under relatively demanding conditions.

Limitations

We utilize an artificial research setting in this study to examine the relationship between mindfulness and performance. Hence, the conditions faced in the research setting might not be identical to real team environments.

Research/Practical Implications

This study provides teams in challenging operational conditions with a solid understanding with regards to how they can utilize the principles and practices of collective mindfulness to achieve performance improvements.

Originality/Value

This study contributes to collective mindfulness literature by examining the benefits of collective mindfulness for mainstream organizational units. It enhances the understanding with regards to how collective mindfulness can be beneficial in non-extreme challenging conditions.
Mindful organizing, engagement, and patient safety.

María Esther García-Buades, University of the Balearic Islands (Spain).
Laura Galiana, University of Valencia (Spain).
Francisco J. Gracia, University of Valencia (Spain).
Noemí Sansó, University of the Balearic Islands (Spain).
Marta Torres, Hospital Universitario Son Espases (Spain).
Fátima Roso-Bas, Hospital Universitario Son Espases (Spain).

Purpose

Patient safety refers to “freedom from accidental or preventable injuries produced by medical care.” In this study, we explore how mindful organizing (or collective mindfulness), work engagement, and number of patients affect patient safety in a hospital setting.

Design/ Methodology

In a cross-sectional design, we used on-line questionnaires to measure mindful organizing (Gracia et al., 2018), engagement (UWES-3, Schaufeli et al., 2017), patient workload, and patient safety. The sample consisted of 188 health professionals in a public hospital in Spain.

Results

The hypothesized path model obtained a very good fit. Mindful organizing had a positive direct effect on patient safety, an indirect effect via engagement. Additionally, number of patients reduced patient safety.

Limitations

The cross-sectional design prevents firm conclusions about the causality of the proposed relationships. Our data are at the individual level, we strongly recommend expanding this model to group and organizational levels of analyses.

Research/Practical Implications

The role of mindful organizing in high risk and reliable organizations is promising. Similar research should expand to include diverse samples, longitudinal, and cross-level studies. Hospital staff and leaders should develop systems of mindful organizing to improve both staff’s wellbeing and performance, and subsequently, to improve patient safety.

Originality/ Value

This study contributes to understanding the relationships between collective mindfulness and important constructs related to patient safety. We provide empirical evidence of the relevance of collective mindfulness among healthcare professionals to improve health care quality.
The role of organizational mindfulness and psychological climate in organizational outcomes.

Paola Magnano, Kore University, Enna (Italy)  
Giuseppe Santisi, University of Catania (Italy)  
Jordi Tous-Pallarés, Rovira I Virgili University, Tarragona (Spain)

Purpose
Recent empirical research has investigated mindfulness from a workplace perspective; mindfulness affects organisational outcomes, e.g. safety climates, security, adaptation and performance. The study proposed aims to explore the relationships between organizational mindfulness, psychological climate and the organizational outcomes (turnover intention, exit, neglect and performance).

Design/ Methodology
We collected data through an online survey; the participant were 1063 Italian workers (M = 507; F = 556), recruited from public and private organizations; the measures included were: Mindfulness Organizing Scale, Escala Clima Psicosocial en el Trabajo, Turnover intentions, Exit and neglect, and Performance.

Results
The results highlighted the role of the psychological climate and the organizational mindfulness in affecting organizational outcomes.

Limitations
The first limitation is the cross-sectional nature of the study; the second regards the self-report measures

Research/Practical Implications
The results of the study can help organizations in improving the organizational mindfulness through dedicated trainings, with the aim to increase a positive psychological climate, to reduce negative outcomes and obtain positive outcomes.

Originality/ Value
This study contributes to the development of the literature about organizational mindfulness, demonstrating empirically the relationships with other psychosocial dimensions in organizations (climate) and organizational outcomes.
Organizing Mindfully: Testing A Structural Equation Model of Antecedents and Outcomes of Collective Mindfulness

Michelle Renecle, University of Valencia (Spain)
Francisco J. Gracia, University of Valencia (Spain)
Inés Tomas, University of Valencia (Spain)
José María Peiró, University of Valencia (Spain)

Purpose
Through mindful organizing, High Reliability Organizations are able to manage unexpected events and maintain error free performance. We aimed to test whether the interaction of two front-line processes lead to mindful organizing over time and examined the impact of mindful organizing on employee satisfaction and turnover.

Design/ Methodology
We tested a structural equation model using a time-lagged design with two data-collection points with 47 teams within the Spanish nuclear power industry. Data was collected with paper pencil questionnaires.

Results
The results show that employees need to feel safe to express critical opinions to their supervisors as well as feel encouraged to actively participate and share their opinions in order for mindful organizing to develop. Mindful organizing was also found to lead to lower turnover intentions through increasing employee’s satisfaction at work.

Limitations
Mindful organizing and both outcome variables were measured at the same time making us miss the dynamic relationships of these variables over time. Our sample size was also slightly below the cut off of the recommended 50 teams, reducing statistical power.

Research/Practical Implications
This study provides insight into which conditions are needed to foster mindful organizing. It also shed light on mindful organizing’s impact on employee’s positive experience at work and desirability to stay in the organization, given controversy speculated in the literature.

Originality/ Value
We contribute to the limited empirical understanding of the nomological network of this construct and furnish decision makers with insight into conditions needed to foster mindful organizing and benefits that can be seen from it.
1559 - JOB CRAFTING IN CONTEXT: RECENT INSIGHTS FROM JOB CRAFTING RESEARCH.

Chairs: Arianna Costantini, Piet van Gool

State of the Art
This symposium aims at advancing knowledge on job crafting adopting an interactive perspective. While much research on the nature of job crafting has been conducted over the past years, we still lack knowledge on how job crafting strategies are influenced by contextual factors. Moreover, the cognitive and affective mechanisms of job crafting remain underexplored. In this symposium we focus on job crafting in the context of task-conflict, social norms, coaching, social networks, and pro-social motivation, and the role of emotions in the process of job crafting.

New Perspectives/Contributions
The symposium brings together researchers from six different countries and consists of two longitudinal, and four diary studies. People seem to craft their job based on their intentions and on individual perceptions of control over such behaviors. In turn, leader coaching behaviors support employees’ implementation of their intentions. Employees can make use of expansive job crafting behaviors to create stimulating interactions, which effectiveness depends on the structure of the employees’ social network. Likewise, employees can craft their job to leverage the creative potential of task conflict. Furthermore, cognitive crafting seems to be particularly effective if prosocial motivation is low. Finally, by engaging in promotion-focused job crafting employees can experience positive emotions that support high work engagement.

Research/Practical Implications
These studies highlight the role of contextual factors influencing job crafting and processes such as creativity, social networks, and wellbeing at work related to it. Its elaborate designs uncovered how the effectiveness of job crafting is influenced by the context.

Effects of contextual cues in influencing and implementing job crafting intentions.

Arianna Costantini

Verona University, Italy

• Purpose
Current work environments require employees to be not only role-takers, but also role-makers. Proactivity depends on individual differences such as self-efficacy, but also on contextual factors that may inhibit or support the translation of behavioral intention into actual behaviors. Building on the JD-R theory and on behavioral literature we hypothesized that (1) perceived behavioral control to engage in job crafting has a positive indirect effect on job crafting behaviors via intention, (2) social norms and behavioral modeling moderate the effect of perceived behavioral control on intention, and (3) leader coaching supports the implementation of job crafting intention into actual behaviors.

- **Design/Methodology**
  Three-wave data with a time-lag of 6 weeks were collected (N = 528 employees). Measures included perceived leader coaching behaviors, perceived behavioral control, injunctive and descriptive norms, and behavioral modeling referred to job crafting behaviors.

- **Results**
  Perceived behavioral control was indirectly related to job crafting via intention. Injunctive and descriptive norms, and behavioral modeling weakened the effect of perceived behavioral control on intention to engage in job crafting. On the contrary, leader coaching strengthened the positive relationship between intention and job crafting behaviors.

- **Limitations**
  Measures were all self-reported.

- **Research/Practical Implications**
  Leader coaching behaviors unrelated to job crafting support the implementation of employees’ intention to engage in job crafting.

- **Originality/Value**
  This study adds to job crafting literature by considering the reciprocal interactions among cognitive, behavioral, and environmental variables underlying the implementation of job crafting.

Crafting Creative, and Energizing Interactions: The Role of Network Structure

Piet van Gool¹, Evangelia Demerouti¹, Gerrit Rooks⁴, Frank Rozemeijer²

Eindhoven University of Technology¹, The Netherlands
Purpose
Social interaction is an important source of energy and ideas for employees. It remains unknown however how employees craft their social interactions and how the structural context influences its effectiveness. Based on Job Demands-Resources theory we expect that in social interactions (1) seeking resources is more effective in a challenging network context (full of structural holes), and (2) seeking challenges is more effective in a network context that fosters resources (a dense network).

Design/Methodology
Using a 5-day contact diary including a network matrix we collected data on job crafting behavior, relational energy, and ideas generated during 517 interactions of 60 purchasing and sales employees. Network structure (density and structural holes) was assessed using the dyadic constraint measure of the interaction partners (Burt, 1992).

Results
Seeking resources and seeking challenges during interactions are positively associated with the relational energy and idea generation during that interaction. The relationship between seeking challenges and both idea generation and relational energy is stronger in interactions with contacts that are high on dyadic constraint. The relationship between seeking resources and relational energy (but not idea generation) is stronger in interactions with contacts low on dyadic constraint.

Limitations
The contact diary approach did not capture the entire ego network of the participants.

Research/Practical Implications
Employees can create energizing and creative interactions using expansive job crafting strategies. The effects of these strategies depend on the structure of their network.

Originality/Value
We are among the first to study the interaction between (network-) structural and crafted resources and challenges.

Creativity under task conflict: The role of proactively increasing job resources

Paraskevas Petrou¹, Arnold B. Bakker¹², Katinka Bezemer¹
Purpose
Existing literature addresses the creative potential of task conflict but we still lack knowledge regarding strategies employees may use to enhance the creative effects of task conflict. The present daily diary study among various occupational sectors used conflict and creativity theories to hypothesize that task conflict has an inverted U-shaped relationship with employee creativity (i.e., creativity is higher at moderate than low or high levels of conflict). We also argue that this curvilinear effect is stronger when employees increase their job resources.

Methodology
A total of 92 employees filled out a diary survey at the end of five consecutive days.

Results
Results of multilevel analyses revealed that, as predicted, task conflict had an inverted U-shaped link with creativity when employees increased their structural job resources. However, when employees increased their social job resources, the link was linear and positive. Our findings also showed that increasing structural or social resources related positively to employee creativity.

Limitations
All variables were self-reported.

Research/Practical Implications
Our results suggest that the link between task conflict and creativity can be either linear or nonlinear and that this may depend on the moderator. In both cases, organizations may want to utilize the creative potential of task conflict by enhancing job crafting among their workforce.

Originality/Value
Rather than addressing the previously found (nonlinear) link between conflict and creativity, the present study uncovers the conditions under which this link most likely occurs, namely, when employees seek help by increasing their structural or social job resources.
Job crafting and emotions

Philipp W. Lichtenthaler¹ and Andrea Fischbach²

PE-Solution¹, Germany
German Police University², Germany

• Purpose
With this study we investigate how job crafting behaviors are related to employees’ motivation and well-being. We propose that promotion-focused job crafting behaviors (i.e., increasing job resources and challenging job demands) are facilitating employee motivation through increases in positive emotions, whereas prevention-focused job crafting behaviors (i.e., decreasing hindering job demands) are attenuating employee well-being through increases in negative emotions.

• Design/Methodology
We conducted two studies to test these hypotheses. First, a diary study, where N = 72 employees reported on 482 workdays. Second, a longitudinal study (two waves with a time lag of four weeks; N = 165 employees).

• Results
Results from both studies show that promotion-focused job crafting was positively related with increases in positive emotions, and that increases in positive emotions mediated the relationship between promotion-focused job crafting and work engagement. Whereas, prevention-focused job crafting was positively related with increases in negative emotions, and increases in negative emotions mediated the relationship between prevention-focused job crafting and emotional exhaustion.

• Limitations
Common-method bias may be an issue, since all study variables were assessed via self-report.

• Research/Practical Implications
With adding a regulatory focus perspective on job crafting, we can now theoretically account for the empirically found beneficial and detrimental effects of different job crafting behaviors, and results of this research suggest that changes in emotional experiences are the underlying psychological processes in these relationships.

• Originality/Value
This study adds to research on the regulatory focus job crafting model.
Cognitive Job Crafting: A Weekly Diary Study Exploring the Mechanisms and Boundary Conditions

Yasin Rofcanin¹, Mireia Las Heras², Aykut Berber³

University of Bath, School of Management¹, United Kingdom
IESE Business School², Spain
Istanbul University, School of Business³, Turkey

• Purpose
The aim of this study is to explore the consequences of a relatively unexplored type of job crafting, namely cognitive job crafting. We develop a model in which two separate mechanisms are proposed to explain how cognitive job crafting may impact employee outcomes positively: affective route (positive emotions) and cognitive route (need satisfaction). We expand our model by integrating one individual level contextual condition (prosocial motivation) and work outcomes relevant for the individual (work performance) and for colleagues (helping behaviors).

• Design
We carried out a seven-week diary study to explore our research model. Participants were full-time working E-MBA students of a university in Istanbul, Turkey. Outcome variables were evaluated by line managers of employees, who recruited them for study purposes.

• Results
Results mainly supported our hypotheses. The findings revealed that there are two routes through which cognitive job crafting may unfold to impact on employee outcomes. The findings, however, revealed that low prosocial motivation, rather than high prosocial motivation, matters to render the impact of cognitive job crafting effective.

• Limitations
A main limitation of our study is that we focused on one type of job crafting. Future research could explore the mechanisms for other types of job crafting, using interventions and experience sampling study designs.

• Research/Practical Implications
An important finding of this study is that it reveals the existence of a new construct; cognitive job crafting and how it relates to important work outcomes. Organizations can adopt interventions to encourage and develop work environments conducive to cognitive job crafting.
WOMEN’S UNDERREPRESENTATION IN LEADERSHIP PART I: THE ROLE OF SELF AND OTHERS’ PERCEPTIONS AND EVALUATIONS.

Chairs: Julie Brueckner (Dublin City University); Janine Bosak (Dublin City University); Mary Kinahan (Dublin Institute of Technology); and Clara Kulich (University of Geneva).

State of the Art

Despite increased participation in the workplace, women are still underrepresented in leadership positions. Across two symposia, we examine how both women’s self-perception and their perception by others impact women’s pursuit of leadership. The presented studies feature (i) empirical and theoretical contributions; and (ii) different research methods including experimental, qualitative, and correlational designs. The first symposium focuses on women’s aspirations to and self-perception in leadership positions and the underlying processes involved.

New Perspectives/Contributions

The first two presentations focus on women’s motivation to reach senior positions in academia: Henningsen et al.’s results suggest that women’s ambitions to pursue deanship are influenced by their communal goal endorsement and prior prevalence of female deans. Similarly, Möltner et al.’s results suggest that women’s motivation to pursue senior academic positions depends on factors such as role models. The next two presentations use experiments to examine women’s self-perceptions: Nater et al. found that women’s leadership aspirations increased when female leaders’ selection was based on merit, not quotas. Maia et al. focus on context and culture influencing leader behaviour and fear of backlash. The final presentations focus on gendered identification and perception of self and others. Chipeaux et al. examine the link between female employees’ leadership aspirations and assimilation to the manager group, while Hentschel et al. present a multi-dimensional framework that examines men and women’s gender stereotypes and self-stereotypes.

Research/Practical Implications

All contributions extend existing research on women’s underrepresentation in leadership roles and provide practical implications for selection and promotion of women.
Who Wants to Become Dean? Relative Effects of Gender Discrimination and Self-Selection Processes on Professors’ Deanship Ambition

Levke Henningsen (University of Zurich, Switzerland), Alice H. Eagly (Northwestern University, USA), and Klaus Jonas (University of Zurich, Switzerland)

Purpose
The study integrated demand-side theories on gender discrimination and supply-side theories on self-selection processes to advance the understanding of promotion practices and career choices for academic deanship.

Design/Methodology
Using administrative data as well as survey data of 278 professors from Germany, Austria, and Switzerland, the study examined the effects of demand-side and supply-side factors on female and male professors’ deanship ambitions in a time-lagged design. Furthermore, we considered indirect effects of recommendation rates and perceptions of the position’s job appeal.

Results
From the demand side, the results revealed no gender differences in recommendation rates for deanship. For example, prior administrative leadership experiences were positively associated with deanship recommendation for female and male professors. From the supply side, female but not male professors’ communal goal endorsement and their estimated prevalence of prior female deans were positively associated with deanship ambitions through job appeal.

Limitations
Other factors – that were not assessed in this study – might affect recommendation rates and attitudes towards deanship, such as monetary incentives, teaching reliefs, or the individual’s scientific and publication success.

Research/Practical Implications
The results highlight the importance of role models in administrative leadership positions. Furthermore, the results imply that faculties could provide job profiles that point out the possibilities and communal aspects of the deanship position to attract more women.

Originality/Value
To our knowledge, the study is the first to integrate demand-side and supply-side theories concerning barriers and facilitators of women’s and men’s deanship participation by applying data from different sources in a time-lagged research design.

Leaning in for Different Reasons:

A Qualitative Study on Women’s Leadership Motivation in Academia
Hannah Möltner, (University of Kassel & FOM University of Applied Science, Germany) and Morten Huse (BI Norwegian Business School, Norway)

Purpose
Despite past improvements, women are still underrepresented in positions within academia, particularly at full professor and leadership level. In Europe only 20% of the full professors and the heads of institutions were women (EC, 2016). However, this imbalance differs between countries. The higher proportions of women in such positions are in the Nordic countries. The objective in our contribution is to explore women’s leadership motivation. We will compare Norway and Germany.

Design
We gathered qualitative data from different sources by conducting interviews, focus groups, and observations. Faculty members from a Norwegian and a German University were included. In a first round we conducted 13 semi-structured narrative interviews with women on postdoc or higher academic levels.

Results
Using self-determination theory (Deci & Ryan, 2000; Gagné & Deci, 2005), we analyzed the data. First, we found patterns characterized by relatively more intrinsic and identified, and less introjected and extrinsic motivation. Second, in comparison the Norwegian women report more extrinsic drivers than the German. Third, we identified helping and hindering factors, such as department vs. chair models at universities, family-(un)friendly practices, and (lack of) role models.

Research/Practical Implications
The study provides a better understanding of what motivates women to pursue an academic career and to assume leadership roles. It informs academia how to create supportive environments.

Limitations
The results of this exploratory study are limited in generalizability, but they offer good starting points for further studies.

Originality/Value
We contribute to a field where few studies have been conducted on the postdoc level.
Inspired to Become a Leader: Are Gender Quotas Helpful in Establishing Effective Role Models for Other Women?

Christa Nater (University of Bern, Switzerland), Madeline E. Heilman (New York University, USA) and Sabine Sczesny (University of Bern, Switzerland)

Purpose

We investigated how differently selected female leaders affect women's and men's fit perceptions for leadership and their leadership aspirations.

Design/Methodology/Approach/Intervention

This hiring simulation study was based on a 2 (participant gender: women, men) x 3 (leader's selection: merit-based, quota-based, no exemplar) between-subjects design. The sample consisted of 323 management students (164 women, 159 men).

Results

Reading about a woman leader – regardless of selection method – increased women's self-ascribed fit for leadership and their expected performance in leadership positions. However, women's leadership aspirations increased only after reading about a leader selected based on merit, but not based on quotas. Higher perceived competence and deservingness of merit-based selected leaders (compared to quota leaders) were responsible for women's increased interest in aspiring to leadership positions. In contrast, men's leadership aspirations decreased after reading about quota-based exemplars, because of their lower trust in the company and their lower perceived probability of being hired.

Limitations

It remains unclear whether quota-based selected female leaders who prove their competence may serve as effective role models and inspire them to become leaders themselves.

Research/Practical Implications

Our data suggest that women leaders, irrespective of selection method, can positively affect women's fit perceptions for leadership. However, the way in which female leaders obtained their position matters for their effect on other women's and men's leadership aspirations.

Originality/Value
Since legislated gender quotas for leadership positions are present in numerous countries across Europe, knowing whether they can help establish effective role models for the next generation of women leaders is essential.

How Organizational Context and Climate Determine Leader Behavior and Fear of Backlash in Crises

Victor De Macedo Maia, Romain A. Raymondie, Laurent Cambon, and Dirk D. Steiner (Université Côte d’Azur, France)

Purpose
Organizational crises can impose different types of behaviors and emotional displays on leaders. However, these actions are not always congruent with leaders’ gender roles, which can result in a backlash. Therefore, in the context where the features needed for effectiveness are not aligned with gender prescriptions, a gap between behaviors perceived as effective and those enacted can result, especially in certain organizational climates. We test this hypothesis in two glass cliff contexts (financial vs. relational) and two organizational climates (traditional vs. inclusive). Given that stereotypical masculine characteristics are perceived as suited for financial crises whereas feminine characteristics are acknowledged in relational ones, we expect a difference between what is perceived as effective and what is enacted when the crisis context and gender stereotypes are incongruent, due to a perceived fear of backlash. The organizational climate may attenuate (e.g., inclusive) or accentuate (e.g., traditional) this gap.

Design/Methodology
Participants read a fictitious scenario about a company struggling with crisis. They assessed which behaviors and emotional display they thought they should enact to solve the crisis and whether they perceived these actions as causing potential positive or negative perceptions and evaluations from their peers and followers. They were asked which leadership behavior they would actually adopt.

Results
We expect to obtain results in line with our hypotheses.

Research implications
This research shows how context and organizational climate can foster leaders’ fear of backlash, hence resulting in different behaviors.

Originality/Value
This research adopts leader’s perspectives in different types of crises and organizational climates.
Desired vs. Enacted Managerial Aspirations Among Female Employees and Their Impact on Ingroup Identification and Self-ingroup Similarity

Marion Chipeaux, Fabio Lorenzi-Cioldi, and Clara Kulich (University of Geneva, Switzerland)

Purpose

One strategy to cope with status-inconsistency, which arises during social mobility between low-status inherited and higher-status achieved memberships, is to assimilate the self to the high-status group (Derks et al., 2016). Further, the mere anticipation of mobility has been associated with self-ingroup distancing (Chipeaux et al., 2017).

Design/Methodology/Approach/Intervention

A correlational study (N = 180) distinguished between female employees’ desired and enacted managerial aspirations. We investigated their impact on ingroup identification and self-ingroup similarity.

Results

Desired and enacted aspirations were associated with a greater identification with the high-status group (female managers). Moreover, when enacted aspirations added to desired aspirations, identification with the high-status group increased, as did the identification with the low-status ingroup (women in general). Further, desired aspirations were associated with a greater similarity between the self and the high-status group on communality and agency dimensions, whereas enacted aspirations were associated with a greater similarity between the self and the low-status group only on the communality dimension. Thus, assimilation to the higher-status group does not necessarily imply self-distancing from the low-status group.

Limitations

Our participants reported working in feminine domains, thus our sample is not representative for other domains.

Research/Practical Implications

The distinction between abstract (desired) and more concrete (enacted) dimensions extend the understanding of social mobility. This individual strategy understood as acting against the low-status groups’ interests (Tajfel & Turner, 1986), may in some cases be motivated by the desire to improve the ingroup’s fate.
Originality/Value
This study investigates the effects of anticipated social mobility among female employees.

Multiple Dimensions of Gender Stereotypes About Others and Self

Tanja Hentschel (University of Amsterdam, Amsterdam Business School), Madeline Heilman (New York University, USA), and Claudia Peus (Technical University of Munich, Germany)

Purpose
We aimed to develop a multi-dimensional framework for assessing current conceptions of men and women, and then use it to consider how men and women are seen by male and female others and how men and women see themselves.

Design/Methodology
We asked 628 men and women to describe men, women, or themselves on scales representing multiple dimensions of the two defining features of gender stereotypes, agency and communality: assertiveness, independence, instrumental competence, leadership competence (agency scales), and concern for others, sociability and emotional sensitivity (communality scales).

Results
Men tended to view male targets as more agentic than female targets in descriptions of self and others. However, women depicted female targets as equally independent and leadership competent as male targets (but not equally assertive), and women’s self-ratings of their independence did not differ from those of men. Both men and women described female targets as more communal than male targets, although men rated themselves as equally sociable as women.

Limitations
Further refinement of the agency and communality dimensions would be highly valuable, as would follow-up studies demonstrating how distinguishing among these dimensions can be useful in predicting workplace outcomes for women and men.

Research/Practical Implications
Our findings demonstrate the complexity of the agency and communality constructs and the potential advantages of thinking about them with greater specificity.
Originality/Value

We demonstrate that agency and communality are multidimensional constructs, enhancing our understanding of gender stereotype content, and furthering the study of gender stereotyping of others and self.
1572 - WOMEN’S UNDERREPRESENTATION IN LEADERSHIP PART II: THE ROLE OF SELF AND OTHER’S PERCEPTIONS AND EVALUATIONS

Chairs: Julie Brueckner (Dublin City University); Janine Bosak (Dublin City University); Mary Kinahan (Dublin Institute of Technology); and Clara Kulich (University of Geneva).

State of the Art

Despite increased participation in the workplace, women are still underrepresented in leadership positions. Across two symposia, we examine how both women’s self-perception and their perception by others impact women’s pursuit of leadership. The presented studies feature (i) empirical and theoretical contributions; and (ii) different research methods including experimental, qualitative, and correlational designs. The second symposium focuses on the perception and evaluation of women in leadership roles, and the underlying processes involved.

New Perspectives/Contributions

In the first presentation, Paustian-Underdahl et al. provide a qualitative and quantitative integrative review of current leadership-gender literature. In the second presentation, Pietraszkiewicz et al. examine how the use of gender-stereotypical wording in job advertisements maintains the status quo. The next two presentations focus on how female and male leaders are perceived. Kinahan et al. find that male and female leaders are perceived differently in their leadership role preferences due to their perceived goal endorsements, while Lohmore et al. provide a theoretical framework for understanding whether female and male leaders are perceived to differ in trustworthiness and type of trust. The final presentations use experiments to examine sex differences in the evaluation of men and women in leadership roles. Gutermuth et al., find that women who are promotion-focused are evaluated more negatively than men. Finally, Brueckner et al., find that perceived motives and CEO gender determine shareholders’ perception of firm-performance.

Research/Practical Implications

All contributions extend existing research on women’s underrepresentation in leadership roles and provide practical implications for selection and promotion of women.
Purpose
The purpose of this review is to clarify how, when, and why gender relates to leadership styles and behaviors by integrating theories and empirical data from across multiple literatures.

Design/Methodology
First, we conducted an integrative literature review to synthesize theory on how and why gender relates to leadership behaviors across contexts including different leadership levels, industries, and decades in time. We then tested a series of research questions based on our qualitative review using meta-analytic techniques and quantitative data from 320 studies.

Results
In examining our main effects, women were rated as significantly higher than men in transformational leadership (d = -.14), idealized influence (d = -.16), individualized consideration (d = -.15), transactional leadership (d = -.15), contingent reward (d = -.20), relational/consideration behaviors (d = -.16), and task-oriented/ initiating structure behaviors (d = -.12). Further, these effects were often moderated by year of study, level of leadership, and industry.

Limitations
There may be confounding between effects which cannot be ruled out in a meta-analysis.

Research/Practical Implications
Given the diversity of theories and empirical findings that exist related to gender and leadership, an integrative review is needed to understand the current state of the field. We aim to clarify the theoretical mechanisms helping to explain when, why, and how gender relates to leadership behaviors.

Originality/Value
Our findings provide implications for theory development, and the changing nature of the state of gender and leadership in modern organizations, which will be discussed in greater detail at EAWOP.
Agency and Communion in Job Advertisements: A Replication Study

Agnieszka Pietraszkiewicz (University of Bern, Switzerland), Magdalena M. Formanowicz (University of Surrey, United Kingdom), Petra Müller (University of Bern, Switzerland), and Sabine Sczesny (University of Bern, Switzerland)

Purpose
Past research on language has found—in correspondence with gender stereotypes—that advertisements for male-dominated jobs, such as engineer or computer programmer, use more agentic wording than those for female-dominated jobs, such as registered nurse or administrative assistant (Gaucher, Friesen, & Kay, 2011). This pre-dominance of either agentic or communal wording in ads might contribute to the traditional gender division of labor, as it reduces women’s and men’s interest to apply for a job dominated by the other sex. Therefore, it is important to monitor whether the wording in real-world job advertisements still differs between male- and female-dominated jobs which is the aim of the present research.

Methodology
Following, the methodology developed by Gaucher and her colleagues (2011), we used current (2017 vs. 2008) and more comprehensive dataset (N = 480,596 vs. N = 456) of real-world job advertisements, and a computerized algorithm, instead of manual coding, to analyze the data.

Results
Male-dominated jobs are still advertised using more agentic words than female-dominated jobs. Whereas Gaucher et al. did not find a difference in communal wording, we found that female-dominated jobs consisted of more communal wording than male-dominated jobs.

Limitations
The study is observational in its nature and its results only suggest that gendered wording in real job advertisements exists.

Practical implications
The results are discussed in reference to the persistence of the gender status quo.

Originality/Value
To our knowledge, the research is the first to use a large sample of real job advertisements to monitor gendered wording.

**Public Good or Private Profit: Perceived Differences in Female Leaders’ and Male Leaders’ Preferences for Leadership Roles?**

Mary Kinahan (Dublin Institute of Technology, Ireland), Janine Bosak (Dublin City University, Ireland), and Alice H. Eagly (Northwestern University, USA)

**Purpose**

Women’s underrepresentation in leadership roles is pronounced for the for-profit sector but is considerably smaller in the non-profit sector. From goal congruity framework, previous research showed that women and men self-select themselves into public good (vs. private profit) leadership roles based on their greater endorsement of communal life goals. In this research, we tested whether perceivers believe male and female leaders differently endorse life goals that in turn fosters beliefs about male and female leaders’ preferences for public good (vs. private profit) leadership roles.

**Design/Methodology**

Study 1 ($N = 80$) examined perceptions of female and male leaders’ gender-stereotypical characteristics, goal endorsements, and public good (vs. private profit) leadership role preferences. Study 2 ($N = 432$) further examined whether goal endorsement mediated perceptions of differences in leadership role preferences for male and female leaders.

**Results**

Study 1 showed that, compared to male leaders, female leaders were rated as more communal and less agentic in gender-stereotypic characteristics, were perceived to prefer communal goals, and were more likely to prefer public good (vs. private profit) leadership roles. Study 2 found that this perceived gender difference in leadership role preferences was partially mediated by perceived endorsement of communal and agentic goals.

**Limitations**

Professional samples would provide better ecological validity.

**Research/Practical Implications**
The results have implications for women in terms of leader selection and promotion into leadership roles.

**Originality/Value**

To our knowledge, the research is the first to examine perceptions of male and female leaders’ goal endorsements and leadership role preferences.

**Trust Me, I’m Your Leader: Do Male and Female Leaders Differ in Perceived Trustworthiness?**

Akanksha Lohmore, Mary Kinahan (Dublin Institute of Technology, Ireland), and Lisa Van der Werff (Dublin City University, Ireland)

**State of the Art**

Despite the worldwide increase in women’s employment and education, women remain underrepresented in leadership roles within organizations (Organization for Economic Co-operation and Development, 2016; Yee et al., 2016). Although research and various initiatives have sought to improve women’s underrepresentation, women leaders continue to face gender-specific barriers to career advancement. According to role congruity (Eagly & Karau, 2002) and lack of fit (Heilman, 1983) theories, female leaders face prejudice because of the perceived incongruity between the female gender role and the requirements of leadership. Trust is widely acknowledged as “the primary attribute associated with leadership” (Lines et al, 2005, p. 221-222) and increases follower’s willingness to accept organizational goals and organizational effectiveness (e.g., Dirks, 2000; Nurmio & Turikki, 2010). Yet, few studies examine whether women and men are perceived to differ in trustworthiness and type of trust, and none to our knowledge examine differences amongst male and female leaders.

**New Perspectives/Contributions**

We provide a novel explanation for women’s underrepresentation by examining perceived trustworthiness of women leaders and trust as influential factors during hiring and promotion.

**Research/Practical Implications**

We aim to develop a theoretical framework to understand that trustworthiness can act as a buffer to negate discrimination and prejudice faced by women leaders. The project will have practical implications for individuals and organization.

**Originality/Value**
To our knowledge, there is no research that examines the impact of perceived trust of women leaders as possible explanation for women’s underrepresentation in leadership.

**Does It Pay To “Lean In”?**

**Promotion-Focused Men are Rewarded; Promotion-Focused Women are Not**

Dinah Gutermuth and Melvyn Hamstra (Maastricht University, Netherlands)

**Purpose**

Eagerly seizing opportunities describes what Facebook COO Sheryl Sandberg coined *leaning in* – what she considers key for women to get ahead. Theoretically, leaning in reflects a *promotion self-regulatory focus*. Indeed, promotion-focused behaviour tends to be evaluated positively at work, suggesting it might help women advance. Ironically, while promotion-focused behaviour may lead men to be evaluated positively, we propose that being promotion-focused may be gender-deviant for women and may not yield the same benefits.

**Methodology**

We conducted two experiments wherein students (*N* = 236) or actual managers (*N* = 127) evaluated fictional job applicants and one dyadic study (*N* = 509 dyads) wherein managers evaluated their employee.

**Results**

The *promotion-focused* female job applicant was offered lower starting salary than an identical male job applicant (both experiments). In the dyadic study, male employees’ promotion-focus was positively associated with their manager’s evaluations of them, while female employees’ promotion-focus was not.

**Limitations**

The experiments may have limited ecological validity, and the dyadic study may have limited internal (causality) validity. Limitations of each are offset by the strengths of the other.

**Research/Practical Implications**

Promotion-focused women do not get the same benefits and recognition that men may get; leaning in may not yield its purported benefits.
Originality/Value

We provide a theoretically-driven test of a popular business notion on improving women’s positions in organizations, and add a fundamental dimension to gender-bias research.

The Impact of Gender and CEO Motives on Next Generation Shareholders' Leader Evaluations

Julie Brueckner (Dublin City University, Ireland), Janine Bosak (Dublin City University, Ireland), and Jonas W. B. Lang (Ghent University, Belgium)

Purpose

Building on the status incongruity hypothesis, the present research examines whether and how backlash unfolds against CEOs who express gender-incongruent motives in their shareholder letters. Specifically, the study investigates if power-motivation causes shareholder biases towards female CEOs who violate proscriptive gender stereotypes. Moreover, we explore if similar penalizing phenomena unfold for male CEOs who express affiliation.

Design/Methodology

In this 2x2 experimental vignette study participants are tasked to evaluate the leader of a fictional company after reading a CEO letter which is either power- or affiliation motivated and is written by a male or a female CEO.

Results

A 2x2x2 ANOVA of participant gender (male, female), CEO gender (male, female) and implicit motives (power, affiliation) reveals that motives significantly predict perceived firm-performance. Preliminary results further show that motives, CEO gender, and subject gender interact to predict shareholders’ perception of firm-performance.

Limitations

Business school students serve as proxy-shareholders.

Research/Practical Implications
By unraveling the effects of gender-incongruent motives on shareholder perceptions of CEOs, the present study adds to the understanding of the societal pressures that unfold in the upper echelons. Moreover, the study has practical relevance for the occupational division of investor relations.

Originality/Value

Adapted from real CEO letters, one of the most important communication channels in the CEO-shareholder relationship, the study created an authentic vignette and advances the understanding of the relationship between motives and gender. The study further is the first of its kind to systematically investigate the main and combined effects of gender and implicit motives on shareholder perceptions.
Psychology's research activities answering the challenges of the demographic change have resulted in rich results regarding the perspectives of individuals on work in specific countries. To a much lesser degree, employers’ and organizational perspectives covering age-friendliness and leadership have been included in research designs. Furthermore, research often is concentrated on one country only, thereby neglecting aspects that may be generalized across different countries. Another weakness of existing research is a lack of discussion regarding organizational practices regarding workers 60 and older into retirement age.

The new perspectives this symposium contributes are twofold: First, it presents cutting edge results on the perspectives of employers and the development and validation of an index of organizational practices of age-friendliness and leadership for older workers before and in retirement age, the Later Life Work Index. Second, it shows how work and organizational psychology can combine forces in different countries (China, Germany, Israel, United States) to work on national organizational perspectives that result in a joint index model.

Research implications include the necessity to further validate the index model. Additionally, potential variance between countries needs to be better understood. Several practical implications include the design of work according to the nine dimensions covering age-friendly organization and leadership. Results have high relevance for the ISO Technical Committee on Aging Societies (ISO TC 314 - Aging Societies) that has commenced in summer 2018 to define a global norm relevant for organizations.
Do employers want to and are they willing to employ older workers?

Justifications and reasons

✓ Purpose

Investigating Israeli employers' perspectives about employing workers at the ages 60-70, around the official retirement age (62 for women, 67 for men).

✓ Methodology

Thirty semi-structured interviews with subject-matter experts: researchers (economics, gerontology, HR management), older workers and managers.

✓ Results

Four employers' groups were identified: (1) Able and willing to employ older workers; (2) unable and unwilling to employ older workers; (3) unable but willing to employ older workers; and (4) able but unwilling to employ older workers. Their justifications were examined.

✓ Limitations

Our study is small in scale and comprises of volunteer participants, 18 of them were employers from diverse types of businesses and sectors. Focusing on the Israeli context, we do not claim our findings to be representative.

✓ Research Implications

The external justification of non-employment allows discrimination to be translated into and legitimized by market or institutional forces. Mapping employers' perceptions will provide a useful policy tool when designing programs for reducing discrimination.
The study reveals not only justifications used by employers but also the perceived 'objective reasons' used by employers. The result – conscious and unconscious social closure – prevents older workers from prolonging their working life.

Developing and validating a scale to measure organizational practices for Chinese bridge employees

Binyun Huang
Jiangxi University of Finance and Economics, Research Center for Innovation and Strategic Human Resource Management, Yuping West Road 665, Mailu Campus, Nanchang, China 330032

Xiaoan Mei
Jiangxi University of Finance and Economics, Research Center for Innovation and Strategic Human Resource Management, Yuping West Road 665, Mailu Campus, Nanchang, China 330032

Xiaobin Xiong
Jiangxi University of Finance and Economics, Research Center for Innovation and Strategic Human Resource Management, Yuping West Road 665, Mailu Campus, Nanchang, China 330032

Fucai Lu
Jiangxi University of Finance and Economics, Research Center for Innovation and Strategic Human Resource Management, Yuping West Road 665, Mailu Campus, Nanchang, China 330032
Purpose

The main research purposes of this paper are to: develop a scale to measure organizational practices regarding workers 60 and older in China based on the Later Life Work index (Wöhrmann, Deller, & Pundt, 2018); and establish content, construct, discriminant, and criterion validity of such a scale.

Methodology

This study consists of three steps: the first study involves 30 Chinese subject matter experts from science, companies, administration, etc. to indicate whether, and to what extent, each item appeared to assess the component of organizational practices in China context. After that, the research team will use this feedback to refine the items further for use in subsequent phases of scale validation. The next two studies then seek to validate the scale by examining its content, construct, and criterion validity in different ownership and scale enterprises and with different groups.

Results

This study will provide consistent support for the content, construct, discriminant, and criterion validity of Chinese Later Life Work Index.

Limitations

The limitations include the lack of random sampling, resulting in possible non-representativeness of the findings.

Research/Practical Implications

The present research advances our theoretical and practical understanding of organizational practices regarding bridge employees in an emerging economy in at least three important ways. First, this study provides evidence of an indigenous conceptual framework for organizational practices targeting at bridge employees. Second, this study afford assessment of additional, more novel, aspects of Chinese context. Third, the scale can be used to differentiate companies in China.

Originality/Value

This is the very first study in this regard in China. Latent profile analysis findings can be used to evaluate Chinese organizations and offer direction for future improvement.
Organizational Practices for Older Workers: Operationalization and Validation of the Later Life Work Index

Max R. Wilckens, Leuphana Universität Lüneburg, Germany
Anne M. Wöhrmann, Federal Institute for Occupational Safety and Health Germany (BAuA)
Jürgen Deller, Leuphana Universität Lüneburg, Silver Workers Research Institute, Germany

Purpose:
The share of older workers among the European workforce increases rapidly. Better health status of older workers and the political ambition to relieve pension systems drive extended working lives. The Later Life Work Index supports organizations to deal with increased age diversity and specific demands by older workers nearing retirement age and beyond.

Approach:
The Later Life Work Index summarizes appropriate organizational practices for older workers derived from qualitative interviews in Germany (Wöhrmann, Deller, & Pundt, 2018) and evidence from the “Age Smart Employer Award” in New York City. We operationalized the index including scale development and validation in several pre-studies with human resource representatives from 30 to 56 companies against multiple criterion scales to form a compact, reliable and valid scale.

Results:
The index contains nine dimensions covering age-friendly organizational culture and leadership, as well as more specific practices regarding work design, health management, individual development, knowledge management, transition to retirement, continued employment options and health and retirement coverage. It can be assessed by 8-20 items per dimension. Scale reliabilities are acceptable.

Limitations: The validation was based on a limited number of organizations in Germany and revealed some adjustment need. However, we conduct a larger study to validate the effects on organizational level outcomes as performance, illness absence and turnover.

Research/Practical Implications:
The index allows organizations to self-assess their capabilities and improvement opportunities regarding employment of older workers.

Originality/Value:
We will present and discuss the index and its operationalization and are eager to show effects on organizational outcomes.
Later Life Work Index: A Closer Look at the Relevant Indicators and the Operationalization of Transition to Retirement

Anne M. Wöhrmann, Federal Institute for Occupational Safety and Health Germany (BAuA)
Max Wilckens, Leuphana Universität Lüneburg
Jürgen Deller, Leuphana Universität Lüneburg

Purpose:
With the baby boomers nearing retirement age, the design of retirement transition processes in organizations becomes increasingly important as it may help better adjustment to retirement.

Approach:
The dimension transition to retirement of the Later Life Work Index will be presented. The operationalization of the qualitatively developed dimension and its indicators includes scale development and a validation study with about 30 participating organizations in Germany.

Results:
Indicators of transition to retirement are 1. Timely transition planning, 2. Phased retirement and individualized transition solutions, 3. Counseling for retirement life preparation, and 4. Continuous inclusion and maintaining contact. In the validation study, the four indicators are reflected in the factor structure. Scale reliabilities are acceptable. In the final and adapted version each indicator is measured with three to five items.

Limitations:
The validation study was conducted with a limited number of participating organizations only in Germany and it revealed some need for adjustment. However, a larger cross-organizational study is currently under preparation. As being part of a larger index, the number of items has to be limited.

Research/Practical Implications:
Providing an easy way to assess the current capability of an organization can help reflect and improve the way retirement transition processes are designed. As the measurement is reliable and validated, it can be applied in future research being interested in the quality of organizations retirement transition processes.

Originality/Value:
The presentation gives insights into relevant aspects of transition to retirement processes in organizations as well as its measurement.
State of the Art:
In I&O-research, it has been repeatedly argued that person-environment fit is a crucial determinant for employees’ well-being and performance. In past research, this fit has been investigated with respect to abilities and job demands as well as with respect to interests and work contents. Another perspective that might be relevant in terms of fit is the interplay of personal values and work/career contexts.

New Perspectives/Contributions:
This symposium brings together talks that all focus on value-related person-environment fit. This fit is analyzed with respect to its contents (e.g., monetary, societal, scientific) and to its predictive role for general and work-related well-being, work and organizational engagement, and career decisions (e.g., entrepreneurship, leadership, academic research). The presented studies include cross-sectional and longitudinal designs, mostly based on large sample sizes (up to 18,000 participants).

Research/Practical Implications:
The present talks show that values are important for understanding the motivational basis of everyday work behavior, job-related experiences, and career decisions. Values themselves, however, cover a broad array of contents that need more in-depth analyses, for instance, with respect to their stability. Moreover, to understand how values’ effects unfold, longitudinal designs (including concurrent predictors) are important. From a practical perspective, career counseling and human resource management should consider individual differences in values (and value profiles) to better support employees’ career decisions and their personal development at work.
Abstracts of the Symposium's presentations

**Gendered work value profiles and STEM careers**
Katariina Salmela-Aro
Educational Sciences, University of Helsinki, Finland
Jiesi Guo, Australian Catholic University
Florence Sortflex, Educational Sciences, University of Helsinki; Finland
Jacque Eccles, University of California, Irvine, US

Purpose & Approach:
Drawing on Eccles’ expectancy-value model of achievement-related choices, we examined how work values predict individual and gender differences in sciences, technology, engineering, and math (STEM) participations in early adulthood (ages of 25/27, 6 or 8 years after postsecondary school), controlling for subjective task values attached to academic subjects in late adolescence (11th grade, age 18). The study examined 1,259 Finnish participants using a person-oriented approach.

Results & Implications
Results showed that: (a) we could identify four profile groups (momentary, prospect, family and society), based on five core work values (society, family, monetary, career prospects, and working with people); (b) work-value profiles predicted young adults actual STEM participation in two fields: math-intensive and life science occupations above and beyond academic task values (e.g., math/science) and background information; (c) work-value profiles also differentiate between those who entered support- vs. professional-level STEM jobs; and (d) gender differences in work value profiles partially explained the differential representation of women across STEM sub-disciplines and the overall underrepresentation of women in STEM fields.
The role of work values in the development of early business leadership aspirations and behaviors

Florencia M. Sortheix
Department of Psychology, University of Jyväskylä, Finland, EADA Business School, Barcelona, Spain

Clemens M. Lechner
GESIS – Leibniz Institute for the Social Sciences, Mannheim, Germany

Martin Obschonka
Queensland University of Technology, Australia

Katariina Salmela-Aro
Department of Educational Sciences, University of Helsinki, Finland

Purpose
Work values are important antecedents of business leadership aspirations—the intention to start a company or to assume a leadership role. Work values also explain the gender differences in these aspirations. Little research, however, has studied how such aspirations translate into actual behaviors, and whether work values could explain this link. We examined the link between work values and actual behaviors (starting a company or being a supervisor) as mediated through aspirations. Second, we aim at explaining gender differences in aspirations and behavior at T2 by work values and aspirations at T1.

Design/Methodology/Approach/Intervention
Using a Finnish panel study (N = 1,233) and structural equation modeling, we investigated whether aspirations and work values at age 26 (T1) predicted entrepreneurial and leadership aspirations as well as actual behaviors two years later.

Results
Results showed that aspirations and work values at age 26 predicted behaviors two years later. Specifically, autonomy (positively) and security work values (negatively) predicted having started a business; and career prospects (positively) and social contribution (negatively) work values predicted being in a supervisor role. Moreover, aspirations mediated the link between some work values and behaviors. Work values and aspirations also partially mediated some of the long paths from gender to business leadership behaviors.
Research/Practical Implications
Results show how work values shape aspirations and transform into behaviors later on. Results suggest that men higher value on certain work values increases their aspirations towards business leadership and behaviors in these roles, maintaining the gender gap.

Originality/Value
This is one of the first studies examining the mediators of the gender-business leadership gap and shows that one reason for the gender gap starts with differences in work values, which then translate into lower entrepreneurial intentions for women and ultimately behaviors.

I want to be a billionaire: Contrasting perspectives on the associations of values with youth’s well-being
Anja Van den Broeck
Faculty of Business and Economics, KU Leuven, Belgium
Bert Schreurs
Faculty of Economic and Social Sciences & Solvay Business School, Vrije Universiteit Brussel, Belgium
Karin Proost
Faculty of Business and Economics, KU Leuven, Belgium; Open University of the Netherlands, Heerlen, the Netherlands
Arne Vanderstukken
HIVA Research Institute for Work and Society, KU Leuven, Belgium; Faculty of Business and Economics, KU Leuven, Belgium
Maarten Vansteenkiste
Faculty of Psychology and Pedagogic Sciences, Department of Developmental, Personality and Social Psychology, University of Gent, Belgium

Purpose
People hold different values: while some attach primary importance to intrinsic values (e.g., affiliation), others prefer extrinsic, materialistic values (e.g., financial success). Self-
determination theory advances that attaching importance to intrinsic values adds to people’s well-being, while extrinsic values have negative implications. The person-environment fit perspective, in contrast, holds that the health-enhancing effect of values would not so much depend on their content (i.e., intrinsic or extrinsic) but on the fit between one’s personal values and the values prevailing in the context.

Design/Methodology/Approach/Intervention
Using the work value survey, this study contrasts both perspectives in predicting life satisfaction, happiness and health of youngsters aged 18 to 30 (N = 10 430) from 54 countries based on their own intrinsic and extrinsic values and the values supported in their environment (N = 88 754.)

Results
Multilevel analyses shows that the type of values held by youngsters and those prevailing in one’s environment matter more than value fit in predicting of youngsters’ life satisfaction, happiness, and health.

Limitations
Longitudinal studies, using more extensive measures of intrinsic and extrinsic values across the world are necessary to further support our findings.

Research/Practical Implications
Our results largely confirm hypotheses derived from SDT rather than the person-environment fit perspective. Youngsters and their environments should thus pay particular importance to intrinsic rather than extrinsic values.

Originality/Value
This study is among the first to study the conflicting theoretical perspectives of SDT and fit on which values are most beneficial for people’s life satisfaction, happiness and health.

**Does conducting “good” science make happy? Scientific values as individual motivational drivers**

Christian L. Burk
Institute of Personnel and Organizational Psychology, RWTH Aachen University, Germany
Bettina S. Wiese
Institute of Personnel and Organizational Psychology, RWTH Aachen University, Germany

Purpose
Sociologist Robert K. Merton described universalism, communism, disinterestedness, and organized skepticism as institutional norms for scientific work. Based on these norms, we (a) developed a measure of corresponding internalized scientific values and (b) explored if scientific values exert an impact on career decisions and work satisfaction while working inside or outside academia.

Design/Methodology/Approach/Intervention
In a longitudinal design with eight measurement occasions (six-month-intervals), 1,416 PhD holders from the STEM fields initially reported on their scientific values and repeatedly on their work contexts and work satisfaction. Career trajectories were investigated using multilevel discontinuous change models.

Results
Overall, PhD holders working as researchers in academia were characterized by stronger needs for scientific values compared to those working in industrial settings with or without research functions. Differential patterns of specific values were revealed. For instance, the need for communism was more pronounced outside academic research. Longitudinally, postdoc researchers with lower needs for scientific values were more likely to turnover to non-academic work fields. In addition, researchers staying in academia were more satisfied with their work, the more they were oriented towards scientific values. While transitions between academic and non-academic fields immediately increased work satisfaction, individual value levels did not substantially moderate this effect.

Limitations
Statistical modeling had to be based on a limited number of subjects returning from industry to academia.
Research/Practical Implications

Scientific values help understanding the motivational underpinnings of career decisions. Stimulating reflection about the fit between individual scientific values and need-supportive career paths may support young researchers concerned with planning their careers.

Originality/Value

A new measure of individual differences in scientific values is introduced. Representatives of academic and non-academic career paths differ in their patterns of scientific values.

**Person environment fit, work engagement, voice behaviours and the moderating role of regulatory focus**

Ilke Inceoglu
Exeter University Business School, University of Exeter, UK

Chris Chu
Surrey Business School, University of Surrey, UK

Svenja Schlachter
Justus Liebig University Giessen, Germany

David B. Allen
Exeter University Business School, University of Exeter, UK

Purpose

Studies have shown that the fit between a person’s values/needs with the work environment (PE fit) is related to work engagement and work behaviours (e.g. Rich et al., 2010). We examine the process through which PE fit is linked to work engagement and subsequent voice behaviours by considering the moderating role of regulatory focus (promotive and prohibitive, e.g. Brockner & Higgins, 2001).

Design/Methodology/Approach/Intervention

We tested a moderated mediation model using a time lagged, multi-source research design to avoid issues of common method bias. 148 employees from two organisations in China completed measures at two time points (time 1: needs-supply fit and regulatory focus, time 2: work engagement). Employees’ voice behaviours were rated by their line managers at time 3.
Results
Prevention and promotion focus moderated the relationships between needs-supply fit and engagement as a mediator in predicting voice behaviours. Regardless of the effect of promotion focus, there was a positive indirect effect of needs-supply fit on promotive voice when prevention focus was low or moderate. No significant indirect effect was observed when prevention focus was high, however; it seems that high prevention focus “blocked” the positive influence of needs-supply fit on promotive voice.

Limitations
Participant drop-out over the course of the data collection.

Research/Practical Implications
High focus on loss prevention at work can impede the positive impact of PE fit on work engagement and subsequent voice behaviours. Results contribute to a better understanding of the mechanisms underlying the relationship of PE fit with work engagement and subsequent voice behaviours.
1600 - THE WORK-HEALTH BALANCE: A NEW DIMENSION TO ANALYZE THE RELATIONSHIP BETWEEN HEALTH AND WORK

Proponents: Andrea Gragnano
Department of Psychology, University of Milano-Bicocca, Italy

Discussant: Alessia Negrini
Institut de recherche Robert-Sauvé en santé et en sécurité du travail, Montréal, Canada

State of the art: Nowadays, the labor market is characterized by a proportion of elderly workers and workers with a long-standing health problem or disability (LSHPD) higher than ever. In this situation, the reconciliation of health and work demands has become a central issue in many organizations. Unfortunately, no popular theoretical elaboration specifically addressed this issue. The Work-Health Balance (WHB) has been recently proposed as a new dimension useful to monitor and affect the balance between health and work demands.

New perspectives/contributions: The proposed symposium hosts a discussant and five contributions that with different research methods and statistical approaches show the relevance of the balancing between job demand and health need for workers’ wellbeing. The contributions consider several working populations that differ by age, country, job type, and health situation and present the relations of WHB with many dimensions of workers’ wellbeing and job participation.

Research/practical implications: The symposium, presenting the first results of international researches employing WHB, shows the different field of application of this dimension, from the study of workers’ satisfaction to the prediction or return to work after sickness absence. The empirical findings of the symposium help understanding how WHB can contribute to the well-being of the working population considering the diverse health needs and the demands of organizations.
Title: Job retention amongst workers with health challenges. A qualitative study.

Author: Amelia C. Gibson
Department of Health-, Social- and Welfare Studies, University of South-Eastern Norway

Purpose: The purpose of this study was to gain insight into the circumstances that influence job retention for employees with health challenges.

Methods: Qualitative in-depth interviews were carried out on six employees with long-standing health problems whilst maintaining the ability to participate in the labour market. The interviews were transcribed in verbatim and analyzed by use of qualitative content analysis.

Main findings: Job retention is influenced by the available resources to handle work and health demands. The resources at individual level consist of perception of health, identity, individual effort, competence, coping and motivation. Social support appeared to be the most important resource at group level. Responsibility and participation appeared to be the most important at organizational level. These resources, with work and health demands on the opposing side, are the foundations of the Demand-resource-balance model (DRB). It is argued that in order to increase job retention, there must be a balance between resources and work and health demands.

Limitations: This study was carried out on employees from large organizations. Resources at group and organizational level may be different in smaller organizations.

Practical implications: Employees with health problems are influenced by the same factors as «healthy» employees but must also consider how their health influences job retention. By identifying these circumstances, organizations can accommodate for this population in order to increase job retention. At societal level, legislation and policy entailing benefits and pay should be made readily available for this population. In addition, this population in particular should be encouraged to join trade union organizations.

Title: The usefulness of Work-Health Balance in older workers and in workers with long-standing health problem or disability.

Authors: Massimo Miglioretti1; Federica Previtali2, Claudia Manzi3, Andrea Gragnano1

1 Department of Psychology, University of Milano-Bicocca, Milan, Italy
2 Faculty of Social Science, University of Tampere, Finland
3 University of Sacred Heart Milan, Milan, Italy
**Purpose:** to evaluate the role of work-health balance in promoting positive organizational outcomes in older workers and in workers with long-standing health problem or disability (LSHPD).

**Methodology:** Two studies were conducted. In the first one, 2992 older workers (mean age 57.6±3.6) of a railways company answered an online survey measuring job resources, WHB and job involvement. Latent profile analysis grouped participants based on the three WHB factors: Work-Health Incompatibility, External Support, and Organizational Health Climate. In the second longitudinal study, the predictive validity of WHB on time of return to work was evaluated in 141 workers on sick leave due to cardiovascular diseases, controlling for socio-demographic characteristics.

**Results:** In the first study, the workers are divided into five clusters consistent with the theoretical assumptions underlying the WHB. Moreover, groups’ comparison shows that the groups significantly differ in perceived job characteristics, perceived organizational future time, and job involvement. The second study shows that WHB influences the time of return to work in workers on sick leave due to cardiovascular diseases (b=−29.77; p=.001).

**Limitations:** the studies were conducted in specific population and the results should be replicated in others groups of workers.

**Practical implications:** The studies show that WHB is a dimension to be considered in the designing and evaluation of interventions that help older workers and workers with LSHPD to maintain an active role at work.

**Originality/Value:** These are the first studies demonstrating the discriminant and predictive validity of WHB.

**Title:** Work-Health Balance among Spanish workers: its mediating role in the Work Ability-Job satisfaction relationship.

**Author:** Gabriela Topa

Social and Organizational Psychology, Universidad Nacional de Educación a Distancia, Madrid, Spain.

**Purpose:** Population aging puts under pressure developed societies not only by the shortcuts of labor workforce but also by the increase of Health Care System costs. Hence, exploring Work-Health balance and their relationships with employees’ wellbeing seems to be a relevant topic. The aim of the present study is twofold. First, to adapt the Work-Health Balance Scale (WHB) for Spanish population and test their psychometric properties. Second, to explore the moderating role of WHB in the relationships between Work Ability and Job satisfaction.

**Design:** Two cross-sectional studies have been conducted. The first (N=223) included Spanish workers aged + 18 years, and the second (N= 294) included workers aged between 40 and 69.
years. Process Macros and bootstrapping of 5000 independent samples have been used to test the hypotheses.

**Results:** Our findings showed that the WHB scale, adapted for Spanish population, has adequate psychometric properties. Findings from the second study suggested that WHB plays a mediating role in the relationship between Work Ability and Job satisfaction. Indirect effect reached significance ($B=.0959; SE=.0272; Boot LLCI=.0556; Boot ULCI=.1505$).

**Limitations:** The use of self-report measures and the cross-sectional design raises concerns about common-method variance.

**Research/Practical implications:** The findings add to our understanding of the role of work health balance on aged workers’ well-being.

**Originality/Value:** The mediating role of WHB leads to a promissory avenue for interventions to increase job satisfaction via improvements in WHB.

**Title:** Work-Health Balance Questionnaire in Mexico: Its pertinence and preliminary results

**Authors:** Hiram Novelo-Ramirez\(^1\); Ana Cecilia Mendoza-Magaña\(^2,3\); Melva Herrera-Godina\(^2\); Guillermo González-Estévez\(^4\); Andrea Gragnano\(^5\)

\(^1\) PhD in Public Health Sciences, University of Guadalajara
\(^2\) Department of Public Health, University Center of Health Sciences, University of Guadalajara
\(^3\) Unidad de Medicina Familiar No. 53, Delegación Jalisco, Instituto Mexicano del Seguro Social
\(^4\) Department of Social Sciences, University Center of Health Sciences, University of Guadalajara
\(^5\) Department of Psychology, University of Milano-Bicocca, Milan, Italy

**Purpose:** To validate the Work-Health Balance Questionnaire (WHBq) in the Spanish language and discuss the pertinence of this construct for Mexican workers.

**Methodology:** We tested the reliability and validity of the questionnaire via online, from a sample of 120 workers using exploratory factor analysis.

**Results:** The WHBq shows good psychometric properties in the Mexican Spanish language and maintains the same structure of three factors of the original version: work–health incompatibility, health climate, and external support.

**Limitations:** The majority of workers were under 40 years old and administrative workers.

**Research/practical implications:** The WHBq is proving to be a reliable and valid instrument in Mexican workers. Its relevancy and usefulness in this context will be key, due to population ageing and the current prevalence of chronic illnesses.
**Originality/Value:** According to the National Institute of Social Security in Mexico the three most commons justified causes for absenteeism are long-standing health problems such as diabetes, arthritis and low back pain. WHBq could be useful to explain the balancing between this health issues and work in Mexico.

**Title:** Identifying factors promoting work ability among menopausal women. A cross-sectional study

**Authors:** Daniela Converso, Sara Viotti, Gloria Guidetti, Ilaria Sottimano

Department of Psychology, University of Turin

**State of art:** Menopause is a complex physiological process that marks the women end of the reproductive phase of life. Previous studies have demonstrated that during menopausal transition work ability may be undermined (Geukes et al., 2012). Work ability (Ilmarinen, 2007) is a central indicator of job sustainability, referring to the physical and intellectual resources on which workers can rely to meet the demands (of emotional, cognitive, and physical type) posed by their work. Despite the importance of promoting job sustainability throughout the entire work-life span, to date, no knowledge is available regarding work-related psychosocial factors that may foster work ability among menopausal women. In order to fill this gap, the aim of the present study was to identify, among various work-related psychosocial factors, the predictors of work ability in a sample of menopausal women employed as administrative officers in the Italian public sector.

**Method:** During a cross-sectional study, 997 menopausal women were asked to complete a self-report questionnaire.

**Results:** Work ability among menopausal women was found to be negatively associated with relational demands, work-family conflict, and positively associated with health-oriented organization policy, and flexible working hour for health reason. On the other hand, cognitive demands, job control and social support from peer and superior did not show significant associations with work ability.

**Practical Implications:** The present study may help to identify properly psychosocial interventions in the workplace specifically dedicated to protect work ability among women dealing with menopausal transition.
1618 - FOSTERING A HEALTHY WORKPLACE CULTURE: UNDERSTANDING WORKER WELLBEING, STRESS, AND WORK RELATIONSHIPS

Chair: Arla Day, Saint Mary’s University

Addressing worker wellbeing and effectiveness requires both an understanding of the key mechanisms, as well as a sustained and holistic approach that supports the individual, strengthens respectful work groups, and develops effective and supportive leaders. That is, because experiences at work have a powerful impact on one’s wellbeing—both positive and negative—we must better understand how to leverage the positive aspects of individual experiences, group dynamics, leadership, and organizational culture to improve worker wellbeing. Therefore, the first presentation provides an interesting perspective of the mechanisms by looking at employment experiences using inductive thematic analysis of interviews with resettled refugees. The impact of underemployment reaffirms the importance of work to one’s wellbeing, and worker experiences and social policy are seen as key factors to one’s adjustment. The second presentation examines leader-subordinate relationships to understand how leaders’ expectations for subordinates regarding technology use after work influences wellbeing and social relationships at work. Finally, the last two presentations assess two workplace interventions to improve organizational and worker health: One presentation targets the workgroup in terms of improving social relationships (e.g., reducing incivility) and wellbeing as a function of group-based training. The last presentation addresses worker health by creating healthier workplaces and worker wellbeing through leadership training. Healthy workplace behaviours and leader and subordinate wellbeing increased over the period of training. We discuss these four presentations in terms of leveraging the positive aspects of employment and positive social interactions at work to improve worker wellbeing.

1. The impacts of unemployment and underemployment on resettled refugee wellbeing: A New Zealand study

Tamsin Dehar¹, Helena D. Cooper-Thomas², Jay Marlowe¹, & Claire Cartwright¹

¹University of Auckland, NZ, ²Auckland University of Technology, NZ

Purpose: Unemployment and underemployment are consistently reported to be a major source of stress for resettled refugees, and are identified as two of the main predictors contributing to poor psychological wellbeing following resettlement. This study explored resettled refugee experiences adjusting to work in New Zealand, as well as the impacts of unemployment and underemployment on their wellbeing.

Design/Method: Semi-structured interviews were conducted with 16 refugee-background adults in New Zealand. Eleven males and five females from a range of African, Middle Eastern and Asian countries participated. An inductive thematic analysis was performed on the data.

Results: Six main themes were established, including newcomer experiences in work, issues of social policy, and the importance of work. Particular attention is paid to those aspects of their experiences that relate to psychological wellbeing.
Limitations: New Zealand is identified as one of the most accepting countries in the world for migrants and refugees. It is possible that the experiences of these participants may be more positive, and therefore not generalisable to other countries. This research has implications for ways in which organizations can intervene to improve wellness at work.

Implications/Value: Limited research has examined resettled refugee wellbeing as they transition into, and adjust to, employment. With increasing refugee numbers internationally, it is important to understand resettled refugees’ work experiences in order to improve both the process and outcomes of their transitions into employment in their new environment. This, in turn, creates potential for far-reaching benefits to resettled refugees, employers, and broader society.

2. Worker Health & Wellbeing: The Impact of Leaders’ expectations about ICT Use

Jillian Tonet, MSc, Saint Mary’s University, Halifax, NS
Arla Day, PhD, Professor, Saint Mary’s University, Halifax, NS

Purpose
Work relationships can be both a source of support and a source of stress (Leiter et al., 2015). Leaders’ behaviours and expectations surrounding after-hours work-based information communications technology (ICT) may impact workers’ wellbeing, but we don’t understand the context for this relationship. Therefore, we examined these behaviours/expectations as well as leader and subordinate perceptions and wellbeing.

Design
We surveyed 219 leaders (N=97 men; N=122 women) and 135 subordinates (N=39 men; N=96 women) to examine the relationships between leaders’ expectations/behaviours and wellbeing (burnout, stress) and moderators of these relationships.

Results
Interestingly, leaders’ own ICT expectations and behaviours were associated with higher levels of burnout for themselves. However, although subordinates who felt their leaders expected them to use ICT at home reported more stress, they did not experience higher levels of burnout. In general, control and preference for integrating work into home roles were associated with more positive outcomes.

Limitations
Future research should examine the longitudinal impact of supervisors’ expectations on their own subordinates using a matched sample over time.

Practical Implications
We know that leaders have a substantive impact on the wellbeing of subordinates. Their formal and informal ICT practices may impact wellbeing, and they also may have an impact by supporting subordinate control over technology and work-nonwork boundaries, while taking individual differences into consideration.

Originality/Value
The study takes a holistic approach to supervisor expectations to understand the relationships of ICT with wellbeing and interpersonal relationships at work.

3. Testing a Workgroup-Based Approach (SCORE) to Improving Workplace Civility and Work Engagement

Michael P. Leiter, PhD
Professor of Organisational Psychology
Deakin University
Geelong, VIC Australia

Purpose
The Social Encounters Scale assesses civil and uncivil social encounters on the same frequency scale, producing a score reflecting the relative frequency of such encounters on an individual or workgroup level. This study considers the extent to which this proportion captures a quality of workplace culture that informs beyond the information provided by incivility and civility as separate measures.

Design
This presentation reviews a pilot of SCORE with an Australian health district comprising hospitals and outpatient facilities in 2018. A baseline survey included 235 respondents from 9 organisational units. SCORE was implemented in five units between May and November 2018. The survey was repeated after Wave 1 (September) and after Wave 2 (December).

Results
The Baseline survey confirmed found that the balance of civil to uncivil encounters varied across the 12 participating units. On average, units reported five times as many civil than uncivil encounters. The most positive units reported a 25 to 1 ratio of civility to incivility. The most negative units reported a one-to-one ratio of civility to incivility.

Limitations
The post-test surveys have not occurred at this time but will be available for the conference.

Research/Practical Implications
The research examines the impact of a facilitated group process for improving workplace relationships. The proportion of positive to negative encounters supplements the frequencies of civil and uncivil encounters as immediate metrics for the intervention’s impact.

Originality
Despite considerable attention to the sources and consequences of workplace incivility, few studies have tested interventions with contrasts with control groups.
4. Leading the way to Healthy Workplaces: Can training leaders improve Worker Wellbeing

Samantha A Penney & Arla Day
Saint Mary’s University
Halifax, NS Canada

**Purpose:** Psychologically healthy workplace (PHW) research has received increased attention over recent years (e.g., Day & Randell, 2014; Kelloway & Day, 2005), but leaders and organizations often feel challenged as to how to actually create a psychologically healthy workplace (Grawitch et al., 2009) and improve worker wellbeing. Integrating PHW and leadership research with current workplace wellbeing models (e.g., JDR Model, Demerouti et al, 2001), we assessed the efficacy of a Leading Healthy Workplaces training program aimed at improving leaders’ behaviours that contribute to a healthy workplace and leader and worker wellbeing.

**Design:** Sixty-eight leaders completed a workshop and 8 weeks of phone-based coaching. Subordinate data (N=226) were collected for all leaders.

**Results:** Leaders’ healthy workplace leadership behaviours (communication and promoting a healthy workplace) and direct reports perceptions of leaders’ behaviours (feedback and promoting a healthy workplace) increased over the course of the program. Both leaders’ and direct reports’ well-being improved as well.

**Limitations:** Future research should examine these issues over a longer timeframe and incorporate more organizational data. Also, identifying ways of increasing retention in training programs is important to study.

**Practical Implications:** We integrated PHW, leadership, and wellbeing models to create a new training program that organizations can use to support leaders, improve worker wellbeing, and create healthier workplaces.

**Originality/Value:** Our research addresses the calls for longitudinal OHP research (Kelloway & Francis, 2013) and well-designed interventions (e.g., Cox, 1993; Kelloway & Barling, 2010), creating a strong basis for a long-term research agenda in leading healthy workplaces.
Working in academia has been for a long time considered as a job intrinsically satisfying and full of good qualities, like autonomy, variety, and flexibility. Data from more recent research suggest that it is no longer true (if ever was in the past).

In the last years, technological, economic, cultural and social changes have deeply modified individual and collective behaviours in academia. Universities have been confronted with such changes, showing for instance that job insecurity, financial cuts, uncertainty for the future, and hard competition (both between institutions, and between departments or researchers) are often part of the everyday life.

It is indeed clear that the quality of working life in universities may be considered at risk, at least in many UE countries, both for researchers/teachers, and for technical and administrative staff. Research on this topic was rather surprisingly rare, and in some cases nearly absent.

Trying to fill this scientific gap, a team formed by W/O psychologists from 16 Italian universities, was formed end 2016, with the aim to develop a tool for the assessment of psychosocial risks and workers well-being in universities.

Based on data collected in some preliminary studies, a research tool (theoretically based on the Job Demands-Resources model) will be presented, with the aim to offer the academic community with a scientifically reliable diagnostic tool, able to suggest also cues for the improvement of working conditions and well-being.

Contributions based on research conducted in EU and abroad will bring to the symposium a fundamental international comparison.

**Contributions**

**Improving work environments in Australian universities**
Dr Silvia Pignata, University of South Australia, Australia
State of the Art

In Australian universities, high email volumes and increasing levels of psychological strain (work stress) can affect employees’ health and well-being and are likely to have direct consequences on recruiting and retaining high quality academic staff, the teaching of future professionals, and the university sector’s growth in national and international markets.

New Perspectives

The paper presents the results of longitudinal and cross-sectional research on work stress in Australian universities; details initiatives taken by university management to enhance well-being; and focuses on employees’ coping mechanisms to deal with work stress.

Research/Practical Implications

In addition to university stress interventions, it is important to examine changes that employees make themselves to cope with stress. They may attribute the changes to increased personal growth and strengthened psychological resources or to the use of negative or protective coping strategies. Employees report using types of ‘positive’ coping strategies, which suggests that they may attempt to conserve and protect their resources. However, academics in particular, report using protective coping strategies to reduce stress that include not caring at all and making decisions to work less which suggests that they have become disengaged or detached, and their work performance may be reduced in the long term.

Originality/Value

As the theory and evidence regarding investigations of work stress in universities is incomplete in several ways, the session examines initiatives taken by both management and employees themselves to address their health and well-being, which is of interest to the community as well as governments, employers and unions.

Quality of life at work in academia: preliminary results for the validation of a tool for Italian university

Paola Spagnoli - Università degli Studi della Campania Luigi Vanvitelli
Margherita Brondino - Università di Verona
Andreina Bruno - Università di Genova
Marco Depolo - Università di Bologna
Emanuela Ingusci - Università del Salento
Barbara Loera - Università di Torino
Francesco Pace - Università di Palermo

*Purpose:* Research on quality of working life in academia appears surprisingly rare in many countries, and in some cases nearly absent. Trying to fill this gap, a team formed by W/O psychologists from 16 Italian universities developed a tool for the assessment of psychosocial risks as well as workers health and wellbeing in universities. The validation of this tool (theoretically based on the Job Demands-Resources model) will be presented in this contribution.

*Design:* A pilot study was conducted on a sample of 120 Italian university researchers/teachers, to make a preliminary test of the psychometric properties of the tool. In order to finalize the validation of the tool a second study was planned on a sample of 1500 researchers/teachers.

*Results:* Factorial analysis and reliability check reported satisfying and promising evidence of the robustness of the tool.

*Limitations:* The pilot nature of the study only allowed us to obtain preliminary results, that should be further examined on a wider sample. The second study will help to support these preliminary results with a more robust confirmatory approach.

*Practical Implications:* Results indicated that the proposed tool is reliable and could be used for depicting university researchers/teachers’ health, wellbeing, and working conditions. Moreover, useful insights for implementing organizational interventions could also be obtained.

*Originality/Value:* The tool, proposed by a team of W/O psychologists from 16 Italian universities, aims to offer the academic community with a scientifically reliable diagnostic tool, able to suggest also useful insights for the improvement of working conditions and wellbeing.

---

Kateřina Zábrodská1, Jiří Mudrák1, Kateřina Machovcová2

1 Institute of psychology, Czech Academy of Sciences, 2 Faculty of Arts, Charles University in Prague

*Purpose:* Relatively little research attention has been paid to effects of changing academic environments on faculty well-being in higher education systems at the periphery, including the Czech Republic.
**Design:** We collected 2,227 questionnaires and conducted 120 in-depth interviews with academics employed at Czech higher education institutions in which we explored their perceptions of their current work conditions and occupational well-being. In the analysis we focused on description of the current work environment at Czech public universities as well as on its effects on occupational well-being of academics.

**Results:** Findings revealed high levels of overall job satisfaction and work engagement and relatively low levels of stress. Most academics reported positive features of their work environment including autonomy and quality, role clarity, influence over academic work, and a strong social community. Negative features included dissatisfaction with pay, poor leadership, and pressure to produce. In this context, job resources were predominantly related to work engagement and job satisfaction and job demands were predominantly associated with stress and burnout, mostly through work-family conflict. In the qualitative analysis, we explore these processes in detail.

**Limitations:** The main limitations stem from the representativeness of the sample.

**Practical implications:** Results indicate some ways in which the occupational well-being of academics could be improved.

**Originality:** The results represent the first large scale, mixed methods research focusing on the quality of work life in Czech public universities.

**Drivers of the Matthew effect. Academic work life and excellence in Czech natural/technical sciences**

Jiří Mudrák12, Kateřina Zábrodská12, Kateřina Machovcová1

1 Institute of psychology, Czech Academy of Sciences, 2 Faculty of Arts, Charles University in Prague

**Purpose:** Research excellence has been described as the “holy grail of academic life.” At the same time, increased emphasis on excellence has been related to disproportionate distribution of resources which produces few “winners” and many “losers.” The main aim of our paper is to analyze the workplace factors that drive such “Mathew effect” at Czech academic workplaces that have increasingly emphasized excellence in research.

**Design:** The analysis is based on a mixed method research projects including a questionnaire study (n=2,227) and qualitative interviews (n=120) focusing on the ways in which Czech academics perceive work conditions at Czech academic workplaces. Specifically, we used multinominal logistic regression for quantitative data and thematic analysis for qualitative data. In this way, we analyzed how “excellent” academics perceive their work conditions in comparison with the academics who do not
meet criteria for academic excellence and the ways in which these work conditions provide excellent academics with an advantage regarding future academic results.

**Results:** The multi-nominal regression showed that the significant predictors of academic excellence were age, position, work engagement, self-efficacy, salary, and influence over work. The subsequent qualitative analysis explore further how these factors work together in accumulating further advantage regarding the excellent results in academic work.

**Limitations:** Main limitations of our study stem from the representativeness of the sample.

**Practical implications:** Our results provide implications for improving research productivity of academic institutions.

**Originality:** The results represent the first large-scale study into the quality of academic work life in the Czech higher education institutions.

**Research and intervention for the Quality of Working Life at the Politecnico of Turin**

*Department of Psychology, University of Turin

**Politecnico of Turin

**Purpose:**

In order to account for the complexity of the academic environment, and supporting the perspective adopted by the QoL@Work (evaluate academics experience as a balance between job-hindrances and job-challenges), a research was developed for and with the Politecnico of Turin, one of the most prestigious universities in Italy.

**Design:** The research was based on in-depth interviews and on an online self-report questionnaire distributed to the entire working population of the Politecnico. Actually is ongoing the development of a complex and recursive data collection system.

**Results:** Results highlighted how the job demands for academics can be defined in their balance between job-hindrances and job-challenges. A cluster analysis identified four main profiles considering different levels of commitment and health-complains, while linear-regression analysis described the impact of work, organizational and interpersonal dimension on wellbeing.
Limitations: The response rate was unsatisfactory for the academic group of participants; a larger number of participants is expected in the next surveys in the light of the participatory process that is ongoing now.

Practical Implications: Results suggested the adoption of a recursive data collection system, aimed at orienting the development of specific university management policies and practices for a better Q@WL.

Originality/Value: The experience here described attests the importance of adopting appropriate research tools and research processes to steer interventions for the wellbeing in Academia.
Hector Madrid
Management School, Pontificia Universidad Católica de Chile

**State of the Art:** In the last years, interpersonal emotion regulation has emerged as a relevant topic of research in organizations, which refers to the strategies that individuals enact to initiate, change or modify feelings in others. Initial studies have applied this construct to, for example, leadership and teamwork, showing that the way that workers make others feel has substantive influence in cognitive, affective and behavioral processes in organizations.

**Contributions:** In this symposium, we will present and discuss a collection of papers that follows and expands this stream of research. First, Williams and colleagues theorize about the role of dyadic emotion regulation to understanding relational quality and helping behavior. Second, Cheshin and colleagues examine the association of interpersonal emotion regulation with leadership emergence. Third, Vasquez and colleagues argue and study the influence of team member interpersonal emotion regulation on team conflict and well-being. Finally, Madrid proposes and examines the influence of team member interpersonal emotion regulation on team motivation and innovation.

**Implications:** Taking together, the studies show that interpersonal emotion regulation matters for relevant psychological processes in the social realm in the workplace. They also expand the literature on affect in organizations in general and in emotion regulation in particular. Furthermore, knowledge derived from these studies informs human resource professionals and practitioners about a novel avenue to foster performance and well-being in organizations.

---

**Emotion Regulation and Dyadic Work Relationships**
Courtney E. Williams, Janaki Gooty, and Shawn D. Long
University of North Carolina at Charlotte

**Purpose:** This work examines the association of dyadic emotional regulation with individual and dyadic work outcomes. Understanding dyadic emotion regulation is important because coworkers can experience a shared affective event in which the unique emotions, cognitions, and behaviors, associated with antecedent- or response-focused regulation, drive their interactions in response to the event. Here, we develop and test the emergence of dyadic emotional regulation as a dispersion model. We posit that a mismatch (or lack thereof) of antecedent- and response-focused emotion regulation strategies within dyadic work relationships will influence key relational outcomes, such as relational quality and helping behavior. We expect that high levels of dispersion in dyadic emotion regulation will decrease relational quality. Additionally, we expect dyadic dispersion emotion regulation to have a cross-level moderating effect on the relationship between individual-level emotion regulation and helping behavior.

**Design:** We are conducting multilevel construct validation using cross-sectional data from MBA students in intact work teams. Data will be modeled with confirmatory factor analyses to examine the convergent and discriminant validity of dyadic emotion regulation from other related constructs. Additionally, we will use random coefficient modeling to test our theoretical model.
Implications: For both researchers and practitioners, the primary implications of our research concern work relationships and how dyadic emotion regulation has the potential to affect such relationships positively and negatively.

Originality: This is a new construct for emotion regulation and work relationships literature.

Emerging as an Informal Leader Means to Regulate Emotions of Others
Arik Cheshin, Gil Luria and Sagi Goldberger
University of Haifa

Purpose: Leadership emergence is a key process to foster influence in organizations, which has been mostly associated with personality. Here, we aim to expand this research by adopting the notion of interpersonal emotion regulation (IER).

Design: Two studies were conducted to test the effects of IER on leadership emergence. In Study 1, students divided into 25 groups of 3-5 participants (N=102) completed a group task. Then, they assessed each member’s influence on team emotion and were asked to identify the leader of the group. In Study 2, students divided into 43 groups of 3-6 participants (N=141) completed a joint class assignment for five weeks. After completion, participants completed a survey on IER to assess each member, together with indicating the leader of the group.

Results: In Study 1, participants that created more positive team emotion were more likely to be chosen as leaders (r = .43, p < .001). In Study 2, participants that scored higher on IER were more likely to be seen as possessing leadership qualities (r = .23, p = .006) and to be chosen as leaders (r = .21, p = .015).

Implications: Individuals that regulate the emotions of others are more likely to be described as leaders. Thus, IER could be used in leadership development programs.

Originality: We suggest that leadership is granted to those who regulate emotion of others and present IER as a key variable that explains how leaders influence emotions.

Limitations: Correlational studies based on student samples.

Interpersonal Emotion Regulation in Teams
Cristian Vasquez, David Holman and Robin Martin
Alliance Manchester Business School, University of Manchester

Purpose: Interpersonal emotion regulation (IER), namely, the use of behaviors to initiate, maintain or change emotions in others), is a common activity among team members. However, little is still known about the effects of IER on team dynamics and performance. The aim of this paper is to examine whether IER influences team member well-being and team performance through its effects on team conflict process.

Design: We conducted a multisource survey study using employee and supervisor data, involving 4659 employees nested in 697 teams.
**Results:** Multilevel structural equation modeling supported that antecedent-focused IER strategies (that seek to alter the cause of others’ undesired emotions) were negatively associated with team conflict, which in turn was negatively associated with team performance and positively associated with team member emotional exhaustion. Conversely, response-focused IER strategies (that seek to alter others’ emotional expressions) were positively related to team conflict which in turn was associated with lower team performance and greater team member emotional exhaustion.

**Implications:** The findings contribute conceptually and empirically to the current literature by showing how IER is an important means through which team members can influence team processes and outcomes. Regarding practical contributions, as these interpersonal behaviors can be trained and developed, it is important that they are fostered by organizations.

**Originality:** We integrate IER and teamwork literatures, and use multivariate statistics, to understand team member well-being and team performance.

**Limitations:** Cross-sectional design and the possible common-method bias between employee-based measures.

---

**Team Member Interpersonal Emotion Regulation and Innovation**

Hector Madrid

Management School, Pontificia Universidad Católica de Chile

**Purpose:** Interpersonal emotion regulation (IER) is a central construct to understand affect, cognition, and behavior in the social realm, which is described as the strategies to make others feel positive (improving) or negative (worsening) feelings. Here, we describe team member interpersonal emotion regulation (TIER) as the set of behaviors they enact to initiate or modify affect among them. Drawing on that, we aim to determine if TIER is associated with team motivation and innovation.

**Design:** We conducted a multisource survey study based on 392 cross-functional teams comprised, in total, by 2071 team members. Data were analyzed with structural equation modeling.

**Results:** Team member affect-improving IER was positively related to team innovation, by means of team behavioral approach motivation. In contrast, team member affect-worsening IER was negatively related to team innovation via team behavioral inhibition motivation.

**Implications:** These results indicate that the way that team members make feel each other has an effect on motivation to approach or inhibit behavior, influencing therefore on team innovation. This, suggests that practitioners should bear in mind training TIER, such that team member should adopt improving regulation but avoid worsening regulation.

**Originality:** This is one of the first empirical studies that test the role of interpersonal emotion regulation in the context of teams.

**Limitations:** The cross-sectional design limits causal inferences and increases the likelihood of common-method bias between TIER and team motivation, due they were measured with the same source of information.
1659 - FRESH PERSPECTIVES ON MEASURING CREATIVITY IN ORGANIZATIONS

Chair: Roni Reiter-Palmon, University of Nebraska at Omaha, USA

State of the Art

Creativity is a key force in organizations. A 2016 report by IBM indicated CEO’s view creativity is one of the most needed characteristics as they cope with today’s complex business environment.

Despite the importance of organizational creativity, measuring creativity is difficult. Many current creativity measures either assess a very specific aspect of creativity, such as divergent thinking or remote associations, or are time and resource intensive.

Contributions

This symposium presents four papers using the Creative Response Evaluation – Work (CRE-W), which is a new measure designed to meet the need for a better measure of creativity for use in the workplace.

The first paper by Reiter-Palmon and Kaufman describes the development and validation of the CRE-W. The second paper, by Mead et al, describes a DIF analysis of the CRE-W comparing US and UK participants. The third paper, by Mancini, Magnani, and Ciancaleoni presents CRE-W correlations with other tests (personality, positivity orientation, cognitive) and how CRE-W fits into organizational assessment. Finally, the fourth paper by Fossati is a case study of managerial assessment using the CRE-W and other interventions to help an organization succeed.

Implications for Research and Practice

Together, these papers will inform practitioners and researchers interested in measuring creativity in the workplace, including those who might use CRE-W and those who are simply interested in the assessment of creativity.

Title: Development of a new measure to predict creativity in the workplace

Presenters: Roni Reiter-Palmon, University of Nebraska at Omaha and James C. Kaufman, University of Connecticut

Purpose: The purpose of this presentation is to discuss the development and validation of a new measure designed to predict creativity for selection and development in organizations.

Methodology: The measure was developed to assess both creative initiative as well as preference for specific approaches to creativity within an organizational context. We first identified two broad approaches to creativity: one where the focus is on thinking in new ways, whereas the other is being creative by adapting and thinking in different ways. To develop the measure, we used scenarios based on real-life job related decisions and provided up to 6 different responses to the situation.
Results: The reliability of the measure was evaluated based on an initial sample of close to 3000 participants from MTurk. The validity of the measure was tested in a new sample with known measures of creativity such as divergent thinking, creative problem solving, and a self-report of creative activities. Results gave support for the creative initiative and the New and Different preferences.

Limitations: This study provides a starting point for the use of the measure in organizational settings. Although validity of the measure has been established against known measures of creativity, information is needed on the relationship with creative job performance.

Implications: The study provides initial evidence for the utility of this measure in organizational settings.

Originality/Value: The measure developed is unique due its focus on job related scenarios and responses, and therefore would be more likely to be used by organizations.

Cultural Differences in Creativity

Alan D. Mead, Talent Algorithms Inc., Lockport IL, USA
Pamela Becker, Hogrefe Ltd., Oxford, UK (Presenter)
Roni Reiter-Palmon, University of Nebraska at Omaha, USA
James C. Kaufman, University of Connecticut, USA
Chenxuan Zhou, Illinois Institute of Technology, Chicago IL, USA

Purpose
This research examines cultural differences in responses by US and UK respondents to a measure of creative initiative in work settings, the Creative Response Evaluation – Work (CRE-W).

Methodology
Participants. A total of 2376 employed, working-age participants were recruited from survey panels in the US and the UK. After data cleaning, US and UK samples were N=855 and N=825.

Measure. CRE-W has 20 scenarios with 4-6 6-point Likert items. Coefficient alpha in the combined sample was 0.91.

Results
Twenty-four items had significant (p<0.01) DIF but the average R2 change was only about 0.01. Four items had effect sizes exceeding 2% of variance (see representative item “3d” in Figure 1).

Limitations
Some significant results may be due to chance and all results are correlational in nature.

Research/Practical Implications
These results suggest cultural differences between the US and UK in perceptions of items involving authority and individualism. Patterns of significance suggested that some scenarios were more affected than others.

**Originality/Value**

Little research has been done concerning culture and creativity, and none using CRE-W.

**Figure 1.** Differential Item Functioning (DIF) for item 3d.

---

**Hire for Creativity**

G. Andrea Mancini, Laborplay – spin-off of University of Florence, Italy (Presenter)

Mario Magnani, Laborplay – spin-off of University of Florence, Italy

Matteo Ciancaleoni, Hogrefe Editore, Florence, Italy

**Purpose**

Creative economy has the potential to unleash global growth by making organizations more effective and more innovative. This work aims to highlight why companies must invest in the evaluation of
creativity through a correlational study with other tests (personality, positivity orientation, cognitive) and how CRE-W fits in organizational assessment.

Methodology

Participants Six different samples, ranging from 50 to 176 employed working age-participants were recruited.

Measure To evaluate the validity of our assessment, we determined the relationship of the three CRE-W scores to external measures of creativity and related constructs. In order to do that, 5 personality tests (NEO-PI-3, BIP-6F, PT, LJI-2, AMI) and 1 intelligence measure (CFT-HR) were administered.

Results
From personality to positivity, the results confirm that the 3 CRE-W scores are related to different constructs useful for effectively identifying the best candidates for an organization.

Limitations
No objective measures, as performance indicators, were available.

Research/Practical Implications
Including creativity as part of the personnel selection process is therefore essential if an organization really wants to value innovation.

Originality/Value
Organizations will not only need to consider new skillsets, but transform recruiting, management, and retention strategies. CRE-W really helps to highlight creative skills.

Luisa Fossati
Hogrefe Editore, Italy

Title: Assessing Creativity in Managerial Assessment: A Business Case

Purpose: Creativity has been defined as the most important economic resource in XXI° century (Floroda, 2002). We developed a business case regarding a managerial assessment in a Tuscan company facing organisational changes: new business lines and new strategies regarding their core business were set. Eleven first-line managers were involved in this assessment. The aim was to focus their strengths and weaknesses in different soft skill areas.

Method: Assessment was conducted by using a test battery, a session of group dynamics, and an interview. Creative Response Evaluation - Work (CRE-W) was included in the test battery to evaluate the way managers approach challenges.
**Results:** CRE-W highlighted different profiles: “pure creative” characterized by new ideas, innovative solutions and risk orientation; “creative grounded”, who value actual results and propose the best practicable solutions considering limits. Finally, “realistic and concretes” lacking in creativity but supported by a great concreteness.

**Limits:** This assessment was conducted in a little group (11 managers). Moreover, creativity was evaluated only using CRE-W and objective measures were missing.

**Practical implications:** This work evidences that assessing creative potential is useful to hypothesize managers’ approach to new problems, change and new challenges.

**Originality:** Evaluating creativity through testing is an innovative way to devise managerial assessment, at least in Italy where personality and aptitude tests are usually administered, while instruments assessing different psychological constructs are less considered.
OCCUPATIONAL HEALTH PROMOTION: LEADERSHIP AND RESOURCES.

Chair: Dr. Katharina Klug & Annika Krick, M.Sc.
Helmut Schmidt University Hamburg

State of the art. Although the association between leadership and health is well-supported in the literature, research on the mechanisms linking leadership, individual resources, and employee health and well-being is warranted. Moreover, existing research has predominantly focused on supervisor behavior influencing employee health. This symposium presents studies linking leadership, individual resources and health, as well as accounting for the active role of employees and the supervisors’ own stress and health.

Contributions. Reiner, Klebe and Felfe investigate the moderating role of affective commitment in the association between “good” leadership and health in a military sample. Klebe, Felfe and Klug investigate associations between supervisors’ own stress, their leadership behavior and employee health. Klug, Krick and Felfe investigate profiles of health-oriented leadership and their respective associations with employee strain and health, taking into account both supervisors’ and employees’ work-specific health behavior. Krick, Reiner and Felfe investigate the effectiveness of a resource-based workplace intervention on employees’ health-oriented self-leadership. Arnold and Rigotti investigate the moderating role of health-oriented leadership in the association between time pressure and individual trajectories of resilience.

Research/practical implications. While the association between good leadership and employee health is generally positive, the mechanisms are complex. The studies highlight the importance of individual resources and self-leadership of employees, as well as the leaders’ own health and well-being.

Leadership and employees’ health – The role of organizational and occupational commitment
Dr. Annabell Reiner, Helmut-Schmidt-University Hamburg
Laura Klebe, M.Sc., Helmut-Schmidt-University Hamburg
Prof. Jörg Felfe, Helmut-Schmidt-University Hamburg

Purpose. Previous research has shown that both leadership) and affective organizational and occupational commitment have positive effects on employees’ health. However, only few studies have investigated the interplay of these factors. It is suggested that commitment may strengthen the positive effect of leadership on health but there is also evidence for compensation. Therefore, we analyzed the moderation effect of commitment on the relationship between leadership and employee’s health in the military context.

Design/Methodology/Approach/Intervention. The hypotheses were tested in a military sample (N = 906). Participants rated their leaders’ behavior, their affective commitment and different health indicators.

Results. As expected, higher scores of “good” leadership were associated with higher commitment and better health. We found interactions showing that the positive influence of “good” leadership on health was stronger for those with lower affective commitment to their organization and job.

Limitations. All variables were self-assessed which raises the likelihood of common method bias. The cross-sectional designs hinders causal interpretations.
**Research/Practical Implications.** More research is needed to specify which aspects and kind of leadership can compensate a lack of commitment. Leader selection and leadership trainings should focus on “good”-rated leadership behavior to support employee’s health.

**Originality/Value.** The study confirms and extends previous research. The finding that “good” leadership seems to compensate low commitment emphasizes the relevance of leadership for employee’s behavior and health.

**Effects of leaders’ psychological strain on transformational and abusive leadership behavior**
Laura Klebe, M.Sc., Helmut Schmidt University Hamburg
Prof. Jörg Felfe, Helmut Schmidt University Hamburg
Dr. Katharina Klug, Helmut Schmidt University Hamburg

**Purpose.** High demands and stress may impact the extent to which leaders display transformational or abusive leadership behavior. While research has shown that stress generally affects peoples’ physical and mental health, effects of stress on leadership behavior are barely known. The following study investigates three questions: 1) Do followers experience a decrease of transformational and an increase of abusive leadership when their leaders are under pressure? 2) Does the amount of stress explain the degree of change in leadership behavior? 3) Is the level of deterioration in leadership behavior related to followers’ health?

**Methodology.** Hypotheses were tested with a sample of \( N = 304 \) employees in a cross-sectional study.

**Results.** As expected, followers report that the level of transformational leadership is lower in stressful periods than under routine conditions, whereas abusive leadership is significantly higher. Moreover, the results show that the decrease of transformational leadership and the increase of abusive leadership behavior is related to the level of leaders’ stress. Finally, the increase of abusive leadership is also related to followers’ cognitive irritation.

**Limitations.** All constructs were assessed from the perspective of employees, which increases the likelihood of common method bias.

**Conclusion.** The present study supports the assumption of deterioration in leadership behavior in stressful periods versus routine conditions and therefore is less consistent and stable as assumed in the literature.

**Value.** This study contributes to the literature taking into account leaders’ own stress to explain leadership style consistency and its effect on follower health.

**Profiles of health-oriented leadership and employee strain**
Dr. Katharina Klug, Helmut Schmidt University Hamburg
Annika Krick, M.Sc., Helmut Schmidt University Hamburg
Prof. Jörg Felfe, Helmut Schmidt University Hamburg

**Purpose.** The concept of Health-oriented Leadership (HoL) proposes three factors that contribute to healthy working conditions: 1) leaders’ SelfCare, i.e., how leaders treat their own health, 2) StaffCare, i.e., leaders’ concern for their followers’ health, and 3) follower SelfCare. These components may form distinct profiles within persons, showing differential associations with employee health.
Methodology. We investigated configurations of HoL via latent profile analysis and their associations with strain and health in two independent samples of N = 612 and N = 676 employees, respectively.

Results. We identified four profiles: 1) “high care”, showing high leader SelfCare, high StaffCare and moderate follower SelfCare; 2) “leader sacrifice”, showing low leader SelfCare, high StaffCare and high follower SelfCare; 3) “low care”, showing low leader SelfCare, low StaffCare and low follower SelfCare, and 4) “follower sacrifice”, showing moderate leader SelfCare, low StaffCare and low follower SelfCare. Employees in the high care profile reported the lowest strain, lowest psychosomatic complaints and the best overall health, followed by the leader sacrifice profile, and the follower sacrifice profile. Health outcomes were the least favorable in the low care profile.

Limitations. The study is based on cross-sectional self-report data, raising the likelihood of common method bias and limiting causal inference.

Implications. Our findings reveal that both leaders’ and followers’ health behaviors, as well as configurations of health-oriented leadership contribute to associations between leadership and health.

Originality. We extend previous research by accounting for both leaders’ and followers’ health-specific behavior at work in a person-oriented approach.

Who benefits from mindfulness? The role of neuroticism for intervention effectiveness on self-care, mindfulness and HRV outcomes among military personnel

Annika Krick, M.Sc., Helmut Schmidt University Hamburg
Dr. Annabell Reiner, Helmut-Schmidt-University Hamburg
Prof. Jörg Felfe, Helmut Schmidt University Hamburg

Purpose. There is a growing interest to adapt mindfulness-based interventions for occupational health promotion. While there is some evidence for effects on self-reported outcomes, less is known about work-relevant resources like self-care and physiological outcomes like heart rate variability (HRV). However, research in the workplace context is still scarce, especially for occupations in agentic and male-oriented cultures, such as the military. It is also an open question whether persons with lower neuroticism may benefit more. This study investigates the effects of a mindfulness-and-resource-based workplace intervention on work-relevant resources like self-care, mindfulness and serenity as well as on physiological outcomes (HRV) among military personnel and examines whether participants high in neuroticism benefit more.

Design/Methodology/Approach/Intervention. Using a pre-post-intervention design, N = 199 employees of the German Armed Forces were assigned to two intervention groups, receiving a six-week multi-component mindfulness-and-resource-based workplace training, or a progressive muscle relaxation intervention (PMR), and a control group.

Results. Repeated measures ANOVA showed that, compared with the control group and the PMR group, the mindfulness and resource-based intervention group reported stronger increases of self-care, self-care, serenity and HRV. Additionally, participants high in neuroticism benefit more concerning mindfulness and serenity.

Limitations. One limitation is the small sample size and non-randomization.
Research/Practical Implications. Our findings provide evidence that a mindfulness and resource-based intervention increases self-care as part of health oriented leadership and other important resources like serenity. The importance of individual differences is discussed. Originality/Value. Mindfulness intervention studies in the military context are rare, especially in comparison to other interventions.

Can Health-oriented Leadership Predict Trajectories of Mental Health as an Indicator of Resilience?

Miriam Arnold, M.Sc., Johannes Gutenberg-University Mainz
Prof. Thomas Rigotti, Johannes Gutenberg-University Mainz

Purpose. Resilience is defined as bouncing back and sustaining when faced with adverse conditions. The situation of novice teachers when starting to work at school provides such adverse conditions. Especially the first months at schools are stressful, including high time pressure, sudden takeover of responsibility or regular assessment. The research question addressed in this paper is if health-oriented leadership (health-specific orientation of leaders towards their followers) as a resource helps sustaining the mental health of novice teachers during this time.

Methodology. In a longitudinal study, during the first half of their training year, novice teachers responded to three questionnaires with a time lag of 10 weeks.

Results. Preliminary results of a latent class growth analysis with a subsample of N = 77 participants show that three different classes of mental strain trajectories can be distinguished. Time pressure as a stressor significantly predicts allocation to the classes while health-oriented leadership buffers the negative impact of time pressure on mental health.

Limitations. A limitation of the study is that no causal inference is possible since the two predictors were reported at T2.

Implications. A practical implication is that training supervisors of novice teachers in health-oriented leadership can help novice teachers to cope with the stressors posed on them during their teacher training.

Originality. The application of latent class growth models in this line of research is new and can add to understanding the impact of stressors and resources on mental health.
**State of the Art**

Digital technologies provide a wealth of opportunities for both, hiring organizations and candidates. Employer review sites (e.g. glassdoor.com), provide the job seeker with information on employers and enable organizations to strengthen their employer brand. Social media recruiting on platforms like LinkedIn enables recruiters to target potential candidates via search algorithms and direct approach mailings. Algorithms, artificial intelligence and asynchronous video interviewing speed up the recruitment process and provide diagnostic information on candidates.

Yet, several questions arise with digitized recruitment: How do ratings on employer review sites impact organizational attractiveness? How can organizations motivate candidates to respond to direct approach mailings? What do candidates think about algorithms and artificial intelligence in selection? How do candidates perceive asynchronous video interviewing?

**Contributions**

The first paper presents the results of an empirical study into the impact of employer review sites on organizational attractiveness. The second paper identifies success factors for social media recruitment using a policy-capturing design. The third paper provides a literature review and a framework on how algorithms and artificial intelligence affect candidates’ reactions. The fourth paper presents the results of an empirical study into candidates’ perceptions of asynchronous video interviewing.
Implications

Organizations should establish a good candidate experience in digital recruitment as negative experiences are quickly posted on employer review sites. Information on employer review sites impacts organizational attractiveness, which is a crucial factor in attracting talent through social media recruitment.

The impact of review sites on organizational attractiveness – an experimental design

Prof. Dr. Tim Warszta, Marie-Christin Lange, B.A., Anne Jones, B.A., Isabel Rogowski, B.A

Westcoast University of Applied Sciences, Heide

Purpose

Employer review sites (e.g. glassdoor.com) offer job seekers to provide comments, evaluations and ratings about an organization given by current or former employees as well as applicants. For hiring organizations, review sites may foster as well as threaten their organizational attractiveness (Melián-González & Bulchand-Gidumal, 2015). Therefore, this study investigates the main effect of positive and negative ratings on organizational attractiveness as well as their interaction with the employer brand.

Design/Methodology
A sample of 222 participants was recruited to take part in a web experiment. A 2x2 design was chosen to systematically vary the fame of the employer brand (well-known vs. unknown) and the favorability of the ratings (favorable vs. unfavorable). First participants were presented the name and a short written description of an organization and rated organizational attractiveness. As an intervention a made-up review site was presented. Afterwards participants rated organizational attractiveness again.

**Results**

Results indicate that favorable ratings impact positively on organizational attractiveness, while unfavorable ratings have a negative impact. Negative ratings have a larger effect size than positive ratings. In general ratings have a stronger effect for unknown organizations, but also for well-known organizations, significant effects were found.

**Limitations**

Data was gathered from an experimental context with a mainly young sample. Findings should be replicated with data from other samples.

**Research/Practical Implications**

Organizations should pay intention to ratings in review sites as these may influence organizational attractiveness.

**Originality/Value:**

To our knowledge, that analyses the interaction of rating favourability and employer brand impacting organizational attractiveness.

Identifying success factors social media recruitment – a policy-capturing design approach

Carolin Weber, B.A.¹, Prof. Dr. Tim Warszta², Lena Plikat, B.A.²

¹Junge Die Bäckerei, Lübeck
²Westcoast University of Applied Sciences, Heide

Purpose

An increasing number of HR departments as well as freelance recruiters are using direct approach mailings in social networks (e.g. linkedIn) as a method for recruiting employees. The purpose of this study is to find out what makes candidates react positively direct approach mailings. Following research into employer branding (Rampl & Kenning, 2014) as well as personality and cultural fit (Judge & Cable, 1997) we examined the impact of the employer brand and the interaction between personality and the capacity for teamwork.

Design/Methodology

A policy-capturing design experiment was conducted surveying a sample of 268 participants. In a 2x2 design four vignettes were formulated testing the impact of the two independent variables employer brand (stating a well-known employer brand name vs. describing just industry and company size) and capacity for teamwork (describing teamwork
as an important aspect of the job vs. giving no information on teamwork) on the dependent variable organizational attraction. In addition, the interaction effect of extraversion and agreeableness with capacity for teamwork on organizational attraction was tested.

**Results**

While employer brand had a strong impact on organizational attraction, capacity for teamwork had a slight yet significant effect. However, no interactions were found for extraversion and agreeableness in combination with capacity for teamwork.

**Limitations**

Results were obtained in a policy-capturing design, and should be replicated in field studies.

**Practical Implications**

A strong employer brand provides a competitive advantage in social media recruitment.

**Originality/Value**

To our knowledge, this is the first empirical study that analyses social media recruitment practices experimentally.

**References**

Interviewing using technology – how do the applicants feel about that?

Viktoria Künzel, B.A.¹, Alina Siemsen, MSc.² & Prof. Dr. Jürgen Deters¹

¹Leuphana University
²cut-e Group

Purpose

As video interviewing becomes more popular in today’s digital world, two forms of video interviews can be found: Synchronous, using a video-enabled instant messaging tool like skype, or asynchronous, using a tool that allows preparing questions and the candidate is recording the answers time-lagged. The purpose of this study is to compare the Candidate Experience of an asynchronous video interview versus a skype interview.

Approach

The participants (N = 56) first conducted an asynchronous interview and then rated their perceived Candidate Experience, which was operationalized using validated scales that derived from Gilliland’s (1993) Schuler’s (1993) work. Afterwards, the candidates were asked to imagine doing a synchronous skype interview instead. Again, they were asked to state their Candidate Experience.

Results

The results show that the variables “Reconsideration opportunity” and “Consistency” are rated significantly higher for asynchronous video interviews, while “Chance to perform”, “Transparency” and “Participation” are rated higher for skype interviews.
Limitations
The study sample is relatively small, and the study was conducted in a low stake situation. Additionally, the candidate did only experience an asynchronous video interview and not a skype interview. Further studies need to follow.

Implications
For organizations, the study results imply that the general usage of video interviewing in a selection context is viewed positively. However, organizations need to consider the application area, as both interview types trigger different aspects of the Candidate Experience.

Originality
This study was the first to compare synchronous and asynchronous video interviews regarding different facets of candidate experience.

References

Selected by algorithms – what do candidates think?

Prof. Dr. Katharina Lochner
University of Applied Sciences Europe

For recruiters, algorithms in selection promise more valid and efficient selection decisions. However, the question is how the use of algorithms impacts candidates’ social acceptance and perceived fairness of selection processes. The purpose of this paper is to provide a framework for assessing candidate reactions towards Artificial Intelligence (AI) and Natural Language Processing (NLP) algorithms in selection settings.

State of the art

In step one the paper collates factors influencing acceptance and perceived fairness in applicants. Factors impacting social acceptance are appropriateness, controllability, quality of measurement, and face validity (Kersting, 2008). Regarding fairness, Gilliland’s (1993) model suggests different factors influencing candidates’ perception of the selection process and outcome. This model was adapted to web-based settings in a study by Konradt, Warszta, and Ellwart (2013).

New perspectives/contributions

In step two these models are adapted and expanded to a setting where AI and NLP algorithms are used in selection. For example, familiarity with and trust in technology influence perceived fairness (Dineen, Noe, & Wang, 2004). Trust is, in turn, influenced by an understanding of control mechanisms for the technology used (Jones, 2002).

Research/practical implications
The model provides a framework for assessing candidate reactions to use of AI and NLP algorithms in recruitment and selection and is currently being tested.

**Originality/value**

The paper integrates two current and important trends: use of AI in selection, and candidate reactions, which are important in times of talent shortage, when an application is usually a candidate’s first contact with a potential employer.

**References**

Contemporaneous perspectives on job performance emphasize the need of a reorientation of this field of research from a focus on the static determinants of organizational behaviors to the understanding of the dynamic mechanism underlying the phenomenon. As currently understood, job performance is dynamical in nature, and tends to show predictable changes all over the work career. Importantly, those changes are mostly informed by contemporaneous changes in age related workers’ psychological functioning. Given the relevance of job performance dynamism for the prediction of organizational behaviors and for forecasting individuals’ career trajectories, this invited symposium aims to present and discuss four innovative perspectives, examining (1) changes in job performance, and (2) mechanisms linking those changes to important areas of organizational functioning. More in detail, Alessandri and Borgogni present a statistical model linking longitudinal changes in job performance with subsequent changes in workers’ organizational level. Cortina and colleagues further investigate the mechanisms linking changes in job performance to promotions. From a more general perspective, Brady and colleagues investigate the moderating effect of job characteristics on the relationship between age and performance. Finally, the contribution of Frese, moving from the concept of actionability in career development, discusses and shows that career success is often a result of perceiving those options and being self-starting and proactive and overcoming problems on the way towards career success. Taken together these contributions show the added value of considering dynamism in job performance (i.e., longitudinal trajectories) for understanding key organizational phenomena, such as workers’ career trajectories, and obtained promotions.

Title: Does Performance Improvement Lead To Advancement? A 6-Year Longitudinal Study

Authors: Guido Alessandri1, Laura Borgogni1 & José M. Cortina2

1 Sapienza, University of Rome
2 Virginia Commonwealth University

Purpose. Despite the clear theoretical link between promotions and job performance, the few studies that have tested this relationship have instead found that the role of job performance in determining promotions is much less than might be expected. In this study, we propose and test a different way of thinking about the performance-promotion relationship. Prospect theory, spiraling theory, and sense making theory were used to support the notion that change in performance is at least as important to the prediction of promotion as is absolute level of performance.

Design. 563 white collar employees of a large European company were assessed at four time points (i.e., Waves 1, 2, 3, and 4), making this sample uniquely suited to the testing of a change model. At each time point we collected data on supervisor rated general job performance and on the hierarchical level of each worker included in the sample.

Results, Implications, and Value. We first replicated the common finding that performance and hierarchical level in the company are weakly related. As hypothesized, changes in job performance
significantly predicted changes in workers’ hierarchical level. Furthermore, change contributed to prediction beyond absolute level. This pattern held equally well for men and for women. In conclusion, our study shows that there is value in focusing on the predictive power of performance change in trying to understand why promotions happen.

Title: Explaining the connection between performance trajectory and promotion
Authors: Jose M. Cortina1, Zitong Sheng1, Guido Alessandri2 & Laura Borgogni2
1 Virginia Commonwealth University
2 Sapienza, University of Rome

**Purpose.** The purpose of our study is to discover the mechanisms that explain the relationship between performance trajectory and promotion found in Alessandri et al. (this session). Their results suggest that decision makers make attributions based on trajectory, but what are they?

**Design.** We are conducting an online experiment in which we manipulate performance level and trend for different paper people and ask respondents to rate these people on characteristics that decision makers are likely to associate with performance trajectories. Based only on performance level and trajectory over a 2-year period, respondents complete the Liden et al. (1993) measure of expected task performance, the Thacker & Wayne (1995) measure of promotability, the John et al. (2008) measure of conscientiousness, the Bateman and Crant (1995) measure of proactive personality, the van Scotter and Motowidlo (1996) measure of job dedication, the Ployhart and Bilese (2006) measure of individual adaptability, and the ability dimension of the Mayer and Davis (1999) measure of trustworthiness.

**Results, Implications, and Value.** Our results, when paired with those of Alessandri et al., will show why trajectory matters. Specifically, they will show that the reason for the Alessandri et al. findings is that decision makers attribute performance trajectory to individual characteristics that would serve a candidate well in the job for which they are being considered. If those characteristics are more important than performance level, then trajectory could be weighted more heavily than level in promotion decisions because of the information that trajectory communicates regarding a candidate’s ability, conscientiousness, proactivity, and adaptability.

Title: Job Characteristics as Moderators between Age and Performance
Authors: Grant Brady1, Donald M. Truxillo2, Pamela Tierney1, David M. Cadiz1, & Jennifer R. Rineer3
1 Portland State University
2 University of Limerick
3 RTI International
Purpose: To date, the moderating effect of job characteristics on the relationship between age and performance has been suggested by lifespan development theories but has not been fully investigated. This study evaluates the moderating role of two job characteristics, job challenges and social support at work, on the relationships between age and task and creative performance.

Design/Methodology/Approach/Intervention: Measures of challenges and social support were collected from 215 employees in a wellness organization. Performance was rated by supervisors.

Results: Job challenges and social support moderated the relationship between age and task performance. Challenges and support were related to better performance among younger workers, but not older workers. Age was negatively related to creative performance; although challenges and support were positively related to creative performance, no moderating effects were found between age and creative performance.

Limitations: The sample was relatively young, age $M = 37.96$ $SD = 11.13$, thus, the “older worker” group was approximately 49.

Research/Practical Implications: Findings that younger workers benefit more from job challenges and support, and past research suggesting older workers benefit most from job resources, suggests a possible curvilinear effect of age. Future research should further explore the negative relationship between age and creative performance.

Originality/Value: Our study demonstrates that the influence of employee age is contingent upon job characteristics for task performance, and that certain characteristics may act as “resources” for individuals at certain points in their lifespan but not others. Thus, it is important to understand for whom various resources relate to performance.

Title: Towards an Action Theory of Career Development over the Life Span

Author: Michael Frese

1 NUS Business School, Singapore

Essentially, action theory argue for actionability in career development that leads to success. Actionability is a term developed to imply that people strive to be proactive, and increasing their options. Career success is a result of perceiving those options and being self-starting and proactive and overcoming problems on the way towards career success.

Building on Havighurst’s developmental task idea, I discuss potential developmental tasks related to careers (Havighurst, 1948). Tasks are socially constructed and they are external to the individual (H.
Zacher, Hacker, & Frese, 2016). There are age- and career-graded influences and social pressures by societies and biology that have the function of developmental and career tasks. However, tasks are not operative until the individual takes over the task, often revising them significantly (Hacker & Sachse, 2014; Staw & Boettger, 1990). The individual does not only change the tasks via the redefinition process, the tasks can also be directly affected by people when they construct niches for themselves. Thus, the tasks are the point when individuals are confronted with (societal) reality but at the same time, the individual has a strong influence on these tasks.

The two terms actionability and tasks help us to understand a number of phenomena of career development, e.g. the positive function of generativity in old age (H. Zacher, Rosing, Henning, & Frese, 2011; Hannes Zacher, Schmitt, & Gielnik, 2012), the positive function of focus on opportunities across the life span (H. Zacher & Frese, 2009; H. Zacher, Heusner, Schmitz, Zwierzanska, & Frese, 2010), or ageing, proactivity and well-being (Cangiano & Parker, 2015).
The process of digitalization is radically transforming the way we work. Jobs and collaboration will become more and more digital. Therefore assessing and developing the necessary digital competencies in employees is important. Moreover, recruitment processes are increasingly digital and require different competencies in recruiters than in the past. Finally, globalized organizations often have dispersed teams that are developed and led using digital tools.

State of the art

Currently there are many different definitions and models of digital competencies (Ala-Mutka, 2011), many of them not suitable for use work and organizational psychology (Ilomäki et al., 2011). The purpose of the symposium therefore is to provide an overview of definitions and a framework of digital competencies, and to present models suitable for different areas of application within organizations, from recruitment to development.

New perspectives/contributions

The paper by Lochner provides an overview of definitions of the term “digital competencies” and integrates different models of into a framework that serves as a basis for the following three papers. The paper by Warszta, Mahling, and Westensee describes competencies recruiters need in the digital age. The paper by Justenhoven and Siemsen describes attitude and ability characteristics that enable a person to work in a digital world.
Finally, the paper by Bildat and Renschler looks at success factors for digital and dispersed teams and digital tools that can be used to support collaboration.

**Research/practical implications**

The symposium showcases models that can be used in practice and encourages further research on these models.

**References**

**Digital Competencies – an Overview and Framework**

Prof. Dr. Katharina Lochner
University of Applied Sciences Europe

In the age of digital transformation, employees’ digital competencies can be considered one key competency for employability (Ala-Mutka, 2011). However, the term “digital competency” refers to many different concepts. The purpose of this paper is (1) to provide an overview of definitions and models for digital competencies and (2) to derive a framework that can be used as a basis for selection and development in organizations.

**State of the art**
The definitions for “digital competency” range from pure knowledge around use of digital tools (European Union, 2015) to different levels of skills, knowledge and attitudes required for learning and responsibly using digital tools (Ala-Mutka, 2011). Thus, also the models vary greatly (Ferrari et al., 2012). Moreover, there are related concepts like “computer literacy” (van Deursen, 2010), “information literacy” (Livingstone et al., 2005), or “digital literacy” (Bawden, 2008).

**New perspectives/contributions**

Many of these models were developed for policy making rather than organizational assessment and development (Ilomäki & Kontosalo, 2011), which makes them difficult to operationalize for this context. Moreover, they lack a proactive component as reflected in the concept of personal initiative (Frese & Fay, 2001).

**Research/practical implications**

Based on these results, a digital competency framework including personality, motivation, attitudes, skills, knowledge, and learning style as well as context variables for the context of assessment and development is presented.

**Originality/value**

The paper integrates various models on digital competencies with results from work and organizational psychology and provides a framework that can be adapted to different job types.

A Competency Model for the 21st Century Recruiter

Prof. Dr. Tim Warszta, Sarah Mahling, Jan Westensee
Westcoast University of Applied Sciences

Purpose

Digitization is rapidly changing recruitment processes. The conventional recruitment process based on receiving applications is more and more changing towards an active and digitized recruitment with recruiters identifying potential candidates via search algorithms and social media platforms. These new technical developments and an increasing competition for talent is resulting in a completely new set of competencies (Lievens, Sanchez, & De Corte, 2004) for recruiters.

Design/Methodology

We conducted a qualitative study with 12 in-depth interviews of senior recruitment managers. First, participants reported the tasks to be carried out in active recruitment. In a second step, they stated critical behaviors for carrying out each task successfully. Competencies were derived by aggregating and analyzing success critical behaviors.

Results

We present a competency model for the 21st century recruiter. Among the competencies we identified are social competencies like communication and empathy as well as technical competencies like diagnostic and digital skills, but also personal competencies like flexibility and persistence.
Limitations

Though the sample size is suitable for a qualitative research approach, generalizability should be tested using a quantitative design with a large sample.

Research/Practical Implications

This research partly closes the gap between recruitment research and recruitment practice. Our model rounds conventional HR competency models by adding new 21st century skills. The competency model can be used for selecting and training recruiters as well as students of Human Resources or Work and Organizational Psychology.

Originality/Value

Up to our knowledge, this is the first empirical study that derives 21st century recruitment competencies via qualitative methodology.

Being ready for the digital future – the Digital Readiness Model

Lena Justenhoven & Alina Siemsen
cut-e Group

Purpose
The volatile, uncertain, complex and ambiguous (VUCA) working environment of today’s world is changing demands on employees compared to a few years ago. Bureaucratic processes and micro-management need to be replaced by employees with an agile mindset, who are ‘digitally-ready’ to cope with consistently changing circumstances.

**Approach**

Latest research (such as Cumberland et al., 2016; Mumford et al., 2017; van Laar et al., 2017) as well as opinions of experts across multiple fields (such as Royal Bank of Canada, 2018) and the expertise of a team of I/O psychologists was consulted to development the “Digital Readiness Model”.

**Results**

Defining “digital readiness” as the ability to perform tasks, manage information, share knowledge and work with others in a digital context, the digital readiness model represents the attitude and ability that enables a person to embrace technology, collaborate with others and work effectively in the digital world of work. It focuses on three foundational competencies, namely Learnability, Agility and Curiosity, and is accompanied by eight additional supporting competencies.

**Limitations**

So far, the model is solely based on a conceptual framework, even though it incorporates well validated assessments. Empirical validation needs to follow.

**Implications**
Using the Digital Readiness Model, researchers and companies can measure the potential and ability to effectively work in today’s VUCA world.

**Originality**

The Digital Readiness Model is the first framework to define and operationalize digital readiness not in the sense of technological proficiency, but with the regard to what employees need to work effectively in today’s digital world.

**References**

**Thriving in “Virtual” Teams: Competencies Beyond Informatics**

Prof. Dr. Lothar Bildat¹ & Kathrin Renschler²

¹NORDAKADEMIE University of Applied Sciences
²Kathrin Renschler, EBC Hochschule University of Applied Sciences

**State of the art**
Modern leadership of remote teams depends on reliable technology and on psychological success factors such as trust (Caya, Mortensen, & Pinsonneault, 2013), team mental models (Mohammed, Ferzandi & Hamilton, 2010), guided reflexivity (Konradt et al., 2015) and valance of team and individual goals (Hertel & Lauer, 2012). But most organisations seldomly have the chance to use scientifically developed online tools to foster performance and team impact. A practice-oriented and yet evidence-based scoring system for the choice of group support software can be useful as well as a training needs analysis for newly created “virtual” teams. HR also needs to focus upon personality variables in terms of team member selection.

**New Perspectives/Contributions**

The paper has a practitioner- and science-focused approach upon a tool for the evaluation of group support software as well as training needs analysis for remote teamwork; it sketches a blended training concept for digital team (self-)leadership.

**Research/Practical Implications**

The paper focuses on competencies required to thrive in digital and remote teams and shows practice-oriented tools for better market decisions (support software), thus aligning science and practice.

**Originality/Value**

The paper provides an overview regarding psychological success factors of digital and remote teams as well as team member selection and development. Moreover, it enhances future-oriented leadership skills.
References

Proponents: Bethania Antunes and Heiko Breitsohl

Discussant: Jonathan E. Booth

State of the Art: Employee volunteering (EV) programs have grown fast in the last decade and scholars suggest that their popularity is linked to their potential for strategic and human resource management. Indeed, EV programs have significant impacts on employee attitudes toward their work and organization, such as employee motivation and commitment, cohesion and teamwork, professional development, performance, as well as reputational gains with organizations’ stakeholders. Much of the existing literature however is concerned with the ‘business case’ for employee volunteering and management research has given insufficient attention to the tensions related to the plurality of actors involved in EV programs and to address these limits there is a need to shift attention from management strategy to how employees, particularly at low and mid-level, negotiate the content and implementation of EV programs.

New Perspectives/Contributions: In this symposium we put emphasis on the internal organizational dynamics of employee volunteering programs that include studying actors at middle and lower levels of the organization and we present four studies examining how employees, managers and non-profit organizations are enabled to contribute to organizational activity on EV programs in organizations, potentially developing sustainable incentives to encourage employees to volunteer.

Research/Practical Implications: By focusing on the internal organizational dynamics of EV programs we open a new avenue for understanding the interactions, tensions and relationships between actors and what makes EV programs more or less effective in organizations.

1. The impact of employee volunteering experiences on workplace needs satisfaction

Heiko Breitsohl
University of Klagenfurt, Austria

Purpose: The goal of this study is to investigate whether participation in an employee volunteering program spills over into the workplace by affecting need satisfaction at work. Moreover, we test two competing explanations for such spillover based on participants’ experiences during the program based on theory on prosocial impact and recovery from work, respectively.

Design/Methodology/Approach/Intervention: The sample for this study consists of employees of multiple companies that are part of a CSR-oriented network in southern Austria. This network coordinates a “social day”-type annual event during which participating employees perform a variety of volunteer work. We employ a quasi-experimental one-group pretest-posttest design with a nonequivalent dependent variable to maximize internal validity given
situational constraints. The design features three measurement occasions, where participants are surveyed on their need fulfillment before (t1) and after volunteering (t3). Prosocial impact as well as recovery from work are measured immediately after volunteering (t2). Control variables include motives for volunteering, participants’ volunteering outside of the program, and perceived employer motives for offering the program.

Results: Data collection for this study will take place in late 2018. Results will be available in time for the Congress.

Limitations: Potential limitations include lack of a control group as well as results being specific to this type of volunteering program.

Research/Practical Implications: The study has potential implications for how employers can enrich workplaces by supporting their employees in their voluntary work.

Originality/Value: This study goes beyond earlier research on employee volunteering by testing competing theories on the spillover between volunteering and the workplace, and by offering stronger causal inference.

2. The Motivational Drivers of Corporate Volunteering: Evidence from Singapore and Malaysia

Ratnesvary Alahakone and Kerstin Alfes
University of Greenwich, UK

Purpose: This paper explores the extent to which extrinsic and intrinsic motivators drive employees’ attitudes towards corporate volunteering (CV).

Design/Methodology/Approach/Intervention: Data were collected with an electronic questionnaire from Singapore and Malaysia. The data were analysed using partial least squares (PLS).

Results: Employees participate in CVs for a variety of motives, the most significant of which is a desire to experience new learning experiences and to have the opportunity to exercise knowledge, skills and abilities that they might not use in their regular jobs. Further, employees are motivated by the support shown by their employers. Participating to express altruism, improving relationships with others, protecting the ego from negative features and enhancing positive strivings of the ego proved to be less important.

Limitations: Data were cross-sectional in nature. The study relied on employees’ self-reports, however common method bias was not evident. Besides social desirability, the findings were also not generalizable.

Research/Practical Implications: Employees are more positive about participating in CV initiatives when they know that there will be new knowledge, skills and experiences involved that they might not be learning on their regular jobs. Employees are not driven by altruistic reasons but compelled to volunteer in order to enjoy the tangible rewards by the organisation. From a practical perspective, when designing CV initiatives for the employees, the HR department must consider providing tasks that provide a variety of skills and knowledge as well as extrinsic rewards that would motivate employees to participate.
3. Corporate Volunteering Programs: Designing for Impact

Mina Askovic

University of Sidney, Australia

**Purpose:** The take-up of corporate volunteering programs is based on beliefs that they constitute a ‘win-win-win’ - for employee volunteers, their organisations and the not-for-profits (NFPs) that they serve. However, many of the assumptions about these benefits remain untested. The purpose of this research is to contribute to a more holistic understanding of corporate volunteering by examining the motivations for, experiences with, and outcomes of corporate volunteering programs for all stakeholders involved.

**Methodology:** The research adopts a sequential exploratory mixed-methods research design consisting of in-depth, semi-structured interviews followed by multi-source, three-wave, time-lagged surveys.

**Results:** Drawing on findings from Phase I, consisting of 37 semi-structured interviews with volunteers and volunteer managers from corporate and NFP organisations, this presentation discusses the benefits and challenges of corporate volunteering in practice, culminating in a conceptual model of individual and organisational factors that lead to volunteer program success. It concludes that framing corporate volunteering as a cross-sector collaboration rather than a CSR initiative can help get the balance right for all stakeholders.

**Limitations:** The qualitative nature of the first phase of the research means the results have limited external validity.

**Research/Practical Implications:** The findings of this research are expected to contribute to practice by providing guidelines and strategies to help volunteer-providing and volunteer-involving organisations enhance their corporate volunteering practices.

**Originality/Value:** This research contributes to a deeper understanding of if, how and when corporate volunteering results in shared value creation.

4. Employer-supported Volunteering Programs: Intended and Unintended consequences

Bethania Antunes and Ratnesvary Alahakone

University of Greenwich, UK

**Purpose:** As employer-supported volunteering (ESV) programs become an increasingly salient feature of companies’ community investment programs, organizations are coming up with new ways to embrace volunteering and tie it to their bottom line. A growing number of organizations are linking performance reviews to volunteering, allowing employees to demonstrate skills and strengths that management might not have otherwise been able to see in action, and at the same time, contributing to increased volunteer participation in their corporate programs. This study investigates the potential intended and unintended outcomes of linking individual appraisals to employee volunteering.
Methodology: This study is based upon a case study design approach in organizations with an employer-supported volunteering program in the UK. Data is gathered using semi-structured interviews with employees, line managers and CSR managers in the organization, along with field observations and analysis of secondary data from documentary evidence.

Results: The results of preliminary interviews point to the benefits and challenges of ESV programs being linked to performance appraisals in organizations.

Limitations: Due to the nature of this study, the results have limited external validity.

Research/Practical Implications: This research responds to calls for a more in-depth study of the internal actors in influencing the content and implementation of ESV programs and it also investigates the potential risks of employee volunteering, as well as the conditions under which various consequences may emerge.

Originality/Value: This study shifts attention from management strategy to how employees, particularly at low and mid-level, influence and negotiate the content and implementation of ESV programs.
New Approach to Investigating Employee Wellbeing – Considering the role of the physical environment and the psychosocial work environment

Yarker, J.; Weber, C.; Hermans, C.

There has been increasing demand for the building industry to deliver workplaces that promote employee health and wellbeing. There is a vast, yet diffuse literature base that can help us to understand the impact of the workplace on health and wellbeing. Within the physical environment, ergonomists, environmental psychologists and real estates researchers aim to identify the predictors of wellbeing (e.g., quality of work settings, noise, light, air quality), and separately, work psychologists have developed a strong understanding of the role played by the psychosocial work environment (e.g., manager support, work autonomy, work culture). However, less is known about the interplay of these important features.

This paper shares a conceptual model and examines how characteristics of the physical environment and psychosocial environment predict different types of employee wellbeing (e.g., physiological, psychological, and social wellbeing), job satisfaction and performance. The conceptual model was tested with two office worker samples from utilities (n = 221) and engineering (n = 407) sectors using multiple regression.

Findings demonstrate the complex interplay of features in the physical and the psychosocial work environment with dominant influences of managerial support, workplace autonomy, and environmental “hygiene factors” as noise and lighting. In addition, behavioral protocols on the usage of work spaces were found to be an important factor influencing employees’ psychological and social wellbeing.

Implications for designing and delivering healthy workplaces are outlined. Specifically, we call for the development of new multidisciplinary approaches to the evaluation of workplace wellbeing.

Keywords: work design, office design, wellbeing, work satisfaction

Building for work, health and wellbeing – evaluating the impact of an office relocation on physical activity and psychological wellbeing

*Loughborough University, Loughborough, UK
**Kingston University, London, UK

The built environment can play an important role in promoting the health and wellbeing of employees. This paper examines the impact of an office relocation on work, health and wellbeing. Differences in physical activity, social interaction, and health and wellbeing...
outcomes are investigated before and after the office relocation using a mixed-methods approach. In addition to an evaluation of changes in outcome measures, a realist evaluation approach has been employed. Widely used when evaluating complex social interventions (e.g. healthcare settings), this approach aims to increase understanding of why and how the relocation succeeds or fails to bring about intended outcomes.

Design: Data sources include i) stakeholder and employee interviews (n=30), ii) health assessments and 1 week physical activity measurements using activPA L (n=30), and iii) employee questionnaires including appraisals of the work environment and self-appraised psychological health and wellbeing (n=500).

Results: Pre-move data has been collected and employees have relocated to their new office. Post-move data collection has commenced. We anticipate being able to share the post-relocation findings, identifying features of the built environment that have facilitated changes in physical activity, social interaction, and their impact on health and wellbeing.

Implications: Implications for designing for health and wellbeing will be outlined, specific attention will be given to the comparative benefits of the built environment and the psychosocial work environment. The methodological contributions will also be discussed.

Keywords: office relocation, physical activity, health, wellbeing.

The Privacy Appraisal Model

Clara Weber

Privacy impairment is a frequently reported issue in open office environments, yet the psychological process behind this experience and its consequences remain unclear. To investigate these points, this study builds on Altman’s (1975) privacy regulation model and Lazarus cognitive appraisal theory (Folkman & Lazarus, 1988). It focuses on the incongruence between workers’ desired and achieved levels of privacy and on the appraisal of the incongruence and its stressful nature.

Structural Equation Modelling was performed on a merged data set of 220 survey responses from two UK office worker samples. Results supported the hypotheses of a previous study that unmet privacy needs significantly predict stress, fatigue and dissatisfaction at work when controlled for work demand. Further, the relationship between unmet privacy needs and stress, fatigue and dissatisfaction at work were mediated by the assessment of coping resources. This means that the perception of privacy related stress largely depends on someone’s perceived ability to cope with the privacy related stressor.

Three variables in the work environment were found to influence both, privacy regulation and privacy related coping: (1) quality of work settings, (2) autonomous workplace culture which gives control over choosing a work location, and (3) behavioural protocols on how office spaces should be used. Results could inform physical workplace design as well as cultural interventions in organisations. To our knowledge this is the first study investigating the psychological process of privacy experience by using a transactional model of stress.

The Meaning and Measurement of Privacy At Work – Development and Evaluation of the Privacy At Work Inventory (PAW)

Clara Weber

Although privacy impairment represents a frequently reported issue in open office environments, many prior conceptual definitions and measures have been inadequate in a number of ways. The goals of the present studies were to use Altman’s (1975) established conceptual definition of privacy regulation, briefly examine prior measures of privacy at work, outline the desirable characteristics of a measure and develop and evaluate a new measure of privacy at work. The Privacy At Work (PAW) Inventory provides separate assessments of four dimensions of privacy. In accordance with the conceptual framework, two dimensions specify output control over information which are task privacy and conversation privacy, whereas two dimensions specify input control over information which are indirect input by visual and acoustical stimulation, and direct input by interruptions. Results from two studies of UK open office workers (n = 238; n = 109) suggest that PAW seems psychometrically sound and evinces meaningful relations with variables known to be associated. However, these results need to be interpreted with caution due to their rather preliminary nature. More research is required to fully evaluate the utility of the PAW in research on privacy at work.

Keywords: privacy, office
INFORMATION AND INTERACTION PROCESSES IN SOCIO-DIGITAL WORK SYSTEMS: CHALLENGES AND PERSPECTIVES FOR PERFORMANCE AND WELL-BEING.

Conny H. Antoni, University of Trier & Annette Kluge; University of Bochum, Germany

State of the Art. Mobile information communication technology (ICT) and the digitalization of work processes allow new forms of flexible socio-digital work system (SDWS), where knowledge workers can work and collaborate almost anywhere at anytime. These technologies also allow new forms of machine-machine and human-machine interaction in cyber-physical production systems (CPPS), where workers and machines can allocate tasks based on changing demands. Although the consequences of so-called industry 4.0 and work 4.0 are still a controversial issue it seems clear that employees have to deal with fast changing work requirement and increasing amounts of ICT mediated information and interaction processes.

Contributions. The first three studies of this international symposium present results how different forms of intentional or directed forgetting can help to learn new work routines of to manage increasing amounts of information. As the use of ICT and ICT based management information systems (MIS) requires trust the fourth study presents a new model of trust in MIS. The last two studies analyze the consequences ICT mediated communication. Study four analyzes whether stronger affective responses occur when leaders communicate via rich media with their followers, than with less rich media. Study five analyzes how employees who are using mobile ICT and doing mobile, multilocational work deal with pressures to be ‘present’ that is being socially available for others face-to-face or virtually.

Implications. Study findings advance theory development and give advice how to deal with increasing amounts of information and ICT mediated interaction processes.

Fast and accurate switching between routines in cyber-physical-production-systems (CPPS)- the role of intentional forgetting (IF)

Arnulf Schüffler, Ruhr University Bochum, Germany
Christof Thim, University of Potsdam, Germany
Jennifer Haase, University of Potsdam, Germany
Norbert Gronau, University of Potsdam, Germany
Annette Kluge, Ruhr University Bochum, Germany

Purpose

A production that is adaptable to volatile markets, mass customization and the emergence of „prosumers“, who co-design products, require new forms of human-machine-interactions in routines. These new forms are called CPPS in which workers and machines allocate tasks based on changing
demands, e.g. quality, quantity, or individuality of products. In a learning factory, we investigate how this flexible human-machine-interaction in knowledge intensive multi-actor routines can be supported by means of IF. The objective is to accelerate the switching to new routines. IF is defined as a business process that deliberately impedes the recall of certain organizational memory items, e.g. routines.

**Design**

In four experiments, it is analyzed whether the switching between routines and forgetting old routines depends on the characteristics of the steps changed in the sequences of the new routine compared to the old routine.

**Results**

Our data (n= 67) show that switching between routines and forgetting old routines indeed depends on the characteristics of the steps changed. E.g., if a new step is inserted into the sequence the error rate of not forgetting rises up to 50%. But this is only the case if the step of the sequence directly before the inserted step remains unchanged. If the step directly before an inserted step has changed also, the error rates drops to 5 %. This exemplary result shows that the error probability of an inserted step in to a routine depends on the characteristics of changed routine.

**Implications**

Implications for manufacturing and routine design are concluded.

**Intentional forgetting in teams: effects of knowledge distribution on information capacity**

Anna Ulfert, Conny H. Antoni, & Thomas Ellwart, University of Trier, Germany

**Purpose**

Intentional forgetting (IF) is associated with positive outcomes such as lowering information overload. On a team level IF can be triggered by redistributing knowledge and roles between team members by means of specialization or generalization. We argue that in teams with high knowledge overlap an individual is left with little information processing capacity (IPC) to work on essential task elements (e.g., monitoring), particularly for complex task.

**Design**

Students took part in an experimental fire chief simulation study (N = 180 individuals, teams of 3) composed of three levels of task complexity (i.e., differing amounts of task rules). Two knowledge distribution conditions were implemented: (1) specialists: participants specialized on a specific vehicle type, (2) generalists: participants used one vehicle of each of the three types. Individual IPC was measured with a multi-method approach (log files, questionnaire, eye tracking). Additionally, experienced strain and team trust were studied.

**Results**

Participants in the specialist condition reported higher information capacity (esp. monitoring behavior and rule learning; p<.05). At all three levels of complexity specialists reported lower strain (all p<.001). In the high complexity condition, specialists showed higher levels of trust (t(177)=−2.32, p=.02). Results
concerning information capacity were further supported by comparing eye tracking results. Generalists were more likely to view the instructions while working on the simulation.

Limitations

Replication studies in organizations are desirable.

Implications

Specialization can reduce individual strain and increase trust

Originality

The present study offers a first understanding of how IF trough knowledge distribution impacts individual’s knowledge capacity.

Directed forgetting in organizations:
Beneficial effects of information systems on mental resources and well-being at work

Guido Hertel, Sarah M. Meessen, Dennis M. Riehle, Meinald T. Thielsch, Christoph Nohe, & Jörg Becker

University of Muenster, Germany

Purpose

Decision-makers in organizations are often overtaxed by huge amounts of information in daily business processes. As a potential supporting device, this study examined directed forgetting (Bjork, 1970) in a simulated sales planning scenario. We assumed that the availability of a computer-based decision support system (DSS) implicitly triggers forgetting of decision-related background information. Such directed forgetting should not only enhance decision quality but also decrease strain of decision makers and release memory capacities for additional tasks.

Design

Assumptions were tested in an experimental study with three conditions and 90 participants using a complex sales planning simulation.

Results

Consistent with our assumptions, results not only revealed higher decision quality when participants could use a DSS, but also higher well-being and higher cognitive resources for an unrelated task (recall of decision-unrelated information) as compared to two control conditions. Moreover, these beneficial effects were further qualified by participants’ trust in the DSS.

Limitations

Replication studies in existing organizational settings are desirable.

Implications
Our findings encourage the implementation of information systems at work to increase task performance but also cognitive resources and well-being. Moreover, our results demonstrate the importance of trust in information systems as major qualifier of the beneficial effects.

**Originality**

This is the first study that demonstrates beneficial effects of forgetting triggered by an information system in a complex business setting. In doing so, the results challenge recent concerns about potential negative consequences of information systems on humans’ cognitive functioning.

**Trust in Management Information Systems (MIS):**

**A Theoretical Model**

Sarah M. Meeßen
Meinald T. Thielisch
Guido Hertel
University of Muenster, Germany

**Purpose:**

Organizations increasingly generate and store huge amounts of data. To use big data volumes in decision-making and to avoid decision-makers’ overload, computer-based management information systems (MIS) are implemented that collect, process, and analyse decision-relevant data. Empirical evidence generally suggests that trust, “the willingness to depend”, is one important precondition for the individual use of such complex MIS.

**Results:**

We introduce a new model of trust in MIS that addresses existing conceptual ambiguities of trust in technology. In particular, we distinguish between perceived trustworthiness of an MIS, experienced trust in an MIS, intentions to use an MIS, and actual MIS use. Additionally, we integrate MIS users’ perceived risks and contextual factors as moderators. Doing so, we extend approaches on the use of electronic services (online trust) and automation in safety- and time-critical contexts (trust in automation).

**Implications:**

For future research, the distinction between trustworthiness, trust, and behavioural intentions implies a more differentiated analysis of both trust processes and their outcomes beyond mere MIS use (e.g., users’ well-being) as well as the consideration of specific moderators. The model guides practitioners in the identification of concrete needs to enhance trust-based MIS use.

**Originality:**

MIS become increasingly important in strategic and operational decision-making, as they provide benefits for workers and organisations. An essential precondition for the use of such complex technology at work is trust. The proposed model integrates related key components and thus offers first guidelines for further investigating and managing trust in MIS.
Daily leader-follower interactions and affective reactions: The role of media richness
Aileen Rakow, Viktoria Gochmann & Sandra Ohly, Universität of Kassel, Germany

**Purpose**: Because modern workplaces are characterized by virtual collaboration, it is important to analyze how leaders communicate with their followers on a daily basis, and how followers react. Based on media richness theory and affective events theory, we expect stronger affective responses when rich media is used, in contrast to less rich media.

**Design**: Using a daily diary, data was collected in 59 employees who reported 215 concrete behaviors of their leader. They also rated their affective well-being after the interaction on a multi-dimensional scale.

**Results**: Multilevel analyses revealed: Followers feel higher positive affect, and lower negative affect when leaders give positive feedback and let followers participate in decision making. Furthermore, positive affect increases more and negative affect decreases more when giving feedback via rich media (e.g. face-to-face) in contrast to when it is given via lean media. However, when leaders engage in managerial activities promoting goal pursuit, the interaction showed the opposite pattern.

**Limitations**: The small and selective sample and the small number of leader behaviors using lean media raises concerns about the validity of these findings.

**Implications**: The advantages of rich media are limited to certain types of leader-follower interactions. Digital media has an advantage for activities such as informing and planning. Leaders need to use media strategically.

**Originality**: This is one of the first studies examining media use of different types of leader behaviors in the field, and links media richness theory to affective events theory.

Using multipresence strategy as coping method in mobile work
Matti Vartiainen & Johanna Koroma, Aalto University, Finland

**Purpose**: The pivotal property of mobile information and communication technology (mICT) is to enable mobile, multilocalcational work. mICT enables doing various tasks in different places creating also pressures to be ‘present’ that is being socially available for others face-to-face or virtually. Social presence is defined as the ‘sense of being with others’ (Biocca et al., 2004, p. 456). Jackson (2002) and Golden (2009) conceptualised dual presence to handle both face-to-face presence in a physical location and virtual presence in a work domain. As mICT enable synchronous and asynchronous communication almost anywhere, we argue that the phenomenon of presence is more diverse than allowed by the dual-presence approach.

**Design**: Highly mobile employees (N=25) were selected from four companies. We looked for the communication events where an interviewee worked in some physical place and simultaneously communicated virtually with others.

**Results**: Altogether 344 communication events were identified. In all of them, synchronous or/and asynchronous technologies were used for communication. The events occurred in the main workplace
(N=114), at home (N=104), in moving places such as taxis (N=51), in third places such as hotels (N=53), and secondary places such as customer premises (N=22). When the contents of communication events were analyzed in details, we found three types of presence strategies: virtual, dual and multipresence. Then, the specific causes and the circumstances that lead to a multipresence strategy were studied as well as the benefits and costs attached to these events.
1775 - HOW TO FOSTER LEARNING AT THE WORKPLACE: NEW PERSPECTIVES

Leonie Theis¹ & Julian Decius²

¹Julius-Maximilians University of Würzburg, Germany

²University of Paderborn, Germany

Scientific Symposium

State of the art

Lifelong and continuous learning is required for companies and employees to be competitive in times of digitalization and globalization (Kyndt & Baert, 2013). Although participation in formal training can be encouraged by HR management (Colquitt, LePine, & Noe, 2000), most learning processes of employees cannot be directly controlled by managers given that the majority of learning takes place self-directed and on demand in the workplace (Eraut, 2011). However, working conditions can be optimally designed to promote learning at the workplace and to develop employee’s skills (Cerasoli et al., 2018).

New perspective/Contributions

The symposium will address which conditions can promote (or impede) learning at the workplace. In detail, the studies examined the role of job characteristics (e.g., demands, learning opportunities), learning environments (e.g., learning climate, workplace goal orientations), and organizational change factors (e.g., changes in hierarchy). Furthermore, light is shed on person-situation interaction effects and interpersonal influences of managers on employee’s learning behavior. A new methodological evaluation approach is suggested that additionally helps to promote workplace learning.

Research/Practical Implications

The symposium contributes to the research field by identifying conditions to foster workplace learning, both at the personal and the organizational level, and thus confirms and extends the existing framework models for workplace learning (e.g., Tannenbaum, Beard, McNall & Salas, 2010). Practitioners can use the results to improve the conditions for their employees and to evaluate the learning successes to develop employees’ competencies and to make companies ready for the working environment of the future.
The impact of different types of organizational change on informal workplace learning

Julian Decius & Niclas Scharper

*University of Paderborn, Germany*

**Purpose**

Organizational changes are increasingly occurring not only in large companies, but also in small and medium-sized enterprises (SMEs). Changes might affect personnel and hierarchy, production processes, requirements for tasks, digitalization, or factory equipment. However, it is not known precisely which impact different changes have on workplace learning, which is largely informal and self-directed.

**Methodology**

An exploratory approach was used to examine which types of change tend to inhibit or even trigger/promote informal workplace learning (IWL). Thus, employees of 21 SMEs were asked about their IWL in T1 and again in T2 one year later, using a quantitative questionnaire. The organizational changes were gathered using a retrospective, guideline-based interview with a HR/management member in each company and evaluated in ten categories using content analysis.

**Results**

The results of repeated measurement ANOVA with one categorical variable (company changes) and eight IWL variables show that some change factors promote informal learning and others inhibit it.

**Limitations**

In T2 only ten enterprises took part again in the survey; 81/183 respondents could be matched using an anonymous code. Self-assessments by employees and retrospective assessments by managers were used.

**Research/Practical Implications**

In addition to contribute to further research about change factors, the results can also be used by SME executives to identify the effects on learning from their intended changes in advance and to plan supportive interventions for employees.

**Originality/Value**

To our knowledge, for the first time the effects of organizational changes on informal workplace learning in manufacturing SMEs were examined using a quantitative approach.
The Role of Workplace Goal Orientation for Self-Efficacy and Learning

Leonie Theis & Tanja Bipp

Julius-Maximilians University of Würzburg, Germany

Purpose

Nowadays, continuous learning is highly important for organizations to be competitive in times of globalization. We examined in two studies to what extent the construct of workplace goal orientation (WGO) predicts self-regulatory processes (i.e. self-efficacy) and learning of employees. WGO refers to the perceived goal characteristics at one’s workplace and includes three dimensions: learning, performance-approach, and performance-avoidance goals. Furthermore, we provided insights into person-situation interactions of goal orientation.

Methodology

We conducted a cross-sectional Study 1 (N = 334) with self-efficacy and learning as outcome variables and an experimental scenario Study 2 (N = 250) to investigate person-situation interaction effects on self-efficacy.

Results

WGO, especially learning goals, were positively related to self-efficacy, which in turn was positively related to learning (Study 1). In Study 2, none of the expected interactions were significant as we only found main effects of learning GO (dispositional and workplace) on self-efficacy.

Limitations

Our findings may be limited due to the sole use of self-reports and investigation of effects at one point in time.

Research/Practical Implications

Our results sustain the importance of a learning goal oriented workplace to foster favorable self-regulatory processes and learning. In practice, the setting and pursuit of learning instead of performance goals to promote employee’s self-efficacy and learning should be emphasized.

Originality/Value
To our knowledge, we conducted the first study investigating the relationship of WGO with self-efficacy and learning. Furthermore, we designed the first experimental study to examine possible person-situation interactions to provide much needed causal evidence for the effects of WGO.

**Social Informal Learning & the Role of Learning Climate**

Samantha Crans, Veronika Brick, Simon Beausaert & Mien Segers

*Maastricht University, Netherlands*

**Purpose**

Employees predominantly learn informally in their work environment and, in particular, with peers and supervisors. Although various typologies of learning activities were previously identified, this study specifically focuses on identifying passive and active social informal learning (SIL) activities. Furthermore, research assumes that learning conditions facilitate workplace learning. However, there is little empirical evidence to underline a specific relationship between learning climate and SIL. This study, therefore, aims to identify to what extent learning climate influences SIL activities.

**Methodology**

Interviews were conducted with 16 employees of a German consultancy firm, using the Critical Incident Technique. The data was analyzed using the thematic analysis approach and ATLAS.ti software.

**Results**

Employees were found to learn from others by receiving feedback, observing others, seeking feedback and information, discussing and sharing knowledge. The results revealed that learning climate dimensions (i.e., Learning Leadership and Space for Learning) facilitate SIL.

**Limitations**

This study is conducted in a consultancy firm, characterized by high time pressure and frequently changing tasks. These characteristics may have limited our results to this specific sector.

**Research/Practical Implications**
It is suggested that future research focuses on different sectors as well as using quantitative measures to establish a predictive relationship between learning climate and SIL. Suggestions for practice are provided concerning how to adjust work environments to enhance synergies of employees learning behaviour.

**Originality/Value**

Our findings give rise to a new framework of SIL in terms of passive, active and collaborative learning activities. Furthermore, this study establishes a relationship between learning climate and SIL.

**The Relevance of Achievement Goals in Talking “Shop” With the Boss:**

“Improve Yourself and Me” versus “Show Off, But Don’t Upstage Me!”

Melvyn R. W. Hamstra\(^1\), Qaiser Mehmood\(^2\) & Bert Schreurs\(^3\)

\(^{1}\)Maastricht University, Netherlands

\(^{2}\)Hamdard Institute of Management Sciences Islamabad, Pakistan

\(^{3}\)Vrije Universiteit Brussel, Belgium

**Purpose**

We test an integrative model of managers’ and subordinates’ mastery-performance goals and learning behaviours. Working from learning and exchange theories, we hypothesize how managers’ goals predict employees’ goals and feedback-seeking and voice behaviour.

**Methodology**

In two dyadic studies (460 & 330 dyads), achievement goals were self-reported; feedback-seeking and voice were assessed using other-reports.

**Results**

Study 1. Supporting social-learning argumentation, manager mastery (performance) goals had a positive indirect effect, through employee mastery (performance) goals, on employee voice. Conversely, corroborating social exchange argumentation, manager performance goals had a negative direct effect on employee voice.

Study 2. Further corroborating social-learning argumentation, mastery goal managers’ modest behaviour encourages subordinates’ mastery goals, and their seeking critical improvement feedback;
performance goal managers’ showing-off behaviour encourages subordinates’ performance goals, and their seeking flattering confirmation feedback.

Limitations

Mixed-source designs mitigated common source issues. Common method issues from using questionnaires remain. Causality should not be inferred, as third variables such as organizational culture were not ruled out.

Research/Practical Implications

Achievement goals offer a way to integrate findings relating to learning behaviour in organizations and leadership mechanisms such as social learning and exchange. The mastery goal pathway seems opportune. Performance goal managers show employees that they should show off but also signal that they should not upstage their manager by speaking up.

Originality/Value

This empirical work offers an integrative theoretical and empirical view on achievement goals in the context of manager-subordinate work relationships. It integrates not only a host of recent findings, but also incorporates classic theories.

The role of learning demands in informal workplace learning

Joris van Ruysseveldt¹, Karen van Dam¹, Hans De Witte² & Irina Nikolova¹

¹Open University of the Netherlands

²KU Leuven, Belgium

Purpose

Previous research showed that learning supportive factors in organizations (learning opportunities and learning climate) promote informal workplace learning. However, it is yet unclear to what extent learning demands, i.e. workers’ experiences of pressures originating from their work environment, trigger them to make use of these learning supportive arrangement to effectively obtain new work related competences (NWC). This study investigates the role of learning demands in informal learning processes at work. We hypothesize that opportunities for learning in organizations advance NWC development more strongly when learning demands are high.

Methodology
Dutch employees \((N = 1711)\) participated in an online survey. Hierarchical regression analyses were used.

**Results**

Controlling for formal training participation, informal learning opportunities and a strong learning climate promoted the acquisition of new work related competencies (knowledge and skills). Additionally, learning demands proved to be beneficial for NWC development, as they strengthened the positive relationship between task related learning opportunities and NWC development. Unexpectedly, an appreciation learning climate advanced NWC development when learning demands are low.

**Limitations**

Study variables were measured using self-reports.

**Research/Practical Implications**

External pressures originating from the work environment advance effective workplace learning, even beyond the influence of strong learning supportive arrangements and formal training participation. Theoretical implications for explanatory models in the field of workplace learning are discussed.

**Originality/Value**

This study expands existing workplace learning models and frameworks by integrating learning demands as an important driver of workplace learning processes.

**The new AIM training evaluation model:**

Using effectiveness and improvement insights from evaluation to foster workplace learning

Kurt Kraiger\(^1\) & Eric A. Surface\(^2\)

\(^1\)University of Memphis, United States of America

\(^2\)Founder, CEO and Principal Scientist ALPS Insights, Inc., United States of America

**Purpose**
The purpose of this presentation is to present a new Alignment & Impact Model (AIM) for evaluation and to illustrate how the model can be used to create value for the organization, align evaluation with organizational strategic objectives, and drive event-driven continuous improvement in L&D practice using data.

**Methodology**

In the time allotted, we will provide a high-level overview of the model focusing on: how it is different from previous models; ease of implementation in practice and research; value-added for creating value for learning and development practices.

**Results**

A short case study will be presented to illustrate use of the model.

**Limitations**

Researchers and practitioners who are primarily comfortable with “levels models” of evaluation may see AIM as more complex.

**Research/Practical Implications**

AIM is a new evaluation model that improves the impact of evaluation, connects L&D to organizational strategic objectives, and creates a “seat at the table” by focusing evaluation on creating value for L&D.

**Originality/Value**

AIM is original in that it focuses on creating value using evaluation data, not simply measuring more levels.
1788 - RETHINKING WORK THROUGH (WORK)SPACES: CURRENT ISSUES FOR ORGANIZATIONAL CHANGE AND DEVELOPMENT OF TEAMS AND COMPETENCIES

Name of the proponents of the symposium:
Maria Ianeva – Center for Research on Work and Development, CNAM
Edwige Quillerou – INRS, Working Life Department
Raluca Ciobanu – EDF R&D
Jean-Luc Tomás – Center for Research on Work and Development, CNAM
Chiara Lai – Colliers International France R&D
Marc-Eric Bobillier Chaumon – Center for Research on Work and Development, CNAM
Jacqueline Vacherand Revel – Ecole Centrale de Lyon

Psychological and organizational literature has rarely considered materiality (Orlikowski, 2007), and especially space, as an integral part of organizational life and workplace individual and collective experience. Workspaces characteristics (in terms of layout, noise, light) are at best featured as components of the physical working conditions and studied in relation to occupational hazards, stress (Burke, 1988; Evans & Cohen, 1987) or job performance and satisfaction (Vischer, 2007). In the recent years, an increasing number of modern companies considers workspace design and layout as a mean to support and manage organizational change and knowledge-sharing amongst professionals and teams. This evolution in workspace design and management calls for more research in work and organizational psychology on space as embedded within activities and as an object of study in its own right (Ianeva, Ciobanu & Vacherand-Revel, 2017).

This symposium gathers academics and practitioners and intends to open up a theoretical and methodological discussion on several critical issues related to the (re)design, the appropriation and management of work through workspaces. What are the theoretical frameworks and concepts relevant for understanding space in its psychological, social and organizational dimensions? How could the design of work environments effectively support professional activities? In what ways workspace design and organization could trigger learning processes and support competence development? Why space matters for work psychologists?

The expected contribution of the symposium is twofold. First, it should provide a basis for a theoretical and epistemological debate among the contributors (work and organizational psychology, cultural-historical activity theory, French ergonomics, clinic of activity). Second, the presentations of empirical research and workplace interventions will highlight practical and workplace intervention-related issues.

Office Design and Organizational Change: an Activity-Theory Perspective

Maria Ianeva – Center for Research on Work and Development, CNAM

Office design and layout are increasingly considered by companies as a strategic resource. Today a growing number of organizations choose to implement non-territorial flexibles offices also referred to as “activity-based” workplace environments (ABW) in order to, both, reduce the real-estate costs and to support organizational change and work performance. This global trend in restructuring office design and work (Bodin, 2010; Cajander & al., 2015) is an important challenge for academics and practitioners. Consequently, several recent studies in work psychology (Ianeva, Ciobanu & Vacherand-Revel), ergonomics (Heddad, 2017) and sociology (Benedetto-Meyer & Cihuelo, 2016) sought to develop our understanding of space as related to work activities.

The purpose of this presentation is to bring into focus and discussion the contribution of activity theory (AT). AT is an interdisciplinary theoretical framework which involves different trends of research (Engeström, 1987 ; Cole, 1995; Clot, 1999) and focuses on the purposeful, meaningful and material character of collective activities. In order to do so, we report on an empirical study on the design and implementation of an ABW within an Information Technology company. The study builds upon AT and situated cognition (Lave, 1988 ; Scribner, 1997) and deals with the impact of these office solutions on collective work practices. Results show that the ABW provides a framework for both interpreting the work of colleagues and organizing one’s own work. The presentation provides reflection on office design as an intervention on organizing processes and activities and an analysis of its conditions and consequences for supporting activity development.

Keywords: cultural-historical activity theory, activity-based workplace, office work

References

We will present transdisciplinary research that combined an engineering approach including Human-Centered Design (Boy, 2015) with occupational psychology including “Clinic of Activity” perspective (Kloëtzer, Clot & Quillerou, 2016) for improving the work done by the designers and for taking care of the future workers. We will be basing our presentation on a design project about a new tool for commercial pilots in the cockpit, conducted in the laboratory with a flight simulator (Boulnois, 2018). We tested different kinds of interviews with expert pilots in a different space context for each stage of technical development of the system. We will show especially how the simple self-confrontation interview in a cockpit simulator was important for the pilots, the designers and the work analyst. Then, we will explain how the crossed self-confrontation interview under special space conditions allows dialogue to take place between the designers and the pilots for imagining the future workplace using emergent workspaces. The space conditions were worked on throughout the design process – including during work analysis and design testing - and the psychological, physical and social space conditions for each trade and for each human activity were revisited. In this way, the occupational psychologist organized the framework for dialogue about the present and the future work spaces to anticipate the changes in work organization, enhancing inter-professional collaboration, and finally increasing the health and safety benefits for the pilots, and potentially the other workers, at the same time.

New way of learning in the nuclear industry: the “activity spaces” as a tool for competence development?

Ralucă Ciobanu, EDF R&D

As the development of employees’ competencies is an issue for organizations, professional training design relies more and more on bottom-up “activity” approach. The entry point for the design of training environments is currently the work activity (Heddad, 2016; Rogalski, 2003). Research (Béguin & Clot, 2004; Rognin, 2002; Grosjean, 2005) highlights the use of the work environment as a resource for organizing the current and future action of the professionals.

Through a design approach and a training experiment, our study addresses the role of activity spaces (material and relational) for trainings in nuclear power plants. Several studies of our R&D department (Couix et al., 2015; Fucks & Boccara, 2014) have already shown that a training has to match real work situations in order to be efficient. In the case we present, the training participants have to orient themselves in a material space as well as a relational and organizational spaces.

The results of our experiment confirm the relevance of providing different pedagogical orientations that emphasize the activity over the previous task-oriented and top-down approach. The instructors-trainees and trainees-trainees interactions take place in an open and dynamic space with an important interindividual variability in order to promote active learning that use based on the joint discovery and analysis of real work by the collective. In this context, the co-presence of the participants is more important than the task at stake. Moreover, this new way of learning is a challenge for the instructors and trainees as well as for training designers.

It is only in movement that spaces show what they are:

A clinic of activity perspective on (work)spaces

Jean-Luc Tomás - Center for Research on Work and Development, Cnam, Paris

The term space is particularly polysemic. In the field of work analysis, and without seeking exhaustiveness, we identify the material space, the space of discussion, the mental space, the space of work, the space of creativity, the space of the body, the space of activity, the space of intervention.

In the clinic of activity, space is not a unit of analysis. It is the activity, with its conflicts, its impediments, its renewals of goals, means and motives that is the unit of analysis. Consequently, it is not the spaces - and their relationships - that explain the activity, but it is the activity of the professionals that is explained with them. Indeed, the activity of professionals is carried out in spaces that do not overlap. In fact, the spaces are therefore structurally in conflict. By moving a famous quote from Vygotsky (1997, p. 43), we can say that it is only in movement that spaces show what they are. And it is when these movements are prevented or hindered that work becomes a risk to health and efficacity.

In order to show how these movements can become supports for the development of the professionals’ power to act (Clot, 2009), we will use clinical materials from an intervention within a neurosurgery department. These materials will allow us to question the links between the organization of space, the space of subjectification, the space of compromises on conflicts of criteria, the space of relationships with others, the space of the body (Tomás, 2008).

Keywords: clinic of activity, intervention, development, activity

Situated acceptance as an approach for thinking workplaces in relation with activity: the case of in the context of Activity based environments

Chiara Lai¹, Marc-Eric Bobillier Chaumon², Jacqueline Vacherand Revel³

¹Colliers International France R&D
²Center for Research on Work and Development, Cnam, Paris
³Ecole Centrale de Lyon

The main goal of this communication is to reassess the workplace as a main component of the activity by taking into consideration the diverse phenomenon accompanying the transformations of the physical setting of work. This brought us to question the organization of the workplace as an asset or as a constraint for the business development. Our research is interested in the activity-based workplaces. We question the way these space typologies influence their users’ activity.

To do so, we have established a two-phase methodology. Three days of observation amid three different units evolving in activity-based workplaces have helped us to identify the uses that emerged from these spatial typologies. Then, a set of two interviews with 8 participants have been conducted based on the four dimensions of the situated acceptance model (Bobillier Chaumon, 2013) and on picture elicitation. Therefore, we show that these workplaces foster cooperation and can enhance and improve the work collectives with new ways of organizing the activity. The collectives came out strengthened and the mechanisms that the individual develops and mobilizes to appropriate her/his space make it relevant for her/his activity (Grosjean, 2005). In that sense, we also found that the workplace doesn’t always provide the sufficient possibilities for the employees to work as they want. Due to this issue, the individual must overcome these problems with his own resources. Furthermore, these typologies of space embody the organization’s values, which can go against personal and collective values. Hence, individuals can encounter difficulties to give meaning to their activity.

1798 - THE WHENS, WHYS AND HOWS OF WORK INTENSIFICATION

Bettina Kubicek*, University of Graz, Department of Psychology, Graz, Austria, bettina.kubicek@uni-graz.at

* chair

State of the art: Work intensification, as a process of raising workload, increasing amounts of tasks to be carried out, shortened time allowed to complete those tasks, and working longer or after hours is a general trend in contemporary organizations. The potential costs of intensified workload, such as impaired physical and mental health and well-being, higher accident rates, conflicts between work and private life, have been widely acknowledged in the literature. Yet, it has been rarely examined which factors lead to work intensification and how negative effects of work intensification can be overcome.

New Perspectives/Contributions: To address these research gaps, the studies that are presented in the symposium focus on the process and outcomes of work intensification as well as its driving forces. The symposium also contributes to a better understanding of potential buffering factors that reduce negative effects of intensified job demands on various outcomes. From a methodological perspective, the studies use various approaches, ranging from cross-sectional over short-term and long-term longitudinal studies to experimental designs.

Research/Practical Implications: The symposium provides researchers and organizations relevant knowledge on person-, task-, and leadership-related factors that amplify or hinder the intensification of work. Furthermore, it sheds light on the potential costs of work intensification by assessing associations between intensified demands and various health and well-being indicators.

Who experiences work intensification? ICT use, proactive behavior, and work resources as antecedents of work intensification

Saija Mauno, University of Tampere, Faculty of Social Sciences (psychology), Tampere, Finland;
University of Jyväskylä, Department of Psychology, Jyväskylä, FINLAND;
Jaana Minkkinen, University of Tampere, Faculty of Social Sciences (psychology); Tampere, FINLAND,
Bettina Kubicek*, University of Graz, Department of Psychology, Graz, AUSTRIA;
Christian Korunka, University of Vienna, Faculty of Psychology, Vienna, AUSTRIA

* presenting author
**Purpose:** In order to understand the driving forces behind the intensification of work, this study examines demographic factors (age, gender, education), structural work-related factors (working hours, ICT use, managerial position, income, sector), personal resources (proactive work behavior, optimism), and job resources (schedule control, task variety) as antecedents of work intensification.

**Methods:** The study is based on cross-sectional (N=4963) and longitudinal (N=2055) quantitative datasets of Austrian employees. Datasets were analyzed via regression analyses.

**Results:** The results show that work intensification remained fairly stable over time. The most consistent antecedents of work intensification (found in cross-sectional and longitudinal data) are schedule control, task variety, ICT use at work, and personal initiative. While schedule control is associated with lower levels of work intensification, all other antecedents are associated with higher work intensification, cross-sectionally and over time.

**Conclusions:** The findings suggest that being initiative and having task variety may have negative effects, as they are associated with an intensification of work. Moreover, schedule control is crucial to counteract intensification.

**Limitations:** All variables are based on self-reports.

**Research/Practical implications:** Employers should recognize that certain personal (e.g., personal initiative) and job resources (e.g., high task variety) might implicate work intensification, which, in turn, may cause more job strain as work intensification can be conceived as a job stressor.

**Originality/value:** Antecedents of work intensification have been rarely studied. However, the intensity of work can be expected to further increase in future due to technological and societal transformations. The study has methodological value because of its longitudinal design.

**Exploring work intensification from a dynamic perspective: A daily change pattern approach**

Marina Horvat*, University of Maribor, Department of Psychology, Maribor, Slovenia;

Sara Tement, University of Maribor, Department of Psychology, Faculty of Arts, Slovenia;

* presenting author

**Purpose:** Although work intensification reflects a temporal increase of different aspects of work intensity (e.g., time pressure, no break periods, multitasking, unfinished tasks), it has rarely been studied from a dynamic perspective. As the literature suggests that changing and less predictable job demands may lead to worse well-being compared to high, yet stable, demands, the outcomes of
changes in work intensity also deserve further attention. With this in mind, the present study aimed at exploring (i) whether work intensity increases across days (i.e., individual-level change trajectory), and (ii) whether the potential pattern of change predicts well-being after work.

**Design/Methodology/Approach/Intervention:** To examine daily trajectories of different aspects of work intensity, we are currently carrying out a daily diary study (estimated N=80 employees). Work intensity and well-being outcomes (e.g., exhaustion) are assessed after work across five consecutive workdays. In order to examine our research questions, latent growth modeling will be applied to our diary data.

**Results:** Although no findings are available yet, notable fluctuations in work intensity across days warrant further analyses.

**Limitations:** Work intensification usually reflects increases of work intensity across a longer period of time. By focusing on daily changes, our approach may not fully capture the theoretical construct.

**Research/Practical Implications:** The study provides insight into daily variations of work intensity in relation to well-being and turns attention to the potential negative consequences of this prevalent job stressor.

**Originality/Value:** This contribution presents a novel approach to work intensity dynamics on daily level and contributes to understanding of work intensification.

**Does recovery from work strain protect employees from the effects of intensified job demands on job exhaustion?**

Jaana Minkkinen*, University of Tampere, Faculty of Social Sciences (psychology); FINLAND

Saija Mauno, University of Tampere, Faculty of Social Sciences (psychology); and University of Jyväskylä, Department of Psychology, FINLAND

Ulla Kinnunen, University of Tampere, Faculty of Social Sciences (psychology); FINLAND

* presenting author

**Purpose:** Technological acceleration is changing working life and one of its implications are intensified job demands (IJDs), referring to work intensification, intensified job-related planning and decision-making demands, intensified career-related planning and decision-making demands, and intensified skill-related learning demands. These job demands set new challenges for workers but recovery from work, more specifically in terms of psychological detachment from work during off-job time, may help
employees to manage better these mostly cognitive challenges. The present study examines the associations between IJDs and job exhaustion and the buffering effect of psychological detachment in these relationships.

**Methods:** Cross-sectional data were collected from four Finnish trade unions in 2018 (N = 3,181). Data were analyzed by using SEM modeling with interaction terms.

**Results:** Higher IJDs were related to higher job exhaustion. As expected, psychological detachment buffered against the negative effects of IJDs on job exhaustion.

**Conclusions:** The results underline the positive role of psychological detachment from work as a personal resource that protects employees’ occupational well-being in the presence of high IJDs.

**Limitations:** The cross-sectional design limits drawing conclusions regarding causality.

**Research/Practical Implications:** Potential risks of IJDs in today’s workplaces should be recognized and enhance employees’ possibilities to mentally detach from work during free time.

**Originality/Value:** IJDs are new job demands arising from technological acceleration which have not been much studied. Buffering factors against IJDs have been studied even more rarely.

**Losing sleep over work: The role of perseverative cognition in the relationship between new job demands and sleep quality**

Katja Kerman*, University of Vienna, Faculty of Psychology, Vienna, AUSTRIA

Roman Prem, University of Vienna, Faculty of Psychology, Vienna, AUSTRIA

University of Applied Sciences Upper Austria, Faculty of Informatics, Communication and Media, Hagenberg, Austria

Sara Tement, University of Maribor, Department of Psychology, Faculty of Arts, Slovenia

Bettina Kubicek, University of Graz, Department of Psychology, Graz, AUSTRIA

Christian Korunka, University of Vienna, Faculty of Psychology, Vienna, AUSTRIA

* presenting author

**Purpose:** Nowadays employees are faced with new job demands, such as work intensification (WI) and planning and decision-making demands (PDMD) that pose risks for their health and well-being. In this study, we capture daily fluctuations in WI and PDMD and their effects on daily sleep quality.
Furthermore, we also investigate two different types of perseverative cognition (i.e., work-related worry and rumination) as potential mediators in this relationship.

**Design/Methodology/Approach/Intervention:** Data collection of a diary study with three daily measurements is currently being finished. In addition to self-report data, ECG is measured during sleep to assess sleep heart rate variability. Objective sleep data will be analyzed and included in the presentation.

**Results:** Preliminary results indicate that WI and PDMD relate differently to sleep quality as well as worry and rumination about work. Specifically, on the day level, WI is associated with rumination, but not with worry or sleep quality. On the person level, WI is associated with both worry and rumination, but not with sleep quality. PDMD are not associated with worry or rumination but are associated with sleep quality, on both levels.

**Limitations:** As the sample is limited to nurses working in Austrian elderly homes, generalizability to other occupational groups can only be assumed.

**Research/Practical Implications:** Future research investigating the effects of job demands on perseverative cognition should consider also differentiating between work-related worry and rumination.

**Originality:** Using a diary study design, we investigate general and daily effects of new job demands on self-reported as well as objectively measured sleep data.

---

**Extended availability - How leadership influences employees’ expectations and willingness to be available after work**

Christine Syrek*, University of Applied Sciences Bonn-Rhein-Sieg, Department of Management Sciences, Rheinbach, Germany

Anna Röltgen, University of Trier, Department of Psychology, Trier, Germany

Judith Volmer, Otto-Friedrich University of Bamberg, Department of Psychology, Bamberg, Germany

* presenting author

**Purpose:** Extended availability may be a mandatory requirement (as an on-call duty), but may also be an informal expectation to respond promptly (or within an accepted time interval) to a request (Dettmers et al., 2016). In the present study, we address the question of how different forms of leadership behavior (i.e. transformational and transactional leadership) influence the perception of
being required to be available for work after work hours as well as the willingness to be available after work.

**Methodology:** We conducted an online experiment with 131 participants, who were shown a video vignette of either a transformational, transactional contingent reward or management by exception leader. All participants in the study were instructed to imagine having just seen the annual speech of their new team leader. Subsequently, we assessed their willingness and expectation to be available for work-related tasks during leisure time.

**Results:** Transactional leadership contributed to the perception of being required to be available for work after work hours. In contrast, transformational leadership enhanced the willingness to be available during leisure time.

**Limitations:** Experimental study design might reduce the generalizability.

**Practical implication:** Extended availability has negative consequences for employees’ recovery and therefore wellbeing and health. Even though transformational leadership is essentially positive, it seems advisable to clarify expectations particularly regarding availability requirements.

**Originality:** This experiment increases our current understanding how leadership behavior triggers implicit expectations concerning extended availability.
State of the Art

Engagement at work is integral to the day-to-day runnings of all businesses, not least in terms of the employers and employees that serve as their foundation, but also the customers and clients they attend to. This symposium looks at work engagement from a multimodal perspective as a predictor and mediator, as well as relating to other aspects of work from resilience and organisational change, to wellbeing, presenteeism, and job autonomy.

New Perspectives/Contributions

This symposium is relevant – relevant to a time where organisational change is constant, and where healthcare systems have finite resources. Engagement is vital for both to operate effectively. In terms of healthcare, this will be discussed from the perception of both the care provider and treatment recipient, as well as mental health services in particular where the mental health of the professionals is offered consideration.

Research

Three of the studies are scientific, with one being practitioner-based. All papers were cross-sectional in design and data collected as part of online surveys. Multilevel analyses were conducted, on top of exploring the multiple relationships between various components of occupational health, and how they interact with one another – in this way, the varying papers can be seen to overlap and offer each other new learnings that can be easily implemented.

Title of paper

Work engagement as a predictor of job satisfaction and well-being.

Title, name and affiliation of the authors

Dr. Roxane L. Gervais\(^1\) & Dr. Prudence M. Millear\(^2\)

\(^1\) Independent Practitioner, United Kingdom, \(^2\)University of the Sunshine Coast, Australia

State of the Art

Individuals spend a large proportion of their daily lives at work. It is useful therefore to ascertain those work characteristics that add to a productive and healthy work environment. The research on work engagement thus far has shown the varied positive outcomes that result when workers are engaged with their work.
New Perspectives/Contributions

Work engagement has shown its versatility in allowing workers to remain connected with the workplace. However, there are fewer studies that assess if being more engaged would contribute to better outcomes within the work environment, inclusive of job satisfaction and well-being.

Research/Practical Implications

The research was cross-sectional in design, with the data collected online. The data analysis included exploratory as well as multivariate analyses. Skill discretion, work climate, lower decision authority, job autonomy, positive affect, job demands, and lower work-life conflict, were all predictors of work engagement. Interestingly, the research showed that work engagement was driven by more control, as well as more job demands. The ‘danger’ of having too many demands as part of a role has been well established and it would be useful to understand better the higher demands and increased work engagement interface.

Originality/Value

The present study supported the varied benefits of work engagement, and showed that more engaged workers are more likely to be satisfied with their work and have higher levels of well-being. This is useful in ascertaining those factors within the work environment that strengthen work characteristics. This presentation will allow a discussion of these issues.

Work Engagement: Mediating the Relationship between Doctors’ Perceived Working Conditions and Patient Care

Kevin RH Teoh1, Juliet Hassard2 & Tom Cox1

1Birkbeck, University of London, London, UK; 2University of Nottingham, Nottingham, UK

Purpose

This study aimed to test the role of work engagement as a mediator in the relationship between hospital doctors’ perceived working conditions and quality of patient care.

Design

14,066 NHS hospital doctors from 167 hospital trusts in England that took part in the 2014 NHS Staff Survey. Measures consisted of perceived working conditions (workplace demands, aggression, manager support, job control), work-related wellbeing (work engagement, perceived stress, presenteeism), quality of care at the individual-level (quality of own care, quality of hospital’s care) and patient care at the organisational-level (patient satisfaction, number of patient safety incidents, standardised mortality rates).
Results

Multilevel analyses showed that at the individual-level, work engagement mediated the relationship that workplace demands, manager support and job control had with both outcome measures. Perceived stress and presenteeism only functioned as a mediator where workplace demands and aggression were predictors. At the organisational-level, only the postulated relationships involving patient satisfaction demonstrated anticipated effects, with work engagement the only significant mediator.

Limitations

In addition to this being a cross-sectional study, data protection laws meant we were unable to control for individual factors such as age, gender, job role and speciality.

Implications

The healthcare sector has predominately focused on negative wellbeing constructs such as burnout. This study indicates that positive manifestations are important, as work engagement is found to be the main mediator within the postulated relationships.

Originality

Few studies have employed a multilevel perspective examining how perceived working conditions and wellbeing have an impact on patient care.

Title

Work Engagement: Do mental health professionals have a Risk Type, and is there a link with resilience?

Name and affiliation of the author

Sonia Shah
University of East London, United Kingdom

Purpose

A combination of a concentration of acutely unwell mental health patients, as well as old and unsuitable buildings, on top of staff shortages and a lack of basic training, makes it a lot more likely that both patients and staff are at risk of suffering harm. This study aimed to examine the risk personality of mental health professionals, and assess the relationship with resilience, which is seen as a protective factor against, for example, emotional exhaustion and depersonalisation.

Design
The researcher administered two surveys to 232 mental health professionals. Survey one assessed risk personality using the Risk Type Compass (Trickey, 2017). Survey two assessed resilience using the Connor-Davidson Resilience Scale 25 (Connor & Davidson, 2003).

Results
Analyses suggest this occupation can be differentiated from a sample of the general population by their risk profile. There are many statistically significant strong positive correlations between various aspects of risk personality and resilience. Specifically, a higher tolerance to risk predicted greater resilience.

Limitations
This study was cross-sectional in design. Further longitudinal research across a greater number of service providers would allow for a more comprehensive understanding.

Practical Implications
Targeted interventions could be developed to assist in promoting the resilience in this group, in turn reducing the risk of burnout and staff attrition, and promoting staff retention, occupational mental health, and potentially recruitment.

Originality/Value
Risk as an aspect of personality brings originality to this paper, as well as adding to the limited empirical evidence with regards to supporting those in caring professions.

Engaging with Change: Risk Personality’s Role in Maintaining Engagement and Preventing Resistance During Times of Organisational Change

Dr Simon Toms
Psychological Consultancy Ltd

Charlotte Flohberg
University of Edinburgh

Purpose
Organisational change is a recurring phenomenon in today’s globalised and complex world. Individual-level focus during organisational change is a recent but growing area of research, with findings suggesting various benefits that include success and maintenance of staff engagement.
The current study looks to build on this emergent literature by exploring the interaction between reaction to organisational change, risk personality, resilience, and wellbeing.

Design

Researchers gave two surveys to 121 participants. Survey one assessed risk personality using the Risk Type Compass (Trickey, 2017). Survey two encompassed scales for ‘Resistance to Organisational Change’ (Oreg, 2013), Resilience (Smith et al, 2008), and Wellbeing (Warr, 1990).

Results

Analyses suggest a statistically significant moderate-to-strong negative correlation between various aspects of risk personality and resistance to change. Specifically, risk aversion predicted high resistance during organisational change. Relationships of similar strength were also reported for Resilience and Well-being, suggesting personality plays an important role.

Limitations

Findings were derived from a cross-sectional research design. Further research over the ‘lifespan’ of an organisational change process would illustrate how these effects would manifest and develop.

Practical Implications

The findings of this study have considerable implications for change agents. Analysis indicates that personality plays a sizeable role in an individual’s level of resilience, as well as resistance and well-being in times of organisational change. This suggests these factors could be predicted and potentially avoided.

Originality/Value

The paper’s originality stems from its specific focus on aspects of personality most relevant to risk, and how these relate to the study’s other variables.
1850 - SOLIDIFYING THE GLASS CLIFF: EMPIRICAL, THEORETICAL AND META-ANALYTICAL INSIGHTS ON WOMEN IN PRECARIOUS LEADERSHIP POSITIONS

Anika Ihmels & Jürgen Wegge
Technische Universität Dresden, Germany

State of the Art (66)
The glass cliff phenomenon refers to women being preferentially appointed to leadership positions in times of crisis. The broad body of research that has been accumulated in the last decade speaks of its robustness in different contexts such as business and politics and presents a variety of underlying mechanisms. This symposium includes five contributions that report both supportive as well as controversial findings regarding the glass cliff phenomenon.

New Perspectives/Contributions (121)
First, Robinson et al. demonstrate the glass cliff in US elections from 1992-2011 where women were selected for hard-to-win seats of the Republican party. Second, Main and Gregory-Smith investigate differences in tenure of female and male board members in FTSE companies from 1996-2017. Ihmels et al. offer a new experimental approach by applying glass cliff vignettes in a group setting. The last two contributions take an integrative perspective. Kulich et al. present a theoretical model based on the mindset of the decision maker thereby explaining how hostile and benign motives can motivate glass cliff appointments. Finally, Ryan et al. report results of three meta-analyses on archival and experimental studies indicating general support for the glass cliff phenomenon as well as significant moderators.

Research/Practical Implications (32)
Our symposium integrates newest approaches regarding mechanisms and moderators offered by glass cliff research with the goal to inspire new research and practical interventions reducing discrimination of women.

The Glass Cliff in American State Legislative Politics (2011-2016)

Robinson, Sarah, Aelenei, Cristina & Kulich, Clara

University of Geneva, Geneva, Switzerland
Paris Descartes University, Boulogne-Billancourt Cedex, France

Purpose
Findings from the UK and Canada suggest that women face a political glass cliff, i.e. they are less likely to win elective contests because they are more likely to run for office in seats that are less ‘winnable’ based on previous election outcomes in their district. In the present research, we considered whether female candidates of the two major parties in the US, Republicans and Democrats, face similar odds.

Methodology
We compiled a dataset with American State Legislative archival election data from 2011-2016. We utilized a structural equation modeling approach for analysis, defining district ‘winnability’ as a latent variable and testing its mediating effect on gender differences in election outcomes.

906
Results
We found evidence for a ‘glass cliff’ for female Republican candidates. Female Democratic candidates were also exposed to harder-to-win seats, but did not differ from men in their electoral outcomes. We argue that these patterns reflect utilitarian ‘vote winning’ strategies, or motives, in the context of differing party ideologies which parallel existing stereotypes of women versus men.

Limitations
Our analysis is limited to one outcome election and one prior election for determining winnability for each district and would be improved by analysis over multiple years and the incorporation of group level factors.

Research/Practical Implications
The glass cliff may have distinct consequences for women depending on the underlying motives which generate precarious nominations.

Originality/Value
Our research uses an alternative robust statistical methodology and the specificity of U.S. state legislative races to show how local structural contexts contribute to differences in gendered outcomes.

The Glass Cliff that Awaits Women Directors: Recent evidence

Brian Main¹ and Ian Gregory-Smith²
¹ Edinburgh University, UK
² Sheffield University, UK

Purpose
Recently, Main and Gregory-Smith (2018) demonstrate for that women who take positions as directors of UK companies the risk of board exit becomes markedly higher than that experienced by their male counterparts at the point of reaching nine years of board service (when all board members lose their independent status). The current paper demonstrates that, notwithstanding the extensive efforts to effect an equal treatment of women, the glass-cliff effect perpetuates.

Methodology
The study uses data drawn for 1374 FTSE companies between 1996 and 2017. We observe the boardroom careers of 15,689 men and 1,496 women. The analysis draws on the panel nature of the data using both ‘difference-in-differences’ analysis and survival analysis.

Results
Women experience a large spike in their probability of exit around year-nine not shared by male directors. In contrast, no glass cliff was found in performance related outcomes.

Limitations
The study is limited by right censoring. A number of newly appointed female directors have yet to complete their careers.

Research/Practical Implications
Existing regulations, such as the restriction on independence after nine years of service, can exacerbate unequal treatment between men and women when combined with unequal valuations of female and male roles in the boardroom.

**Originality/Value**
The study exposes gender-based biases that persist in a high profile area (the boardroom). Notwithstanding the increases in female representation since the Davies Review (2011), the study demonstrates that much remains to be done in terms of securing equal treatment for these women once in post.

**Behind Closed Doors: Investigating Appointments and Arguments in Glass Cliffs as Group Decisions**

Anika Ihmels, Moritz Kaplonek, Alina Andree, Denise Dörfel
Technische Universität Dresden, Germany

**Purpose**
Previously, experimental research on the glass cliff – the phenomenon that women are primarily appointed to leadership positions in crisis (Ryan & Haslam, 2005) – has simulated appointment decisions solely as individual decisions. Aiming for a higher external validity, the present study applies established vignettes to a laboratory group setting.

**Design**
After reading a newspaper article describing an organization in success (crisis), 32 teams with 4 team members each (N=128) were asked to discuss two equally qualified candidates (male and female) and to make an appointment decision. Group composition varied regarding gender (all-male, lone female, diversity, lone men).

**Results**
There was no glass cliff in individual and group decisions as women were preferred regardless of organizational performance. Decisions of women (men) with minority status differed from balanced and majority conditions in their support for the male (female) candidate. Only 10% of discussion content featured gender-specific arguments, such as gender stereotypes (women’s communal traits), female quotas and group composition. Group composition was discussed more in all-male groups than in token women and diversity groups. In groups that eventually decided for the female candidate, gender-specific arguments were more prominent.

**Limitations**
The study was conducted in a small student sample.

**Implications**
Results are in line with research on tokenism and the queen bee phenomenon. They shed light on the influence of group composition on glass cliff mechanisms, e.g. that women’s potential to signal change was predominately discussed in all-male groups.

**Originality**
This is the first known study to apply glass cliff research to the group setting.
Motives and mindsets: when and why people select women to glass cliff positions

Clara Kulich & Vincenzo Iacoviello
University of Geneva

State of the Art: (75)
Glass cliff research has illustrated that women and ethnic minorities are more likely to obtain leadership positions in precarious contexts. The reasons for this bias are multifold. Some studies have suggested hostile motives may lead decision-makers to appoint women in precarious positions to put them up to failure, while other studies have suggested that they are appointed for their potential to change the situation. Moreover, findings illustrate that high as well as low sexist participants may cause glass cliffs.

New Perspectives/Contributions (100)
We introduce a theoretical model that predicts when benign and when hostile motives should lead to the glass cliff based on the mindset of decision takers. When people are in a mindset to do the best for the organization and have benign motives, they will choose a minority candidate because s/he is associated to the potential to change the crisis situation. When people’s mindset is to focus on the candidates’ social category, they will either try to prevent the failure of the majority candidate, or to provoke the failure of the minority candidate (e.g., scapegoating).

Research/Practical Implications (53)
This model offers a theoretical framework to studies investigating the causes of the glass cliff, and an explanation to ambiguous results in the literature. In practice it implies that the type of motives and mindsets which cause a glass cliff will impact the type of consequences for the individuals occupying glass cliff positions.

Originality/Value (18)
No model has so far attempted to integrate the disperse findings on the causes of the glass cliff.

Women and Precarious Leadership Positions: A Meta-Analysis of the Glass Cliff Phenomenon

Thekla Morgenroth¹, Teri A. Kirby¹, Michelle K. Ryan¹²*, & Antonia Sudkaemper¹
* presenting author
¹ University of Exeter, UK
² University of Groningen, The Netherlands

Purpose
Research into the glass cliff – whereby women are more likely than men to occupy relatively risky or precarious leadership positions (Ryan & Haslam, 2005, 2007) – has been conducted for over 15 years. The purpose of this research is to investigate the robustness of the glass cliff phenomenon through meta-analysis.

Methodology
We present the results of three separate meta-analyses of key aspects of the glass cliff phenomenon: (a) archival field studies, (b) experimental studies investigating whether women are evaluated more
positively in times of crisis, and (c) experimental studies investigating whether women are more likely to be selected for leadership positions in times of crisis.

Results
All three meta-analyses provide evidence for the glass cliff phenomenon. However, there is considerable variability in effect sizes and the analysis reveals a number of significant moderators.

Limitations
The complex nature of the glass cliff means that we could not analyse all potential moderators systematically. This analytic necessity may have obscured some of the nuances of the glass cliff.

Implications
Taken together the results suggest both the need for a nuanced discussion of the phenomenon and the need for future research into the glass cliff.

Originality
To our knowledge, this is the first meta-analysis of the glass cliff.
Studies on bullying and mistreatment at work provided unquestionable evidence that these situations lead to a plethora of negative consequences for its targets and for the organizations. This underscores the need for a thorough understanding of and preventative measures against such behaviours. Our symposium aims to address this need. First, three studies fill current voids in our understanding of the phenomenon by presenting alternative angles to bullying and mistreatment. Salin and colleagues explore whether workplace bullying can, besides a situation triggering negative consequences, also be regarded as a context that diminishes the positive effects from motivation and engagement enhancing HR practices. Griep and colleagues investigate whether the effects of acting incivil as well as efforts to reconcile are different for employees and supervisors. Keashly develops an integrative model on bullying in the academia as a specific and understudied context in studies to date. Second, two studies explore specific interventions that may counteract bullying and mistreatment at work. Van den Brande and colleagues investigate whether an e-learning tool focusing on coping strategies adds to individual resilience against workplace bullying. Tuckey and colleagues develop an evidence-based framework and instrument for tackling risk factors of workplace bullying at the organizational level. Besides developments in insights, the studies included in this symposium apply various methods – moderation analysis, diary study, integrative literature review, quasi-experimental design, multi-study design – that could inspire future research on bulling and mistreatment at work specifically as well as in the broader field of Work and Organizational Psychology.

The symposium includes following studies:

1. High performance work practices and engagement: Workplace bullying as a disruptive factor – Denise Salin, Guy Notelaers, & Elfi Baillien
3. The academic workplace: Unique context for examining workplace bullying – Loraleigh Keashly
4. Quasi-experimental study to evaluate an online workplace bullying intervention – Whitney Van den Brande, Elfi Baillien, Martijn Schouteden, Tinne Vander Elst, Hans De Witte, & Lode Godderis
5. Advancing the risk management of workplace bullying as a health and safety hazard – Michelle Tuckey, Yiqiong Li, Annabelle Neall, Peter Chen, Josh Mattiske, Maureen Dollard, Sarven McLinton, & Alex Rogers
High performance work practices and engagement: Workplace bullying as a disruptive Factor

Salin, D.¹, Notelaers, G.², & Baillien, E.³

¹ Hanken School of Economics, Finland
² University of Bergen, Norway
³ KU Leuven, Belgium

Purpose
High performance work practices (HPWPs) have typically been shown to positively influence employee attitudes and performance. In this study, we seek to analyze if interpersonal mistreatment in the workplace may affect this relationship. More precisely, the aim of this study was to analyze if workplace bullying moderates the relationship between high performance work practices and engagement.

Methodology
A survey was conducted in Finland (n=434) among service-workers, mostly within the retail sector. Validated measures were used to measure HPWPs (Chuang & Liao, 2010), engagement (Schaufeli & Bakker, 2003) and bullying (Notelaers et al., 2018). Hayes’ PROCESS macro in SPSS was used to conduct the moderation analysis.

Results
The results confirm a positive relationship between high performance work practices and engagement and suggest that workplace bullying acts as a moderator. More precisely, when employees are subjected to high levels of bullying, the positive relationship between high performance work practices and engagement diminishes.

Limitations
The cross-sectional nature of the design does not allow for conclusions about causality.

Research/Practical Implications
The results point to the importance of exposure to workplace bullying as a critical event, which disrupts the positive effect of high performance work practices on engagement.

Originality
The findings demonstrate that not only does interpersonal mistreatment lead to negative effects on target attitudes and well-being as shown by previous research, but mistreatment may also offset the effects of organizational factors generally associated with positive employee outcomes.

Employee-supervisor incivility spirals: Who benefits and who suffers?

Griep, Y., Vranjes, I., & Hershcovis, M. S.

University of Calgary, Canada

Purpose
We investigate the theoretical paradigm of incivility spirals (Andersson and Pearson, 1999), namely the reciprocation of incivility in employee-supervisor dyads. Moreover, we examine whether those in higher formal status positions are rewarded from being uncivil and the role of reconciliation is in this process.

**Methodology**

We estimated a time-lagged multilevel model on daily survey data from 105 employee-supervisor dyads for 20 consecutive workdays (1,501 observations).

**Results**

Employees or supervisors who acted uncivilly were more likely to consistently act uncivilly and trigger uncivil counter-reactions in their supervisors or employees, respectively. Moreover, supervisors who were the target of incivility or who behaved uncivilly themselves received higher performance ratings, whereas the opposite was true for employees. Finally, we found that employees are rewarded, and supervisors punished, for reconciling, as observed from their performance ratings.

**Limitations**

The self-reported nature of the data could introduce social desirability, while the use of daily-time lags may result in recollection bias.

**Research/Practical Implications**

These findings nuance the central paradigm of incivility spirals by incorporating the role of formal status and reconciliation. We find that while supervisors are rewarded for behaving uncivilly and not reconciling, it is not acceptable to be uncivil as an employee, unless they are the one to reconcile.

**Originality**

This is one of the first studies to provide empirical evidence about the differential effects of incivility spirals among supervisors versus employees. Additionally, the use of repeated data and objective performance ratings make a strong case for the role of formal status as an important contextual variable.

---

**The academic workplace: Unique context for examining workplace bullying.**

Keashly, L.

Wayne State University, USA

**Purpose**

Examine how the norms of academe, structure of academic work, institutional structures, the nature of higher education and societal norms shape the enactment, experience and response to bullying involving faculty.

**Methodology**

An integrative literature review examining faculty conduct and bullying, specifically through the lens of academic culture (debate and critique), principles of academic freedom and faculty governance, academe as a self-regulating profession, nature and changes in higher education structure and
environments as reflected in neo-liberalism, visibility of faculty work through e-media, and societal (de)valuing of intellectualism.

Results

The culture and values of academe permit faculty greater behavioral latitude than staff. This has implications for what is considered (in)appropriate behavior and who should respond. Specifically, faculty colleagues rather than administration are best positioned to address these situations with other faculty. Neoliberalism and the rise of anti-intellectualism threaten faculty status in higher education, creating a stressful environment in which bullying becomes a survival tactic. Faculty are becoming the victims of new bullies including the public (mobbing through e-media) and the state (increasing involvement in HE).

Limitations

This analysis focused on the professional culture and broader environmental influences and did not include personal, interpersonal and institutional dynamics, which would provide a fuller picture.

Research/Practical Implications

Empirical examination of these propositions would involve comparison to other industries, cross disciplines (variation in professional norms) and between countries (variation in societal value of higher education and faculty status). Practically, this reveals the importance of faculty involvement in assessment and response strategies.

Originality

This examination of academics and academe highlights 1) the significance of cultural/professional norms as an understudied influence on workplace bullying and 2) the need to examine the public and the state as workplace bullies.

Quasi-experimental study to evaluate an online workplace bullying intervention

Van den Brande, W. 1,2, Baillien, E. 2,3, Schouteden, M. 1, Vander Elst, T. 1,2, De Witte, H. 2,4, & Godderis, L. 1,2

1 IDEWE Group, Belgium
2 KU Leuven, Belgium
3 University of Bergen, Norway
4 North-West University, South Africa

Purpose

This study tested the effectiveness of an evidence-based intervention aiming at reducing exposure to workplace bullying by discouraging emotion-focused coping strategies and stimulating self-efficacy. We hypothesized that the levels of emotion-focused coping strategies and workplace bullying decrease over time among employees in the intervention groups, whereas the level of self-efficacy was expected to increase over time.

Methodology
We employed a quasi-experimental design with three measurement points for two intervention groups (i.e. Group 1 and Group 2) and one control group (i.e. Group 3). Multilevel analyses were performed in R (N = 2,873).

**Results**

Our hypotheses were partially confirmed: in comparison to the control group, Group 1 reported lower levels of exposure to workplace bullying behaviors after completing the intervention. Group 2 reported lower levels of emotion-focused coping strategies after completing the intervention. No significant effects were found for self-efficacy.

**Limitations**

The mixed findings could relate to restrictions of the study design. Hence, we advise future intervention studies to also assess contextual factors (e.g. organizational context) in order to strengthen our results.

**Research/Practical Implications**

This study showed that the intervention is useful in order to reduce workplace bullying by focusing on emotion-focused coping strategies. However, we argue to implement similar interventions considering contextual factors (e.g. support from the management).

**Originality**

Despite the well-known negative impact of workplace bullying incidents, there are very few studies testing interventions to reduce bullying. Therefore, we evaluated the effectiveness of an online intervention directed at reducing the employee’s exposure to workplace bullying.

**Advancing the risk management of workplace bullying as a health and safety hazard**

Tuckey, M.¹; Li, Y.²; Neall, A.¹; Chen, P.³; Mattiske, J.¹; Dollard, M.¹; McLinton, S.¹; Rogers, A.¹

¹ University of South Australia, Australia
² University of Queensland Business School, Australia
³ Auburn University, USA

**Purpose**

In two studies, a conceptual framework and practical tool for workplace bullying risk management were developed and formatively evaluated.

**Methodology**

In Study 1, 342 bullying complaints lodged with a state work health and safety (WHS) regulator were analysed thematically. In Study 2, based on the framework arising from Study 1 an audit checklist was created, then trialled by WHS inspectors responding to psychosocial hazards. Inspectors received training on the framework and checklist, and participated in interviews regarding the trial from which key themes were identified.

**Results**
Study 1 identified three organizational risk contexts for workplace bullying: (1) administrating and scheduling working hours; (2) managing work performance; and (3) shaping relationships and work environment. Study 2 revealed that the checklist enhanced the quality and efficiency of the regulatory response, and helped overcome barriers to tackling psychosocial hazards.

Limitations

Outcome data were not collected during the trial, but will be vital in future to evaluate the effectiveness of the checklist in aiding bullying prevention.

Research/Practical Implications

These studies position recognized work and organizational antecedents of bullying within functional risk contexts. They provide an evidence-based framework for risk management efforts and a practical tool for tackling bullying risk factors at the organizational level.

Originality

Prevention efforts typically treat bullying as an interpersonal problem, yet work and organizational factors (e.g., role ambiguity, constraints) are the primary contributing factors. We tackle one important reason for this discrepancy – a lack of translational research to bridge the gap between empirical findings and evidence-based practical tools.
It is well known that work stress and burnout reduce employee well-being. While many precursors of stress are at work, research has identified sources of work stress outside the workplace such as work-family conflict. Thus, when examining causes of worker stress, factors outside the immediate workplace as well as those associated with the employees themselves, should be considered. Four papers here report original empirical research on factors that affect employee well-being, stress and burnout. In one paper with 354 employees, use of communication technology at home was associated with higher engagement but lower work-life balance satisfaction. In additional longitudinal research, 1,159 ‘sandwich generation caregivers’ (caring for children and elderly family) experienced increased depressive symptoms during follow-up; organizational and supervisor support alleviated depression. Another paper analyzed the relationship between depression and burnout in 235 health care providers and found that depression was aligned with the exhaustion aspect of burnout but less so with the other aspects of the burnout syndrome. While depression and burnout share some co-morbidity, their differences are consequential for employee well-being and interventions. In a fourth paper, job insecurity during the recent recession in a country with high unemployment, Greece, contributed to greater worker stress and reduced psychological resources such as self-efficacy in an employed sample (n=310), thus indicating the importance of bolstering employees’ resilient skills during challenging economic times. Taken together, the research here indicates the importance of considering non-work factors when addressing work stress, burnout and well-being at work and designing interventions.

INDIVIDUAL PAPERS

Balancing work-based information and communication technology use at home: The Good, the bad, and the ugly?

Arla Day, PhD, Professor, Saint Mary’s University, Halifax, NS, Canada
Jillian Tonet, MSc, Saint Mary’s University, Halifax, NS, Canada

Purpose
Use of work-based Information and communications technologies (ICTs) at home, and expectations around this use, may have both positive and negative effects on workers’ well-being (Day, Barber, & Tonet, in press), in terms of their burnout, stress, and work-life balance (WLB) outcomes. However, few studies have examined this complex interplay.

Design
354 leaders and subordinates from across Canada and the US completed an online survey
on their ICT use, expectations, burnout, stress, and WLB issues.

Results
Workers with caregiver responsibilities engaged in more work-relatedICT use at home, but also experienced more stress. In turn, although ICT use at home was associated with higher engagement in some groups, it was also associated with lower satisfaction with WLB and higher levels of ICT addiction and workaholism.

Limitations
We use cross sectional data so causality cannot be determined. Results provide interesting insights into ICT use at work, and longitudinal data would expand our knowledge about the impact of ICT use and expectations on workers with different needs.

Practical Implications
Some organizations have ‘banned’ ICT after work hours in an attempt to improve well-being and work-life balance. Results suggest that the situation is not this simple, and we must examine individual situations and needs, as well as organizational expectations and support.

Originality/Value
The study helps to clarify the potential paradox of ICT use/expectations with well-being. We focus our work on a new model to help to detangle the conceptual complexities of balancing ICT in one’s work and non-work roles.

Sandwich Generation Caregivers and Depression: The Moderating Role of Organizational Support
Sharon Toker, Ph.D. Professor & Keren Turgeman-Lupo, Ph.D., Tel Aviv University, Tel Aviv, Israel
Galit Armon, PhD, University of Haifa, Haifa, Israel

Purpose
We aimed to study the effect of being an employed ‘sandwich-generation-caregiver’ (i.e., caring for both children and elder family members), on the likelihood of experiencing an increase in depressive symptoms over time, compared with employees who care only for children or for elders, or who do not provide any form of caregiving. A second aim was to examine the degree to which two different sources of support—family-supportive organizational practices and supervisor-emotional support mitigate this effect.

Design
We used a two-wave longitudinal design. 1,159 Israeli employees completed two study questionnaires, with an average time gap of 18 months.

Results
We found that sandwich generation caregivers indeed experienced a significantly higher increase in depressive symptoms during follow-up compared with all other groups. We also found that this effect
was weakest among employees with high levels of either family-supportive organizational practices or supervisor emotional support.

Limitations
Limitations include potential common method bias due to self-reports of study measures and a research sample that represents mainly white collar employees.

Practical Implications
The favorable effects of supportive organizational and managerial practices should raise HR practitioners' attention to the toll inflicted on sandwich-caregivers and the attenuating role organizations can play.

Originality/Value
Sandwich-generation-caregivers constitute 8-28% of the population in countries in the West. However, few studies have focused on them, with most being cross-sectional and failing to compare sandwich-generation-caregivers with others. Our study is the first to overcome these gaps and to include organizational boundary conditions.

Limits of the Superficial Overlap of Burnout and Depression
Michael P. Leiter, PhD, Professor Deakin University, Geelong, VIC Australia

Purpose
Considering burnout as simply exhaustion not only misses the more challenging and intriguing aspects of the syndrome, it muddles distinctions among other forms of distress, such as depression which include exhaustion as an indicator. On the surface, exhaustion looks similar in people experiencing burnout and depression, but the overlap shrinks when appreciating burnout’s links with job demand/resource imbalances.

Design
This presentation reviews data from a survey of health care providers (N=235) who have completed the MBI and the 5-item Mental Health Index (MHI).

Results
The analysis indicated that MHI items reflecting depression (feeling blue and down in the dumps) did not distinguish participants with a full Burnout profile from those with an Overextended profile. This pattern confirms depression as aligning with the exhaustion aspect of burnout but being less aligned with the other aspects of the full burnout syndrome.

Limitations
The analysis is based on self-report from an employed population for which there is no evidence of clinical depression.

Research/Practical Implications
The confusion of burnout with depression diminishes the impetus to improve the quality of work environments while pursuing therapeutic remedies for people enduring poorly managed demand/resource imbalances at work. Burnout's close links with work-life quality encourages improving work-settings while clinical diagnoses call for improving the patient to adapt to whatever the work environment provides.

Originality
The analysis applies a new framework of MBI profiles based on person-centered profiles to the question of depressions and burnout. While the two syndromes share some co-morbidity, their differences are consequential for employee well-being.

Job insecurity and economic hardship: Predictors of stress in an employed Greek sample
Esther R. Greenglass, PhD  Professor York University, Toronto, Canada
Antoniou Alexander Stamatios, PhD  Professor, National and Kapodistrian University of Athens, Athens, Greece

Purpose
The Great Recession that occurred 10 years ago resulted in economic hardship and unemployment world-wide with some countries i.e., Greece, harder hit than others. In Greece, the unemployment rate rose from 6% (2008) to 16% (2011) and continued to rise. Our model examined the role of job insecurity, economic hardship and psychological resources as predictors of stress in an employed sample in Greece.

Design/Methodology
We used a cross-section design with 310 Greek employees (mean age 35) who completed a questionnaire in 2011.

Results
Our model was an acceptable fit to the data (using SEM). Job insecurity was related to greater economic hardship and increased stress; job insecurity was also associated with reduced psychological resources (self-esteem, reframing and self-efficacy). Economic hardship and resources were indirectly related to stress through worry.

Limitations
The cross-sectional design precludes attribution of causality

Practical Implications
Since our study was conducted in Greece during the recession, findings apply to employed individuals who work in challenging economic times. The negative relationship between worry and psychological resources such as self-esteem and self-efficacy should increase HR awareness of the importance of bolstering individuals’ resilient skills to enable them to cope effectively in a difficult job climate.
Originality/Value
The finding that job insecurity was related to reduced psychological resources suggests that job insecurity may undermine psychological resources needed for coping. Second, this research tests a model integrating job insecurity, economic hardship, and psychological resources with stress in a highly anxious and uncertain job context.
This invited session is a hybrid panel/symposium session.

Dr. Mark Poteet
President & Senior Consultant at Organizational Research & Solutions, USA

How people invest their time at work for accomplishing their tasks and managing relevant workplace relationships may differ substantially across different organizations and national cultures. Yet, one phenomenon that holds true across countries and industries is the steady rise of the workplace meeting as a key site of human interaction in organizations. Employees are in meetings for almost one day per week on average, managers spend up to 80% of their (typically quite pricey) work time in meetings, and CEOs report having 37 meetings per week. Meetings are held for accomplishing numerous goals in organizations, ranging from problem solving and idea generation to consensus building, decision making, action planning, exerting leadership influence, and crafting organizational strategy.

This session is designed to discuss and elevate the flourishing science of workplace meetings. In part one of the session, an overview of meeting science will be provided. The overview will highlight key insights into pre-meeting activities, social dynamics within the meeting itself, and meeting outcomes operating at multiple levels of analysis (behavioral, individual, team, and organizational).
In part two of the session, a highly interactive will occur to help the audience better understand the research, overall learnings, gaps, and potential research directions. As for the research directions, we draw from the literature on multiplexity, in terms of social ties or relationships that have both a task and a social component and that can bring about potential role conflict. Applied to meetings, we argue that multiplexity can refer to a variety of intraindividual attitudes and expectations for a meeting (e.g., expecting to receive guidance; expecting to be heard; expecting a break from other work tasks). A multiplexity lens can also help explain the conflict between ever increasing amounts of time spent in meetings and the need to still accomplish tasks and manage relationships outside the meeting. As part of this section of the session, we will look to generate audience input in unique opportunities associated with the study of meetings in Europe.

In part 3 of the session, we will move to the practical implications of meeting science. In this part of the session, a practitioner/consultant (Mark Poteet) and an academic (Steven Rogelberg) who consults in the meeting space will discuss practical implications of meetings science for organizations and highlight talent management, HR, and leadership development actions derived from the insights of meeting science to date.
ORAL PRESENTATIONS

24 - TOWARD A GREATER UNDERSTANDING OF WORKPLACE SAFETY FOR PROFESSIONAL TRUCK DRIVERS

Lina Valenzuela (1) - Michael Burke (2)
Universidad Icesi, Cali, Colombia (1) - Tulane University, New Orleans, United States (2)

Purpose

For professional truck drivers, we (a) evaluated two competing hierarchical models of safety climate: the prevailing singular higher-order factor model and a proposed multiple stakeholder model focused on concern for employees and concern for the public, (b) examined the dimensionality of safety performance, and (c) tested expected indirect effects of safety culture and safety climate through safety performance on drivers’ hard braking and speeding.

Method

This investigation involved 227 lone professional truck drivers from Colombia, who completed safety culture, safety climate, and safety performance surveys. Data on drivers’ hard braking and speeding were collected three months after survey administration.

Results

Confirmatory factor analyses provided support for the safety climate model with a single higher-order factor reflecting truck drivers’ assessment of how the work environment affects their personal well-being. Second, our analyses supported a multi-dimensional conceptualization of professional drivers’ safety performance. Third, we found that Using Personal Protective Equipment was an important predictor of hard braking and, in combination with safety culture, safety climate perceptions, and Complying with Driving Standards, explained meaningful variance in hard braking.

Limitations

A limitation was that safety culture, climate, and performance surveys were administered concurrently.

Research/Practice Implications

Our findings clarify the meaning of safety climate and safety performance for professional truck drivers, and indicate how aspects of safety performance predict the critical safety outcome of hard braking.

Originality

Together, the findings advance our understanding of workplace safety for lone workers and particularly for professional truck drivers, with intervention points identified for improving safety outcomes.
In describing measures used in their research, authors frequently report having adapted a scale, indicating that they changed something about the scale. Although such changes can raise concerns about validity, there has been little discussion of this practice in our literature. To estimate the prevalence and identify key forms of scale adaptation, we conducted two studies of the literature. In Study 1, we reviewed the descriptions of all scales (n = 2,088) in four top journals over a two year period. We found that 46% of all scales were reported by authors as adapted, and that evidence to support the validity of the adapted scales was presented in 23% of those cases. We also identified several forms of adaptations. In Study 2, we examined the use of six scales across the literature, allowing us to identify unreported adaptations. We found that 85% of the administrations of these scales had at least one form of adaptation and many had multiple adaptations. Evidence to support the validity of the adaptation was again minimal. In Study 3, we surveyed editorial board members and a select group of psychometricians to evaluate the extent to which particular adaptations raised concerns about validity and the kinds of evidence needed to support the validity of the adapted scales. We will review key findings from these studies and offer recommendations for how best to make specific scale adaptations and for how to best to support the validity of those adaptations.
Several research results have demonstrated the prevalence of narcissistic features in leadership positions (Braun, 2017). Psychopathic and narcissistic tendencies in job applicants are a worrying factor for those making recruitment decisions. The dimensional nature of personality characteristics, even of narcissism, is sometimes overlooked (Trull & Durrett, 2005). This may result to labelling all types of narcissism as undesirable in personnel selection. Therefore, there is a need to distinct between dark side (DS) narcissistic features from less detrimental narcissistic tendency. The purpose of this research was to develop a measure of non-constructive narcissism and psychopathy.

We employed a large data pool of recruitment candidates (N=9195) and MIRT (multiple item response theory analysis) to create a reliable questionnaire for DS narcissism. The results demonstrated a theoretically and psychometrically plausible item combination for measuring DS narcissism particularly in organisational context, named MF (mean factor) index.

Future research is needed to examine the new measure and its relationships to real-life organisational outcomes. This would enable us to study further the predictive validity of the MF index. The practical value of our findings lies in their ability to distinct the dark side traits from the more constructive narcissist tendencies.

This study was completed utilizing real-life job applicant data. The MF-index provides an important tool for personnel assessment. It helps to identify the DS features from the less detrimental ones, and on the other hand, to give the more constructive narcissistic tendency applicants a chance to be included as productive members of work organizations.
33 - INVESTIGATING LEADER CAREGIVING THROUGH THE LENS OF ATTACHMENT: A MODERATED MEDIATION ANALYSIS

Per-Magnus Moe Thompson (1) - Thomas Hol Fosse (2) - Joachim Berntsen Skouverøe (2)

BI Norwegian Business School, Leadership and Organizational Behaviour, Oslo, Norway (1) - Norwegian Defence University College, Oslo mil, Akershus, Oslo, Norway (2)

The rationale for studying leadership from an attachment perspective often rests on the idea of leaders as caregivers. Therefore, it seems somewhat paradoxical that most studies focus on leaders’ attachment style rather than their caregiving orientation. The present study investigated the mediating role of caregiving avoidance in the relationship between leaders’ avoidant attachment style and followers’ experience of being cared for (i.e., interactive empathy, IE). Furthermore, given the context-sensitive nature of the attachment and caregiving behavioral systems, the moderating effect of group cohesion was tested. Data was collected from 410 military recruits in the Norwegian defense sector. The moderated mediation model was statistically significant. However, contrary to previous research, cohesion was found to have a favorable effect on avoidant leaders’ tendency to withdraw from caring. This suggests that highly cohesive groups may provide avoidant leaders with a sense of attachment security which allows for activation of the caregiving behavioral system, hence enabling the leader to better provide care for followers. Implications for future research and organizational practice are discussed.

Keywords: attachment style; caregiving; interactive empathy; group cohesion; moderated mediation
Social loafing, one form of motivational loss in teams, can be a significant source of process loss and poses a challenge to team research and practice. Few studies have incorporated team member attitudes and individual differences in social loafing models. At the team level of analysis, research is even scarcer. The purpose of this study was to examine the degree to which learning orientation (individual-level factor) and team learning behaviors (team-level factor) impact change in peer and self-rated social loafing.

In the present field study, we used a multiwave design to track and explain changes in social loafing for 195 teams. We conducted latent growth curve (LGC) modeling within a multilevel analysis framework.

The results showed that only team learning could explain why social loafing dropped for certain teams. Individuals who were part of teams scoring higher on team learning throughout nine weeks of teamwork decreased their peer and self-rated social loafing. Learning orientation could only explain initial states of self-rated social loafing.

These findings suggest that team learning behaviors are powerful levers to reduce individual motivation losses above individual differences. The study presents an opportunity to take a learning approach in facilitating and coaching work teams. Since not all teams engaged in team learning behaviors, it also points to the importance of pursuing work on how process interventions can be implemented to sustain and increase ongoing learning in teams.

The limitations of the study are the use of questionnaires to measure complex concepts and of undergraduate student project teams.
LEADERS’ IMPACT ON EMPLOYEE ABSENTEEISM: A SYSTEMATIC LITERATURE REVIEW

Ann-Kristina Løkke (1)
Aarhus University, Management, Aarhus, Denmark (1)

Purpose
The current literature on leaders’ impact on absenteeism is characterized by various conceptualizations and operationalizations. Thus, the aim of this article is to provide a structured overview of the current state of research on the relationship between leaders’ behaviour and employee absenteeism.

Design/Methodology
We searched 16 online databases within management, occupational health, psychology, and economy using keywords such as “management” and “leadership” and various synonyms of “absence”. The initial search yielded 2401 articles; based on several inclusion criteria, 66 studies were selected for the review.

Results
Leadership style, leaders’ interventions, and their own work absence influence employee absence. Thus, behavior such as task monitoring, social support, and showing confidence influences employee absence, besides high quality leadership. Furthermore, interventions such as workplace health promotion strategies as well as leaders’ general attitude towards reasons for absence have an influence. The review indicates that employee absence is associated with both leadership and management.

Limitations
Only 15 out of the 66 studies in the review are longitudinal which poses some limitations in the causal interpretation of the findings regarding the success of managerial initiatives.

Research/Practical implications
The findings can contribute to decision-making concerning development of research questions, designs, and operationalization. Findings support that Human Resource managers should integrate multi-level initiatives in the organization to reduce absence.

Originality/Value
The review is the first of its kind, and it can thus serve as a foundation for developing an agenda for future research and action.
40 - REPRESENTATION OF INTELLECTUAL CAPITAL AMONG MANAGERS OF NON-PROFIT SOCIAL ENTERPRISES

Paula Benevene (1) - Eric Kong (2) - Barbara Barbieri (3) - Massimiliano Lucchesi (1) - Michela Cortini (4)

Università LUMSA, Scienze Umane, Rome, Italy (1) - University of Southern Queensland, School of Management and Marketing, Toowoomba, Australia (2) - Università degli Studi di Cagliari, Cagliari, Italy (3) - Università degli Studi di Chieti e Pescara, Chieti, Italy (4)

Purpose: This study aims to understand the representation of intellectual capital among the non-profit organisations. More specifically, the study deals with the representation of human capital (HC), relational capital (RC) and organizational capital (OC) by the senior management of a group of Italian social enterprises.

Design / Methodology / Approach / Intervention: This exploratory study used a qualitative approach. In-depth interviews were conducted and individually administered to 81 managers of Italian social enterprises. The texts of the interviews were analyzed using the T-Lab software (word occurrence and co-word mapping analysis, Markovian sequences analysis).

Results: Results suggest that managers of social enterprises are not fully aware of the importance of IC and how this can create added value. The results highlighted a limited awareness of the components of IC and their generative power amongst the senior management of Italian social enterprises, suggesting a limited exploitation of organizational knowledge.

Limitations: The study reached only Italian organisations, which do not constitute a statistically representative sample

Research/Practical Implications: findings suggest that managers of social enterprises managers are not fully aware of the importance of IC and how it may create value for their organizations. This study stresses that senior managers of social enterprises need to have a more thorough understanding of IC management and knowledge creation. This would allow them to fully exploit the potential of IC in their organizations for their growth.

Originality/Value: This is the first known attempt to explore the perception of the components of the IC within social enterprises
WHilst there is research documenting the effect of poor sleep on cognition, mood and health, the role of managerial level as a potential antecedent of poor sleep, and as a factor in determining the self-reported consequences of poor sleep is yet to be fully understood. This study sought to examine (a) the reported sleep quantity and quality of employees across four organisational managerial levels and (b) the subsequent reported impact on their work, social and emotional and physical well-being. 945 participants, allocated to one of four groups determined by self-reported managerial level in their organisation, completed a questionnaire measuring sleep duration (sleep quantity) and sleep quality (time to fall asleep, and the PSQI) along with completing a new self-report measure of sleep impact across three domains; work (cognition), physical health and social and emotional behaviours (AISE; Ashridge Index of Sleep Effects). Analysis revealed that whilst both sleep quantity and quality were poor regardless of managerial level, sleep quantity did not differ across managerial level, whereas the most senior managers reported significantly better sleep quality (PSQI) than middle managers and those without managerial responsibility. The results also revealed a similar trend in relation to the impact of poor sleep, with the most senior group of managers reporting less impact across all three well-being domains. This is the first study, using a working population to examine the role of managerial level as a potential antecedent of poor sleep, and as a factor in determining the self-reported consequences of poor sleep.
Purpose
Power defines relationships between people. Although power differences between individuals emerge naturally in teams, little is known about the antecedents and dynamics of power over time. We addressed this research gap by analyzing the determinants and dynamics of individuals’ power in NBA teams.

Methodology
Utilizing a longitudinal dataset of all teams competing in the NBA from 1997 to 2015, we applied dynamic random effects ordered probit specifications.

Results
Our main findings were that individuals’ power was persistent (i.e., genuinely state-dependent) such that players’ state of power in the past predicted their power at a later stage. Individual-level factors that determined whether a player gained and maintained power included greater contributions to their teams (i.e., competence) and less uncooperative behaviors. Additionally, team quality (i.e., how competitive a team was) negatively affected individuals’ power and power maintenance.

Limitations
We discussed the limitations regarding a) the generalizability of our results to other business settings, b) the teams where reciprocal interdependence is low, and c) the individuals who feel powerful besides having actual power.

Research/Practical Implications
We discussed how our findings may help managing power struggles in teams.

Originality
It has been proposed that power is self-reinforcing; however, because most studies do not include longitudinal data, there is no strong support for this claim so far. The NBA database provided us access to longitudinal data that allowed to test this hypothesis directly and we provided evidence that individuals’ power is indeed self-reinforcing (i.e., genuine state dependence) in team settings over time.
56 - INDIVIDUAL PERCEPTIONS OF BOUNDARY CONTROL MITIGATE THE EFFECT OF (IN)CONGRUENCE BETWEEN WORKERS’ PREFERRED WORK/NON-WORK BOUNDARIES AND THEIR ENACTED BOUNDARY MANAGEMENT ON WORK-LIFE CONFLICT

Christin Mellner (1) - Pascale Peters (2) - Susanna Toivanen (3)

Stockholm University, Work- and Organizational Psychology, Stockholm, Sweden (1) - Radboud University, Department of Business Administration, Nijmegen, Netherlands (2) - Stockholm University/Karolinska Institutet, Centre for Health Equity Studies, Stockholm, Sweden (3)

Purpose

This study investigates the inter-relationships between employees’ boundary management types, representing different combinations of boundary (in)congruence, between preferred and enacted boundary management, and work-life conflict, and the potential moderating role of work-nonwork boundary control herein.

Design/Methodology/Approach

Data for this cross-sectional study comprised 3,154 Swedish professional workers in different occupations within both the public and private sector. Correlations, t-tests, Chi square tests and univariate general linear model analyses (ANCOVA) were performed.

Findings

Both enacted integration and boundary incongruence per se were positively associated with work-life conflict. Moreover, incongruence accompanied by a high degree of enacted integration increased work-life conflict, whereas boundary control reduced work-life conflict. Finally, boundary control mitigated work-life conflict. Interestingly, this was especially the case among employees both preferring and enacting integration, i.e., boundary congruence, but also among employees preferring segmentation but enacting integration, i.e., boundary incongruence.

Practical implications

This study provides valuable knowledge on employees’ boundary management types that are associated with different levels of work-life conflict, and the role of boundary control herein as an important factor to combat work-life conflict. Organizations play an important role in creating new legitimate beliefs and as such, leisure norms could be implemented that promote employees’ boundary control, and subsequent reduced work-life conflict.

Originality/Value

This study provides new insights on the relationships between employees’ preferred and enacted boundary management taken together, and work-life conflict, and especially the role of boundary control herein. This kind of knowledge is of high relevance in contemporary working life characterized by an ever-increased blurring of work-nonwork boundaries.
Purpose
The present study offers insights into understanding how employees’ personal values (self enhancement and self-transcendence) explain the preference for styles of effective leader. Beyond the direct effect on perceptions of the effective type of leader, we argue that values may also interact with organizational contexts in influencing perceptions. We suggest that managerial position may moderate the relationships between personal values and perception of the effective leader.

Design/Methodology/Approach/Intervention
Two hundred fifty five teachers participated in this study by completing questionnaires. The questionnaires were administered using identical electronic and hard copy versions.

Results
The findings support the hypothesized effects of personal values on perceptions of the effective leadership. However hypotheses regarding moderation effect were not supported.

Limitations
The limitation of the study is related to the fact that all the data were collected through self-reporting.

Research/Practical Implications
The study highlights the theoretical understanding of the relationship between personal values and individuals’ perceptions in organizations. The present study emphasizes the way to which individuals’ cognitive structures characterize the effective leader. These findings should serve as a constructive tool for managers in choosing leadership style that matches the employees’ values.

Originality/Value
Despite the highly acknowledged notion that implicit leadership theory is affected by gender, culture or personal traits, we provide theoretical and empirical support for the impact of personal values on perception of effective leadership.
Purpose: Management philosophers maintain that respect must be conferred upon every individual, given their potential to be a moral agent. However, if managers expect to see respect in the workplace, they must demonstrate and consistently role-model the behavior themselves. This means proactively addressing incivility and discrimination, before a lack of respect becomes an ethical issue.

Design/Methodology: Insights from Positive Organizational Ethics are leveraged to present an ethical decision-making model from two perspectives: individualistic and tribal-collectivistic. The intent is for managers to become aware of and generate mutual respect, especially for organizational members who exercise values emanating from alternative, marginalized, or minority cultures.

Approach/Intervention: Leveraging prior research in ethical decision-making, this work shows how alternative perspectives influence cognitions and emotions that can impact management response-actions. Expanding upon a traditional Western framework offers a more mindful consideration of alternative ways of thinking, feeling, and being in the world.

Results: The model presented can be used in management education as a tool to encourage awareness and deliberate mindfulness. Suggestions for the model’s application are offered, including specific moral competencies, skills that can be learned to support respect as a moral action.

Limitations: Future research can test the model and its use in management education.

Practical Implications: Learning to be respectful toward differing and potentially divergent perspectives is crucial in developing trans-cultural sensitivity and dialogue, necessary in today’s global workplace.

Originality/Value: Management education tends to encourage a reactionary approach toward resolving ethical issues, rather than leveraging a strength-based approach to prevent them from occurring. This research supports the notion of ongoing adult moral development in organizational settings.

In today’s turbulent times, employees are often expected to keep up with multiple and ongoing changes in their daily work. Research has shown that such task changes can be beneficial as well as harmful for employees. What is currently less clear is how—and why—such changes have these effects, as few studies have investigated the intrapersonal processes following task changes over time. In reply, we develop a new longitudinal model by drawing on the challenge-hindrance stress framework and theorize that that there are two key mechanisms underlying the positive and negative effects. Specifically, we propose that employees can appraise task changes as (1) challenges because they stimulate learning and allow employees to utilize their skills (skill utilization), or (2) as hindrances because changes bring along uncertainty about the future of one’s job content (qualitative job insecurity: QJI). Subsequently, we argue that skill utilization relates positively, and QJI relates negatively, to employee job satisfaction. Finally, we propose that the appraisal of task changes in terms of challenges and hindrances is contingent upon employees’ trait regulatory focus and thus depends on their promotion or prevention focus.

We tested our moderated-mediation model in a four-wave dataset obtained from a large heterogeneous sample of Flemish employees (October 2012: N = 2,374; May 2013: N = 831; November 2013: N = 795; May 2014: N = 585; time lag of ca. six months between subsequent measurement points). A multilevel modeling approach was used in which measurements were clustered within persons. Specifically, mediation and moderation effects were tested at the within-person level while controlling for variance in the study variables between persons.

The results largely supported our hypotheses, as task changes positively predicted QJI, and both task changes and QJI related negatively to job satisfaction across time. Although task changes did not show a significant direct link to skill utilization, skill utilization positively predicted job satisfaction six months later. Further, the results showed that promotion focus boosted the relationship between task changes and job insecurity across time and that prevention focus buffered the lagged indirect relationship between task changes and skill utilization.

The study ends with discussing how the model extends current knowledge on intrapersonal mechanisms that unfold from task changes. We also discuss how our model can help practitioners and scholars with creating more sustainable task change that positively—instead of negatively—affects employees.
Purpose: Behavioural safety research has placed considerable emphasis on safety compliance and safety participation as key variables in understanding the role of human behaviour in accidents. This focus may limit our ability to understand how human behaviour contributes to system failures and accidents. This paper discusses the measurement and use of three behavioural variables (human error probability HEP; behavioural consistency BC; control error probability CEP), as a means of extending our understanding of the role of human behaviour in workplace safety.

Design: A gamified assessment (the SBT), which uses 3D animation and requires the completion of a sequence of tasks involving 29 decision points and an ideal of 50 control actions, was developed to measure HEP, BC, and CEP. Individuals completed the SBT, and their HEP, BC and CEP scores were examined in relation to independent data provided by supervisors or colleagues on their workplace rule-breaking behaviour.

Results: Chmiel (2005) rule breaking scale was used to assess workplace behaviour, and significant correlations were found with the SBT scores, (HEP $r = .45$; BC $r = -.31$, and CEP $r = .42$) indicating predictive validity.

Limitations: To fully understand the value of the HEP, BC and CEP measures, further validation studies using other measures of workplace behaviour are required.

Implications: The ability to obtain measures of HEP, BC, and CEP will enrich theory development, and allow for valid employee screening and selection decisions.

Originality/value: The field of behavioural safety research lacks objective measures, and has been stagnant in terms of the constructs it is examining. Introducing new variables, such as HEP, BC, and CEP is timely.
Purpose – The purpose of this paper was to evaluate long-term effects of a mindfulness-based emotional intelligence intervention on organizational leaders’ health-related sustainability. This was studied specifically with regard to psychological detachment, i.e., possibilities for mentally letting go of work-related thoughts and emotions during leisure, recovery, and health.

Design/methodology/approach – 40 leaders within a Swedish telecom company active at the global market were randomized to an intervention study comprising an 8-week mindfulness program. Three waves of data collection over a 6-month period were conducted. Repeated measures ANCOVA analyses were performed.

Findings – Findings showed that mindfulness practice increased psychological detachment, and improved recovery and health. Moreover, increases in mindfulness per se could be attributed to the studied intervention effects.

Originality/value – This research add new knowledge on the role of mindfulness in enhancing positive antecedents for buffering health-related work-life outcomes among leaders in knowledge intensive, modern work organizations.
73 - EXPLORING THE BENEFITS OF EXPRESSIVE WRITING FOR WORKPLACE EMBITTERTMENT; A RANDOMISED CONTROL TRIAL

Evie Michailidis (1) - Mark Cropley (2)
Cyprus Institute of Marketing, the Cyprus Business School, Nicosia, Cyprus (1) - University of Surrey, Guildford, United Kingdom (2)

Purpose: Clinicians working in occupational health services often recognise features of embitterment in organisations however, research on interventions for embitterment are scarce. The present study aimed to assess the effectiveness of an expressive writing intervention on working adults who experience workplace embitterment.

Design/Intervention: Employing a randomised control trial we ought to test an expressive writing intervention for its effects on embitterment, work-related rumination and sleep quality and assess whether the effect of the intervention was maintained over time by following up participants after one and three months.

Results: Findings partially supported our hypothesis as results showed that participants who completed the expressive writing intervention (N = 23) did not show significantly lower levels of embitterment, affective rumination, higher levels of detachment, either improved sleep quality, compared to participants who completed the factual writing (N = 21), when baseline values were controlled for. However, when looking at the mean scores embitterment and affective rumination levels diminished, detachment levels increased and sleep quality improved throughout the course of the intervention for both groups.

Limitations: High attrition rates and reliance on only self-reported questionnaire data.

Research/Practical Implications: The stability of embitterment as indicated in previous studies as well as the fact that both groups showed reduced levels of workplace embitterment, raises the question of whether any type of writing benefits embittered employees and is worth investigating further.

Originality/Value: This is the first randomised control trial study design on workplace embitterment which also adds to the organisational health psychology interventions literature.
Purpose – Recent literature reviews have called to expand and sharper focus of the costs and of prosocial behaviors such as OCB. Attending this call, we focus on the potential costs of OCB on task performance i.e., the main indicator of individual performance. We aim to empirically identify four performance-profiles: high task-OCB, low task-OCB, high task and low OCB, and low task and high OCB), as well as their links with three wellbeing indicators: purpose in life and personal growth, life satisfaction, and job satisfaction.

Design – Cross-sectional survey data are collected from employees (1094) and supervisors from 35 organizations in Spain.

Results – We identified the four performance-patterns and also a pattern with medium levels of task-OCB performance (from 14% to 25% of the sample). Highest levels of task performance (evaluated by supervisors) and OCB (self-evaluated) were associated to highest levels of well-being and vice-versa. Furthermore, high task performance and low OCB were associated to no-optimized wellbeing where job satisfaction was high and purpose in life and personal growth were low. The opposite was associated to low task performance and high OCB.

Limitations – Limitations are the nested nature of the data and the cross-sectional design.

Research/Practical implications – Employee wellbeing is a strategic resource for companies aiming to improve task performance and OCB. Companies should protect their ability to build-up different aspects of employee wellbeing.

Originality/Value – This study integrates disparate literatures attending the bright and dark side of OCB.
The purpose of the current study is to investigate the role of job crafting in work intensification demands such as tight deadlines, shortage of time to finish a task and high work speed. The current study followed a mixed methodology design, implemented in two phases. Study 1 was the qualitative phase that explored employees’ experiences of work intensification and their coping mechanisms. The twenty semi-structured interviews allowed for the development of a research model and hypotheses considering the relationships between work intensification, work-related resources, job crafting, flexible working practices and job satisfaction. Study 1 showed that work intensification could be experienced as a positive phenomenon by employees that perceive it as a challenging stressor. As a result, they experience resource gains and engage in task crafting behaviours. This was a critical finding because the level up to which an individual experiences a stressor is less significant than the way it is perceived, as hindering or challenging. Study 2 was the quantitative phase that investigated the research model with a two-lag longitudinal survey design. Study 2 confirmed all hypotheses of the model indicating that, even in intensified working environments work-related resources motivate higher engagement in task crafting which increases job satisfaction over time. The current study aims to promote job crafting as an approach for employees to take the initiative to redesign their job so that it would better fit their skills and interests thus, to enhance positive well-being outcomes, especially within work intensified circumstances. To sum up, the study highlighted the importance of work-related resources and organisational practices as top-down approaches to be perceived by employees as opportunities that spark their engagement in bottom-up approaches such as job crafting.
Purpose

Managers have to deal with many employees who might have different expectations about how managers should behave. Managers need to take into account these individual expectations while interacting with their employees. To do so, they need to correctly assess their employees’ expectations (interpersonal perception accuracy – IPA) and to adapt their leadership style accordingly (adaptive leadership). In two studies, we tested whether IPA is related to adaptive leadership and whether this link differs between men and women.

Design/Methodology

The first study included 55 participants and the second 166 participants. Both studies followed the same procedure. First, participants’ IPA was assessed. Then, in an immersive virtual environment, participants were asked to give separate pep talks to two employees who were described as preferring different leadership styles. Adaptive leadership was assessed via coding of participant’s leadership behavior.

Results

For women, IPA was related to adaptive leadership when a participative leadership style was required but not when a directive leadership style was required. For men, IPA was not related to their ability of expressing leadership adaptability either when a participative or a directive leadership style was required.

Limitations

All participants were university students. Future research including real managers is required.

Research/Practical implications

IPA might play a more important role in leadership behavioral processes in women than in men. Development program for female managers might benefit from incorporating IPA training.

Originality/Value

These studies focus on actual behavior; they respond to calls to study more actual behavior.
80 - DOES BEING IN A TALENT POOL ALWAYS REAP BENEFITS? THE MODERATING INFLUENCE OF NARCISSISM

Janki Kanabar (1) - Luke Fletcher (1)
Aston University, Aston Business School, Birmingham, United Kingdom (1)

Purpose: Although talent pools are utilised to develop employees for future high-level roles, they require substantial investments and their effectiveness is not always guaranteed as individual differences may not be accounted for. This study aims to examine whether narcissism, as a dimension of the ‘dark triad’, influences talent pool outcomes. We test a moderated mediation model that hypothesises that positive effects of being in a talent pool on commitment, turnover intentions, and performance are mediated by organisational-based self-esteem (OBSE) and general self-efficacy (GSE), and these mediation paths are moderated by narcissism.

Methodology: A quasi-experimental study was conducted with 100 employees in a U.K. bank that had a pre-existing talent pool (N talent pool=50; N non-talent pool=50). An online questionnaire measured narcissism, OBSE, GSE, commitment, turnover intentions, and performance.

Results: Overall support for the model was found: a) talent pool employees had higher commitment and performance, and lower turnover intentions, b) these relationships were mediated by OBSE and GSE, and c) narcissism weakened the relationship between talent pool membership and OBSE.

Limitations: Self-report measures may have left data vulnerable to social desirability bias. Also, a sample from one organisation limits generalisability of results.

Implications: The research suggests the need for differentiated talent strategies for organisations. Additionally, the importance of applying an understanding of the dark triad to talent management is highlighted.

Originality/Value: Using a naturally occurring talent management initiative elevates ecological validity and strengthens the robustness of findings. The moderating role of narcissism brings valuable novel contributions to talent management literature.
Purpose – The purpose of this study is to investigate predictors and outcomes of both general social capital and job search-related (i.e., domain-specific) social capital during the job search.

Design/Methodology – We collected data from unemployed job seekers at three points in time, as they went through unemployment agencies’ workshops.

Results – We found different correlates for general social capital (i.e., psychological capital, learning goal orientation, job search behaviors, job search effort) compared to job search-specific social capital (i.e., conscientiousness, metacognitive activities). We also found that more conscientious job seekers built up higher levels of job search-specific social capital in the first two months of the unemployment agencies’ workshops, which in turn led to higher levels of metacognitive activities and effort in their search for employment. Finally, we found that conscientious job seekers with high and average learning goal orientation (LGO) exerted more effort, but not those with low LGO.

Implications – Our results provide some insight into the relationships between social capital and job search, including the importance of differentiating general from job search-related (i.e., domain-specific) social capital.

Originality/Value – Little research has examined the role of social capital (i.e., kind, helpful, or friendly feeling or attitude available to individuals and groups; Kwon & Adler, 2014) during the job search process (e.g., McArdle, Waters, Briscoe, & Hall, 2007; Mouw, 2003; Vinokur & Caplan, 1987). This study further differentiates general from domain-specific social capital, as they might have different theoretical and empirical implications in the job search (Van der Gaag & Snijders, 2005).
JUST SHARE IT? A MULTILEVEL INVESTIGATION ON PREDICTORS AND OUTCOMES OF SHARED LEADERSHIP

Kai Klasmeier (1) - Jens Rowold (1)

TU Dortmund University, Department of Human Resource Development and Change Management, Dortmund, Germany (1)

Purpose

For modern organizations shared leadership becomes increasingly important. Based on adaptive leadership theory and social exchange theory we examine transformational leadership, trust and organizational support as predictors of shared leadership. Furthermore, we analyze the influence of shared leadership on team performance and creativity.

Design/Methodology/Approach/Intervention

In total 153 teams with 647 employees participated in our field study. Data collection took place at three time points. Team performance and creativity were assessed by team supervisors. To test our hypotheses, we used a multilevel path-model with Bayesian estimator.

Results

We found effects of transformational leadership and trust on shared leadership at the team-level and for trust and organizational support at the individual-level. Furthermore, shared leadership had a positive impact on team performance and creativity.

Limitations

Some teams did not participate completely in the study so that maybe not the whole variance of team behavior is captured.

Research/Practical Implications

Further studies should examine the differential effects of transformational leadership and organizational support on individual and team-level. Moreover, shared and vertical leadership could be analyzed on a daily basis to understand the interplay between both leadership sources. Based on the results, organizations can increase shared leadership behavior by focusing on transformational leadership and trust-building.

Originality/Value

This study contributes to the understanding of the antecedents and outcomes of shared leadership. Furthermore, the dynamic development of team processes based on an IPO-model is explored.
Purpose: When team members participate equally in discussions performance has been found to be higher (Wooley et al, 2010). However, methods of stimulating equal participation have rarely been studied. This research examines whether feedback and reflection can promote participation equality and behaviour change within teams.

Methodology: A quasi-experimental study was conducted to observe 101 student teams (515 participants) as they participated in a teamwork module. Teams were randomised into three conditions: ‘feedback with reflection’, ‘reflection only’ and ‘control’. A real-time observation methodology (Farley et al, 2018) was used to measure participation equality and two participation behaviours (Bringing In and Shutting Out) during consecutive meetings.

After the baseline meeting, ‘feedback with reflection’ participants received information on their participation equality and behaviours. They also engaged in reflection activities designed to stimulate reflexive discussions. ‘Reflection only’ teams received the latter, but not the former. Control teams received neither.

Results: Multilevel analyses showed that ‘feedback with reflection’ teams did not participate more equally after the intervention, compared to ‘reflection only’ and ‘control’ teams. However, ‘feedback with reflection’ team members used significantly more Bringing In (compared to both other conditions) and Shutting Out (compared to control teams) post-intervention.

Limitations: Interrater reliability analyses showed that ICC levels were low to moderate. However, they were similar to levels reported in other real-time coding studies.

Practical Implications: Real-time coding captures behavioural statements as they occur, which facilitates the speedy delivery of feedback.

Originality: This is the first study to examine participation equality using a real-time coding approach.
Keywords: team diversity, interdisciplinary work groups, teamwork challenges

Purpose

Complexity of our world’s problems can only be resolved when integrating approaches of different disciplines. Therefore many researchers are challenged by working in interdisciplinary teams. Against the expectations interdisciplinary projects do not always tap their full potential and stress their employees with typical problems. Although this topic is of particular interest there are only few empirical studies regarding barriers in interdisciplinary collaboration. The goal of this qualitative study was to investigate which challenges are emphasized according to research area.

Design

We conducted semi-structured interviews with \( N = 32 \) interdisciplinary researchers from four research training groups; two in science and engineering (S&E) (bioengineering, human-machine-interface) and two in humanities and social science (H&S) (social trust, social-media communication). Researchers were asked about challenges, like communicational or methodological problems, prejudices or role conflicts.

Results

Results of qualitative content analysis showed that prejudices and stereotypes play an important role as a barrier to all interdisciplinary teamwork (91% of participants reported such problems). Especially profession-centrism (belief the own discipline is better than others) was shown to be a threat to successful cooperation (69%). Participants from S&E research groups, compared to H&S, showed more and graver problems regarding group dynamics, like role conflicts.

Limitations

Results of this qualitative study should be broadened with quantitative results from a larger sample.

Implications

Findings shed light on typical challenges in interdisciplinary teamwork and can help to reduce strain for employees in these work settings.

Originality

This study investigates for the first time empirically interdisciplinary challenges, comparing different research areas.
Purpose. Studies have shown that psychological safety (PS) in teams is related to positive outcomes such as speaking up, and performance in teams. However, PS has also been shown to indirectly enhance detrimental behavior in teams. In our study, we want to gain more knowledge on how PS in teams affects individual behavior by integrating it into the theory of reasoned action. We test our model in the healthcare environment, looking at physicians' influenza vaccination behavior.

Design/Methodology/Approach/Intervention. 208 physicians of a Swiss hospital filled in our questionnaires at two time points (T1 = attitude towards getting vaccinated, perceived norm, intention and PS; T2 = vaccination behavior).

Results. We found that PS enhances the effect of attitude towards getting vaccinated on physicians' intention to get vaccinated which in turn predicts physicians' reported influenza vaccination behavior.

Limitations. We assessed self-reported vaccination behavior which might not be congruent with the objective behavior.

Research/Practical Implications. Our study enables a better understanding of PS's role in the prediction of individual behavior. We found that PS enhances the effect of individuals' attitudes on a specific behavior. Our results show that PS can have positive and negative side-effects by enhancing the influence of individuals' positive and negative attitudes.

Originality/Value. Our results can help to anticipate conditions under which PS might lead to detrimental behavior and how to counteract it.
Digital health interventions can support positive behaviour change and are becoming increasingly popular for individuals and organisations to manage mental health. They are easily accessible, scalable, and provide return on investment. Problematically, there are only few science-backed smartphone applications on the market. This project aimed at validating a digital health intervention. Working with the European Union’s Horizon 2020 research and innovation programme, we conducted a large-scale randomised controlled trial (RCT) at multiple companies in a naturalistic setting, using a smartphone application to reduce stress at work. The ‘Kelaa’ app is theoretically grounded in the job demands-resources model. As a digital intervention, it enables employees to understand their balance of demands and resources. Via a personalised evidence-based psycho-educational learning journey, employees can build further resources, and thus, reduce stress. Participants (n = 367) were recruited from multiple European businesses. The RCT ran for 4 weeks with 3 measurement points each 2 weeks apart, assessing indicators of stress, wellbeing, resilience, and sleep. The data was analysed by means of hierarchical multilevel analyses. The results suggest that using the app (vs. waitlist control group) significantly improved stress and wellbeing over time. Particularly using the sleep tracking function led to improved sleeping troubles. Theoretical and practical implications are discussed, focussing on the benefits of using technological solutions to mental health in the workplace to support organisations and their employees to thrive.

Summary:

Working with the European Union’s Horizon 2020 research and innovation programme, Soma Analytics conducted the first large-scale, naturalistic, randomised controlled trial (RCT) using a smartphone application to reduce stress at work.

The ‘Kelaa’ app is theoretically grounded in the job demands-resources model. As a digital intervention, it enables employees to understand their balance of demands and resources and reduces stress by supporting employees as they build further resources via a personalised evidence-based psycho-educational learning journey.

Participants (n = 367) were recruited from European businesses. The RCT ran for 4 weeks with 3 measurement points each 2 weeks apart, assessing indicators of sleep, wellbeing, stress, and resilience. Theoretical and practical implications are discussed.

Introduction

Poor mental health is currently costing UK businesses £33-£42bn, the equivalent of £1,300 per employee per year in presenteeism, absenteeism, and turnover costs (Deloitte, 2017). One in six employees experience mental ill health at any one time (Lelliott, et al., 2008).
Technology can provide a solution, as individuals make use of the internet, social media, and smartphone technologies (Bolier & Abello, 2014). Accessible, scalable, and providing return on investment (Ebert, et. al., 2018), digital health interventions can support positive behaviour change and are becoming increasingly available for individuals and organisations to manage mental health. Unfortunately, the quality of such interventions differs widely (Bolier & Abello, 2014). There are few science-backed smartphone applications on the market, and even fewer applications designed for workplace interventions, looking at both individual mental health and overall organisational culture change. For instance, in a systematic review, only five of all evaluated apps by Donker et al. (2013) had supporting evidence from a randomised controlled trial, none of which are currently readily available on the market for businesses to access.

Kelaa Mental Resilience is a smartphone application created by Soma Analytics. It allows employees to measure their levels of wellbeing, stress, and resilience using validated scientific measures. An in-app sleep-tracker enables users to measure and track their sleep quality and quantity. Kelaa also provides evidence-based bite-sized interventions using sleep science, positive psychology, CBT, ACT, and mindfulness. Interventions tailored to support employees through workplace challenges are provided, with available interventions exploring topics such as workplace relationships, shift work, productivity, and work-life balance.

The Kelaa application is primarily based on the Job Demand-Resources Model (Bakker & Demerouti, 2007). Job Demands describe “those physical, social or organizational aspects of the job that require sustained physical or mental labour and are therefore associated with certain physiological and psychological costs” (Demerouti, Bakker, Nachreiner, & Schaufeli, 2001, p. 501). Examples of Job Demands can be work overload, interpersonal conflicts, and job insecurity (Schaufeli & Taris, 2014), whereas Job Resources are defined as physical, social, or organisational aspects of a job that may (a) be functional in achieving work goals, (b) reduce job demands and associated physiological or psychological costs, or (c) stimulate personal growth and development (Demerouti et al., 2001, p. 501). Kelaa aims to help employees understand their current balance of demands and resources, and then to build further resources to meet the demands that they face. Overall, the app aims at helping them to reduce stress and thrive in the workplace.

The current research project aims at reducing the research gap in mobile health technologies in the workplace. The goal is to examine whether the digital health and wellbeing application ‘Kelaa’ can show statistically and functionally significant improvements in validated measures of stress, wellbeing, resilience, and sleeping troubles.

Hypotheses:

Compared to the waitlist control, participants in the “Kelaa App” group show a) lower levels of self-reported stress, b) higher levels of self-reported wellbeing, c) higher levels of self-reported resilience, and d) less self-reported sleeping troubles, after using the app for 4 weeks.

The effects are more intense the more a person uses the app over time.

Methodology

This intervention validation study was conducted as a randomised controlled trial (RCT). It followed a longitudinal experimental design, with participants being randomly assigned to one out of two different conditions: Kelaa App Use vs. Waitlist Control. The trial was conducted over a period of 4 weeks in a naturalistic setting. Measurements were taken at baseline (T1, Week 0), mid-intervention (T2, Week 2), and the end (T3, Week 4).
Kelaa App Use (experimental group): Participants in this group received access to the Kelaa App for 4 weeks.

Waitlist Control (control group): Participants in this group received no intervention and no tracking opportunity for the duration of the trial. Upon completion of the trial, participants in the control group received access to the Kelaa App.

Trial sites: Participants were recruited from 5 trial sites in organisations in the UK, Ireland, and Germany.

Ethics approval was provided through the European Commission Horizon 2020 Ethics Appraisal Procedure (European Commission, 2018). After finishing the trial, participants were thanked and fully debriefed. They had the opportunity to provide feedback on their personal experiences using the app and to suggest ways to improve their experience.

Measures

To assess change in the relevant variables over time, participants completed the same series of scales at each measurement occasion (T1, T2, T3). Reliability of all scales at all times was good or excellent. Participants were asked to answer the questions based on their experiences during the last 2 weeks. Self-reported levels of stress were assessed with the two subscales General Stress and Cognitive Stress from the Copenhagen Psychosocial Questionnaire - Revised Version (COPSOQ II; Pejtersen, Kristensen, Borg, & Bjørner, 2010). Subjective wellbeing was measured with the 7-items Warwick-Edinburgh Mental Wellbeing Scale (Tennant et al., 2007). We assessed resilience with the 13-item resilience scale (RS-13; Leppert, Koch, Brähler, & Strauß, 2008). Finally, participants were asked about sleeping troubles with the subscale Sleeping Troubles from the Copenhagen Psychosocial Questionnaire - Revised Version (Pejtersen et al., 2010).

Data analysis

To evaluate the efficacy of the Kelaa App (vs. Waitlist Control), the following were tested for: 1) between group differences, 2) within group changes over time, and 3) interaction effects of group and time. The data was analysed by means of hierarchical multilevel analyses for longitudinal data using HLM 7 for Windows (Raudenbush, Bryk, Cheong, Congdon, & du Toit, 2011).

All participants who adhered to their assigned group (i.e., Kelaa App Use group with at least one sign-in to the app and Waitlist Control group with no app use) were included into the analyses. Results of the analyses are based on n = 367 participants (Kelaa App group: n = 142; Waitlist control group: n = 225). As an indicator of whether using the app really improved the outcome variables, the number of completed sessions and the number of nights tracked were entered as an additional predictor.

Results

Stress & Wellbeing. As expected, there was an improvement in the self-reported experience of general stress and cognitive stress with a continuous time-trend towards experiencing less stress, as well as an improvement in the self-reported wellbeing with a time-trend towards reporting more wellbeing over time (significant time slopes). The difference between the two groups (group*time interactions) was significant for all three variables, indicating that persons in the Kelaa App group experienced a greater decrease in both general and cognitive stress and a greater increase in wellbeing over time. The more sessions participants in the Kelaa App group completed, the less stress they reported over time and the larger was their increase in wellbeing over time (sessions*time interactions significant).
Resilience. The significant time-trend indicated that participants reported more resilience over time (significant time slope). However, the difference between the two groups was not significant (group*time interaction not significant). Similarly, there was no significant difference between the two groups if app use intensity was included as a predictor (sessions*time interaction not significant).

Sleeping troubles. Self-reported sleeping troubles significantly decreased over time (significant time slope), but there was no significant difference between the two groups (interaction group*time not significant). As the app offers the option to track ones sleep, and thus, to focus specifically on improving this variable, the number of nights tracked was included as a predictor. The number of nights tracked turned out to be a significant predictor for the improvement in sleeping troubles (nights*time interaction significant).

Discussion & Conclusion

To reduce costs and keep UK businesses thriving, innovative solutions to mental health in the workplace are needed. Kelaa Mental Resilience supports employees to access the right resources at the right time to reduce stress, increase wellbeing, and build resilience.

The results of the RCT showed that employees using the Kelaa smartphone application improve resilience, wellbeing, stress, and sleeping troubles. The longitudinal experimental design and the naturalistic setting at different trial sites extends the ability to generalise results across environments.

Problematically, there was a large dropout rate over time and a high variability in compliance to app use in the experimental group. Further, scales used in the study may have measured rather ‘traits’ than ‘states’ (e.g., resilience), and might therefore not be sensitive enough to detect more subtle changes over time. Further, due to the naturalistic nature of the RCT, there is low internal validity: there were a range of factors outside of the app that could not be controlled for, and which therefore may have influenced the dependent variables over and above the trial.

Even with these limitations, this research suggests that there is a benefit to using scalable, technology solutions to mental health in the workplace to support UK business and their employees to thrive.

YVC Yezreel Academic College, Department of Political Science and Health Systems Management, Yezreel Academic College P.O. Yezreel Valley, Zip, Israel (1) 

Purpose: The goal of the present study is to explore factors which may support or undermine public services motivation (PSM) and work engagement in the workplace. Specifically, the research focuses on the underlying motives behind managers’ PSM and work engagement in public sector organizations.

Methodology: Twenty-eight interpersonal interviews were conducted with managers in various Israeli public organizations and employed open-ended questions designed to probe the respondent’s internal subjective experience of his or her PSM and engagement at the workplace.

Results: Analysis of interviews yielded three very different motives to PSM and work engagement: Nature of task in the organization, 2. Career-life continuum, 3. Civil service rules.

Limitations: Since the study was based on a group of managers in the Israeli public sector, additional qualitative research is required on both managers and workers from different sectors to confirm the findings of this study.

Practical Implications: The findings may provide greater understanding through which to leverage motivations and maximize PSM and engagement at work.

Originality: To date, we still know little about how and whether PSM and work engagement act in concert to influence public servants’ performance.
Purpose: Many employees have to cope with time and performance pressure. They often use strategies of work extensification (e.g. overtime) and intensification (e.g. a high work pace). However, those strategies are risky for employee well-being and health. Therefore, alternative, more favourable ways of coping and especially their preconditions were subject of a qualitative research study.

Design/Methodology: Research case studies were conducted in 5 different companies with a sequence of research steps: [1] preliminary discussions, [2] structured expert interviews and [3] - as core - semi-structured interviews with employees. In total, 45 employee interviews took place lasting 50 to 90 minutes. All interviews were recorded, transcribed verbatim and analysed with software-supported qualitative content analysis.

Results: Employees described a wide range of alternative coping behaviours which can be regarded as counter-strategies to prevent work extensification and intensification. To enable alternative strategies, key facilitators could be identified and assigned to different levels: [1] organization (e.g. participation), [2] team (e.g. social support, mindfulness) [3] task (e.g. autonomy, predictability) and [4] individual level (e.g. experience).

Limitations: Results cannot be generalized due to a preselected sample of professional service and knowledge workers.

Research/Practical Implications: Key facilitators on different levels should be considered to foster alternative coping with time and performance pressure e.g. through job design, organizational culture or team development.

Originality/Value: Alternative coping with time and performance pressure and its preconditions were assessed qualitatively with a multi-step case study design. Research with this focus and methodology is comparatively scarce.
Purpose: Given the backdrop of ‘doing more with less’, this study sought to shed light on how public service motivation (PSM) may interact with the public healthcare worker’s perception of their job resources as well as their work unit’s alignment to organizational values to influence engagement and alienation at work. Drawing on conservation of resources and person-environment fit theories, we hypothesised that the relationship between job resources and engagement/alienation will be strongest when PSM is low whereas the relationship between group value alignment and engagement/alienation will be strongest when PSM is high.

Methodology: An online questionnaire was completed in 2016 by 196 employees within two English public hospitals.

Results: Support was generally found for the propositions that PSM interacts with job resources and group value alignment to influence engagement and alienation. Additional analyses revealed that the commitment and compassion dimensions of PSM may be the most relevant to understanding these moderating effects.

Limitations: This was a cross-sectional self-report study of employees within one type of public service environment.

Research/Practical Implications: PSM may, on one hand, act as compensatory (personal) resource when there is a lack of job resources, and, on the other, acts to enhance the psychological effects of working in a work unit that aligns with the organization’s values.

Originality/Value: This study provides insight into the specific motivational foundations of public service workers by examining how public service motivation, as a salient individual difference, influences the effects that the work context has on psychological outcomes.
Mayerhofer et al. (2008) analyzed the impact of CSR policies on the attitudes towards companies and brands using the example of purchasing instant coffee. Results revealed a sensitivity of consumers towards CSR activities of companies. Organic food is classed as credence goods – thus a company's reputation may be even more important, because it "radiates" on the company's own brands (cf. Möhlenbruch / Wolf, 2008, pp. 42-50). Acc. to Yoon et al. (2006), the CSR measures implemented by a company are questioned critically and partly attributed to business-related marketing.

The aim of this study is to evaluate the influence of personality characteristics (values; locus of control; ambiguity tolerance), attitudes towards CSR/company, importance of product attributes and sustainable orientation on the attitude towards organic private labels. For this purpose, a standardized online survey (n = 709) was conducted among Austrian consumers interested in sustainability.

It turned out that the higher the self-transcendence of a female consumer (PVQ universalism, benevolence), the more positive the attitude is towards CSR (or Cause-related marketing) of food retailers. The higher the self-transcendence of a male consumer (PVQ universalism) is pronounced, the more positive the attitude towards CSR (or CrM). Consumers who have assigned the property "sincere green projects" to the trading company showed higher a social reputation of the food retailing company than those who did not cite this characteristic. The sincerity of the ecological projects thus acts as moderating variable for the positive effect of CSR measures on the reputation of the company.
Purpose. The field of employee well-being (EWB) is bourgeoning, and counts a multitude conceptualizations and measurement approaches. This review offers organizational scientists guidance in the selection and measurement of EWB constructs.

Methods. An integrative reviewing procedure was applied, because a systematic literature review would have been unfeasible (i.e. too much literature to cover) and undesirable (i.e. survey measures would be overrepresented). The review is guided by a construct and measure classification. The taxonomy of constructs is based on three dimensions: philosophic foundation, scope and stability. The classification of measures distinguishes between closed survey, word, behavioral, physiological and genetic measures.

Results. Measures of (state) job satisfaction, (state) work engagement, dispositional affect, mood, emotions, flow, psychological well-being and life satisfaction were reviewed. It became clear that closed survey measures remain to be the dominant measure for EWB constructs. Nonetheless, the review showed that EWB constructs can also be gauged using less traditional measures, hedonic ones like job satisfaction, life satisfaction, emotions and moods, in particular.

Conclusion. The review demonstrated that (i) it the conceptual underpinnings of a construct play a pivotal role in the choice for of suitable measurement strategy, and (ii) novel measures of well-being show great promise. It is therefore suggested that the field of EWB measurement would advance by theory-driven measure selection, rigorous triangulation and multi-disciplinary collaboration.
Purpose. Truck drivers are at high risk for illbeing and unhappiness. Besides investigating the relationship between momentary happiness and subjective well-being (i.e. job and life satisfaction) and health constructs (i.e. self-reported health and feelings of stress), this study draws on the job demands-resources model to discover what makes them happy and unhappy during the day.

Design. Self-report survey data (N = 4995) generated by a convenience sample of 82 Dutch truck drivers served as input for correlational analyses and fixed effects panel regression analyses.

Results. The analyses showed that aggregated momentary happiness correlates with job satisfaction, life satisfaction, self-reported health and feelings of stress at work. Further, the results indicate that road congestion and employment contract are the only job demands that significantly influence momentary happiness during driving and at work, respectively. Social support of colleagues, flexible work hours and task variety further turned out to have a positive effect on momentary happiness at work.

Limitations. The list of activities in the ESM procedure was not exhaustive. All survey measures were single-item, and could in turn suffer from low reliability and validity. The representativeness of the sample could be low, due to self-selection and high drop-out rates.

Implications. Truck driving companies are urged to pay attention to the happiness of truck drivers, and design policies accordingly. Based on this study, it is suggested to provide fixed employment contracts, engage in careful scheduling to minimize driving on busy roads, facilitate flexibility in working hours, encourage colleague interaction, and offer task variety.
EMPLOYEE RESILIENCE: THE INTERPLAY OF SLMX AND ELMX IN CONJUNCTION WITH FOLLOWERS NARCISSISM

Marjolein Caniels (1) - Isabella Hatak (2)

Open University, Management, Science and Technology, Heerlen, Netherlands (1) - University of St. Gallen, Swiss Research Institute of Small Business and Entrepreneurship, St. Gallen, Switzerland (2)

Purpose: We empirically test theorizing on the alignment of social and economic leader-member (SLMX and ELMX) approaches for employee resilience. Additionally, we explore a new approach to LMX relationships that views follower narcissism as a trait that is adaptive in certain contexts.

Design/Methodology /Approach/Intervention: Data is collected from 123 Dutch employees. We use polynomial regression analysis with surface response analysis to test the relationship between SLMX-ELMX interactions and employee resilience, as well as the moderating role of follower narcissism in this relationship.

Results: Findings indicate that for LMX to optimally contribute to employee resilience, SLMX needs to dominate over ELMX. However, for narcissistic followers, employee resilience is strongest at both the low SLMX-low ELMX end of the spectrum and at the high SLMX-high ELMX end of the spectrum, thus questioning the usefulness of an average or imbalanced shaping of LMX for narcissists’ thriving in a dynamic organizational environment.

Limitations: Self-reported data.

Research/Practical Implications: By developing and nurturing reciprocal trust-based long-term relations with their followers, leaders can strengthen resilience. When being confronted with narcissistic followers, leaders need to additionally emphasize the transactional nature of the relationship to foster effective dealing with change and setbacks at work.

Originality/Value: Our study resolves a limitation of previous LMX studies, most of which have not accounted for narcissism as a dark-side follower characteristic. Our study indicates that the conventional understanding of LMX approaches, i.e. that SLMX is more useful for employee outcomes than ELMX, needs to be reconsidered under dark-side follower characteristics.
ON THE HORNS OF A DILEMMA: HOW BYSTANDER-HELPING INTENTION IS AFFECTED BY PERCEIVED ORGANIZATIONAL SUPPORT, RELATIONAL IDENTIFICATION WITH THE SUPERVISOR, PERCEIVED VICTIM RESPONSIBILITY AND BYSTANDER

Nevra Cem Ersoy, İzmir University of Economics, Department of Psychology
Mehmet Peker, Agean University, Department of Psychology

Previous research has investigated influence of individual characteristics on bystander help for mobbing victims. However, whether relational or organizational factors have an effect on bystander responses has yet to be investigated. We were interested in the interplay of organizational, mobber, victim and bystander characteristics. We assumed that bystander helping behavior can only be understood by the interactions of these factors. With this aim, we designed a 2×2×2×2 vignette study to test the effects of perceived organizational support (POS), relational identification with the supervisor, perceived victim responsibility and bystander empathy on the helping intentions of bystanders. POS, relational identification with the supervisor and attribution of responsibility were manipulated by scenarios. Empathy factor was measured with a scale. We hypothesized that for employees who do not identify with their supervisor, high POS increases helping intention, especially if they perceive victim as not responsible. A three-way interaction between POS, empathy and perceived victim responsibility was also hypothesized. We assumed that high POS and empathic bystanders report higher intention to help scores in the absence of perceived victim responsibility. Our sample consisted of 132 working adults. The results yielded two significant three-way interactions. Interestingly, empathic participants in the low POS and high-perceived victim responsibility condition reported higher helping intention. Moreover, empathic individuals who did not identify with their supervisor reported higher helping intention when they perceived victims as not responsible. We discussed the results in the context of Attribution theory, Skarlicki and Kulik’s third-party reactions model, Empathy-Altruism Hypothesis and retaliatory behavior perspective.
The Pygmalion effect is a boost in subordinates’ performance caused by raising managers’ expectations. Pygmalion Leadership Style (PLS) is a set of behaviors managers use when their expectations of employees’ performance are high. We tested an expanded Pygmalion leadership theory that includes emotional reactions among followers and evaluated the effectiveness of training designed to impart PLS to managers.

This was a randomized-rollout field-experiment in which 38 municipal department managers got PLS workshop training. The workshops couldn’t be delivered to all at once; therefore, the control managers were deferred to a later date. We measured PLS and the dependent variables among 165 subordinates before the workshops and a month later. In the follow-up, the erstwhile control managers got their PLS workshops, rendering them a second experimental group. The dependent variables were measured for the third time to test the original hypothesis in the control-turned-experimental group and to test for sleeper or fadeout effects in the original experimental group.

Analysis detected significant treatment effects on PLS, confirming the manipulation check; trained managers were adopting PLS. Managerial self-efficacy among the experimental managers had increased, as had the efficacy they attributed to their subordinates. The subordinates experienced a significant rise in positive emotions. In the follow-up stage, utilization of PLS increased further, as did the boost in employees’ positive emotions.

Conclusion: creating Pygmalion effects through training enhances not only managers’ leadership and managerial self-efficacy but also their subordinates’ positive emotions. This was the first confirmation of the positive impact of PLS on subordinates’ emotions.
The “Beauty” Job Crafting and the “Beast” Overcommitment: Promoting Employees’ Well-Being in the Elderly Care Sector

Miguel Angel Piñeiro (1) - Marina Romeo (1) - Montserrat Yepes-Baldó (1)
Universitat de Barcelona, Social Psychology, Barcelona, Spain (1)

Purpose. To analyze the moderation effect of over-commitment in the job crafting - well-being relationship, in the elderly care sector in Spain.

Design/methodology. A cross-sectional design was implemented and a sample of 353 participants were assessed using the Job Crafting Questionnaire, an adaptation of the Over-commitment Scale from the ERI-Q, and the General Health Questionnaire (GHQ-12).

Results. A positive interaction between relational and task crafting and over-commitment is observed in the prediction of well-being levels. The effect of over-commitment in the task crafting – well-being relationship proved to be statistically significant when opposed to low, medium and high levels of over-commitment. The effect of over-commitment in the relational crafting – well-being relationship proved to be statistically significant only when opposed to medium and high levels of over-commitment. A direct and simple effect was observed between cognitive crafting and well-being, not moderated by over-commitment.

Limitations. Implementation of non-behavioral measurements, and non-longitudinal designs are suggested. The development of behavioral measures for job crafting is encouraged, along with the implementation of longitudinal designs sensitive to changes in over-commitment. Possible over-commitment results are biased by an economically contracted environment.

Practical/research implications. Job crafting training, over-commitment early detection, and further research on job crafting strategies’ preferences, are suggested.

Originality. The moderating role of over-commitment in the job crafting - well-being relationship in the elderly care sector represents one of these attempts to better understand evidences of how work-related efforts modify a worker’s psychological functioning and adaptation, reason why, especially in contexts of uncertainty, its study becomes relevant.
131 - IS LAUGHTER THE BEST MEDICINE? THE ROLE OF HUMOR IN RESPONSE TO WORKPLACE INJUSTICE

Dr. Rashpal Dhensa-Kahlon (1) - Dr. Hayley German (2) - Dr. Karen Niven (3)

University of Surrey, People & Organisations, Guildford, United Kingdom (1) - Huddersfield University, Business School, Huddersfield, United Kingdom (2) - University of Manchester, Business School, Manchester, United Kingdom (3)

Purpose

Workplace injustice is a ubiquitous occurrence that evokes strong negative reactions in employees, including negative emotions. Recent enquiry explores how employees can recover from injustice. We investigate the efficacy of humor in managing injustice. Drawing on emotional regulation theory, we test whether humor regulates the effects of workplace injustice on negative emotions and whether additionally, it can elicit positive emotions.

Design/Methodology

We present two online studies (survey, experiment) with workers. Study 1 explored whether people higher in trait humor experienced more positive (happiness) and less negative (anger) emotion than those lower in trait humor. Study 2 tested whether humor creation related or unrelated to an injustice manipulation influenced positive and negative emotions via two regulatory pathways; distraction and reappraisal.

Results

We show that trait humor serves to up-regulate happiness in study 1. In study 2, we found marginally greater support for humor serving as a form of distraction in eliciting happiness, and that both reappraisal and distraction reduced anger.

Limitations

We relied on retrospective memory in study 1, and though we tested causality in study 2, there is a lack of generalizability to ‘real’ workplaces. We focused on proximal outcomes of emotion rather than distal consequences of injustice and humor.

Research/Practical Implications

We contribute to a nascent line of enquiry on managing workplace injustice episodes, finding that laughter can be the best medicine.

Originality/Value

We explore the efficacy of a novel technique for managing in-situ responses to injustice, which has the potential for spontaneous use in many contexts: humor.
Purpose

This study examined how the dual-focused visionary leadership contributes to both employee and team creativity through goal-relevant mechanisms.

Design/Methodology/Approach/Intervention

Data were collected from multiple sources, comprising 272 employees from 75 teams from various companies in China. Hierarchical linear modeling analysis (HLM) was used to test the hypotheses.

Results

The results indicate that employee-focused visionary leadership not only directly increased employee creativity, but also indirectly enhanced employee creativity through goal congruence. Team-focused visionary leadership indirectly increased team creativity through team goal commitment. Moreover, we found a cross-level influence that team goal commitment contributed to employee creativity.

Limitations

The data was collected from various industries; thus, the question arises to what extent the findings are generalizable.

Research/Practical Implications

This study is one of the first to establish the benefits of visionary leadership on evoking creativity individually and collectively, and reinforce a goal approach to studying the different mechanism in these relations. These results also practically suggest that it will behoove leaders to adopt a dual focus for visionary behaviors in managing creativity.

Originality/Value

Examining the positive effects of visionary leadership on both employee and team creativity simultaneously demonstrates the utility of dual-focused visionary leadership in the creativity realm. Identifying mediators of the goal congruence at individual level and the goal commitment at team level, this study provides insights on adopting the goal perspective as an lens to understand the role of visionary leadership in-depth.
Purpose:
Within the challenge- hindrance framework time pressure or job complexity are typically classified as challenging factors promoting positive (e.g. work engagement) as well as negative (e.g. strain) outcomes. Most empirical research about the effects of challenge stressors is either focused on within- or between-person effects. By simultaneously testing within- and between-person relationships the aim of this study is to gain a deeper understanding of the nature of challenge stressors.

Design:
We conducted a diary study over five consecutive work days with a sample of N = 95 (58.9% females) employees. We employed multilevel analyses to compare the relationship of challenge stressors (time pressure, job complexity) on irritation (as indicator for strain) and work engagement at the between and the within-level.

Results:
Multilevel analysis showed a positive relationship of time pressure with irritation as well as engagement (controlling for strain) at the between level, but not on a day-level. Whereas job complexity showed to be positively related to irritation and engagement on the day-level, but not on the between-level.

Limitations:
Results of this study are based on self-report data increasing common method bias. Cognitive appraisal processes as potential mediating mechanisms were neglected in this study.

Implications:
Further research should focus on intra- and interindividual differences and investigate personal or organizational resources which can buffer the negative impact of challenge demands on strain.

Originality/Value:
With this research we gain a deeper understanding of differing within- and between-person effects of challenge stressors. Not all challenge stressors have the same effects on intra- and interindividual level, as would be expected.
136 - DOES PROVIDING OPPORTUNITIES GENERATE CREATIVITY? TWO EXPLANATORY MECHANISMS AND BOUNDARY CONDITIONS OF THE PARTICIPATIVE LEADERSHIP-CREATIVITY RELATIONSHIP

Wenjing Cai (1) - Li Lin (2)
Vrije Universiteit Amsterdam, Amsterdam, Netherlands (1) - Wageningen University and Research Centre, Wageningen, Netherlands (2)

Purpose
Based on social cognitive theory and social exchange theory, this study identified the motivational and exchange-based mechanisms that simultaneously link the participative leadership-employee creativity relationship, and proposed that employee identification with leader acts as a moderator in the relation between participative leadership and employee creativity.

Design/Methodology/Approach/Intervention
Multi-source data were collected from 409 leader–follower dyads in China at two points in time.

Results
Participative leadership affects creativity via the simultaneous influences of creative self-efficacy and supervisor-subordinate guanxi. Furthermore, only the effect of supervisor-subordinate guanxi is conditional on the moderator (identification with the leader) for the path from participative leadership to employee creativity.

Limitations
Given the partial mediation effects, other potential mechanisms should be considered.

Research/Practical Implications
The results of the parallel mediation effects practically suggest that participative leaders can exert more exchange-based influences through building guanxi with their subordinates, rather than motivating their subordinates creative efficacy, to trigger creativity. The results also enrich current knowledge regarding how individual differences may explain the effectiveness of participative leadership.

Originality/Value
As one of the first to concurrently examine the two parallel and complementary mediating pathways in the leadership-creativity relation, the study extends our understanding that the exchange-based mechanism is more important than the traditional motivation-based mechanism in linking participative leadership and creativity. The results also evidentially support the applications of participation philosophy in the Chinese context to effectively manage employee creativity.
LEADER UNETHICAL BEHAVIOUR DEPENDS ON THE DEGREE OF POWER AND MACHIAVELLIANISM

mahshid khademi (1) - Marianne Schmid Mast (1) - Christian Zehnder (1)
University of Lausanne, Organizational Behaviour, Lausanne, Switzerland (1)

Purpose
A widespread belief suggests that power corrupts. But we posit that individuals differ in how they use their power. We examined the effect of power and individual differences on unethical behaviour.

Design
Using incentivised experimental games, in study 1 we manipulated power by the number of followers and the amount of control a leader had over the followers’ outcomes. In Study 2, we manipulated the understanding of leader’s position with regards to responsibility. In responsible condition, leaders directly decided the followers’ outcomes but in control condition, followers’ outcomes were decided randomly. We measured leaders’ Moral Disengagement and dark triads.

Results
We found no support for a general effect of “power corrupts”. However, in study 1 (N=80) we found a positive interaction effect between Machiavellianism and power predicting leader’s unethical behaviour. No such relation was found for Moral Disengagement.

Results of the study 2 (N=128) showed that narcissism increased the likelihood of leader’s unethical behaviour in positions with responsibility. But in positions with no responsibility, leader’s Machiavellianism predicts leader’s unethical behaviour.

Limitations
Manipulating power by using real followers and money required substantial resources. Future research should try to replicate our findings in a more efficient design, with larger sample size.

Practical Implications
This study highlights the importance of personnel selection for high stake positions with regards to the narcissistic and Machiavellian orientations.

Value
Manipulating real power protects the design from any confound and demand effects.
Reciprocity between personal resources, goal commitment and goal attainment-A cross cultural perspective

Purpose: The current study is a cross-cultural test of conservation of resources theory. Specifically, it hypothesized that personal resources, including self-efficacy, optimism and subjective well-being have reciprocal relationships with goal commitment and goal attainment at work.

Methodology: In a two-wave longitudinal study, data were collected from 793 sales professionals in France, Pakistan and the United States. Furthermore, predictors and outcome variables were tested on time-lag basis. Values were incorporated to confirm cultural differences among three study countries.

Results: Findings from multigroup cross lagged path analysis confirmed the reciprocal model as the best fit to data (i.e. CMIN= 18.488, DF= 6, P< .05, CFI= .990 and RMSEA= .072) across all three countries. Corresponding waves from all three countries were partially invariant at metric and scalar level. Cross lagged path analysis for each country individually also confirmed reciprocal model as the best fit. This validates the dynamic relationships between all study variables over time and also indicate the portability of personal resources across cultures.

Limitations: Data collected at only 2 time points and English version of scales used for Pakistani sample are the main limitations of this study.

Research/Practical Implications: Evidence from different cultures is another step towards further development of resource based goal striving concepts. Another contribution is the test of revised Portrait Values Questionnaire (PVQ-RR) in Pakistani settings.

It justify the importance of training interventions related to personal resource, commitment enhancement and self-regulation at work.
144 - HIGH PERFORMANCE WORK SYSTEMS AND TOP TALENT RETENTION: TESTING A MODERATED-MODERATED-MEDIATION MODEL

Jarrod Haar (1) - Urs Daellenbach (2) - Sally Daevport (2) - Conor O’Kane (3)
Auckland University of Technology, Management, Auckland, New Zealand (1) - Victoria University of Wellington, Management, Wellington, New Zealand (2) - Otago University, Management, Dunedin, New Zealand (3)

Purpose: Examines the relationships between high performance work systems (HPWS) and top-talent retention and boundary conditions (moderated-moderated-mediation), specifically: human capital (mediation) and Porter’s quality focused strategy and R&D relationship learning (moderators). Hypothesize positive effects from HPWS and human capital on retention and positive moderating effects from quality strategy (quality emphasis stimulating employees) but detrimental moderating effects from R&D relationship learning (involves networking with outside customers/suppliers – exposing top-talent to potential (future) employers).

Design/Methodology /Approach/Intervention: Self-reported survey of 241 firms. Analysis in SPSS with PROCESS 3.1 to test a moderated-moderated-mediation model (model 18).

Results: HPWS influenced top-talent retention and human capital partially mediated this effect. Quality strategy was directly (positively) related to top-talent retention, although R&D relationships was not directly related. Significant interaction effects highlighted the detrimental influence of R&D relationship in combination with quality strategy. A significant moderated-moderated-mediation index is found and analysis highlights that the mediating effect of human capital varies at quality strategy levels: effects being positive at low and average levels of R&D relationships, but negative at high levels of R&D relationships.

Limitations: Self-reported data, although analysis showed common method variance was not present.

Research/Practical Implications: Understanding the boundary conditions of HPWS and highlighting the complexity conditions under which talent can be retained.

Originality/Value: Studies of employee turnover rates fail to focus on the retention of top-talent, which is arguably a more important factor for firms than simply turnover. The extensive boundary conditions have not been previously explored.
Purpose: Examines the relationships between work-life balance (WLB) and turnover intentions of top executives - examining job burnout (emotional exhaustion, cynicism) as mediators. We add knowledge sharing as a moderator and combine to test for moderated-mediating model: hypothesizing a boundary condition whereby the mediating effect of job burnout on turnover intentions is limited if the executive believes they are rewarded for knowledge sharing in their organization.

Design/Methodology /Approach/Intervention: Self-reported survey of 127 top executives (range of firm size). Analysis in SPSS with PROCESS 3.1 to test a moderated-mediating model 8.

Results: WLB negatively related to emotional exhaustion, cynicism, and turnover intentions, with the job burnout dimensions fully mediating the influence of WLB on turnover intentions. Knowledge sharing was directly and negatively related to cynicism and interacted with WLB towards job burnout. Significant interaction effects highlight that high knowledge sharing is beneficial for cynicism irrespective of WLB levels, but high knowledge sharing is detrimental towards emotional exhaustion at high WLB. A significant moderated-mediating effect indicated that the mediating effect of cynicism varies at levels of knowledge sharing: effects being significant and negative at levels around the knowledge sharing Mean, but non-significant at higher levels, indicating a boundary condition from knowledge sharing.

Limitations: Self-reported data, although analysis showed common method variance was not present.

Research/Practical Implications: Understanding boundary conditions on turnover intentions highlights the complexity conditions under which executive talent can be retained.

Originality/Value: Studies of turnover intentions often ignore job burnout and boundary condition identification provides nuanced understandings not previously explored.
Shreya Shah (1) - Dr. Pooja Purang (1)
Indian Institute of Technology (IIT) Bombay, Humanities and Social Sciences, Mumbai, India (1)

Purpose: To study the effect of overall organizational justice perceptions (OJP) on promotive and prohibitive voice behaviour of employees.

Design: A survey was conducted using an online Google form. The sample consisted of 106 respondents, recruited through convenience sampling.

Results: The results revealed that OJP has a significant effect on prohibitive voice behaviour but OJP did not have a significant effect on promotive voice behaviour.

Limitation: Employees’ OJP may be affected by the organization’s work values and practices. Respondents for this study belonged to different organizations. Practices and values salient to their organization may have therefore affected their OJP and voice behaviour. Data if collected from only one organization can provide better insight.

Research/Practical Implication: This study extends our understanding of how OJP can encourage prohibitive voice behaviour. It provides an evidence that employees are willing to challenge the status quo even if others disagree, when they perceive their organization to be fair. Hence, organizations should create fair work experiences for employees to encourage them to raise concerns about work practices or incidents harmful for the organization.

Originality: Voice behaviour unlike ‘voice’ has not been empirically examined before in relation with OJP. Examining justice holistically helps us understand justice as employees see it, unlike the facet based approach. This study also highlights that prohibitive and promotive voice behaviour are shaped by different antecedents.
149 - INTERACTIVE EFFECTS OF DAILY WORK DEMANDS AND AUTONOMY ON WELL-BEING TRAJECTORIES

Karoline Hudl (1) - Paul Weber (1) - Hannes Zacher (1)

University of Leipzig, Work and Organizational Psychology, Leipzig, Germany (1)

Based on job demands-resources theory, this study used a dynamic approach to investigate interactive effects of daily work demands and autonomy on within-person trajectories in well-being across the day. Due to similarities in employees’ and students’ work characteristics, we collected data from 64 students using a diary study design. Well-being (i.e., momentary vitality, fatigue) was measured with four questionnaires each day on four consecutive workdays, while work demands (i.e., quantitative and qualitative demands) and work resources (i.e., autonomy) were measured once a day after work. We hypothesized a three-way interaction between time of the day, work demands, and autonomy on vitality, such that vitality decreases more strongly over the day if demands are high and resources are low. A similar interaction was expected for fatigue, such that the increase of fatigue will be stronger over the day if demands are high and resources are low. Results of multilevel analyses showed that changes in well-being indeed depend on daily work conditions. We found a significant three-way interaction of time, quantitative demands, and autonomy on fatigue as expected, but not on vitality. Additionally, there was no significant interaction involving qualitative demands. This study is among the first to examine propositions of job demands-resources theory using a dynamic approach. The findings highlight the necessity to consider within-person trajectories in well-being and their dependency on fluctuations in daily work characteristics. Future research should further develop this idea by including additional work demands and resources and by using different samples, including employees or volunteer workers.
EMPLOYEE BURNOUT IN MOBILE WORK: THE ROLE OF QUANTITATIVE WORKLOAD AND MOBILITY-RELATED SUPPORT

Sylvia Kraus (1) - Kerstin Rieder (1)
Aalen University of Applied Sciences, Aalen, Germany (1)

Purpose Drawing on the job demands–resources model of burnout and the action-regulation theory, this study examines the role of general and mobility-specific working conditions of mobile workers in the IT sector.

Methodology We used cross-sectional data relating to 398 mobile IT-service workers in three organizations. Hypotheses were tested using moderated multiple regression analysis.

Results We found that the quantitative workload, as well as mobility-related social support predict burnout in mobile IT-service work. In addition, we found evidence that mobility-related organizational support might moderate the relationship between quantitative workload and burnout.

Implications The results confirm that mobility-related support plays an important role in understanding the development of burnout in mobile work. The study suggests that, in addition to reducing quantitative workload, fostering mobility-related social and organizational support may improve well-being for mobile workers.

Limitations The cross-sectional design of the study affects the ability to draw valid and reliable conclusions about causality in the relationship between working conditions with burnout.

Originality The study extends the body of research related to action regulation theory and the JD-R model and is the first to examine the specific importance of mobility-related support in the context of mobile workers.
Purpose

This study examines potential mediating effects of sales approaches (Customer Orientation or Selling Orientation) in the relationship between work motivation (Intrinsic or Extrinsic) and insurance sales agents’ performance.

Methodology

A cross-sectional design was utilized by sampling 378 insurance sales agents in Malaysia that were required to complete Selling Orientation-Customer Orientation scale, Work Preference Inventory and insurance salespeople’s performance scale through Google survey.

Results

Through Structural Equation Modelling, this study found that customer orientation mediates the relationship between intrinsic motivation and performance, however, selling orientation does not mediate the relationship between extrinsic motivation and performance.

Limitations

The relationship between sales approaches and insurance sales agents’ performance could be affected by time, as customer orientation is a long term practice that build trust and rapport between agents and clients, whereas sales orientation is a coercive tactics to boost sales in a short term, thus harmful to the agents-clients relationship. In the long term, the outcome in agents’ performance would differ by the approaches used.

Implications

The results has provided a better understanding of how work motivation affects insurance sales agents’ performance through sales approaches, thus, training programs on customer orientation should be provided to train agents to be more customer focused to improve performance.

Values

This study provided a better understanding on the intricate connections between insurance sales agents’ work motivation, sales approaches and performance. Understanding sales approaches helps agents to be aware of the sales tactics used in different selling needs.
Purpose: Job insecurity is known to have detrimental effects on work motivation, health and subjective well-being. We intend to study whether beyond these short-term effects, prolonged job insecurity can result in personality change over the long run. Drawing on the cybernetic Big Five theory, we propose that prolonged job insecurity will be associated with an increase in neuroticism and a decrease in agreeableness and conscientiousness, the three traits reflecting stability.

Design: We used matched data from 1,245 employees over a nine-year period from the Household, Income and Labor Dynamics (HILDA) Survey in Australia. Job insecurity and other controls (i.e., job control, time demand and job stress) were measured in all years; personality was measured in the first, fifth and ninth years.

Results: The results of a structural equation model specifying variables across two time frames (Time 1 to Time 4, Time 5 to Time 9) showed that, in each time frame, prolonged job insecurity over four years consistently predicted an increase in neuroticism as well as a decrease in conscientiousness and agreeableness, as theorized. As expected, the results showed null or unreliable effects of prolonged job insecurity on extraversion and openness, the two traits reflecting personality plasticity.

Implications and Originality: This study reveals the significant impact of job insecurity on one’s personality when experienced over a prolonged period, thus extending literature on the negative impact of job insecurity. This study also sheds light on theories in personality development, showing how individuals’ personality can be changed over time by job experiences.
161 - EMPLOYEES’ PSYCHOPATHY AND COUNTERPRODUCTIVE WORK BEHAVIOR – THE DIFFERENTIAL IMPACT OF INDIVIDUAL RESILIENCE

Miriam Schilbach (1) - Anja Baethge (1) - Thomas Rigotti (1)

Johannes Gutenberg-University, Work and Organizational Psychology, Mainz, Germany (1)

Purpose: As former research has shown, psychopathic individuals are prepared to engage in counterproductive workplace behavior (CWB) in order to achieve work-related goals. However only few of the previously conducted studies differentiate between the subtypes of psychopathy: primary and secondary psychopathy. In this study, based on the strength model of self-control, it is hypothesized that secondary psychopathy is positively linked to CWB whereas primary psychopaths, due to the availability of further individual resources do not need to use CWB. In addition to the main effects and based on the assumption that resilience generates alternative goal-attaining strategies it is assumed that an individuals’ resilience buffers the effect between psychopathy and CWB.

Design: A daily-diary-study has been conducted throughout the course of one week. A total of N = 193 employees were included in the statistical analysis (multilevel modeling).

Results: As hypothesized secondary psychopathy was positively related whereas primary psychopathy was unrelated to CWB. An individuals’ resilience buffered the effect of primary psychopathy on CWB toward individuals. Against predictions resilience intensified CWB toward individuals in secondary psychopaths.

Limitations: Data is solely based on self-reports and future studies should include colleagues in order to assess work/team climate.

Implications/value: The results highlight that individual resilience in combination with other personal traits might not necessarily lead to positive outcomes for the work environment. This implies the necessity of gaining a holistic picture of employees’ personality structure in order to be able to supply human-resources development measures which are beneficial on individual as well as team-level.
Purpose – The present study aims to understand the impact of commute-to-work time on employee wellbeing in Istanbul’s complex and cosmopolitan setting. In doing so, it tests the resource-drain and detachment from work arguments associated with commuting time and wellbeing.

Methodology – Data are drawn from the 2015 European Working Conditions Survey (EWCS). This provides data from 2000 workers in Turkey. Commute time is measured in minutes. Dependent variables include job satisfaction, work meaningfulness, work-life balance, job sustainability, physical and psychological wellbeing. Control variables include working conditions (e.g., full-time, private sector, permanent job, occupation and education level) and demographics (e.g., age). Data were analysed using the PROCESS SPSS macro for testing indirect effects.

Results – Findings show that compared to those living in rest of Turkey, workers in Istanbul report significantly higher commute-to-work time and poorer work-life balance, job satisfaction, physical and psychological wellbeing. The latter effect is in part attributable to commute-to-work time.

Limitations – EWCS provides nationally representative yet cross-sectional data. This limits causal attributions between the relationships observed. Secondary data also does not allow more in-depth understanding of the commuting time, e.g., different commuting arrangements and satisfaction with commute.

Implications – Findings support a resource drain perspective to the relationship between commute-to-work and wellbeing. In cosmopolitan cities, like Istanbul, where infrastructure may not necessarily be adequate, commute-to-work time adds another layer of pressure to working day.

Originality – The paper contributes to our understanding of complexities of work in urban settings and have implications for improving employee wellbeing.
Throughout the literature, leaders are assumed to play a critical role in establishing work climates that explicate the policies, practices, and procedures related to expectations of employee performance. Additionally, several models exist proposing how organizational-level involvement-based systems are related to lower-level constructs, such as service climate. The current study advances these literatures by introducing and testing a multi-wave model of climate development that begins with high-involvement leadership, which is derived from recent work on involvement-based climates. We propose and test a model in which high-involvement leadership leads to the development of a multiple-stakeholder service climate, espousing the importance of both service to employees and service to customers, which subsequently impacts employee performance. We test this model via multi-level latent growth modeling using three-wave data collected during a real-world intervention within a cancer treatment hospital (N = 552). The results from the intervention demonstrated the effectiveness of high-involvement leadership to impact change in both service climate and employee performance, thus contributing in theory and practice. We further discuss the implications of the study along with opportunities for subsequent research.
Purpose - The purpose of this paper is to further our understanding of expatriation experiences. We introduce the construct of the hypothetical home self, defined as a counterfactual of the self that is situated in an expatriate's home country. Drawing upon the literature on self-comparisons, we investigated how the comparison between the current expatriate self and a better or worse hypothetical home self influences the expatriate's cognition (e.g., host country satisfaction, intention to repatriate) and behaviors (e.g., person-environment fit behaviors, home country job search, cultural identity manifestation), controlling for national identity salience and cross-cultural adjustment.

Design/ Methodology - In Study 1, we surveyed international students (N = 218). In Study 2, we surveyed expatriates (N = 233) on two occasions separated by a period of 6 months.

Findings - Our studies provide preliminary evidence for the effect of hypothetical home selves on expatriation outcomes over and above adjustment and national identity salience. Our studies also highlight pathways from cognitions (e.g., satisfaction) to behaviors (e.g., home country job search), suggesting that hypothetical home selves have an indirect effect on expatriates' behaviors.

Limitations - We relied on self-reported questionnaires.

Implications Research on expatriation has focused largely on cross-cultural adjustment as a driver of expatriates' cognitions and behaviors. The present paper suggests hypothetical home selves as an antecedent to these variables, thereby providing a novel perspective on expatriation.

Originality/ Value - This research enhances our understanding of the complex identity processes involved in cross-cultural transitions.
EXAMINING FAKING BEHAVIOUR IN A HIGH-FIDELITY JOB APPLICATION SIMULATION

Patrick Dunlop (1) - John Donovan (2) - Djurre Holtrop (1) - Liam Ashby (3) - Anu Bharadwaj (3)

Curtin University, Future of Work Institute, Perth, Australia (1) - Prudential, Talent Management, Newark, United States (2) - University of Western Australia, School of Psychological Science, Perth, Australia (3)

Purpose
Faking by job applicants on personality assessments is difficult to study. Experimental manipulations in laboratory studies provide poor representations of real job applications. Field studies comparing applicants to non-applicants are plagued with endogeneity because applicants do not choose jobs at random. Finally, almost no faking research includes behavioral criterion variables, thus whether faking compromises validity is unknown. To address these limitations, this study employed a novel within-subjects design with a high-fidelity job application manipulation and objective performance measure.

Method
We assessed the personalities (HEXACO-PI-R) of 189 MTurk participants under research conditions. Three months later, participants applied for a competitive opportunity to undertake a high-paying task on MTurk. We explained that selection would be contingent on their diligence, perfectionism, and fairness/integrity, and we measured their personality under applicant conditions. We then ‘selected’ all participants to perform an error-checking task.

Results
Significant increases from research to application conditions were observed on the perfectionism, diligence, and fairness facets. Performance was better predicted by the facets measured under research conditions than applicant conditions.

Limitations
First, participants applied for a one-off task rather than an ‘enduring’ job. Second, personality correlated very weakly with the performance task.

Research/Practical Implications
People elevated their scores substantially on selection-criterion related trait scales when in a competitive application. Personality scores collected under applicant conditions were less predictively-valid than those collected under research conditions.

Originality/Value Discussion
There are very few within-subjects studies of faking behaviour involving a truly competitive selection situation, and fewer studies that incorporate a behavioural criterion measure.
Over the past 40 years, it is firmly established that LMX has important positive effects on various individual and organizational outcomes, such as job satisfaction and performance. We propose new hypotheses to update LMX theory, thereby adjusting it towards the rapidly changing employment relations and organizational context of the 21st century. We mainly aim to do so by introducing the concept of social status into LMX theory, thereby taking into account the social context of the relationship.

Status is inherent to each position in a social network and stems from performances and competencies. Status may therefore vary over time and differ across networks. Depending on their status in multiple networks, both leader and member bring resources to the LMX relationship, and thereby affect its quality. For example, as a member has resources available in his networks, this may reduce his dependency on the leader, thereby lowering his motivation to invest in the exchange relationship.
