Since October 2016 we are gathering longitudinal data among both supervisors and their PhD students at Ghent University (Belgium), tracking social status and the LMX relationship. We follow dyads with starting and potentially ending relationships. The preliminary results indicate a positive association between social status and LMX. A better understanding of the role that social status plays in the emergence, maintenance and dissolution of LMX relationships, will give us a more complete picture of the role of LMX in modern organizations.

This research project is the first empirical investigation in the field of personnel selection, exploring the occurrence and differences of faking in telephone interviews compared to face-to-face interviews. To do this, an explorative laboratory study and an online survey were conducted. The laboratory study simulated a realistic personnel selection process for an internship in the field of human resources, using a between-subject design. It has a sample size of N = 56 probands, composed of students. The sample size of the online survey consists of N = 356 probands. We could prove a significant difference between the ability and the opportunity to fake in telephone and face-to-face interviews. The ability to fake is higher in the face-to-face interview, whereas the opportunity to fake is higher in the telephone interview. The willingness to fake and the faking behavior of the probands did not show any significant difference between the two interview types. By calculating a frequency analysis we could prove the importance of nonverbal communication for faking in the employment interview. As a result, we suggest a modification of the faking model of Levashina und Campion (2006) by adding nonverbal communication as antecedence of the ability, willingness, and opportunity to fake. In terms of the raising usage of video interviews in personnel selection, including nonverbal communication, the model needs to be proved in further research. In follow-up studies, one should aim to recruit a more heterogeneous sample in order to be able to transfer the results to other cohorts besides students.
Purpose: This study aims to investigate the relationship of effort-reward imbalance (ERI) on employee burnout (BO), organizational injustice (OI) and sensitivity to terror (STT).

Methodology: The study applies longitudinal approach, comprises two data waves of three months’ time. Using a 432 sample size data collected from four big cities in Pakistan where terrorist attacks are rampant and collected during a period when terrorist attacks were at a peak. Hypotheses are tested using AMOS 22 and hierarchical regression.

Results: We found negative relationship between ERI and burnout. OI mediated the influence of ERI on BO. The conditional effect of the mediation of organizational justice was significant in three of the sensitivity to terror conditions but it weakened, becoming non-significant, when the level of sensitivity to terror was low. We also found that sensitivity to terror (STT) significantly moderated ERI and burnout.

Research limitation: Various classical limits are associated, limitations includes self-reports, cross-sectional design and single country setting.

Practical implications: The study findings expand our knowledge of the ERI on employee burnout, the role of OI and the role of STT. The findings of this study suggest that effort-reward imbalance and employer injustice in terror-ridden firms can be balanced through developing collective policies for those in upper level management and lower level management positions.

Originality/value: This is the first study to empirically examine the sensitivity to terror on employee burnout and is of value to firms operating in terror-ridden areas.
The digital workplace creates a dilemma between the benefits of an entrepreneurial workstyle enabled by communication and collaboration technology and the drawbacks of increasing performance expectations, constant connectivity and a blurring line between work and non-work, which makes it difficult for employees to detach from their work. Our research addresses the question how employees can achieve both, a high level of well-being and an outstanding work performance.

We follow Antonovsky’s approach of Salutogenesis and look at a sample of high performing individuals in the bruising environment of a global software company. We combine physiological stress measurements (heart rate variability) and semi-structured interviews regarding employees’ working life.

Despite similarities of the objective work situation, individuals in our sample display differences in the sustainability of their performance. Our analyses reveal a strong Sense of Coherence (SoC) among the sustainable high performers (SHPs). SHPs make sense of job demands and see them as challenges instead of problems. SoC enables the development and application of coping strategies so that employees can craft their work to achieve well-being. Our findings suggest that psychological detachment explains differences in the sustainability of work practices. Employees with higher stress levels were aware of the importance of detachment for their well-being but did not enact detachment strategies consequently, whereas those with low stress levels actively engaged in detachment and consciously disconnected from their work. Our results can enrich human resources management in providing a basis for interventions to improve well-being.
Purpose:
The percentage of Canadians attending weekly religious services has consistently declined and aged over the past 20 years. For example, the United Church of Canada has reported closing or amalgamating approximately 50 churches a year (Brown, 2015). This research examines leadership challenges in organizations (i.e., churches) facing decline.

Design / Methodology:
Sixteen religious leaders were interviewed about their experiences, including their leadership philosophy, challenges faced in their leadership role, how they make meaning of change, and the role of spirituality versus religion in people’s lives. Transcripts were coded using abductive thematic analysis.

Results:
Interviewees acknowledged the challenges of leading in an environment where formal religion is, increasingly, not a central social theme. They noted the spiritual, philosophical, and practical problems associated with keeping faith central in people’s lives. Themes capturing dyadic-focused, transformational, and servant leadership were prevalent.

Limitations:
Conclusions are limited by the number, denominations, and geographical clustering of interviewees.

Implications:
Results provide insight into the challenges of church leadership, many of which are made more complex by expectations commonly attached to leaders in these contexts (e.g., pastor as servant) and by virtue of our increasingly busy and “connected” world.

Originality / Value:
This research provides insight into dilemmas facing a population understudied in the literature – religious organizations and their leaders.
The current career construction literature has predominantly focused on individual characteristics (e.g., career adaptability) as antecedents of individuals’ job search outcome. This may overlook other possible antecedents from alternative theoretical approaches. In this paper, in light of career construction theory, we integrate the event-system theory and investigate the impacts of both career adaptability and career-related events, more specially, the dimensions (i.e., novelty, disruptiveness, criticality, and controllability) and aspects (i.e., positive versus negative) of these events on graduate students’ job search self-efficacy and job search success. Drawing upon a sample of 214 graduate students in China, the results show that for positive events, the levels of its criticality and controllability are positively related to individuals’ job search self-efficacy and job search success, while its novelty is negatively related to individuals’ job search self-efficacy and job search success. For negative events, only the level of its controllability is found to be positively related to individuals’ job search self-efficacy and job search success. Furthermore, we find the mediating effect of job search self-efficacy in linking dimensions of events and job search success is significant. Overall, this study brings an event-based perspective into the existing career construction theory, and adds to the range of possible antecedents that can impact individuals’ career-related attitudes and outcomes.
A QUALITATIVE INTERVIEW STUDY OF JOB CRAFTING AMONG TEACHERS IN PRIMARY EDUCATION

Erik Jeltema (1) - Nicole Hoefsmit (2) - Karen van Dam (2)

Open University, Former student Work and Organizational Psychology, Heerlen, Netherlands (1) - Open University, Department of Work and Organizational Psychology, Faculty of Psychology and Educational Sciences, Heerlen, Netherlands (2)

Purpose

About one in five employees in the Dutch education sector reports burnout complaints (Statistics Netherlands, 2018). Job crafting can prevent burnout. To date, we lack an in-depth understanding of how A) primary teachers craft their jobs, B) workplace stakeholders support their job crafting, and C) teachers’ job crafting can be counterproductive to colleagues. This study aims to explore these topics using the Job Demands-Resources classification of job crafting (Tims et al., 2012).

Design

To acquire rich insights into primary teachers’ experiences, in-depth interviews (17) were conducted. These interviews were transcribed verbatim and analysed through open, axial and selective coding (Boeije, 2014).

Results

Job crafting includes: following courses (increasing structural resources), asking colleagues for support (increasing social resources), delegating tasks (lowering hindrances) and integrating personal interests into teaching (increasing challenges). The results illustrate the important roles of colleagues and students in triggering teachers to craft their jobs. Counterproductive consequences of job crafting for colleagues include an increased workload.

Limitations

An example limitation is that participants might not have remembered all job crafting behaviours accurately.

Research implications

Quantitative, longitudinal studies are needed to address, among others, the counterproductive consequences of teachers’ job crafting for the sustainable employability of colleagues.

Value

To our knowledge, this is the first study to shed light on the many creative ways in which teachers in regular primary education craft their jobs. The results suggest the relevance of a professional school climate where teachers are trusted to inspire each other with productive job crafting behaviours.
212 - ORGANIZATIONAL JUSTICE: AN EXPERIMENTAL INVESTIGATION OF INTERPERSONAL ANTECEDENTS USING THE HEXACO-MODEL

C. Richard Hossiep (1) - Stephanie Weiler (1) - Viktoria Baumeister (1) - Gerhard Schewe (1)
University of Münster, Münster, Germany (1)

Purpose:
A number of studies has investigated the impact of personality on Organizational Justice but very few have used the recently advanced HEXACO-Model of personality. Drawing on the HEXACO-model we wanted to examine both the effect of personality on Justice perceptions as well as the interaction of different Justice Dimensions.

Design:
To investigate the relative importance of justice dimensions we created vignettes that suggested high/low distributive and/or informational justice resulting in a 2x2 experimental design. To investigate the impact of personality on justice perceptions we collected data on the participants’ personality using self-ratings of the Honesty-Humility, Emotionality and Agreeableness – the conceptually most relevant – factors of the HEXACO-personality inventory. We collected data in two studies, Study 1 consists of more than 250 responses from randomly recruited participants and Study 2 includes more than 250 responses, using a crowdsourcing platform.

Limitations:
Possible limitations include the suitability of our vignette case for manipulation of the justice dimension. Furthermore, as the data is cross-sectional the generalizability might be limited.

Research/Practical Implications:
Our results from both study 1 and study 2 suggest that there are meaningful interactions between justice dimensions perceptions. Further we find a moderation effect of the Honesty-Humility-factor on distributive justice: People scoring high on Honesty-Humility are less prone to experiencing high distributive Justice.

Originality/Value:
To our knowledge this is the first time that the HEXACO-model has been linked to individual Justice Dimensions. Despite all Justice Factors being positively related, research on justice dimension differences might be a fruitful area for further research.
UNCOVERING THE EFFECTS OF TEAM OPENNESS TO EXPERIENCE ON TEAM CREATIVITY:
THE ROLE OF PSYCHOLOGICAL SAFETY

Claudia Sacramento (1) - Joanne Lyubovnikova (2) - Ieva Martinaityte (3) - Andrea Juhasz (4)
Aston University, Work and Organisational Psychology, Birmingham, United Kingdom (1) - University of Liverpool, Liverpool, United Kingdom (2) - University of East Anglia, Norwitch, United Kingdom (3) - Aston University, Birmingham, United Kingdom (4)

Purpose: Although the effects of openness to experience on individual creativity are well established, research on how this effect might unfold in a team context is scarce. Building on the team climate perspective on team creativity, we argue that mean openness to experience in teams leads to a climate of psychological safety which, in turn, facilitates creativity, and that this mediation effect becomes stronger as the project creative requirements of the team increase.

Design: The proposed moderated mediation model was tested across two independent studies, the first comprising 35 business student teams working on a ten-week project, and the second comprising 28 professional teams from the automotive industry.

Results: Team mean openness to experience was positively associated with team creativity via psychological safety, and this relationship was strengthened under conditions of higher project creative requirements.

Limitations: The sample size in each study was relatively small at the team level and future research should consider other potential mediating mechanisms beyond that of psychological safety.

Research/Practical implications: Our findings not only contribute to theoretical understanding regarding the relationship between team personality composition and team creativity, but also provide much-needed insight into how, and under what conditions, team mean openness to experience leads to higher team creativity, thus enabling us to delineate several practical implications.

Originality/Value: This study is the first to explore how team mean openness to experience can lead to creativity.
Over the years the researchers have studied various constructs of leadership extensively, however, to gain sustainability and stay competitive, organizations are needed to focus on creativity and innovation. It is essential for organizations to be creative and innovative so that may gain efficiency and success. We examine the impact of creative and innovative leadership behaviors on employees’ task performance in a study of 453 employees and their 79 immediate supervisors in software companies of Pakistan. Drawing on self-determination theory, we develop a moderated-mediation model that investigates the effects of supervisors’ creative and innovative behaviors on employees’ task performance.

The results indicate the importance of creative and innovative leadership that has positive impact on employees’ task performance, and that this relation was mediated by thriving at work. We further found that the effect of thriving on task performance was contingent on a consciousness.

Our study contributes that leaders’ behavior and individuals’ personality trait play significant roles in facilitating thriving at work and that thriving is an important means by which managers can enhance employees’ performance. Concerning the greater impact of creativity and innovation for organizations, the managers should conduct the trainings with their focus on to creative and innovative leadership behaviors. Thus, creative and innovative leadership behavior is expected to assist managers in nurturing and supporting creativity and innovative behavior at the individual level. Also, managers may take advantage of training efforts by creating a formal mechanism by which employees meet frequently to share issues concerning to their work.
NOT EVERYBODY THRIVES THE SAME WAY: THE IMPACT OF APPROACH MOTIVATION ON WELL-BEING AND PERFORMANCE VIA GROWTH STRENGTH IN SKILL UTILIZATION

Florian Klonek (1) - Yukun Liu (1) - Anya Johnson (2) - Helena Nguyen (2) - Sharon Parker (1)
Curtin University, Future of Work Institute, Perth, Australia (1) - The University of Sydney, Business School, Sydney, Australia (2)

Purpose. Building on an antecedents of work design perspective, we investigate person-level attributes that explain changes in skill utilization over an extended time frame. We hypothesize that performance approach motivation (PAPM, i.e., workers drive towards showcasing their performance) and avoidance motivation (PAVM, i.e., workers’ tendency to avoid performance situations) are person-level growth factors of skill utilisation: PAPM enhances skill utilisation, whereas PAVM diminishes skill utilisation. Further, we expect a positive relationship of skill utilisation with wellbeing and performance over time.

Design/Methodology. We collected longitudinal survey data from 104 employees in 3 waves across 4 years and tested a moderated mediation model using hierarchical linear modelling.

Results. PAPM moderated the effect of time on wellbeing and job performance via skill utilisation. That is, workers high on PAPM increased skill utilisation over time, whereas workers low on PAPM showed no growth. We found no moderation effect for PAVM.

Limitations. The use of self-report measures and lack of objective performance data are limitations of this study.

Research/Practical implications. We contribute to the literature by illuminating how interpersonal differences (i.e., motivational orientations) can shape work characteristics over time.

Originality/Value. This study contributes towards a better understanding of skill utilization in the workplace. Furthermore, the longitudinal data and the multi-level framework on person-level attributes and within-person changes contributes towards identifying variables that explain how skill utilization changes.

Keywords: skill utilization, approach motivation, avoidance motivation, job design, longitudinal modeling
Purpose: Many services provided in society rely on volunteers, but finding and retaining volunteers can be challenging. This paper examines the differences between ‘light’ volunteers (less than 60 hours a year), ‘regular’ volunteers (60 hours or more), and non-volunteers.

Design: A large scale project was conducted assessing values (Schwartz 21 values), personality (BFI2) and demographics of 7000 people. A subset of 4004 where asked about their volunteering activities and the groups were compared using ANOVAs with post hoc comparisons.

Results: In terms of personality, all volunteers were higher on extraversion, openness and agreeableness than non-volunteers. Regular volunteers were slightly higher on conscientiousness than light volunteers and light volunteers were slightly more conscientious than non-volunteers. Finally, regular volunteers had significantly lower negative emotionality than did light and non-volunteers. For values, regular volunteers scored lower on the values of hedonism and achievement than both other groups, non-volunteers scored higher on security than all volunteers, and all volunteers scored higher on the values of tradition and universalism (social) than non-volunteers.

Limitations: Participants who did not volunteer 60 hours or more a year were not asked how many hours a year they volunteered therefore we are not able to determine whether it substantially different than 60 hours.

Research/Practical implications: Through finding differences between light, regular and non-volunteers, we can better understand the different preferences of each group and how to address them.

Originality/Value: Previous research has investigated the value and personality differences between volunteers and non-volunteers but has not looked for differences between people who volunteer regularly and those that volunteer intermittently.
Purpose

The purpose of this paper is to investigate the impact of organizational support (OS) and virtual community trust (VCT) on organizational engagement (OE) and person-job-fit (PJF) in virtual temporary work relationships. The emergence of the platform economy has changed the work environment fundamentally and enabled the increase of new ways of organizing work, such as temporary organizing and the increase of self-employment. Consequently, we need to reinvestigate the predictors of employee commitment and well-being in this new context of work.

Design/Methodology

We propose a theoretical model on the relationship between OS, VCT and OE as predictors of PJF. Our model draws support from social exchange theory (Cropanzano & Mitchell 2005) and the model of antecedents and consequences of organizational engagement (Saks 2006).

Results

Based on our data of 128 experts contracting on digital platforms, VCT has a strong positive effect on OE, and both VCT and OE have a positive effect on PJF. However, the role of OS in these atypical work relationships was found to be non-significant.

Limitations

The data itself is rather limited although it provides interesting insights for future research.

Research/Practical Implications

Through identifying the antecedents of employee commitment and well-being in virtual platform work, it is possible to increase our understanding of how to enhance the working climate in atypical work relationships.

Originality/Value

This paper provides new insight and empirical evidence to the significance of trust as a source of positive work behavior and as a source of organizational engagement in virtual temporary work relationships.
226 - DIGITAL FLUENCY – A KEY COMPETENCE TO PERFORM IN THE DIGITAL AGE?

Sophia Zimmermann (1) - Florian Kunze (1)
University of Konstanz, Politics and Public Administration, Konstanz, Germany (1)

Purpose: The digital transformation represents both an opportunity and a challenge for organisations. Therefore, employee competencies which may enable organisations to exploit the advantages of the digital change gain in importance. However, only little research on such competencies has been conducted in the field of I/O psychology. We address this research gap by conceptualizing and validating a competence which may help organisations to succeed in the digital age. In a nutshell, we propose that digital fluency – “the ability to reliably achieve desired outcomes through use of technology” (Briggs & Makice, 2011, p. 6) consisting of implicit and explicit technological knowledge and technological self-efficacy – will positively affect employees’ task performance, technology related performance and their technology application.

Design/methodology/approach: Study hypotheses are tested among a multisource, time-lagged sample of a German medium-sized company with 300 employees.

Results: We validate the new digital fluency scale and find positive relationships on task performance, technology related performance and technology application.

Limitations: Common method variance might have influenced the relationship between digital fluency and technology application. However, the risk of biased results is reduced by the fact that the technology application scale consists of items which ask for actual behaviour rather than personal perceptions.

Practical Implications: We introduce digital fluency as new employee competency in the digital age that might be by specific leadership and HR practices.

Originality values: We introduce and validate a new scale that can enable more systematic research in the field of I/O psychology on the pressing issue of the digital change.
Purpose

Students’ teaching ratings influence university rankings as well as teacher success. However, this is problematic, if student ratings are driven by cognitive biases and/or unrealistic expectations. This study tests implicit biases and their influence on Higher Education teachers.

Method

201 UK University students participated in a scenario study with a 2 (male x female) x 2 (experienced x inexperienced) factorial design. Participants were asked to indicate how likely it would be that a University teacher they were imagining would exhibit 65 different attributes.

Results

We found five factors determining implicit teacher theories: student focus, dynamic teacher, teaching focus, manageable workload, and organized teacher. To be viewed an “ideal” teacher, women needed to have a significantly higher student focus, needed to be seen as more organized, and had to be perceived as a more respected researcher. This is particularly true for inexperienced women, while significantly less student-focus was expected from inexperienced males. Results are in the tables/figure below.

Limitations

This study surveyed students at different levels of their studies. It would be important to conduct a longitudinal study to track student’s perceptions over time.

Research/Practical Implications

To fulfill student expectations, female teachers, in particular the inexperienced, will have to invest more time and resources into teaching to achieve good ratings, potentially putting them in a disadvantaged position to succeed in their research.

Originality/Value

Male and female students expect more from females in order for them to be seen to provide excellent teaching. This puts unequal pressure on early career females.

230 - THE INFLUENCE OF SELF-INITIATED EXPATRIATES’ LOCAL LANGUAGE PROFICIENCY ON REACTIONS TO PSYCHOLOGICAL CONTRACT BREACH

Johannes Kraak (1) - Renaud Lunardo (2) - Yochanan Altman (3)

Toulouse Business School, Corporate Social Responsibility and Human Resources, Toulouse, France (1) - Kedge Business School, Marketing, Talence, France (2) - Open University Hong Kong, Kowloon, Hong Kong (3)

Purpose

This paper studies the impact of local language proficiency on psychological contract (PC) dynamics between perceptions of breach, feelings of violation and workplace deviance for self-initiated expatriates (SIEs). SIEs decide to move to another country and are locally employed. Healthy employment relations depend on effective communication. It is likely that local language proficiency influences SIE reactions to negative PC changes.

Design/Methodology /Approach/Intervention

A sample of English-speaking SIEs working in a local language environment (N=218) participated in our study. The moderated mediation model was tested with PROCESS.

Results

Results revealed a significant interacting effect of local language proficiency on the relationship between breach and violation: lower levels of language proficiency lead to increased violation feelings following breach. Furthermore, a significant index of moderated mediation indicated that local language proficiency also moderates the indirect effect of breach on deviance through violation.

Limitations

This study focuses on English-speaking SIEs working in local companies. More research in different language and industry settings is needed to better understand the importance of language for SIEs in PC dynamics.

Research/Practical Implications

This paper expands PC literature by providing new insights into the employment relationship for an ever-growing group of international employees. We contribute to practice by providing insights to employers on how to improve SIE PC dynamics.

Originality/Value

SIE research mainly focuses on large MNCs with English as company language. We study SIEs working on local contracts in local language environments.
Purpose: Evidence-based management (EBMgt), which focuses on the quality of the evidence used in decision-making, is being heralded as a way to improve managerial decision-making. Considering that it is managers who must adopt this approach, identifying the competencies necessary for them to do so is imperative. Accordingly, the aim of this study was to identify the competencies of evidence-driven middle-managers within hospitals.

Methodology: Qualitative data was collected using semi-structured interviews and the critical incident technique from 36 executive managers from 11 hospitals in Lebanon about the competencies of evidence-driven middle managers with whom they work. Observer-report was used to reduce self-report response biases.

Results: Using content analysis, 16 competencies were identified and grouped into four domains: technical (ex. research knowledge), cognitive (ex. systematic thinking), interpersonal (ex. relationship management), and intrapersonal (ex. adaptability). These competencies were either functional, facilitating the performance of specific core steps of EBMgt, such as research knowledge which contributes to the acquisition of evidence, or foundational, enabling an evidence-based approach as a whole, such as adaptability. Further, while many competencies overlapped with healthcare management competencies in the literature, some such as openness to change remained unique to the current model.

Limitations: This study is limited by the relatively small sample size, the inclusion of only executive managers, and the focus on hospital settings in Lebanon.

Implications: The competency model can guide training initiatives aimed at building the necessary capabilities among managers in the era of data.

Originality/Value: This is the first competency model of evidence-driven middle managers in hospital settings.
Purpose: Evidence-based management (EBMgt) seeks to encourage the use of practices with the best evidence for their effectiveness, consequently improving managerial decisions. There is, however, limited understanding and theorizing on how EBMgt plays out in different decisional and organizational contexts. Accordingly, the aim of this study was to conduct an in-depth examination of EBMgt among managers in hospital settings and, using this evidence, develop a theoretical model of EBMgt.

Methodology: Qualitative data was collected using semi-structured interviews and the critical incident technique from 36 managers from 11 hospitals in Lebanon.

Results: Using Gioia, Corley, and Hamilton’s (2013) approach, a model was identified depicting that the way evidence is utilized in decisions (to improve decisions, gain support, or justify an a priori choice) is influenced by managers’ motives and the characteristics of the decision itself. Managers’ choice of the sources of evidence is a function of factors relating to the evidence, individual, organization, healthcare system, and nation. Managers conceptualize evidence in EBMgt as not just the ‘best available evidence’ but the ‘best available evidence’ that aligns with resource, political, cultural, and ethical constraints at the level of the individual, organization, and nation.

Limitations: This study is limited by the small sample size and the inclusion of only executive managers.

Implications: The model supports the conceptualization of EBMgt as a multi-level phenomenon, expressed at the individual level and influenced by factors at different levels, and requiring cross-level collaboration.

Originality/Value: This empirically driven and theoretically informed model of EBMgt in hospital settings addresses the gap in the literature.
Purpose

In this study, we draw on theories from the close relationships literature to interpret leadership dynamics in the workplace. We argue that leader and follower attachment styles, cognitive models that are formed by individuals’ life experience and relationships with significant others, are associated with leader-member relationship quality (LMX) as well as work outcomes (e.g. well-being and performance). We hypothesise that LMX mediates the relationship between attachment insecurities (attachment anxiety and avoidance) and work outcomes. We further propose that, in leader-follower dyads, the perceived LMX quality is contingent not only on an individual’s attachment style, but on the attachment style of their dyadic partner. Finally, we investigate whether individuals’ political skill is able to buffer the negative effect of attachment insecurity on LMX quality.

Design/Methodology

The study adopts a longitudinal quantitative design with a sample of nursing and doctor teams from a large local hospital in China. Data are being collected at three time points, with three-month gaps in between each wave. Currently we have completed the first two waves, and sample consists of 592 responses (66 teams) from both leaders and followers.

Results

Multilevel modelling will be adopted to analyse the data. Findings will be presented.

Limitations

Data were collected in healthcare industry alone. Although the effect of gender is controlled, the number of female participants is significantly larger than male participants due to the nature of the occupation in China.

Originality/Value

This study has taken into account both leader and follower traits and skill in terms of their influence on relationship quality, capturing the interdependent nature of the leadership process.
The purpose of this research was to explore the work design, in particular the characteristics of tasks performed and knowledge required by them, comparing on-site workers and teleworkers. The sample was composed of 417 Brazilian on-site workers and 119 Brazilian teleworkers. Two dimensions of the Work Design Questionnaire developed by Morgeson and Humphrey (2006) were applied. These dimensions sought to understand the workers' perception about the task and knowledge characteristics. Data were analyzed using SPSS v. 21. Results showed that knowledge characteristics remain the same in the two work modalities. Teleworkers perceived some of the tasks characteristics as attributes more present in work than the on-site workers, mainly regarding autonomy and feedback of the task itself. This research did not address other dimensions that involve work design, which should be studied in future research, like social characteristics of work. It is believed that social characteristics are mostly modified when changing the work modality. Soon, organizations will need to improve how they manage telework so organizational performance can be achieved in the best way possible. Results evidenced that work itself is not different in distinct modalities, so organizations do not need to change it to implement telework. Studying work design in this modality is important to the creation of norms and guidelines that regulate telework so it can be applied in the best way.
Purpose: To synthesise existing understanding in the literature regarding the relationships between leadership, organisational identity and follower organisational identification, through the lens of organisational change.

Methodology: A systematic review was undertaken, integrating research conducted between January 2005 and May 2017 that focused on the relationships between a range of leadership styles, organisational identity and follower organisational identification, within the context of organisational change (k = 104). A meta-analysis (k = 62) then examined the correlation between followers’ perceptions of leadership styles and their organisational identification.

Results: The systematic review highlighted positive relationships between a range of leadership styles, organisational identity and follower organisational identification. The relationship between followers’ perceptions of leadership styles and organisational identification was substantiated via the meta-analytic review, which established a moderate and significant pooled correlation between the constructs ($r = 0.47$, $k = 62$, $N = 22,649$). Seven of the eight leadership styles examined were positively correlated with organisational identification.

Limitations: The correlations included in the meta-analyses were based on employee ratings (i.e. of their leader and organisational identification). Potential publication bias was also evident.

Research/Practical Implications: Results suggest that leaders, through their actions, can have a positive impact on organisational identity and followers’ organisational identification. Furthermore, leaders can foster these connections in a variety of ways rather than subscribing to one particular leadership style.

Originality/Value: This research presents the first known systematic review examining the relationships between the four research constructs, and the first meta-analysis examining a range of leadership styles and their relationship to followers’ organisational identification.
This study aimed to compare teleworkers’ perceptions of tasks and knowledge characteristics, comparing telework and on-site work situations. The sample was composed of 111 teleworkers from two different Brazilian public organizations of the executive and judicial power. The participants had previous experience with on-site work in the same organization. A translated, adapted and reduced version of the Work Design Questionnaire by Morgeson and Humphrey (2006) was applied with 13 items associated to a scale (1= Less than On Site Work, 2=On Site Work, 3=Higher than On Site Work). The answers were analyzed using SPSS v. 21. No statistically significant results were found regarding the perception of Work Knowledge Characteristics. Regarding Task Characteristics, the high percentage of answers stand-out, indicating that telework gave them more autonomy to manage work when compared to on-site work. It was not possible to analyze social characteristics that can impact these perceptions. The sample analyzed is homogeneous in terms of activity they perform and educational levels, so results cannot be generalized. With support of information and communication technologies, it was observed that it is possible to implement telework, preserving the same degree of complexity and nature of tasks. It is suggested that future research and instruments include other factors and variables of the organizational context that can vary when comparing teleworkers and on-site workers.
Purpose: Organizations have to strive in an uncertain and challenging environment. Hence, the role resilience has played at work has been of special interest in the last decade, although empirical research is still scant, especially regarding the antecedents and the consequences resilience has. In this study we analyze the role corporate social responsibility plays towards employees (CSRE) in the promotion of resilience at work, and how resilience results in organizational learning capability (OLC) and firm performance. Methodology: Structural equation modeling was used to test our model with a sample of 296 companies from different sectors. Results: Results show that CSRE had a positive influence on organizational resilience, which in turn affected firm performance via OLC. Research/practical implications: We empirically showed how important the activities aimed at taking care of employees are, and how CSRE for employees, helps build stronger organizations. Moreover, our study has extended empirical clarification concerning the underexplored relationship between resilience and the outcomes of organizational performance by unveiling the mediating role OLC has in this relationship. Practical implications in terms of further human resources management activities are also discussed.

Keywords: Organizational resilience, corporate social responsibility, organizational learning capability, firm performance.
Purpose. It has become imperative to support individuals in sustaining longer but also healthy and productive working lives. Whereas the advantages of promoting and enabling successful ageing at work (SAW) have been widely acknowledged, no single instrument for measuring this emerging construct has been published so far. This study aims to operationalise the construct of SAW and to develop the first SAW scale, rooted conceptually in the most recent advancements of the life-span development approach.

Design/Methodology/Approach/Intervention. The projected instrument was piloted and validated in three consecutive studies involving MTurk samples (pre-pilot, pilot, and calibration) including over 500 workers in total.

Results. Based on reliability statistics, parallel and factor analyses, two dimensions of SAW were extracted – Content and Strategies. They correlated substantially with constructs within the nomological network of SAW.

Limitations. This research is on-going. More data are needed to establish the criterion validity of this new scale regarding a range of objectively measured work outcomes in organisational settings.

Research/Practical Implications. Measuring and enabling SAW is important at all career stages.

Originality/Value. This new psychometric instrument is applicable to a variety of work settings and groups of workers. Measuring SAW can raise awareness and prepare both individuals and organisations for managing SAW (thus, maintaining high well-being and job performance) throughout the working life-cycle.
Ines Catharina Wulf (1)

Heinrich Heine University Duesseldorf, Chair of Business Administration, in particular Organization Studies and Human Resource Management, Duesseldorf, Germany (1)

Purpose

Due to the demanding work environment health care professionals are often affected by mental health problems. Besides negative effects on individual well-being, mental health problems can reduce professional effort and increase turnover rates in health care. Those who develop a mental health problem often receive necessary treatment with a great deal of time delay. Two reasons for this are low mental health literacy and stigma. However, empirical investigations regarding the role of workplace mental health literacy and stigma on help-seeking and help-outreach intentions are currently missing. This study aims at extending the literature on the role of stigma and workplace mental health literacy in health care.

Design/Methodology

Based on a sample of health care trainees the research model will be tested by using SEM.

Results

The study will provide insights to the complex process of mental health help-seeking and help-outreach of health care professionals.

Limitations

Causal inference as well as generalizability is limited based on the sample.

Research/Practical Implications

By analyzing the ways in which personal stigma, self-stigma and workplace mental health literacy conjoining to influence help-seeking and help-outreach intentions, this study contributes to our understanding of mental illness prevention in health care.

Originality/Value

This study is among the first to consider both personal stigma and help-outreach among health care professionals. Therefore it contributes to a deeper understanding of barriers in the help-seeking process for a specific profession, using a recently validated German version of the MHL-W.
LEADER’S MOTIVATION FOR LEADERSHIP AND ITS ASSOCIATIONS TO SUBORDINATES’ SATISFACTION WITH THEIR LEADER AND QUALITY OF LMX RELATIONSHIP

Elina Auvinen (1) - Heidi Tsupari (1) - Mari Huhtala (1) - Taru Feldt (1)
University of Jyväskylä, Department of Psychology, Jyväskylä, Finland (1)

Purpose: We investigated how leader’s motivation for leadership positions, conceptualized as Motivation to Lead (MTL), relates to subordinates’ perception of leader satisfaction and LMX quality. Based on the 3-dimensional structure of MTL, we anticipated that different combination of leadership motivation would exist resulting in latent MTL profiles.

Design and methodology: Latent Profile Analysis was conducted to explore leaders’ motivational profiles in the whole sample (N=1004) by using MTL-scale. In the following analyses, we used a sample of 233 leaders and their 987 subordinates. Subordinates assessed their leader using 10-item scale of satisfaction and the LMX-7 scale. The relationship between leader’s MTL profile and subordinates’ leader perception was analyzed with ANCOVA.

Results: Four MTL profiles emerged in whole leader sample and were replicated in smaller subsample: Leaders had either Affective-identity based MTL (n=123), Negative overall MTL (n=66), Low Affective-Identity yet High Non-Calculative MTL (n=30) or High Affective-Identity and Social-Normative based MTL (n=14). Subordinates of Low Affective-Identity yet High Non-Calculative MTL -leader assessed their LMX quality as worst. They were also most dissatisfied with their leader’s orderliness, responsibility, ability to make decisions, give feedback and inspire others. Subordinates of High Affective-Identity and Social-Normative based MTL -leaders were most satisfied with their leader’s decision-making and orderliness.

Limitations: Cross-sectional design allows no causal inferences.

Research/practical implications: Our research provided pioneering empirical evidence on the role of leader’s individual motivation regarding subordinates’ satisfaction with leadership. Further research in longitudinal design is needed to examine the possible mechanisms.

Originality/value: To our best knowledge, this was the first time to apply person-centered methods and examine subordinates’ satisfaction with leadership in the MTL-context.
Purpose

Workplace flexibility has become a common work mode for many white-collar workers. There is some evidence that it is positively associated with work connectivity behavior during non-work time (WCB). However, the mechanisms that underlie this relationship remain unclear. Drawing on the theory of planned behavior (TPB), the study aims to shed light on three potential mediators (attitude, subjective norms, perceived behavior control) by which causal influences are transmitted.

Design/Methodology

White-collar workers are surveyed at two points in time with a time lag of two months. In order to test the hypotheses structural equation modeling is applied.

Results

Based on preliminary results, we can provide valuable insights to the understanding of how workplace flexibility is linked to WCB. Currently, data collection is ongoing (t2). The final results could be presented at the EAWOP 2019 congress.

Limitations

Even though a longitudinal design was chosen, causal inference is limited due to the non-experimental nature of the study.

Research/Practical Implications

The results may be helpful in understanding the formation of WCB in a workforce that increasingly becomes flexible. As many organizations (e.g. BMW, Puma) have voiced the aim to foster workplace flexibility but to limit WCB, the results may be also interesting for practitioners.

Originality/Value

This study is the first to clarify the nature of the relationship between workplace flexibility and WCB, by exploring three underlying mechanisms. Furthermore, it extends the TPB by including habit strength as a moderator of the intention-behavior relationship, which may put a boundary condition on the explanatory power of intentions to perform WCB.
Purpose: We aim to contribute to the literature on meaning of work and test the idea of transformational leadership as being a leaders’ response to motivating work. Specifically, we investigate how job resources, human resource (HR) practices and leaders’ prosocial motivation interact in predicting weekly variation in transformational leadership through leaders’ weekly work engagement.

Design: We conducted a quantitative weekly diary study and collected data of leaders from various organizations in Switzerland over five weeks (k=106, n = 530).

Results: Our multi-level analyses suggest that leaders are more engaged in weeks during which their job resources are high. In weeks with low job resources, enabling HR practices appear to help leaders to remain engaged. In weeks in which leaders feel highly engaged, they show leadership that is more transformational. The latter relationship between engagement and transformational leadership is stronger for leaders with high prosocial motivation.

Limitations: We test (cross-level) interaction effects, but our weekly diary design does not allow drawing strong causal conclusions.

Practical Implications: Our findings suggest that organizations can stimulate transformational leadership by providing leaders with job resources and HR practices that support them in fulfilling their role.

Originality: Previous literature has provided much guidance on when and why transformational leadership is effective. In contrast, we advance the understanding of when and why transformational leadership emerges.
Purpose
The purpose of this paper was to examine the extent to which perceptions of mastery and performance climates are influenced by social and economic leader-member exchange (LMX) relationships. In addition we sought to uncover the moderating role of leader’s political skill.

Design/Methodology
Using data from different sources, a field study was conducted among 186 followers and 93 leaders from a Norwegian public organization. Multilevel analyses were used to test the hypotheses.

Results
Results indicated that perceptions of mastery climate are positively influenced by social LMX and perceptions of a performance climate are positively influenced by economic LMX. In addition leader political skill moderated the association between social LMX and mastery climate. The form of moderation suggests that social LMX is particularly important for the facilitation of a mastery climate among less politically skilled leaders.

Limitations
Although we utilized data from different sources, the data were cross-sectional, thus prohibiting causal inferences.

Implications
Managers should be aware that a performance climate is likely to result from leaders’ reliance on economic exchanges with followers, whereas a mastery climate is likely to result from leaders’ reliance on social exchanges with followers. The latter may prove particularly useful when the leader is less politically skilled.

Originality/Value
By integrating achievement goal theory with LMX theory, this study contributes to our understanding of factors forming the motivational climate. By incorporating leader’s political skill, we respond to recent calls for more research on how leader skills combine with other variables to influence employee outcomes (e.g., Yukl, 2012).
Content: Purpose

Emerging research on the dark side of entrepreneurship indicates that entrepreneurial intentions are affected by dark triad traits (narcissism, psychopathy, and Machiavellianism). The present study contributes to this research by looking at the level of entrepreneurial teams in terms of team-level averages of dark triad traits in conjunction with a more positive team characteristic, resilience.

Design/Methodology

Specifically, we studied 87 teams performing entrepreneurial challenges and assessed how entrepreneurial intentions were formed in these teams over time. We sent out a survey at two points in time, once before the teams were formed and once after they finished their project.

Results

We find that team level psychopathy and desire for control are negatively related to intentions, and that team level amoral manipulation is positively related to entrepreneurial intentions. Furthermore, we find that team resilience buffers the negative effects of dark triad traits. Overall, our results indicate that the relationship between dark triad traits and intentions is more complex than previously hypothesized as dark triad traits and their subdimensions at time one are sometimes positively and sometimes negatively related to entrepreneurial intentions at time two.

Originality/value

This is the first study to show dark triad traits at the level of entrepreneurial teams and how it unfolds over time to predict entrepreneurial intentions. Our findings contribute to this stream of research by going beyond the cross-sectional individual-level approach and showed that, at the team level, various dimensions of Machiavellianism were related both positively and negatively to entrepreneurial intentions over time, while psychopathy was strongly negatively related to intentions.

Disclosure of Interest: None Declared
As organizations expand internationally, there is an increasing need for a globally mobile talent pool. Expatriate workers and host-country nationals are involved in complex cross-culture interactions. They are required to navigate unfamiliar relationships with a diverse array of actors from different national, professional, and organizational backgrounds. In such ambiguous contexts, trust is pivotal in the development and management of relationships (Dietz et al. 2010). An emergent theme from a larger qualitative study by the authors has provided the catalyst for exploring the interplay of trust in international work. Thus, our aim is to explore the role of trust between workers, management and organizations in international settings to surface practices which influence trust. Reporting on 30 semi-structured interviews with expatriates, we employed an interpretivist epistemology to understand how trust is developed and affected during international work. The preliminary findings highlight that the trust individuals place in organizations manifests through the provision of a safe and secure living environment. Additionally, findings surfaced ways of trust breach, e.g. lack of transparency about living costs, particularly hidden costs that the expatriate worker may not have accounted for, caused distrust. The shifting socio-political landscape affects the way in which international work unfolds and emphasises the importance of instilling mutual trust between different parties, particularly in relation to interactions between foreign workers. It is important to increase our understanding of how trust is developed and affected during international work to identify practices that enhance trust between different parties, at individual, management and organizational levels.
Using on Social Identity Theory (Tajfel & Turner, 1979) as an explanatory framework, the present research seeks to assess the influence “proactive behaviour congruence” between workers and managers has on their trust relation. It further explores whether tie strength moderates the relation between leader-follower “proactive behaviour congruence” and trust. Finally, it attempts to understand how the resulting trust between the dyad influences their affective relations and employees’ choice to remain silent.

The research hypotheses were tested by employing a vignette study (study1) and a cross-sectional study (study2). Results of Study 1 show dyadic proactive behaviour congruence is positively related to trust and positive affect; whereas dyadic incongruence is negatively related to trust and positive affect. Results of Study 2 show that high leader-follower proactive behaviour congruence is positively related to trust; whereas incongruence and low leader-follower proactive behaviour congruence is negatively related to trust. Tie strength moderates the relationship between “proactive behaviour congruence” and trust, increasing trust when there is a mismatch of perception or when congruence is low. Finally, silence is negatively associated to trust.

The research extends the contention that social identity matching plays an important role in trust development and that identification is a distal antecedent of affect and employee silence. A potential implication is that identity congruence is an important factor in the leader-follower sense-making process. Repercussions for managers and leaders are expand and several lines of future research are identified.
The moderating effect of a perceived supportive leadership on the association between unclear roles in the organization and workplace bullying – a two-wave study

Stefan Blomberg (1) - Michael Rosander (2)

Linköping University, Department of Occupational and Environmental Medicine Center, and Department of Clinical and Experimental Medicine, Linköping, Sweden (1) - Linköping University, Department of Behavioural Sciences and Learning, Linköping, Sweden (2)

Purpose: To investigate the moderation of perceived supportive leadership on workplace bullying growing out of unclear roles in a Swedish governmental department.

Methodology: 1846 employees were invited to a two-wave survey; 74.9.-% participated in the first wave (T1) and 69.3.-% in the second (T2). Workplace bullying was measured with NAQ-R (Einarsen, Hoel, & Notelaers, 2009). Unclear roles and perceived supportive leadership were measured with subscales from PSYWEQ (Rosander & Blomberg, 2018): Roles in the Organization (RIM) and Perceived Supportive Leadership (PSL).

Results: There was a significant, clear and surprising moderation that was both negative and positive depending on the level of PSL. For low levels of perceived supportive leadership at T2 there was a positive relationship between unclear roles at T1 and workplace bullying at T2. For high levels of perceived supportive leadership there was a negative relationship between unclear roles at T1 and workplace bullying at T2. That is, a perceived supportive leadership can actually lower the risk for workplace bullying to such an extent that the levels of workplace bullying were lower compared to when the roles were clear and non-conflicting at T1.

Limitations: The investigation was carried out in one organization. Thus, the results are not representative for the workforce in general.

Implications: The study calls for research that can duplicate the results in other organizations. The study still implicates the utmost importance of a perceived supportive leadership.

Value: The study contributes to important knowledge on how to prevent bullying, especially in organizations with unclear roles.
Purpose: A Swedish gender-neutral pronoun (hen), was recently introduced in the Swedish language as a complement to she (hon) and he (han). Hen can be used when referent gender is unknown, unimportant or non-binary. In two experiments, we tested if hen decrease a male- and gender-normative bias in a recruitment situation.

Design: In a between-subjects design the participants read a summary of a job candidate referred to with different labels, and chose what picture they believed showed the candidate. In Experiment 1, the labels were “the applicant”, “NN”, “she/he”, “hen”. The photos showed gender-conforming women and men. In Experiment 2, the labels were “she/he”, “hen”. The photos showed gender-conforming or -nonconforming individuals.

Results: In Experiment 1 (n = 418) “the applicant” and “NN” contained a male bias in that the majority participants chose a man on the picture; “hen” and “she/he” did not contain a male bias. In Experiment 2 (n = 143), “she/he” contained a normative bias in that the majority of participants chose a gender conforming person on the picture; “hen” did not activate a normative bias.

Limitations: These experiments were performed in controlled lab settings and should be replicated in real-world settings.

Research/practical implications: We show that nuances in referents (pronouns, labels for applicants) leads to different preconceptions of the candidate’s gender. Thus, HR practitioners should choose inclusive words without implicit biases.

Originality/value: These are the first experiments documenting how a gender-neutral pronoun may facilitate inclusion in the work place.
Purpose. We introduce the concept of Playful Work Design (PWD), which integrates research on play and individual work design, and develop and validate its measurement. We propose that individual employees may proactively design their work to be playful (e.g., by setting competitive goals, using humor), and in this way improve their work-related meaningfulness, well-being, and performance.

Methodology. Items were generated in collaboration with several work design practitioners. Participants were recruited using social media and the personal network of the researchers. Study 1 explored the questionnaire’s factor structure (N=589), as well as its convergent and discriminant validity (N=454). Studies 2 (N=285) and 3 (in progress) further examine the scale’s validity.

Preliminary Results. Study 1 revealed PWD is best described by a 2-factor structure that corresponds to playful behavior focused on making work more fun (α=.76) and competitive (α=.74), which was confirmed in Study 2. In addition, both studies assessed convergent and discriminant validity of the scale. Study 3 will assess the predictive validity of the scale.

Limitations. The data is cross-sectional.

Implications. We hope to stimulate research on Playful Work Design by developing a valid measurement tool. This questionnaire allows for systematic investigation of how, when, and why play is used at work.

Originality/ Value. The current paper makes two major contributions. First, we introduce a new and unique approach to individual work design that revolves around play, which may promote work enjoyment and performance. Second, we construct and validate the measurement of the PWD scale in a series of studies.
Purpose: This paper explores the dynamic nature of interns’ workplace commitment bonds in professional service firms (PSFs), following the journey of their commitment during the internship. It addresses the dynamic nature of their multiple commitments, the reasons behind them, and their antecedents.

Methodology: A longitudinal study of hundred interviews was conducted with twenty interns in three PSFs. The data was gathered using semi-structured interviews that took place on five intervals distributed among the duration of the internship programme.

Results: Interns experienced two types of dynamics of commitment: ‘High Dynamic’ that was related to their present commitment to work entities (current commitment), and ‘Low Dynamic’ which was associated with organizational commitment and their intention to commit in the future (future commitment). Different antecedents caused the commitment bonds to interact and change.

Limitation: Future research can investigate a larger number of participants in different work contexts, and identify other commitment change factors.

Implications: It offers a deeper understanding of the dynamics of interns’ commitment and their intention to commit, which do not exist in previous studies. Practically, it helps employers to understand the development of interns’ commitment to influence their future organizational commitment.

Originality: This is one of the first studies to examine the dynamics of multiple commitments in the internship context. It addresses how commitment changes and offers a better understanding of the reasons behind it. Additionally, it answers the call for more research on how individuals’ multiple commitments can interact and change with time (Klein, 2016).
Purpose: Trust has been posited as a primary outcome of interpersonal emotional regulation (IER), but to date this has not been explicitly examined. Drawing on Little et al.’s (2011) framework for interpersonal emotion management, the aim of this study is twofold: (1) to examine whether the use of IER by a manager following salient goal failure of a subordinate will influence the subordinate’s trust perceptions of the manager and likelihood of disclosure; (2) and whether subordinate trust mediates the relationship between manager IER and subsequent behavioural intentions of the employee (e.g. future disclosure, turnover intentions).

Design/Method: 500 participants were recruited through Amazon’s Mechanical Turk to complete an experimental vignette study. Participants were randomly assigned to one of four IER conditions (situation modification, attentional deployment, cognitive change, modulation of the emotional response) or a control condition and were evaluated to assess their trust, emotional expressivity and future behavioural responses towards the manager.

Results: Preliminary findings indicate that manager IER strategies influenced participants trust in the manager and trust mediated the effect of IER strategy on subsequent behavioural responses.

Limitations: The experimental design requires replication in field settings.

Research/Practical Implications: This is one of the first studies to examine the inter-relationships between trust and interpersonal emotional regulation. Practically, it has implications for when and why employees will admit to failures in the workplace which in tur has implications for improving systems and processes in organisations.

Originality/Value: There is a paucity of research examining the relational context that influences IER processes and trust.
271 - PATIENT-PHYSICIAN RELATIONSHIP QUALITY AND QUALITY OF LIFE: THE MODERATING ROLE OF TRUST

João Fontes_da_Costa (1) - Teresa Oliveira (1)
Faculty of Economics, Management, Coimbra, Portugal (1)

Purpose

The link between Patient-physician relationships (PPR) and clinical outcomes is known (Linetzky et al., 2017; Filardo et al., 2017; Schriger et al., 2015). Patient–physician Trust (PPT) is linked, namely, to higher medication adherence (Gabay, 2015). Our study focuses on the link between the quality of relationships, namely with General Practitioner’s (GP) as family doctors, and the Quality of Life Perception (QLP), considering the moderating role of PPT.

Design/Methodology

Non-randomized sample of 1296 patients, using the Barrett-Lennard Relationship Inventory (BLRI) to measure empathy, regard and congruence. The QLP was measured with the EUROHISQOL 8-index scale. PPT was measured using the short Wake Forest Interpersonal Trust scale.

Approach/Intervention

The scales were validated in previous studies and had good psychometric properties.

Results

The Structural equation modeling supported the hypotheses. PPR impacts the QLP and PPT has a moderating role between PPR and QLP. A good PPR enhances patient’s QLP.

Limitations

The cross-sectional nature of the study does not capture fluctuations in the PPR. The sample measures only patient’s perspective on the PPR.

Research/Practical Implications

By knowing the impacts of PPR and PPT in QLP, we acknowledged the complexity of the clinical relation and objective medical efforts. There are implications for professional expectations as well. Empathy can be learnt in medical schools (Loureiro, 2011); these results reinforce the need to consider it in Training programs.

Originality/Value

This study tested the contributions of PPT and PPR in QLP, going beyond the known antecedents. The moderating effect of Trust is an important contribution to theory.
Purpose. Many contemporary job stress models assume that job characteristic (i.e. job demands and resources) are experienced in the same way by all workers. Conversely, drawing on appraisal theory, we argue that (a) there exist considerable inter-individual differences in the appraisal of job demands and job resources (b) the type of appraisal (i.e. challenge and hindrance appraisal) affects the relationships between job characteristics and employee well-being (i.e. burnout and engagement).

Method. Two multi-occupation cross-sectional studies were conducted. Sample 1 consisted of 527 Chinese workers and Sample 2 of 514 Chinese workers. The data were analyzed using hierarchical multiple regression analyses with moderation testing.

Results. In both samples we found that job demands (time urgency, role conflict, and emotional demands) and resources (autonomy, supervisor/colleague support, and feedback) can be simultaneously appraised as a challenge and a hindrance. In addition, the results showed that, job demands were associated with negative outcomes, especially if workers appraised these characteristics as low challenge; whereas job resources were associated with positive outcomes, especially if workers appraised these characteristics as less hindrance.

Limitations. Cross-sectional design and self-reports data.

Practical implications. When focusing on investing in employee well-being it is important to take appraisal of job characteristics into account.

Originality. Our studies extend research on job characteristics within the challenge–hindrance framework by first time focusing on the moderating effects of appraisals; we introduce a new way of measuring the appraisal of specific job characteristics and we consider the role of both challenge and hindrance appraisal in conjunction.
279 - IS SOCIAL MEDIA DISRUPTING LEADERSHIP?

Authors: Viki Holton, Senior Research Fellow, Ashridge Executive Education at Hult International Business School
Professor Patricia Hind, Director, Ashridge Executive Education at Hult International Business School, Ashridge, Berkhamsted, Hertfordshire, HP4 1NS, UK.

Originality/Value: The phenomena that is social media has radically changed the nature of human interaction, impacting upon the quantity and the nature of information exchanged. It may be that social media experiences are fundamentally changing the concept of what we understand to be leadership – particularly through major changes to how relationships are managed.

Purpose: This study by Ashridge Executive Education and UNICON investigated whether the leadership practices of those familiar with social media differ from those who are less fluent. If so, what are the implications for work and organisational psychology, as well as for those who provide leadership development?

Design/Methodology: A multi-method approach included:
A virtual inquiry workshop.
Interviews with leaders fluent in using social media (FSM leaders) and those less fluent (LFSM leaders).
A survey of managers (n = 50) assessing social media usage for work related purposes.

Results: Early results indicate that the rapid response expected in social media communications may be to the detriment of longer-term strategic thinking. There is an element of personal risk for leaders using social media and the time investment required may be at the expense of other aspects of their role.

Research/Practical Implications: Business schools providing effective leadership development that speak to these needs will gain competitive advantage for themselves and for their clients.

Limitations: Our study is small scale and may mean we have not collated the broadest possible range of opinions and behaviours.
281 - GRATITUDE AT WORK: A SELF-DETERMINATION THEORY APPROACH

Wenceslao Unanue (1)
Universidad Adolfo Ibañez, Business, Santiago, Chile (1)

Purpose
A substantial body of research has found a positive link between gratitude and well-being in life settings. However, only a few cross-sectional studies have explored gratitude at work. Therefore, we tested the longitudinal link between gratitude and several well-being and attitudes constructs at work. In addition, we explored the mediational role played by the satisfaction of the basic psychological needs for autonomy, competence and relatedness – as postulated by the Self-determination theory – in the mentioned links.

Design/Methodology
We assessed two large samples of Chilean workers using SEM and three-wave cross-lagged design with one month (Study 1; N = 725) and three months (Study 2; N = 1841) between each wave.

Results
First, we found in both studies that gratitude prospectively predicts higher work satisfaction and engagement as well as lower burnout and job insecurity. Second, our results also show that need satisfaction mediates the mentioned links in both studies.

Limitations
We used self-report measures.

Research/Practical Implications
We consistently showed in two studies that gratitude is a key life orientation that may help increasing need satisfaction, which in turn may lead to higher engagement and work satisfaction as well as to lower burnout and job insecurity. This process would start a vicious circle for employee's well-being.

Originality/Value
We show for the first time that (1) gratitude prospectively predicts several job outcomes over time (2) need satisfaction mediates the mentioned process.
THE PROSPECTIVE LINK BETWEEN ORGANIZATIONAL CITIZENSHIP BEHAVIOR AND WELL-BEING AND ATTITUDES AT WORK: NEED SATISFACTION AS AN UNDERLYING PSYCHOLOGICAL PROCESS

Wenceslao Unanue (1)
Universidad Adolfo Ibanez, Business, Santiago, Chile (1)

Purpose
Research has found a positive link between organizational citizenship behavior (OCB) and well-being and attitudes at work. However, most studies are still cross-sectional. Therefore, we extended previous research by testing the longitudinal link between OCB and several construct of interest in the workplace. In addition, we explored the mediational role played by the satisfaction of the basic psychological needs for autonomy, competence and relatedness – as postulated by the Self-determination theory – in the mentioned links.

Design/Methodology
We assessed a large sample of Chilean workers using SEM and three-wave cross-lagged design with one month (N = 703) between each wave.

Results
First, we found that OCB prospectively predicts higher work satisfaction, engagement and performance as well as lower burnout. Second, we found that need satisfaction mediates all the mentioned links.

Limitations
We used self-report measures and a short period of time between waves.

Research/Practical Implications
We showed that OCB may increase need satisfaction, which in turn may lead to higher engagement, work satisfaction and performance as well as to lower burnout. This process would start a vicious circle for employee’s well-being.

Originality/Value
We show for the first time that (1) OCB prospectively predicts several job outcomes over time (2) need satisfaction mediates the link between OCB and well-being and attitudes at work.
The purpose of this study is to analyze the relationships and dimensionality of employees’ staying and leaving attitudes. While the current literature often uses staying and leaving attitudes inconsistently or even interchangeably, the present study seeks to examine whether staying and leaving attitudes of employees are poles of one dimension or separate constructs.

Design/Methodology/Approach/Intervention
For analyzing staying and leaving attitudes balanced scales were developed, which systematically reflect cognitive, affective and behavioral aspects as well as long term and short term perspectives. The instrument was tested in three samples (cross-sectional and longitudinal) to determine dimensionality and relationships of the constructs, as well as with related constructs of the nomological network.

The results give hints that staying and leaving attitudes are separate constructs with strong negative intercorrelations. Slight differences in the relationship of staying and leaving attitudes to other constructs were found, with staying attitudes showing slightly stronger relations.

Limitations and Implications
Future research can build on the present study and investigate staying and leaving attitudes in relation to objective staying or leaving indicators of employees. The present findings indicate that focusing on staying attitudes might be promising.

Originality / Value
Existing operationalizations of retention and fluctuation are largely inconsistent and confounded by different time perspectives or aspects measured (cognitive, affective and behavioral aspects). The present study provides balanced scales to bring more insights in the discussion of how to measure and distinguish employees’ staying and leaving attitudes.
Sexual aggression and violence against women is a global issue. The “Me Too” movement in the United States has provided solidarity for millions of women to speak out about the inappropriate, abusive and in some cases illegal behavior they've faced. In addition, India has seen a steady increase in sexual aggression and violence against women in recent years including sexual harassment, abuse, molestation, and rape. There has been a strong surge in social activism and legislative actions directed towards awareness and prevention of sexual aggression. However, there has been little discussion and research on how sexual aggression affects the psychological well-being of the women who are the victims or potential victims of these crimes in the workplace. A qualitative study was conducted to examine the following constructs related to the psychological well-being of professional working women as well as unorganized female laborers in the city of Kolkata, India: (a) cultural definition of sexual aggression as a social stressor; (b) personal and social resources available for coping with sexual aggression at workplace; and (c) social and cultural norms related to sexual aggression that may affect the psychological well-being of women. In this ethnographic study, data was collected from 18 professional women and 14 laborers/domestic workers through focus group interviews, and artifacts. Based on this and other data, short term and long-term strategies, and stronger policies to prevent sexual harassment at workplace will be discussed and ways that these strategies can be implemented in the workplace will also be covered.
Purpose: Creativity is viewed as a two-stage process, whereby in a first step comprehensive definitions of problems are provided and in a second step these definitions are integrated to obtain a creative solution. In a team, this two-stage process is little understood. We propose that team mental models dissimilarity will enable team members to define problems comprehensively and in a second step these definitions will be integrated through conceptual combination. Thus, while mental models provide the raw material needed for creativity, conceptual combination integrates this material to obtain creative outcomes.

Design: We conducted a 2 (mental models: similar/dissimilar) x 2 (conceptual combination: related/unrelated) experimental study on 30 dyads. Problem definitions were measured after the manipulation of mental models and before conceptual combination.

Results: Teams with more dissimilar mental models provided more comprehensive problem definitions. Problem definitions interacted with conceptual combination, leading to more creative final outcomes. Therefore, problem definition comprehensiveness mediated the relationship between mental models and creativity for unrelated conceptual combination.

Limitations: The small sample size and experimental setting may prevent generalizations.

Research/Practical Implications: We show fundamentally that creativity in teams is a two-stage process, whereby diversity in cognitions but also capacity to integrate diverse cognitions matters for creative outcomes. Team cognitive diversity could be enhanced and members directed to pay particular attention to the stages of problem definition and integration.

Originality/Value: This is among the first studies to consider the role of team cognition for the processes behind creative performance.
Purpose

The psychological contract (PC) literature focuses on negative behavior (i.e. organizational deviance) as a consequence of perceived breach or feelings of violation. The logic is that breach and violation result in an unbalanced PC. The employee will try to restore balance by getting back at the organization. Following that line of thought it seems logical that employees would also resort to (pro-organization unethical) negative behavior in the case of PC fulfilment in an effort to help their organization.

Design/Methodology /Approach/Intervention

Study 1 (N=120) presented service employees with 2 vignettes (breach/no breach) and a questionnaire, using a global breach scale. Study 2 (N=81) also assessed under- and over-fulfillment.

Results

Results show that pro-organization unethical behavior is highest when participants report fulfillment or over-fulfillment whereas organizational deviance behavior is highest when there is under-fulfillment or breach.

Limitations

Although we have identical results across both studies, our findings are not representative for all service employees. Further research is needed to assess how these processes unfold across different settings.

Research/Practical Implications

This study contributes to PC literature by providing new insights into the way that employees react to PC breach and fulfillment. Our findings also help practitioners by showing them that a positive employment relationship still requires monitoring for potentially undesired employee behavior.

Originality/Value

To our knowledge this is the first paper that explores negative employee behavior (in the form of pro-organization unethical behavior) as an outcome of PC fulfillment.
EXPLORING LINKS BETWEEN WORK VALUE CONGRUENCE, ENGAGEMENT AND TURNOVER INTENTIONS

Johannes Kraak (1) - Seçil Bayraktar (1) - Pinar Imer (2)
Toulouse Business School, Department of Corporate Social Responsibility and Human Resources, Toulouse, France (1) - Bahcesehir University, Department of Business Administration, Besiktas, Turkey (2)

Purpose
This paper aims to investigate the relationship between work value congruence (i.e. fit between two employee perceptions: (X1) work value importance and (X2) the extent to which organizations deliver on these values) and engagement and turnover intentions.

Design/Methodology/Approach/Intervention
The sample consisted of Turkish employees from different sectors (N=1308). Polynomial regression and response surface analysis assessed the joint influence of both independent variables (X1 and X2) on the outcome variables.

Results
Findings show that it is not only important to achieve work value congruence (between X1 and X2), but that the level of this congruence (low vs. high levels) also matters: higher congruence levels lead to increased engagement and decreased turnover intentions. Furthermore, providing above or below the perceived levels of importance also influences outcomes.

Limitations
This study focuses on one (national) context. Further study is needed to establish if similar results can be found for other samples and cultures.

Research/Practical Implications
We expand the work value literature by providing new insights into the effects of congruence between the work value elements. This paper shows the importance for employers to know what employees find important as higher levels of congruence and/or delivering more than the perceived importance levels is associated with more positive outcomes.

Originality/Value
To our knowledge this is the first study that fully uses the potential of polynomial regression and response surface methodology when studying work values, leading to new insights.
294 - WHEN ASKING FOR HELP IS EFFECTIVE: A MOMENTARY DYADIC SUPPORTIVE EXCHANGE STUDY

Marijntje Zeijen (1) - Paraskevas Petrou (1) - Arnold Bakker (1)

Erasmus University Rotterdam, Center of Excellence for Positive Organizational Psychology, Rotterdam, Netherlands (1)

Purpose
Receiving support from colleagues is a vital part of working life. Hence, scholars increasingly emphasize the importance of seeking support. Currently we lack knowledge as to when asking for support leads to receiving support. Hence, we build a momentary dyadic support model in which we hypothesize that the link between asking and receiving support is stronger when the potential support provider regards the quality of the exchange relationship as high and scores low on workaholism. Furthermore we predict that the received support is negatively related to the receiver’s subsequent emotional exhaustion and positively to the receiver’s subsequent provision of support based on an intrinsic motivation.

Design/Methodology
We collected data over three moments on five consecutive working days (N = 90 participants, N = 915 datapoints).

Results
Multilevel analyses reveal that asking support relates strongest with receiving support when the support is asked from a co-worker that scores low on workaholism and when the social exchange quality is high. Receiving support negatively predicted the level of subsequent exhaustion, and positively predicted the subsequent intrinsic provision of support.

Limitations
Since we focused on one week, we do not know if the results hold throughout multiple working weeks.

Research/Practical Implications
Helping each other works best when the exchange relationship is of good quality, when employees are not workaholic and when the help is intrinsically motivated.

Originality/Value
Rather than assuming that asking support automatically leads to support reception, we reveal that this process depends on the perception and behaviour of the support provider.
295 - ENTREPRENEURIAL SOCIALIZATION: THE IMPACT OF PERSONAL CULTURAL ORIENTATIONS AND ENTREPRENEURIAL MENTORING ON ATTITUDES, INTENTIONS AND ENTRY

Martin Baluku (1) - Kathleen Otto (2) - Edward Bantu (3)

Makerere University, School of Psychology, Kampala, Uganda (1) - Philipps-University Marburg, Faculty of Psychology, Marburg, Germany (2) - Kisii University, Faculty of Education and Human Resources, Kisii, Kenya (3)

Purpose

Based on Krueger (2001) integrated model of intentions and the model of entrepreneurial socialization and organization formation (Starr & Fondas, 1992), we examine the impact of entrepreneurial socialization on entrepreneurial attitudes, intentions and entry. We conceptualize entrepreneurial socialization as involving culture and mentoring. The paper particularly focuses on personal cultural orientations of risk aversion, ambiguity intolerance and independence. We posit that entrepreneurial mentoring buffers against the negative impact of risk aversion and ambiguity intolerance and boosts the positive impact of independence orientation on entrepreneurial attitudes and intentions. The paper also examines whether the movement from attitudes to intentions, and from intentions to actual entry is enhanced by mentoring.

Methodology

The study is being conducted among 700 final year university students in Germany, Kenya, and Uganda. The first phase of the study was conducted in the final year/semester. And a follow up study to establish whether participants have entered self-employment or other form of employment conducted in a period of six (6) to 24 months after graduation.

Results

Partial results indicate that risk aversion and ambiguity intolerance are negatively related to entrepreneurial attitudes and intentions. While independence orientation and mentoring are positively correlated to attitudes and intentions. Follow up survey is being conducted. Further analysis will be performed using PROCESS Macro to establish the mediating effects of attitudes and the moderating effect of mentoring in the relationships between personal cultural orientations, self-employment intentions, and entry.

Implications

Implications for entrepreneurial socialization interventions to promote entrepreneurial entry, as well as implications for theory and research will be discussed.

Originality/Value

The study finding will contribute to the understanding of the role of mentoring in the development of entrepreneurial intentions and implementation of the intentions. Extant literature suggests that some cultural orientations are not related to entrepreneurial intentions and entry. The present study posits that this is not true for individuals who have accessed entrepreneurial mentoring.
TIME TO LEAVE? ORGANIZATIONAL JUSTICE AS PREDICTOR OF EARLY OR LATE RETIREMENT

Constanze Eib (1) - Claudia Bernhard-Oettel (2) - Constanze Leineweber (2) - Paraskevi Peristera (2)

Uppsala University, Department of Psychology, Uppsala, Sweden (1) - Stockholm University, Stockholm, Sweden (2)

Purpose: Research has highlighted that a poor psychosocial work environment is associated with early retirement, which constitutes a drain of knowledge and resources. Organizational justice is one aspect of the work environment that can be addressed by management representatives. In this study, we focus on organizational justice as important job resource with substantial relations to work and health outcomes. Justice theories suggest that organizational justice communicates to employees that they are valued members of the work group. Also, when feeling fairly treated, employees are more likely to want to reciprocate fairness, with, for instance, keep working with the company. The aim of the current research is to investigate the relationship between organizational justice and early and late retirement.

Methodology: The Swedish Longitudinal Occupational Health Survey (SLOSH) was used. A total of 1570 retirees were available who retired in 2012, 2014 or 2016. Of these, 509 retired before they were 65 years old, 551 when they were 65 years old, and 510 above 65 years of age. Procedural justice was assessed with 7 items from a validated scale.

Results: Preliminary findings show that those who retired after the statutory retirement age of 65 years reported higher procedural justice one year before they retired than the other two groups.

Implications: Results suggest that organizational justice may be a good predictor to gauge whether employees want to continue working after their statutory retirement age.

Originality: One of the few studies investigating how organizational justice relates to actual retirement using longitudinal data in Sweden.
Comparatively high performers are valuable assets in an organization, yet one unintended consequence of working with comparatively high performers is the development of feelings of envy among team members. Although past research has considered active or harmful consequences of envy, an overlooked yet prevalent reaction to feelings of envy is to distance oneself from the comparatively high performer. Drawing from the social comparison literature, we propose a model of work-related interactions with comparatively high performers at the dyadic level. In particular, we propose a model of how a comparatively high-performing team member elicits envy in another member, and how the feeling of envy leads to two distancing behaviors: lower advice seeking and lower knowledge sharing. Further, we consider how a comparatively high performer’s expressed humility can mitigate feelings of envy in team members, thus dampening the cycle of envy before it begins. In a sample of 245 employees from 48 work groups, social relations analyses revealed that a comparatively high performer on a team elicited envy from a focal team member, and this caused the focal member to have lower levels of advice seeking from and knowledge sharing with the comparatively high-performing member. Fortunately, the comparatively high-performing member’s expressed humility mitigated feelings of envy in the focal team member, serving as one solution that can help alleviate unfavorable social comparisons.
FEINING WANG (1) - JIA JIA (2)

University of Toronto, Faculty of Arts and Science, Toronto, Canada (1) - Capital University of Economics and Business, College of Business Administrations, BEIJING, China (2)

Purpose: Maximizers are those who tend to pursue optimal solutions in decision-making. Previous research has found that maximizers are more likely to experience negative emotions, like dissatisfaction and regret. It seems that maximizers are a group of unhappy people. However, most researches focused on the instant feelings after decision making. This research raised a question from a dynamic perspective: are maximizers really not happy? We develop a longitudinal study by examining the dynamic development of maximizers’ happiness. The happiness includes both hedonic happiness (emotional experience) and eudaimonia happiness (psychological state).

Design/Methodology/Approach/Intervention: 797 college freshmen completed the same paper-and-pencil measure four times across an academic year. Results showed maximizing tendency would predict more happiness in the long run.

Results: Results showed maximizing tendency would predict more happiness in the long run. Individuals with higher maximizing tendency experienced more hedonic happiness and more eudaimonia happiness. Besides, the maximizing tendency is negatively related to the change rate of eudaimonia happiness, showing that the more maximizing the participants tend to be, the slowly their eudaimonia happiness changes. In sum, from a long-term perspective, maximizers experience more meaningful lives and more positive internal states.

Limitations: The mechanism is not examined in the current model.

Research/Practical Implications: In sum, from a long-term perspective, maximizers experience more meaningful lives and more positive internal states.

Originality/Value: This research extends the theoretical evidence of maximizing decision-making style, providing new lens for future research.

Keywords: Maximizing, eudaimonia happiness, hedonic happiness, dynamic perspective, decision-making style
HELPING OTHERS MAKES ME FIT BETTER: HELPING BEHAVIOR BY NEWCOMERS AND COWORKER ATTRIBUTED MOTIVES ON NEWCOMERS' ADJUSTMENT

HUIYUAN JIA (1) - XIAOFEI XIE (2)

Capital University of Economics and Business, College of Business Administrations, BEIJING, China (1) - Peking University, School of Psychological and Cognitive Science, BEIJING, China (2)

Drawing on social exchange theory and attribution theory, this study seeks to explore whether newcomers’ helping behavior benefits their own adjustment and whether the helping behavior attributed by coworkers to certain motives (prosocial motivation and impression management motivation) moderates these benefits. On the basis of results obtained from time-lagged surveys conducted on 114 newcomers, the study suggests that newcomers’ helping behavior positively influences newcomers’ distal outcome (i.e., organizational commitment) through the mediating effects of two proximal outcomes (task mastery and social integration). Besides, the benefits of newcomers’ helping behavior to their proximal adjustment outcomes were stronger when coworkers attributed newcomers’ helping behavior to prosocial motives but were not influenced by the attribution to impression management motivation. The research has limitations on data sources, as most of the variables were rated by newcomers. This study (1) theorizes and provides preliminary evidence for the positive implications of newcomer helping behavior on newcomers’ subsequent work performance and social integration and (2) provides evidence that two types of attribution are independent and have distinct moderating effects, thereby extending the understanding on the implications of both helping behaviors and attribution in the Chinese context.
Purpose: Social judgments may have far-reaching consequences such as in voting or hiring decisions. Previous studies indicate that the physical environment may be a source of affect influencing behaviours and attitudes of office workers. However, studies examining whether workplace illuminance may impact social judgment are scarce. We expected that satisfaction with workplace illuminance would positively influence the judgments of warmth and competence of other persons.

Design/Methodology: In a laboratory study (N = 166), illumination was manipulated in terms of brightness and colour temperature. Participants assessed their satisfaction with illuminance and evaluated six pretested photos of unknown persons on warmth and competence. A field study (N = 187) aimed to replicate the results of the laboratory study. Full-time employees assessed their satisfaction with light at the workplace and evaluated the same six photos on warmth and competence.

Results: In both studies, higher satisfaction with workplace illuminance was associated with positive evaluations of other’s warmth and competence.

Limitations: We did not specify which illuminance conditions lead to satisfaction with light. Future research may examine this and whether adjusting illuminance in line with subjective preferences enhances satisfaction with light.

Research/Practical Implications: The present research contributes to the understanding of the relation between the physical environment and social judgment and allows practical implications for the design of environments in which judgment of others is important.

Originality/Value: Obtaining internally valid (experiment) and externally valid (field survey) findings, the present research investigated how environmentally induced satisfaction lead to positive social judgment in the work context.
WORK-LIFE INTERFACE: THE POSITIVE ROLE OF WORK-LIFE BALANCE ON EMPLOYEES’ SATISFACTION AND ORGANIZATIONAL QUALITY

Katja Babič (1)
Faculty of Economics University of Ljubljana, Management, Ljubljana, Slovenia (1)

Purpose
The aim of this paper is to show how Work-Life-Balance (WLB) oriented way of work affect employee satisfaction and their productivity and organizational quality. Specifically, we consider a three-way interaction between work-life balance in explaining how this influence employee satisfaction and organizational quality.

Design/Methodology
We conducted field studies: working professionals in Slovenia. Data were analyzed using a series of moderated hierarchical regression analyses including three-way interaction: satisfaction, quality, WLB.

Results
As hypothesized, ensuring work-life balance way of work is positively related to employees’ satisfaction and organizational quality. Furthermore, our findings suggest that implementation of WLB into organizational culture positively influence on both productivity: on employees and organizational productivity.

Limitations
Just time and research fee

Research/Practical Implications
Our results have important theoretical and conceptual implications for both sides: on employees’ satisfaction and on organizational quality. We provide measures and suggestion what organization should implement in their organizational culture to increase employee satisfaction at work and in their private life which influence on their productivity, happiness and healthy. Those measure also influence on organizational productivity and quality. Research was made on individual level, because each individual has his own motivational grip. Nowadays, the motivational measure needs to be adjusted to each individual.

Our findings offer practical guidelines on how organization could provide better organizational climate to increasing quality and satisfaction of employees.

Originality/Value
This is the first paper to examine the role of WLB in enhancing employees’ satisfaction and organizational quality. The WLB work environment provides that people are more flexible, self-motivated, working on their healthy and do in private life what they like it. With his approach, employees working cooperatively and employees strive to achieve common goal collectively. The WLB improve satisfaction, motivation, feeling of trust, commitment and involvement. WLB caused better
results at the individual level and effect the organizational level. WLB also provides a more humanized, flexible and more satisfying way of the work environment. This way of work is appropriate for employees who are disciplined, organized and who have higher personal needs.
Most crossover studies focus on couples' crossover of experiences and mood. Recently some researchers have found crossover of burnout from supervisors to subordinates. However, no published research has demonstrated the crossover of resources in the workplace. Our aim is to examine the crossover of resilience and distress between supervisors and employees and the impact of supervisors' resilience on employees' distress. Resilience is the ability to bounce back and recover from the most negative consequences of stressors and continue to function even after stressful traumatic events. Furthermore, we include supervisors' social support as a moderator in the crossover process. We aim to make several contributions to current research: (1) Investigating the crossover of resilience for the first time; (2) Including both positive (resilience) and negative (distress) crossover in one study; (3) Studying top-down crossover (supervisors to employees) and bottom-up crossover (employees to supervisors); and (4) Introducing social support as a moderator such that employees with lower social support would be more responsive to their supervisors' distress, whereas employees with higher social support will be more reactive to their supervisors' resilience. Data on resilience, distress and social support were collected from matched dyads of 182 employees and their 91 supervisors in the Oregon National Guard and are currently being analyzed. Resilience is a very important resource for people in the organization and therefore worthy of investigating the possibility of crossover of such a resource.
Purpose: We sought to adapt a supervisor supportive training intervention that was developed and previously tested in a randomized controlled trial with construction workers. The adaptation and customization was for the United States Forest Service and the effects of the intervention were tested on workers’ health, safety, and well-being.

Design & Intervention: Baseline (N = 132) and follow-up (N = 72) surveys were collected approximately 6 months apart, with a supervisor training intervention between time points. The intervention, given in two of the four participating forests, consisted of a computer-based training and a two-week behavior tracking period to allow supervisors to practice supportive behaviors learned in the training, including safety support, work-family support, and role clarity support.

Results: Employees in the intervention group reported significantly lower (p < .05) psychological distress and worry about forest safety encounters following supervisor participation in the intervention. Several other intervention outcomes approached significance (p < .10), including fewer actual forest safety encounters, higher life satisfaction, better organization-level safety climate, and higher pain in the neck/shoulders.

Limitations: Data included only two time points and a relatively small sample size.

Implications: In both research and practice, adapting existing interventions to fit new contexts saves resources and allows for wider dissemination of evidence-based interventions. Outcomes can differ substantially across contexts.

Originality/Value: Despite common use in practice and industry, the process of adapting interventions for new contexts is not frequently discussed in research but has great potential to benefit organizations and workers.
312 - OUTCOMES OF A VETERAN-SUPPORTIVE SUPERVISOR TRAINING FOR SUPERVISORS & VETERANS

Leslie Hammer (1) - MacKenna Perry (2) - Jacquelyn Brady (3)

Oregon Health & Science University, Oregon Institute of Occupational Health Sciences, Portland, United States (1) - Oregon Health & Science University, Portland, United States (2) - Portland State University, Portland, United States (3)

Purpose: We sought to test the effects of a supervisor training intervention on supervisors and military veterans in a randomized controlled trial across 35 civilian organizations in the Northwestern United States.

Design: The intervention included a computer-based training and subsequent behavior-tracking exercise, focused on increasing behaviors to support veterans’ needs at work. To assess intervention effects on supervisors, data came from 1,825 supervisors at baseline, with 982 also completing the 9-month follow-up. To assess intervention effects on veteran employees, data came from 189 veterans with participating supervisors, 156 of whom completed the 3-month survey and 138 of whom completed the 9-month survey.

Results: The intervention directly impacted supervisors, such that intervention group supervisors held significantly more positive views of veteran employees after nine months. Additionally, supervisors’ views of veteran employees at baseline significantly moderated intervention effects on veteran employees. For veterans with supervisors who held more positive views of veteran employees at baseline, the intervention group reported less stress three and nine months following the intervention, plus better sleep quality nine months following the intervention. There were no significant effects on veteran sleep quality at three months or on sleep quantity at three or nine months.

Limitations: Only 189 out of 497 veterans were matched with a participating supervisor, limiting our veteran sample to 38% of the full sample.

Implications: The veteran-supportive supervisor training benefitted both supervisors and employees.

Value: Organizations can use the intervention to improve how veterans are perceived and to benefit veteran employees’ health and well-being.
Although working under tremendous pressure, some employees still commit to the organization. We proposed that the perception of stress as a challenging goal could become the fuel to strengthen employee organization commitment. This could be because of the knowledge attained (learning) and energy (vitality) gained through resolution of challenging situation which makes them thrive in the workplace, and ultimately transfer the thriving resources to their commitment to the organization. This study examines the relationship between challenge stressors and organizational commitment when mediated by thriving at work. A quantitative research was conducted amongst 144 employees. The results of the study indicated a positive relationship between challenge stressors and thriving at work which brings an understanding that self-determined individuals within an organization do not view challenge stressors as challenges but rather opportunities which can help them thrive in the workplace. In addition, the results indicated that organizational commitment is high when an employee gains knowledge and vitality which they deem important for self-development and career growth. The paper extends the theoretical contribution of Conservation of resources theory by highlighting the importance of preserving important resources when partaking in activities that enhance one’s personal and professional abilities instead of depleting them. Furthermore, the findings of the research offer an important perspective on the predictors of organization commitment bringing about an important outlook for future researchers.
Psychological capital (PsyCap) is a personal resource which is positively associated with well-being and performance. Several studies explored the effectiveness of interventions in increasing PsyCap variables (the omnibus concept, or one of the four components), and the aim of this meta-analysis was to evaluate their overall effectiveness. Following a systematic search of online databases, we used following the inclusion criteria: to have an experimental design, the sample to be formed by employees or students, to contain a measure of PsyCap, and a passive control group. Thirty-two trials (Ntotal = 4076) met these criteria. The overall effect of the interventions on all PsyCap variables was significantly small to medium (d = .39, k = 32, Z = 5.90, p < .001). Separate analyses on each of the PsyCap variables revealed also significant effects: small effects on developing PsyCap (d = .21, k = 6, Z = 2.25, p < .05) and hope (d = .29, k = 4, Z = 2.45, p < .05), small to medium effects for self-efficacy (d = .37, k = 13, Z = 4.60, p < .001), and resilience (d = .47, k = 11, Z = 3.02, p < .05), and a medium effect for optimism (d = .53, k = 7, Z = 2.23, p < .05). The effectiveness of the PsyCap interventions on well-being and performance is significant. Moreover, the moderator intervention length is relevant for the interventions aimed to increase resilience, as interventions below one month are effective. More tailored interventions and trials that measure PsyCap, well-being, and performance simultaneously are needed for a more accurate picture of effectiveness.

Keywords: psychological capital interventions, well-being, performance, meta-analysis
Purpose - to identify and reconstruct the image of entrepreneur, which indicates and stimulates economic dynamics of modern society, intentions and values, influences the entrepreneurship discourse, intentions, entrepreneurship style.

Design / Methodology / Approach / Intervention
The special method was developed and applied: consecutive reconstruction of meaning in accordance with the hierarchical model of description. This complex method includes thematic-rhematic division of sentence, semantic classification, methods of structural semantics, intentional analysis.

5000 respondents generated answers to opened questions about entrepreneurs, which were processed through method of meaning reconstruction.

Results
The image is unrealistic; stereotyped (73%); negative (60%). Positive image of entrepreneur: "master" who can work and take care of people.

Negative image: unsocial, isolated person with simple unsuccessful business, can do nothing for people.

We identified 12 scales by which society perceives and evaluates entrepreneurs, the key one is self-orientation/community orientation: ability to care of the community and to ensure safety. We identified 5 stylistic features of entrepreneurship.

Research / Practical Implications
Entrepreneurship is colored negatively, as agent for fulfilling social obligations; attitudes stimulate feelings of guilt, not creative activity. This leads to social stagnation. The results allow to build a program for changing the social attitude to entrepreneurship.

Limitations research
Results are limited by the territory and possibility for cross-cultural analysis.

Originality/Value
Firstly, method of meaning reconstruction was developed, it allows to identify, evaluate, predict the behavior of social groups for the long term.

New problems in the economic behavior and values were revealed.
318 - THE DISTINCT EFFECTS OF WORK MASTERY, ENGAGEMENT AND AFFECTIVITY ON THE DIMENSIONS OF BURNOUT: EXPLORING THE POSSIBILITIES OF THE BURNOUT ASSESSMENT TOOL

Torhild Anita Sørengaard (1) - Eva Langvik (1) - Marit Christensen (1) - Ingvild Saksvik-Lehouillier (1) - Ingrid Steen Rostad

Norwegian university of science and technology, Department of Psychology, Trondheim, Norway (1)

Purpose: Burnout is often conceptualized as a work-related phenomenon, defined as a lasting response to chronic emotional and interpersonal stressors. Psychosocial work factors and affectivity can predict symptoms of burnout, and may act as either risk- or protective factors. The aim was to examine the distinct effects of work mastery, engagement, positive and negative affect on distinct dimensions of burnout using the Burnout Assessment Tool (BAT), and to explore if the predictors had significant relations to all five sub dimensions.

Methods: The online questionnaire was distributed through social media and e-mail to members of the Norwegian Trade and Office in June 2018. The sample consisted of 170 store employees (84% females and 16% males). The mean age was 39 (SD = 11.61). Structural equation modelling (SEM) was performed to examine the structure of the latent variables and the relations between them.

Results: Work mastery had significant relations to exhaustion (β = -.30), mental distance (β = -.17), impaired emotional control (β = -.44) and cognitive control (β = -.55), psychological distress (β = -.26) and psychosomatic complaints (β = -.37). Work engagement was related to exhaustion (β = -.28) and mental distance (β = -.56). Positive affect had a significant relation to mental distance (β = -.15) and psychological distress (β = -.16). Negative affect had a positive relation to all dimensions (β = .23 to .36). Total burnout was related to work mastery (β = -.22), engagement (β = -.25), negative affect (β = .29) and positive affect (β = -.15). The model explained 76% of the variance in burnout, and between 59 and 82% for the sub dimensions.

Limitations: The sample size was somewhat lower than the recommended size of at least N = 200 when applying SEM as statistical analysis.

Implications: The effects of psychosocial work factors and affectivity vary across the burnout dimensions, which have theoretical and practical implication for means aimed at preventing or treating burnout in the working population.

Originality: The study demonstrates the importance of distinguishing between the underlying dimensions of burnout in research, given the distinctive influence of psychosocial work factors and affectivity on them.
Purpose

Using a cross-lagged panel design, we investigated reciprocal relationships between work events (interpersonal and task-related events) and affect at work. We suggest that positive work events are associated with an increase in positive affect and that negative work events are associated with an increase in negative affect over time. Moreover, we argue that affect at work may not only be a consequence of work events, but may also shape the events that employees experience at work: We suggest that positive affect at work is associated with increases in positive events experienced at work while negative affect is associated with increases in negative events.

Design/Methodology

We collected longitudinal data with three online surveys with a time lag of three months each. We used a sample of young employees aged between 18 and 25 (N at Time 1 = 1,038).

Results

Positive affect predicted an increase in positive work events while negative affect predicted an increase in negative work events over time. Work events did not consistently predict changes in affect.

Limitations

Future research should address the mechanisms by which affect may increase the experience of positive and negative work events.

Research/Practical Implications

Employees’ affect may not only be a consequence of work events but may also actively shape work experiences in a positive or negative way. Organizations should foster positive affect at work while supporting employees in regulating negative affect.

Originality/Value

By examining reciprocal relationships between work events and affect we add a new perspective to research on work events.
322 - EMOTIONAL EXHAUSTION AS AN ANTECEDENT OF SURFACE ACTING: A DIARY STUDY

Hadar Nesher Shoshan (1) - Sabine Sonnentag (1)
Mannheim university, Work and Organizational Psychology, Mannheim, Germany (1)

Purpose: Investigating whether emotional exhaustion is not only a consequence of surface acting, as suggested by the emotional labor literature, but also an antecedent of it.

Design: A five-day diary study (N = 120 persons), with three measurement points per day (morning before work, beginning of the workday, before lunchtime).

Results: A multilevel structural equation model showed that employees, who were generally more emotionally exhausted before work, displayed more surface acting towards their first customer of the day. On the daily level, on days when people displayed more surface acting towards their first customer, they experienced higher beginning-of-the-workday emotional exhaustion. This higher exhaustion predicted more surface acting towards the last customer before lunch, which later predicted before lunch emotional exhaustion. The results were stable when controlling for negative affect, previous levels of emotional exhaustion and previous levels of surface acting.

Limitations: Self-reported data is a limitation of the study. Additionally, adding more data points during work could have yielded a richer dataset.

Implications: Theoretically, our results highlight the importance in adding during-work measures to daily-diary designs. Practically, we showed that surface acting occurs within a daily vicious cycle, starting and ending with emotional exhaustion that organizations should try to stop.

Originality: Our results suggest that the reciprocal relation between emotional exhaustion and surface acting does exist. Moreover, we show innovatively that this relationship differs significantly on the within-person versus the between-person level. As the workday proceeds, surface acting is predicted more by experiences at work and less by between-person differences.
THE RELATIONSHIP BETWEEN DAILY WORKLOAD AND DAILY CO-WORKER RELATIONSHIP QUALITY: EMOTIONS AS MEDIATORS AND ATTACHMENT ORIENTATIONS AS MODERATORS

Claudia Schusterschitz (1) - Wilhelm Geser (2)

UMIT - University for Health Sciences, Medical Informatics and Technology, Psychology and Medical Science, Hall in Tirol, Austria (1) - Leopold-Franzens Universität Innsbruck, Psychology and Sports Science, Innsbruck, Austria (2)

Purpose

Based on affective events theory, we test the assumption that emotional reactions to workload, mediate the daily relationship between workload and co-worker relationship quality. Besides, we analyse whether attachment orientations moderate these emotional reactions to workload, and their impact on co-worker relationships. In so doing, we built on attachment theory and recent findings, demonstrating attachment-related differences in emotional reactions to job stressors, the regulation of work-related emotions, and work relationship quality.

Design/Methodology

In an online diary study, employees completed daily reports of workload, work-related emotions, and co-worker relationship quality, over a period of ten workdays. Attachment anxiety and avoidance were assessed once.

Results

Results of multilevel analyses support the mediating role of emotions on the between and within level. Attachment avoidance moderates emotional reactions to workload, and their impact on relationship quality, on the between level. On the within level, the relationships between workload and emotions, and between emotions and co-worker relationship quality, are moderated by attachment anxiety.

Limitations

A limitation is the simultaneous assessment of the daily variables, without varying their daily order.

Research/Practical Implications

Future research on work-related stress and emotion regulation, and on work relationships, may profit from the consideration of attachment orientations as theoretically grounded, dispositional moderators.

Originality/Value

Present findings provide evidence that workload is related to co-worker relationship quality on a daily basis, via emotional reactions to workload. Beyond that, they demonstrate that attachment theoretical assumptions also are of value in understanding daily stress and emotion regulation at work.
Purpose. After a hard day at work good sleep recharges batteries and is important to stay healthy. However, sleep, as one of the most important recovery mechanisms, is often impaired by work factors itself. Demands like time pressure are known to be risk factors linked to sleep problems. In general, daily work-related effort depends on demands as well as personal resources. Personal resources refer to the state of the organism including the psycho-physiological constitution – such as general health. Reduced health-resources should enhance vulnerability. If the necessary activation exceeds the existing capacity, additional effort must be provided to meet daily demands. This additional effort further lowers the person’s capacity increasing need for recovery whereas its likelihood to be completed decreases. This study investigates general health as a moderator to the time pressure-sleep quality relationship.

Design/Methodology. Daily data was gathered over the course of 1 work week from 57 employees. Daily time pressure was assessed after work and self-reported sleep quality at the next morning.

Results. Multilevel analyses reveal daily time pressure to be negatively associated with sleep quality. This association only occurred if personal health resources were low.

Limitations. Danger of inflated effects due to common method variance (self-report).

Implications. Considering the current health status of individuals may help to prevent loss spirals that are characterized by increased undermining of personal resources, which, in turn, may induce an augmented reactivity to stressful conditions.

Originality/Value. This study highlights the importance of health as a moderator to the daily stressor-recovery relationship.
The Moderator Role of Psychological Capital on the Relationship Between Emotional Labor and Well-Being Model PERMA

Mental health work, consists a degree of emotional labor, but it was not studied before in any research. Also, PERMA model was not studied in Turkish culture before. This study has two purposes. One of them is to understand emotional labour dimensions which Turkish mental health professionals experience, psychological capital which they have and degree of wellbeing which was evaluated by PERMA wellbeing model. Second aim of this study is to investigate the relationship between emotional labor and wellbeing model PERMA, and the moderator role of psychological capital between these constructs among mental health professionals. 350 mental health workers were voluntarily contributed to this study who were in EMDR training programme in Istanbul. Some of the respondent were contributed to this research by filling out the scales online. Emotional Labor Scale (Diefendorff, Croyle and Gosserand, 2005), Psychological Capital Scale (Luthans, Avolio, Avey and Norman, 2007) and PERMA Scale (Butler and Kern, 2016) were used which were validated according to Turkish norms. The data analysis is on progress. In this study it is expected that; surface acting will be negatively correlated with PERMA, deep acting will be positively correlated with PERMA, genuine emotions will be positively correlated with PERMA. PsyCAP will function as a moderator between surface acting and PERMA. Overall, the results of this study will help to understand Turkish mental health professional’s level of emotional labor, psychological capital and PERMA levels. Also, this research will enable to associate emotional labour dimensions with PERMA and the role of psychological capital will be examined in different type of sampling.

Keywords: Emotional Labor, Psychological Capital, Well-being, PERMA, Mental Health Workers, Positive Psychology, Flourishing
327 - THE ROLE OF NON-FINANCIAL GOALS ON THE TRUSTWORTHINESS OF FAMILY BUSINESSES

Maike Gerken (1) - Timo Esser (1) - Marcel Huelsbeck (1)

University Witten/Herdecke, Witten, Germany (1)

Purpose: The aim of this study is to analyse how non-financial goals as perceived by managers affects the trustworthiness in family businesses. The paradigm of socioemotional wealth, composed of identification with the firm, binding social ties, and emotional considerations, will be used to explain the relations between non-financial goals and perceived trustworthiness. We test our assumptions in family businesses and non-family businesses to compare the results.

Design/Methodology: The study is based on data collected via a survey. The participants (N=485) are managers working in family and non-family businesses in Germany.

Results: We find a positive effect of non-financial goals on trustworthiness in general. Additionally, the interaction between managers of non-family businesses and their identification elicits a stronger effect on trustworthiness. Yet, emotional considerations, e.g. decisions that are affected by emotions or are tailored to the needs of specific groups, have a negative effect on trustworthiness. This result is identical for managers in family businesses and non-family businesses.

Limitations: The study focuses on a specific function, namely managers. The results are limited to their perspective and cannot be generalized to other types of employees.

Research/Practical Implications: Trust is essential in organizations. Especially family businesses are often associated with a high level of trustworthiness. Previous research suggests that levels of trustworthiness can be managed. This research investigates the extent to which non-financial goals can be used to facilitate the trustworthiness of family businesses.

Originality/Value: This study combines literature on family businesses, i.e. socioemotional wealth, and indicate it’s importance for trustworthiness.
329 - ASYMMETRY IN TELEWORKING PATTERNS AND EMPLOYEE LEARNING: MEDIATION BY TRUST.

Arne Vanderstukken (1) - Irina Nikolova (2) - Jeroen de Jong (2) - Monique Ramioul (1)

HIVA - KU Leuven, Leuven, Belgium (1) - Open University of the Netherlands, Heerlen, Netherlands (2)

Purpose. Research scrutinizing the effects of individual teleworking habits is thriving. To date, however, not much is known about the impact of asymmetric teleworking patterns (i.e. variability in the number of days each team member teleworks) on employees’ attitudes and behaviors. Since teleworking is still often seen as a privilege to be earned, asymmetries in teleworking patterns may represent an uneven distribution of privileges, which we expect to corrupt the team processes (i.e., team trust) and therefore stagnate positive individual outcomes (i.e., skill development, job satisfaction).

Method. To test our predictions, we conducted a two-wave survey study in nine Belgian organizations (N (T1) = 642 in 113 teams, N (T2) = 261), with a six month gap between the waves. Mediation was tested with Hayes’ process analysis, controlling for age, level of education and individual amount of telework per week.

Results. Asymmetric teleworking patterns negatively impacted employee’s skill development 6 months later. Moreover, this effect was found to be mediated by team trust. The analyses testing the effects on job satisfaction did not yield any significant results.

Limitations. Owing to sample restrictions at T2 (i.e. insufficient response at team level), we were unable to test how asymmetric teleworking patterns at T1 affect team learning and satisfaction at T2.

Implications. Managers are advised to ensure fair and transparent teleworking policies that can foster team trust and employees’ skill development.

Conclusion. Skill development is hindered when some team members telework more than others, because this situation may breed distrust.
ORGANIZATIONAL-LEVEL CONSEQUENCES OF FLEXPLACE WORK:
THE CRUCIAL ROLE OF TRUST CLIMATE FOR EMPLOYEES’ AFFECT AND ORGANIZATIONAL PERFORMANCE

Hendrik Huettermann (1) - Eva-Maria Oppel (2) - Heike Bruch (1)

University of St. Gallen, Institute for Leadership and HR Management, St. Gallen, Switzerland (1) - University of Hamburg, Hamburg Center for Health Economics, Hamburg, Germany (2)

Purpose: This study investigates the organizational-level consequences of flexible work arrangements with regard to the location where employees conduct their work (flexplace work). For this purpose, an integrative theoretical model is tested that examines the effects of the degree of flexplace work in organizations on employees’ collective positive affect and organizational performance; moreover, trust climate is introduced as a critical contingency of flexplace’s organizational-level effects.

Methodology: Hypotheses are tested in a multi-source field study of 20,073 employees, top management team members, and HR representatives in 98 organizations.

Results: Findings indicate that flexplace work is associated with higher collective positive affect among employees and enhanced performance only in organizations with high levels of trust climate. In contrast, when trust climate is low, increasing levels of flexplace work are negatively associated with employees’ collective positive affect and diminish organizational performance.

Limitations: The study is based on a cross-sectional design and relies on top management team members’ subjective ratings of company performance.

Implications: Our results highlight the crucial importance of fostering high levels of trust climate for realizing the positive potential inherent in flexplace work. By investigating its consequences on organizational performance, our study moreover underlines the business case of flexplace work.

Originality: Prior studies on flexplace work have almost exclusively focused on its individual-level consequences and have yielded inconclusive findings concerning its potential to yield positive organizational outcomes. Our study advances this field of research by broadening the scope toward organizational-level consequences of flexplace work and examining both underlying mechanisms and critical boundary conditions of its effects.
332 - GOAL SETTING RELOADED: THE INFLUENCE OF MINIMAL AND MAXIMAL GOAL STANDARDS ON SATISFACTION AFTER PERFORMANCE FEEDBACK

Steffen Giessner (1)
Rotterdam School of Management, Rotterdam, Netherlands (1)

Purpose: We integrate goal-setting theory (Locke & Latham, 1990) with research on the regulatory function of goal standards on valence judgments – providing a new model explaining how goal standards determine individuals’ satisfaction with their goal-performance discrepancies. We assume that minimal and maximal goal standards affect the satisfaction function of goal-performance discrepancies in predictable ways. After failure, minimal standards lead to relatively low levels of satisfaction, irrespective of the degree of deviation from the goal. However, when goal standards are maximal, the satisfaction level becomes higher the closer one comes to achieving one’s goal. These effects are reverse for positive goal-performance discrepancies. Here, a minimal standards leads to a more continuous evaluation of over-achievement whereas a maximal standards lead to a fairly high level of satisfaction, irrespective of the degree of over-achievement.

Design/Methodology: Five experimental studies with a total sample of 1506 participants tested these assumptions. We used different paradigms and pre-registered one study.

Approach/Intervention: All independent variable have been manipulated.

Results: Overall, our results confirmed our hypotheses.

Limitations: We made use of experimental data which limits external validity.

Research/Practical Implications: Our research provides insights how goal standards impact satisfaction levels after feedback. Managerial goal setting is a core application for this research.

Originality/Value: Our integration of classical goal setting theory with insights from self-regulation research on goals offers a new theoretical model on the link between goal achievement levels and task satisfaction.
This position paper brings together recent developments in the field of attendance behavior, which is needed based on the increased amount of research in the field. Identified in a EAWOP Small Group Meeting and rooted in the ongoing conceptual and methodological challenges faced by presenteeism researchers, the paper focusses on: (1) ‘Conceptual Background’, (2) ‘Measurement’, (3) ‘Context’, and (4) ‘Research Design’.

Each of the elements will be based on up-to-date findings, highlighting were the state of the field and fruitful avenues for further research. First, due to the variety of existing definitions, competing understandings in terms of sickness presenteeism as well as the notion of positive presenteeism will be discussed. Second, the measurement of the act of presenteeism, as well as the associated productivity loss with attending work while ill, will be reflected. Third, following the ongoing call to investigate presenteeism in specific contexts, social, occupational, cross-cultural aspects, as well as contemporary changes in the workplace and their respective relationship with presenteeism will be explicated. Finally, research designs which are underused but fruitful avenues to new insights in the field—such as the person-centered approach or intervention studies—will be discussed. Based on this collection of state of the art questions in the field, we identify key questions and outline promising directions for future research, while underlining possible threats and challenges, and including recommendations for practice.
PASSIVE-AVOIDANT LEADERSHIP AND DAILY SAFETY COMPLIANCE: THE MODERATING ROLE OF FOLLOWERS’ REGULATORY FOCUS

Jørn Hetland (1) - Arnold B. Bakker (2) - Morten B. Nielsen (3) - Roar Espevik (1) - Olav K. Olsen (1)

University of Bergen, Dept. of Psychosocial Science, Bergen, Norway (1) - Erasmus University Rotterdam, Institute of Psychology (IOP), Rotterdam, Netherlands (2) - The National Institute of Occupational Health (STAMI), Oslo, Norway (3)

Purpose. This study examines 1) the relationship between passive avoidant leadership behaviours and follower daily safety incompliance in an operative work context, and 2) the potentially attenuating (prevention focus) and enhancing (promotion focus) role of followers’ personal regulatory focus.

Methodology. Data from a quantitative diary study (30 days) among 57 (6 female) naval cadets participating in a sail ship voyage from northern Europe to North America was used – yielding 1533 measurement points. In the data collection, we applied a general questionnaire including the measurement of follower trait-level regulatory focus (prevention and promotion focus), and a daily questionnaire including measurements of passive-avoidant leadership and safety incompliance. Data were analysed by multilevel analyses (MLwiN 2.20).

Results. Multilevel analyses showed in support with our main hypothesis that passive-avoidant leadership behaviours related positively to followers’ daily safety incompliance behaviour. Moreover, in support of the hypothesised moderating effects, passive-avoidant leadership interacted negatively with prevention focus and positively with promotion focus in the prediction of day-to-day safety incompliance.

Limitations. The use of single-source ratings was a limitation of this study.

Research/practical implications. This study suggests that followers increase violations of safety rules on days their leader(s) demonstrate passive-avoidant leadership behaviours. From a practical point of view, leaders should avoid passive-avoidant leader behaviours in operative work settings, and especially towards employees that are highly promotion focused.

Originality. To our knowledge, this is the first study examining the link and possible intervening mechanisms between passive-avoidant leadership and followers’ day-to-day safety compliance behaviour in an operative work setting.
Purpose. Narcissism refers to an extremely heightened preoccupation with the self (Hart, Adams, Burton, & Tortoriello, 2017) which has negative outcomes on performance (Wallace & Baumeister, 2002). Research suggests that narcissists are particularly vulnerable to an ego-threat (Leary, Terry, Allen, & Tate, 2009), but little is known about how narcissists will react when faced with an ego-threat in the workplace. In this research, we investigated the relationship between narcissism and three types of silence and voice (defensive, prosocial, acquiescent) in response to ego-threat.

Methodology. The research adopted a 2x2 factorial quasi-experimental design. We experimentally manipulated a workplace context where an individual’s team receives feedback on their work (either positive or negative) and the responsibility for the work was either the individual or a colleague.

Results. There was a significant association between grandiose narcissism and defensive voice, and vulnerable narcissism and defensive silence, regardless of feedback context. Furthermore, there was a negative relationship between narcissism and psychological safety when receiving negative personal feedback, and a positive relationship when a colleague received negative feedback.

Limitations. The experimental nature of the study requires replication in field settings.

Research/Practical Implications Our findings provide support for the vain and exhibitionist nature of a grandiose narcissist through their need to view the situation personally (Cain, Pincus & Ansell, 2008). Managers should take caution in delivering feedback as it can impact both the recipient and their team.

Originality/Value. This novel study provides a starting point for further investigation into the defensive behaviours of narcissists in work settings.

References

Purpose: Based on the social exchange theory as our theoretical framework, this study examines the relationship between High Performance Work Systems (HPWS) and employee outcomes, measured by job satisfaction and affective commitment. In addition, this article investigates whether the social exchange relationship can reduce employees’ burnout leading thus to lower intention of leaving their jobs. Finally, this study calculates HPWS as both a system and as bundles of practices.

Design/methodology: Partial Least Squares Structural Equation Modeling (PLS-SEM) was used on a sample of 296 clinicians across seven Greek regional hospitals.

Results: The findings demonstrate first a strong effect of HPWS on social exchange, and employee outcomes. In addition, the social exchange relationship seems to create positive employee outcomes that ultimately decrease employees’ feelings of burnout, and consequently their intentions of leaving their hospital. Finally, of the three bundles comprising the HPWS, opportunity to participate has no effect on the overall HPWS construct.

Limitations: The most significant limitation concerns the nature of this study, which is a cross-sectional one.

Research/Practical implications: The findings provide evidence for the potential fruitfulness of the HPWS approach even in turbulent times. Moreover, the findings clearly show that different sets of HR practices may impact the same outcomes in a heterogeneous way.

Originality/value: This study examines the processes through which HPWS positively influences health-related outcomes, leading to lower employees’ feelings of burnout and intention to leave their jobs. Moreover, this study underscores the significance of measuring HPWS as both a system and as bundles of practices.
Purpose: The present study aimed at further exploring the potential dark side of living a calling among Swedish ministers by investigating the relations between living a calling and aspects of burnout such as exhaustion and work disengagement. It could be that individuals who are living a calling find their work so meaningful or important that they continue working even though they feel drained (e.g. Duffy, Douglass, Autin, England & Dik, 2016).

Design: A survey was emailed to 2877 ministers of the Church of Sweden. The response rate was 29% and the final sample consisted of 843 ministers.

Results and practical implications: Preliminary analyses show that, living a calling has a negative direct effect on both exhaustion and work disengagement. Thus, contrary to our expectations, living a calling seems to have a buffering effect on aspects of burnout. Analysis showed that this effect is partially mediated by perceiving the work as meaningful. Furthermore, the effect of living a calling on work meaning was moderated by quantitative as well as qualitative work demands. The findings are in line with an earlier study by Duffy et al. (2016) and contradict the suggestions that living a calling may lead to negative outcomes when for example work load is high.

Limitations and originality: Since ministers are expected to highly be living a calling the variation in the independent variable was limited. However the study adds to the minimal amount of research that has investigated the potential dark side of living a calling.
Purpose
The career has been identified as an important source of regret in people’s lives but our understanding of this prevalent emotion is still limited. This study explores the characteristics and dynamic nature of career regret, as well as associated behaviours.

Design/Methodology/Approach/Intervention
The study was conducted among British individuals at different stages of their career. In-depth, semi-structured interviews were conducted with X participants, which involved drawing on their career narratives and experiences to date.

Results
Social comparison plays an important role in feeling career regret – both actual social group and hypothetical.

The study found that career regret has different outcomes depending on the stage at which it is experienced.

Emotional labour emerged as an important negative outcome of experiencing career regret.

Limitations
Further research is needed, drawing on a more varied sample. Future research should include a quantitative study to test the relationships uncovered in this study.

Research/Practical Implications
The study has uncovered theoretical avenues, particularly related to the role of career regret in emotional labour and negative workplace behaviours. Practical implications around how to manage this potentially debilitating emotion in the workplace, including psychological framing, are drawn from the interviews also.

Originality/Value
To date very little research has focused on career regret; this study provide strategies for constructively dealing with this emotion in the workplace and identifies avenues for further research.
Purpose: Line managers, and line manager fairness, are increasingly viewed as central to effective HRM delivery, especially in employee career management and development (Crawshaw, 2006; Crawshaw & Game, 2015). The aim of this study was to explore a potential boundary condition on the link between line manager interactional justice and employees’ career-related attitudes and behaviours. Drawing on social identity theory we tested a moderated mediation model in which employee organizational trust mediates the links between line manager interactional justice and employees’ perceived career growth opportunities, and turnover intentions, moderated by employee careerist orientation.

Design/Methodology: Data were collected using an international survey of working part-time MBA students (N=891) and analysed using SPSS (PROCESS macro).

Results and Limitations: Fully supporting the model, employee perceptions of line manager interactional justice related positively to organizational trust which, in turn, related positively to perceived career growth opportunities, and negatively to turnover intentions. These effects were significantly weaker when employee careerist orientation was high. A potential limitation of the study is the cross-sectional, self-report design.

Research/Practical Implications: The findings shed light on the possible limits of line manager influence over employee careers, opening new avenues for future research. For organizations/practitioners, this research confirms the important role of line managers in delivering career management policy and highlights the need to better understand employees’ trait-based career attitudes, since these may impact the effectiveness of organisational career policy and practice.

Originality: We provide new evidence on why and when line manager interactional justice influences employees’ career attitudes and behaviours.
Monica Molino (1) - Claudio G. Cortese (1) - Chiara Ghislieri (1)
University of Turin, Department of Psychology, Turin, Italy (1)

Purpose
With the rapid advances of technology, we are assisting to a new industrial revolution, the so called Industry 4.0 era, which is introducing several changes in how organizations operate and how people learn and do their work (Cascio & Montealegre, 2016). In this framework, many questions arise about how these transformations may affect workers’ wellbeing, and WOP is called to address these open issues. The present study aims at investigating personal and organizational antecedents (resilience, need for achievement and opportunities for information/training) and a consequence (work engagement) of technology acceptance within factories, comparing white- and blue-collar workers.

Design/Methodology/Approach/Intervention
The study involved a sample of 689 workers (white-collars=245, blue-collars=444) employed in an Automotive Company. Participants filled-in a self-report questionnaire. Analyses were conducted through SPSS24 and Mplus7 for the full multi-group structural equation model (MG-SEM).

Results
The MG-SEM [Chi-square(102)=258.91; p<.01; RMSEA=.07; CFI=.93; TLI=.91; SRMR=.06] showed, in both samples, a positive relationship of the three antecedents with technology acceptance, which in turn showed a positive relationship with work engagement. All indirect effects were significant.

Limitations
Cross-sectional design and the use of a self-report questionnaire were the main limitations. Moreover, further personal and organizational variables could be considered in the model.

Research/Practical Implications
Results highlight the importance to provide information and opportunities for training to all employees, in order to support the Industry 4.0 transformations without consequences for workers’ motivation.

Originality/Value
This study investigates the motivational dynamics related to the introduction of new technologies within factories involving the little-studied population of blue-collar workers.

Keywords: Industry 4.0; technology acceptance; work engagement; personal resources; training
Stress-related sick leave is more common among psychologists and social workers than the general working population in Sweden. The transition from higher education to work-life seems to interact with the work environment to influence long-term health.

Purpose

To explore how different profiles of psychosocial work environment variables relate to health and well-being among newly graduated social workers and psychologists.

Methods

Of the 5213 surveys distributed, 2091 responses are included in this study (1248 social workers and 843 psychologists; 1742 women, 331 men and 14 unknown).

The cluster variables were selected among the context related resources surveyed: Professional isolation, (social support and stress during) Transition to work-life and Influence at work.

Results

Of the eight context-related clusters, the two “best” clusters differed significantly from the two “worst” on almost every variable tested, including General Health and Life Satisfaction. The four clusters “in the middle” did not differ significantly from each other, except on the three cluster variables. As no differences were found in health and well-being, yet each of the “middle” clusters lacked in one or two of the cluster variables, indicates that some lacking resources can compensate for by the other(s). This finding is in line with the JD-R theory.

Limitations

These results are based on cross-sectional self-reported survey data.

Practical implications and originality

This large scale study puts focus on the context and the role of compensatory resources, opening up for fruitful health interventions.
348 - SHOULD BOARD MEMBERS FOLLOW THE MAJORITY? FIRST PREFERENCES LEAD TO BIASED DECISION-MAKING

Tessa Coffeng (1) - Elianne van Steenbergen (1) - Femke de Vries (2) - Naomi Ellemers (1)

Utrecht University, Social, Health, and Organisational Psychology, Utrecht, Netherlands (1) - University of Groningen, Law, Groningen, Netherlands (2)

Should Board Members Follow the Majority? First Preferences Lead to Biased Decision-making

Tessa Coffeng, Elianne F. van Steenbergen, Femke de Vries & Naomi Ellemers

Purpose: The current research investigates whether Supervisory and Managing Board members will choose the optimal solution in group decision-making when having shared as well as unique information (i.e., hidden profile paradigm).

Design/Methodology/Approach/Intervention: A hidden profile field experiment was conducted among Supervisory and Managing Board members (N = 75), who were randomly assigned to groups of three in order to participate in a candidate selection task. Each group member received shared as well as unique information about three candidates, privately wrote down his or her first preference, and engaged in a group discussion in order to jointly choose the best candidate.

Results: 24 percent of the groups chose the optimal solution after group discussion. This finding was, however, not a result of the group discussion. Rather, the first preference of the majority significantly predicted the groups’ decisions.

Limitations: For practical reasons, the sample size was relatively small and the available time for conducting the experiment was relatively short compared to other hidden profile studies.

Research/Practical Implications: Supervisory and Managing Board members need to be alert when the majority favours a specific outcome prior to group discussion, and find ways to consider all available information before actual decision-making.

Originality/Value: This study was conducted among high-level decision-makers, which are often hard to gain access to for scientific research. The insights of the current research are therefore especially valuable for bridging the gap between the hidden-profile literature and the practice of high-level decision-making.
349 - TOWARDS SUSTAINABLE INNOVATIONS IN EDUCATION: THE ROLE OF ENVIRONMENTAL FACTORS FOR TEACHERS’ INNOVATIVE WORK BEHAVIOR

Peggy Lambriex-Schmitz (1) - Marcel Van der Klink (1) - Simon Beausaert (2) - Monique Bijker (1) - Mien Segers (2)

Zuyd University of Applied Sciences, Research Center Educational Innovation and continuous Professional Development, Heerlen, Netherlands (1) - Maastricht University, Department of Educational Research and Development, School of Business and Economics, Maastricht, Netherlands (2)

Purpose

The 21st century labour market requires employees that proactively shape innovations, and know how to solve complex social problems. Teachers are expected to perform innovative behavior not only entailing the generation but also the implementation and sustainability of new ideas. The learning environment, and more specifically management support and exposure to innovation are factors for innovations to succeed.

This study examined the role of the supportive learning environment, management support and exposure to innovations in predicting innovative work behavior (IWB) of teachers across the different phases of the innovation process, including the sustainability phase.

Design

This cross-sectional correlation study was conducted among teachers from two vocational colleges in the Netherlands (n= 225). Teachers were invited to fill out an online questionnaire on voluntary basis.

Results

Results of hierarchical regression analyses show that a supportive learning environment is significantly positively related to the creativity phases (opportunity exploration and idea generation). Management support is significantly positively related to idea generation and the implementation phases (idea realization and idea sustainability). Exposure to innovation predicts nearly all phases of IWB (except for opportunity exploration).

Limitations

We conducted our research in vocational education. Results cannot be generalized to other types of education.

Practical Implications

The study provides insight in how educational institutes can stimulate teachers’ Innovative Work Behavior.

Value

This is one of the first studies that investigated the role of environmental factors for vocational teachers’ IWB, including idea sustainability.
 BACK TO THE FUTURE, WOMEN EXPERIENCES AS TRAILBLAZER AT WORK

Maryam Aldossari (1)
University of Edinburgh Business School, Edinburgh, United Kingdom (1)

Purpose:
Current study sought to uncover how women legitimise their place in work environments where they have traditionally been excluded. Given a unique, political context we aim to uncover mechanisms of legitimising social inclusion used by Saudi Arabian women who were typically first in their generation to enter the workforce.

Design/Methodology
In collecting data, we adopted a qualitative approach using semi-structured in-depth interviews with a total of 57 Saudi women from a wide range of organisations and industry background.

Results
Life trajectory approach was used to analysis women’s work experiences that embedded within structural, social, and cultural contexts. The results revealed that while the inclusion process mirrors some of the unique tactics used by women and employers in such places as the U.S. and the U.K., differences in approaches arose because of specific cultural aspects based on religion and tribe.

Research/Practical Implications
Theories of inclusion in the workplace must move past passive mechanisms for “managing diversity” and focus on reducing ways in which newcomers are stigmatised and marginalised. This work uses at its core the work of Goffman (1967) and Scambler (2006) to add to current research on workplace inclusion (Ferdman, 2014). Practically, the study has implications for women seeking equality of pay and opportunities in organisations through the mechanisms to demonstrate value and curry acceptance.

Limitations
The research findings presented here have been reported from data gathered at one point in time. Longitudinal research design can potentially provide deeper insight.

Originality/Value
This is the first paper that offers useful directions to theorising the complexity of inclusion in non-Western contexts.
THE „WHY” MATTERS – THE EFFECT OF MOTIVES FOR EMOTION REGULATION ON THE EMOTIONAL LABOR – WELL-BEING LINK

Anna Winkler (1) - Dieter Zapf (1) - Marcel Kern (1)
Goethe Universität Frankfurt, Arbeits- und Organisations-Psychologie, Frankfurt am Main, Germany (1)

Purpose
Emotion regulation strategies and their effect on well-being have often been a subject of study. The question concerning why employees regulate their emotions has not been a main focus of research during the last few years.

Aim of the present study was to investigate the effects of two emotion regulation strategies on well-being and examine how these relationships are influenced by motives for emotion regulation.

Design/Methodology
28 employees filled out a questionnaire at three to six working days about emotion regulation strategies, motives for emotion regulation as well as well-being parameters. Data was analyzed using multilevel modeling.

Results
The results indicate that, generally both Surface and Deep Acting can have negative effects on well-being. The moderation analysis shows that the negative effect of Surface Acting on well-being is even more negative when high instrumental or pleasure motives exist, whereas the high pleasure and instrumental motives have a favorable impact on the Deep Acting – well-being link.

Limitations
Different job types could not be analyzed separately as result of sample size. Automatic emotion regulation was not measured.

Research/Practical Implications
The results offer a better comprehension of the EL – well-being link. Future research should be taking notice of automatic emotion regulation as a third emotion regulation strategy.

Originality/Value
To the best of our knowledge, the present study is among the first to investigate the moderator function of motives for emotion regulation on the EL – well-being link.
A growing body of research on challenge and hindrance stress focuses on the focal person’s differential reactions to these types of stress (e.g. LePine et al., 2004; Tuckey et al., 2015). However, little is known about others’ reactions to a focal person’s challenge stress, and whether this could be an alter-centric alternative explanation for the positive outcomes of challenge stress. Drawing on signaling theory, we posit that challenge stress is positively linked to the eventual indicators of career success (career satisfaction and manager-rated promotability) through the amount of mentoring received from one’s manager (others’ reaction to the focal person’s stress). We also identify individual’s personality as a boundary condition, such that, for individuals higher in openness to experience, the potential benefits of challenge stress on mentoring and career success will be more subdued. We tested our hypotheses in a time-lagged, multi-source research design in a public service organization in the UK. Multilevel analyses on a sample of 258 employees and their managers reveal that experiencing challenge stress is conducive to career success, as it elicits a valuable resource - mentoring. Moreover, the signaling value of challenge stress is highest when openness to experience is not readily observed in employees. While not adopting a longitudinal design, this study uncovers a novel mechanism by examining the way in which challenge stress elicits others’ reaction, thereby moving beyond individuals’ internal responses to stress. The study also examines career success, which has not been yet tested as an outcome of challenge stress.
Purpose: Social conflicts are one of the most severe stressors at work. They entail negative consequences for employee wellbeing and the ability to mentally detach from work-related thoughts during non-work time. The objective of the present study was to test if within-person change in psychological detachment mediates the effects of change in perceived social conflicts on emotional exhaustion and mental wellbeing; do increases in stressors propel wellbeing losses through deterioration of detachment?

Design: We tested our hypotheses with latent difference score mediation drawing on data from N = 246 registered nurses (mean age of 40.4 years, 78.9 % women). Participants responded three times to a survey with a time lag of six months, respectively.

Results: We found significant mediation effects with a decrease (Time 2 to Time 3) in psychological detachment as a mediator for the effects of increases (Time 1 to Time 2) in social conflicts at work on emotional exhaustion and mental wellbeing at Time 3 (controlling for Time 1).

Limitations: It needs to be tested whether results generalize beyond registered nurses. However, similar effects are also possible for other occupational groups, as conflicts arise in virtually every occupational setting.

Research Implications: These findings highlight the importance of focusing on within-person change in psychological detachment to gain deeper insights into its dynamic interplay with job stressors and wellbeing in the long run.

Originality: We provide the first empirical evidence for the mediating role of detachment in the stressor-wellbeing link with a focus on within-person change over one year.
Purpose: Although peer performance ratings are critical for addressing many human resource functions (Aguinis, 2013), comparisons of individuals in different teams may not be comparable at face value because peer ratings are affected by the context (Loignon et al., 2017). Thus, we conducted two studies to understand how and why team context influences peer ratings of individual performance.

Methods/Results: In Study 1, we conducted cross-classified modeling on a sample of 7,160 performance observations of 568 targets made by 567 perceivers who participated on four different teams. Team membership accounted for 24.27% and 6.13% of model variance for perceivers and targets, respectively.

In Study 2, we conducted social relations modeling (Kenny et al., 2006) with a sample of 679 performance observations collected from 217 individuals in 46 teams to test the effects of psychological safety on each variance component. Psychological safety accounted 22.81% of percever variance and 1.94% of target variance.

Research/Practical Implications: Results of the two studies showed that group context has a stronger effect on the social cognitions of perceivers than on target behavior and that psychological safety may act as a heuristic that influences perceiver judgments. We also discuss how peer ratings can be adjusted to make more valid cross-team performance comparisons.

Originality/Value: This is the first study to account for individual differences by testing the effect of group membership with people who were members of different groups. We also develop theory by showing how a specific aspect of the group context – psychological safety – influences perceiver judgments.
Purpose

Study aims to investigate abusive supervision in the broader context of supervisor-subordinate relationship. Abusive supervision (ABS), such as lying and ridiculing, are detrimental to the employees. However, these behaviors occur in a dyadic and exchange-based relationships between the employee and supervisor – as leader-member exchanges (LMX). Little research conducted on both LMX and abusive supervision has produced inconclusive results. This paper proposes abusive supervision is a negative antecedent of LMX and outcomes may occur through decreased LMX. A conceptual framework can be found below.

Design

Online survey-based two-phased data collection was conducted. Participants were contracted through e-mailings or social media ads. Time lag was 1 month. Well established surveys were used.

Results

Final sample of 268 respondents was analyzed with mediation analysis of LMX between ABS and outcomes. Full mediation was found for EE, POS, OCB-S. Both direct and indirect effects found for OCB-O, OCB-I and IJ. LMX was insignificant with CWB-I. The outcomes are partially or fully associated with decreased LMX by abusive supervision. Second study is in progress for replication.

Limitations

Cross-sectional study hinders causality claims. Even though the proactive measures have been taken (time-lag, anonymity, etc.), CMB is possible.

Implications

Results suggest LMX (the broader subordinate-supervisor relationship) is critical to understand ABS’s detrimental outcomes. LMX may emerge as the most significant mediator of ABS with further studies.

Originality

The first study providing comprehensive analysis of ABS and LMX, theoretically positioning and empirically testing with emotional, attitudinal and behavioral outcomes.
367 - POSITIVE AND NEGATIVE RUMINATION FOLLOWING TIME PRESSURE: THE ROLE OF STRESS APPRAISAL

Ben Searle (1) - Sabine Sonnentag (2)

Macquarie University, Department of Psychology, North Ryde, Australia (1) - Universität Mannheim, Work and Organisational Psychology, Mannheim, Germany (2)

Purpose

Time pressure is considered a challenge stressor (a type of demand associated with positive outcomes), yet it is often linked to negative outcomes. These inconsistent effects may be due to stress appraisals, which can mediate effects of stressors on mood. As time pressure can affect work-related thoughts during non-work time, we investigated whether and how stress appraisals mediate effects of time pressure on post-work rumination.

Methodology

Online surveys were administered twice daily for five days. Midday surveys measured daily work-related time pressure and the extent to which it was appraised as a challenge, a hindrance, and a threat. Evening surveys measured positive and negative forms of post-work rumination. In total, 205 participants completed both surveys on the same day for at least two of the five days (916 observations).

Results

Within-person results showed hindrance appraisal was associated with more negative rumination, whereas threat appraisal was associated with less positive rumination. Between-person results showed people who consistently appraised time pressure as a challenge consistently reported higher positive rumination and lower negative rumination.

Limitations

Limitations include the use of self-report methods.

Implications

Although post-work rumination can be affected by situational factors such as time pressure, the nature of that rumination can vary depending on how the situation was appraised. This demonstrates the utility of measuring how work stressors are appraised. Interventions targeting appraisals may prove effective.

Originality

This is the first study linking appraisal of work stressors to post-work rumination. It also extends knowledge by revealing differences between hindrances and threats.
Purpose: We investigated leaders’ moral identity style in relation to their followers’ perceptions of leader integrity (moral behavior, behavioral integrity, consistency) and LMX relationship quality. Leaders can 1) flexibly process relevant information before making moral decisions (informational style), 2) conform to formal norms that pertain to the moral conflict (normative style), or 3) avoid facing and dealing with moral problems (diffuse-avoidant style).

Methodology: The nested sample included 233 leaders with 987 followers. Moral identity style was coded on the basis of leaders’ self-generated descriptions of their moral decision-making. The followers rated their leader using the Perceived Leader Integrity scale and the LMX-7 scale. Data was analyzed with multilevel modeling.

Results: Leaders who used situational information to make flexible moral decisions were seen to behave with high integrity by their followers. More rigid, normative moral identity style associated with follower-rated consistency. Leaders’ moral behavior had the strongest associations with high-quality LMX at both the individual and shared follower level, but no associations were found between moral identity style and moral behavior.

Limitations: No causal inferences can be made based on the cross-sectional design.

Practical Implications: Leaders’ who demonstrate moral behavior can support high quality relationships with their followers. Moral identity that is depicted by flexible commitment to personal values signals to the followers that the leader “practices what (s)he preaches”.

Originality: The identity style can be applied to capture leader morality in the work domain. This novel approach showed promising results based on follower perceptions of leaders with different moral identities.
Caroline Knight (1) - Malcolm Patterson (2) - Jeremy Dawson (2)
Curtin University, Centre for Transformative Work Design, Future of Work Institute, Bentley, Australia (1) - The University of Sheffield, University of Sheffield Management School, Sheffield, United Kingdom (2)

Purpose: To synthesise work engagement intervention studies and inform future research by exploring: (1) the types, styles and content of engagement interventions; (2) their effectiveness; and (3) their underlying mechanisms.

Methodology: Relevant databases were systematically searched for interventions employing a validated engagement measure. 33% of studies were double-coded. Harvest plots informed the development of GRADE evidence statements.

Results:
The final 40 included studies comprising five types: personal resource building (k=5); job resource building (k=12); leadership training (k=3); health promotion (k=18); job and personal resource building (k=2). Twenty (50%) studies observed significant positive effects on work engagement (Figure 1), two (5%) had a negative effect (Figure 2), and eighteen (45%) had no effect (Figure 3). Resources, demands, and well-being were important mediators. Moderators included intervention type, employee participation, and manager support. Bottom-up interventions, and particularly job crafting and mindfulness interventions, were most successful. Implementation difficulties included poor response and attrition rates, and adverse factors (e.g. organisational restructuring, redundancy, economic downturn).

Limitations: Unpublished studies were not included, raising publication bias potential, but increasing the quality of the findings. Potential miss-classification was mitigated by double coding.

Research / Practical implications: Future research should assess the active components of interventions, potential mediators (e.g. attention, cognitive reappraisal), and moderators (e.g. personality). Practically, need assessments and senior management support is crucial for success.

Value: This is the first narrative systematic review of work engagement interventions. Going beyond effectiveness, this review unpacks how and why interventions work.

Figures
Figure 1: A harvest plot indicating the nature of the evidence for interventions with at least one positive effect on work engagement or one of its sub-components (k=20); NB: Each bar represents one study; the height of the bar indicates study design (3=randomised; 2=non-randomised, controlled; 1=uncontrolled); solidly shaded bars indicate top-down interventions; textured (dotted) bars indicate bottom-up interventions; T=interventions involving a training component; O=interventions involving other types of participation (e.g. participative action research, group reflection); JC=Job crafting intervention; M=Mindfulness-based intervention

Figure 2: A harvest plot indicating the nature of the evidence for interventions with at least one negative effect on work engagement or one of its sub-components (k=2); NB: Each bar represents one study; the height of the bar indicates study design (3=randomised; 2=non-randomised, controlled; 1=uncontrolled); solidly shaded bars indicate top-down interventions; textured (dotted) bars indicate bottom-up interventions; T=interventions involving a training component; O=interventions involving other types of participation (e.g. participative action research, group reflection); JC=Job crafting intervention; M=Mindfulness-based intervention
Figure 3: A harvest plot indicating the nature of the evidence for interventions with no effect on work engagement or one of its sub-components (k=18); NB: Each bar represents one study; the height of the bar indicates study design (3=randomised; 2=non-randomised, controlled; 1=uncontrolled); solidly shaded bars indicate top-down interventions; textured (dotted) bars indicate bottom-up interventions; T=interventions involving a training component; O=interventions involving other types of participation (e.g. participative action research, group reflection); JC=Job crafting intervention; M=Mindfulness-based intervention
In a series of two experimental studies we investigate how being sick with a common cold in a selection context influences the appraisals that evaluators form and how, in turn, people appraisal dimensions influence evaluators’ hiring recommendations. Further, we investigate whether a theoretically grounded individual difference variable, namely the degree to which evaluators are dispositionally altruistic, influences the appraisals of sick applications.

Being sick at work is a very common occurrence. Aronsson & Gustaffsson (2005) found that 53 percent of employees reported coming to work while ill more than once over the past year with 15 of employees admitting to have done so over five times over the past year.

Following Johns (2010) we define presenteeism as “attending work while ill” (p. 521) and we take the novel perspective of others and how they appraise the sick person in a work context. Indeed, a recent review of the presenteeism literature notes that “Another aspect of social dynamics that bears scrutiny is the reaction of colleagues and clients to the act of presenteeism” (Johns, 2010, p. 536).

Our current research has the following implications: 1) We identify the common event of having a cold as a driver of people impressions. 2) We show that having a cold in a job selection context leads to important negative selection outcomes via negative people impressions. 3) We provide empirical evidence for a personality attribute that ameliorates the negative appraisal of sick job applicants.

Please see the below theoretical model that we advance.
Purpose

The purpose of the paper is to investigate the indirect relationship between personality (Big Five) and job performance (in-role behaviour [IRB], organisational citizenship behaviour toward individuals [OCB-I]) through job crafting behaviour as a mediator.

Design/Methodology

Data was collected from a sample of South African working individuals (N = 580) and structural equation modelling (SEM) was employed to perform the statistical analyses.

Results

Results showed that each of the Big Five personality traits differentially affect job performance through job crafting. In particular, extraversion, agreeableness and neuroticism were found to indirectly affect OCB-I through relational crafting behaviour whereas conscientiousness and openness to experience were found to indirectly affect IRB through task crafting behaviour.

Limitations

Causality cannot be assigned due to the cross-sectional nature of the study and caution should be taken when attempting to generalize the findings to other cultural or international contexts that extend beyond South Africa.

Research/Practical Implications

Organisations should encourage and promote job crafting as a proactive workplace strategy that employees can use to express their personality traits and improve their job performance. Also, during the selection process, organisations should take into account the personality of individuals as it has implications for important work behaviours such as job crafting and job performance.

Originality/Value

The study contributes to the dearth of research surrounding the individual antecedents of job crafting behaviour and sheds light on the indirect relationship between personality and job performance.

Keywords: Big Five, job crafting, job performance
Reputation rankings and other forms of social hierarchy have long been used to motivate cooperative behaviors inside organizations. Yet, recent research warns that pressures associated with potential gains in rank may incite cheating and acts of deception, suggesting that rankings may undermine the cooperative behaviors they should motivate. This study seeks to understand whether rankings produce enough cooperative behaviors to offset the negative externalities they may produce. Using data from the online community Stack Overflow—a question and answer site for programmers, I examine over 1.2 million observations of 16,200 individuals’ weekly movements through reputation rankings and their corresponding rates of cooperative and uncooperative behaviors. I find that increases in rank are associated with a higher likelihood of cheating. However, actors that exhibit uncooperative behavior are also more likely to cooperate compared to actors that did not cheat. These findings suggest that upward movements through rankings create pressures that increase the likelihood that actors will perform uncooperative behaviors, but that individuals who are most susceptible to these pressures are on average more cooperative. At the level of a system this suggests that cooperation can be maintained even though rankings produce pressures that can perturb a system. Ultimately uncooperative behaviors such as cheating, may not be harbingers of failing systems of cooperation, but instead may be symptoms of robustness. This study contributes to theories of cooperation, dynamic perspectives of social hierarchy, and macro-level perspectives of prosocial behavior.
Purpose
According to the European working time regulation act, every worker is entitled to mandatory longer rest breaks on working days exceeding six hours. Several findings indicate, however, that these breaks are often skipped. Indeed little is known about the extent of skipping breaks and about its antecedents and consequences.

Design/Methodology
We analyzed data of the Working Time Report Germany 2016 (n = 17,620), a representative cross-sectional employee survey, for antecedents of skipping breaks and consequences on detachment and psychosomatic complaints.

Results
Skipping often work breaks is reported by 28% of employees, especially by female executives and staff with low rest break autonomy. High work intensity, long working hours, shift or weekend work, and small reconcilability of work and family are associated with an increased risk of skipping breaks. Combining these risks, prevalence of skipping breaks increases to 66%. The amount of employees with disturbed detachment or psychosomatic complaints is between 8% and 14% higher, if breaks are skipped than if not. However, results also support breaks as job resource reducing the negative consequences of stress.

Limitations
The study is based only on self-reported cross-sectional data.

Research/Practical Implications
In the changing world of work psychological demands will increase. Therefore the focus on recovery opportunities has to be intensified. The perspective should be widened for the demands and resources associated with skipping breaks and should be examined in longitudinal studies as well.

Originality/Value
To our knowledge, analyses regarding antecedents and outcomes of skipping work breaks are rare, especially taking detachment from work into account.
THE EFFECTS OF ABUSIVE SUPERVISION AND EXPLOITATIVE LEADERSHIP ON COMMUNICATION PRACTICES IN TEAMS, POSITIVE/NEGATIVE AFFECT AND INDIVIDUAL JOB PERFORMANCE

Anamarija Klaic (1) - Klaus Jonas (1)
University of Zurich, Department of Psychology, Zurich, Switzerland (1)

Purpose
Remarkably little systematic research exists on the effects of destructive leadership such as abusive supervision and exploitative leadership on communication practices in scientific teams, even though teamwork has become prevalent in the scientific work context. Building on the Affective Events Theory (AET) by Weiss and Cropanzano (1996), we hypothesized that abusive supervision and exploitative leadership have a negative effect on functional communication practices (e.g., developmental feedback) and a positive effect on dysfunctional communication practices (e.g., knowledge withholding) in teams. Furthermore, we hypothesized that the functional communication practices have a positive effect on individual job performance by enhancing positive affect in team members, while the dysfunctional communication practices have a negative effect on individual job performance by fostering negative affect in team members.

Design/Methodology
To test these assumptions, we acquired 161 scientific team members to participate in an online daily diary study for five consecutive work days.

Results
Multilevel mediation analyses conducted with R support our hypotheses.

Limitations
It remains to be tested how abusive supervision and exploitative leadership relate to team-level outcomes such as team innovation performance or team effectiveness by affecting functional and dysfunctional communication practices in teams.

Research/Practical Implications
These results imply that supervisors of scientific teams should refrain from showing destructive leadership behaviours in order to foster functional communication practices and prevent dysfunctional communication practices in teams.

Originality/Value
To our knowledge, our study is the first to analyse the relationship between destructive leadership and team processes (i.e., communication practices in teams).
Do Performance-Oriented Servant Leaders Exist? A Latent Profile Analysis of Servant and Authoritarian Leadership

XIAOTONG ZHENG (1) - Yuyan Zheng (1) - Les Graham (1)
Durham University, Business School, Durham, United Kingdom (1)

Purpose: Drawing on leader self-complexity (LSC) theory, we adopt a person-oriented approach to examine two topical leadership styles – servant leadership and authoritarian leadership. In organizations, leaders may encounter contradictory situations in which they serve their followers but also have to maintain control by enforcing organizational rules and procedures. Hence, we assume leaders can be both servants and authoritarian.

Methodology: We collect data from a sample of 1999 members of a UK police force.

Results: Five leadership profiles are identified. Among them, the most common is the performance-oriented servant leader (POSL) (32.9%), which is followed by the pure servant leader (SL) (26.7%). The least prevalent profile (5.2%) is that of punishment-oriented authoritarian leadership, which we label the evil leader. The other two profiles (19.2% and 16.1%) are authoritarian-oriented but not as extremely as punishment-oriented leaders. We label these the bad and the ugly leader. We also examine variations in follower self-concepts across the profiles. Followers who perceive their leaders to be POSL or SL are associated with higher collective self-concept and lower individual self-concept. Furthermore, follower self-concept mediates the relationship between being POSL, the reference group, relative to other leadership profiles, and job satisfaction and uncertainty.

Implications: Our research contributes to the literature on servant leadership by using a configurational approach to investigate the self-complexity of servant leaders. It provides empirical evidence that servant leaders can also be performance-oriented, that they can shape follower collective self-concepts and have positive effects on follower job attitudes. Our findings have practical implications for leadership development.

Originality/value: Our research is among the first to examine servant and authoritarian leadership using a pattern approach.

Limitations: The cross-sectional nature of the data with the same source rating limits our interpretation, but this indicates a promising avenue for future research.
ENTER THE ARENA! SELF- AND OBSERVER-RATINGS OF POLITICAL SKILL AND JOB PERFORMANCE

Mareike Kholin (1) - Gerhard Blickle (1)
University of Bonn, Department of Psychology, Bonn, Germany (1)

Purpose

Political Skill has been shown to be closely related to job performance and career outcomes (Munyon et al., 2015; Ng et al., 2005). It is conceptualized as a construct which captures both processes of self-perception and observable behavioral patterns (Ferris et al., 2007). However, most studies focus on self-ratings of political skill. The Trait-Reputation-Identity Model (TR-Model; McAbee & Connelly, 2016) differentiates three factors: the overlap of self- and other-ratings (Trait), specific information of other ratings (Reputation), and specific information of self-ratings (Identity). In this study, we use the TRI-Model to gain further understanding of the perceptional mechanisms of political skill in social interaction and its prediction of occupational success.

Design

On the basis of 204 triplets of employees, colleagues and supervisors, we conducted SEM to implement a TRI-Model of political skill. We then predicted task performance, contextual performance and income on the basis of the three TRI-factors.

Results

The results show that the Trait-factor of political skill predicts task performance, contextual performance and income. Additionally, the reputation factor predicts contextual performance.

Limitations

We don’t have a predictive design and therefore cannot draw conclusions on causality.

Research/Practical Implications

The results support the conceptualization of political skill as an interpersonal construct which should be assessed by multi-source ratings.

Originality/Value

This study is the first that applies the TRI-Model on political skill and gives a differentiated insight in the perception and the underlying mechanism of political skill in social interaction.
DEPARTING FROM THE STATUS QUO: EXAMINING THE EFFECTS OF WORK ENGAGEMENT ON PROSOCIAL RULE BREAKING

Jennifer A. Harrison (1) - Janet A. Boekhorst (2) - Michael Halinski (3)
NEOMA Business School, People & Organizations, Rouen, France (1) - University of Waterloo, Conrad School of Entrepreneurship and Business, Waterloo, Canada (2) - Ryerson University, Ted Rogers School of Management, Toronto, Canada (3)

Purpose: Previous research has almost solely emphasized a positive side of work engagement by highlighting how it leads to the three primary job performance behaviors (i.e., high task performance, high extra-role behaviors, and low deviant behaviors). Interestingly, the prevailing assumption is that highly engaged employees enact positive behaviors, which inherently excludes engaging in deviant work behaviors (even if well-intended).

Design/Methodology/Approach/Intervention: Drawing on social exchange theory, we explore the effects of work engagement on prosocial rule breaking. An important personal exchange resource, dispositional gratitude, is explored in shaping the prosocial rule breaking—engagement relationship. Data were collected over two points in time from 104 employees working for a start-up car company in Southeast China.

Results: The results provide support for the majority of hypothesized relationships. Engaged employees are especially motivated to help their organizations by breaking organizational rules. Dispositional gratitude was found to moderate the work engagement—prosocial rule breaking relationship in an unexpected way.

Limitations: The 2-wave data consisted of self-reported measures from a specific region in China, thereby limiting generalizability. These limitations will be addressed in Study 2.

Research/Practical Implications: We extend work engagement scholarship by providing insight into more nuanced performance behaviors.

Originality/Value: Work engagement appears to have unintended consequences whereby engaged employees choose to break rules with the intention of benefiting organizations.

Keywords: Work engagement, prosocial rule breaking, dispositional gratitude, social exchange theory
THE IMPACT OF MOTIVATION TO LEAD ON FOLLOWERS' PERCEPTIONS OF LEADER BEHAVIOR: THE MEDIATING ROLE OF STRESS

Sara De Hauw (1) - Katleen De Stobbeleir (2)
Open Universiteit, Heerlen, Netherlands (1) - Vlerick Business School, Gent, Belgium (2)

Purpose
The importance of being motivated to lead (MTL) is recognized by both scholars and practitioners. Little is however known about the potential consequences if such motivation is absent and how a lack of MTL trickles down and affects followers. To address this question, we adopted a transactional stress and demands-resources perspective to investigate how low MTL influences followers’ perceptions of task-, relational- and change-oriented leader behaviors, and whether this relationship is mediated by the level of stress that the manager experiences.

Methodology
Data were collected from 328 managers with supervisory responsibilities who engaged in a 360-degree feedback programme at a Belgian Business School. MTL and stress were rated by the focal manager, while the expression of the leader behaviors were rated by their followers.

Results
SEM showed that leaders who are unmotivated to lead experience more stress and as a consequence engage less in task- and change-oriented leader behaviors according to their followers. No significant relation was found between leaders’ stress and their followers’ perceptions of relational-oriented leader behavior.

Limitations
Future research is needed to explore why low levels of MTL did not impact relational-oriented leader behavior, as well as the impact of different mediators and moderators.

Research/Practical implications
This study creates insights into the negative process that may unfold when leaders experience little MTL which has implications for both research and practice.

Originality/Value
This study integrates the leadership and stress literature, creating value to both the theory of MTL and different stress theories.
Purpose
To test the direct and interactive influence of leadership attachment styles (secure, anxious, avoidant) and HR systems (compliance, commitment) on two distinct stages of the micro-innovation process—creativity and innovation.

Design/Methodology/Approach/Interventions
An experiment (n = 163) where we manipulated HR systems and leadership attachment styles with vignettes, and a multisource (supervisors, HR managers and employees) field study in three EU-based private firms (n = 217).

Results
Experimental results established the direct influence of a compliance HR system on both creativity and innovation and a positive effect of secure attachment on innovation. The interplay between attachment and HR system marginally predicted creativity under the commitment HR system and avoidant attachment, and it significantly predicted innovation under the commitment HR system and either secure or anxious attachment. The field study replicated the direct role of commitment HR in stimulating innovation (but not creativity), and pointed toward a more important role of leadership attachment.

Limitations
External validity of the experiment, cross-sectional design of field study.

Research/Practical Implications
To the literatures on leadership (the context of leadership attachment), strategic HR (a multi-level view linking HR systems with leadership attachment to portray a holistic picture of the context of micro-innovation at work) and creativity/innovation (by delineating between these two stages).

Originality/Value
Showing that particular types of social-contextual conditions (i.e., interactions between leadership attachment styles and types of HR systems) are beneficial for one aspect of the individual innovation processes (e.g., idea generation), and different conditions are favorable for stimulating other aspects (e.g., idea implementation).
392 - INTERDISCIPLINARITY: THE ROLE OF INTERDISCIPLINARY COMPETENCIES FOR SUCCESS AND TEAM SATISFACTION

Anna M. Claus (1) - Bettina S. Wiese (1)
RWTH Aachen University, Institute of Psychology, Aachen, Germany (1)

Purpose

Innovation in both academia and industry lies at the borders of traditional disciplines. Interdisciplinary teams make use of expertise and methods from different fields; however, they often struggle with the unique challenges that come with interdisciplinary work. Interdisciplinary competencies in the dimensions (a) initiative for exchange, (b) knowledge integration, (c) target group-specific communication, and (d) reflection of disciplinary perspectives help overcome interdisciplinary obstacles. But do interdisciplinary competencies of an individual foster the success of interdisciplinary endeavors and team satisfaction?

Design/Methodology/Approach

In an online survey study with N = 151 dyads of employees working together interdisciplinarily, we tested how self-reported interdisciplinary competencies were linked to self-reported and peer-reported team success and team satisfaction.

Results

Interdisciplinary competencies were positively related to project outcomes; namely, perceived project success and collaboration satisfaction.

Limitations

We relied on cross-sectional self-report measures of only one single team member. Future research might include more team members, use longitudinal designs and implement behavioral measures of competencies.

Research/Practical Implications

The results indicate that individual competencies of employees make a difference in interdisciplinary collaborations. As a consequence, companies and organizations would benefit from supporting employees in developing the necessary skills to optimize innovation processes in interdisciplinary endeavors.

Originality/Value

The potential of interdisciplinarity is oftentimes lost due to challenges within the teams. This study sheds a light on individual competencies as an important factor in making interdisciplinary teams a success.
395 - JOB CONTRACT, WORK-RELATED STRESS, AND PERCEIVED WELL-BEING:

DOES AGE MAKE A DIFFERENCE?

Valerio Ghezzi (1) - Claudio Barbaranelli (1) - Valeria Ciampa (1) - Cristina Di Tecco (2) - Matteo Ronchetti (2) - Benedetta Persechino (2) - Sergio Iavicoli (2)

Sapienza - University of Rome, Department of Psychology, Rome, Italy (1) - Italian Workers’ Compensation Authority (INAIL), Department of Occupational and Environmental Medicine, Epidemiology and Hygiene, Monteporzio Catone, Italy (2)

Purpose: While job contract may play an important role for work-related stress and employee well-being, little is known about its interaction with employee age in determining such outcomes. By using an integrated variable- and person-centered research approach, the present study is aimed at investigating the role of job contract, age and their interaction in shaping work-related stress risk well-being outcomes (i.e., perceived physical health, depression, and job satisfaction).

Method: The present study capitalizes on the InSula project dataset (INAIL, 2014), comprising data collected via CATI-administered surveys from a nationally representative sample of 8,000 employees.

Results: Older temporary workers performed poorer than others both in psychosocial risk for work-related stress and well-being dimensions. Moreover, the impact of work-related stress risk on well-being outcomes was stronger for older temporary workers than for other employees.

Limitations: Main limitations of the present study are concerned with the use of a cross-sectional research design and self-report data provided by a single informant. Moreover, these findings could be strengthened by collecting longitudinal and cross-cultural data.

Implications: Being a permanent or a temporary worker may affect differently psychosocial risk for work-related stress and well-being of young and old employees. Moreover, the effect of psychosocial risk for work-related stress on employee well-being is stronger for old temporary workers than others.

Originality: This is the first study to simultaneously address the role of employment status and age in shaping work-related stress risk and well-being by integrating variable- and person-centered research perspectives.
Purpose

This study investigates the impact of high-involvement work practices (HIWPs) on task performance through the mediating role of proactive work behavior. Further it seeks to determine whether compliance-achieving HR practices (CAHR) temper this mediated relationship in a positive or negative way.

Design/Methodology/Approach/Intervention

A multilevel quantitative cross-sectional study was carried out among 323 employees working in 66 teams across a broad range of sectors.

Results

The results revealed that employee’s perceptions of HIWPs lead to higher levels of task performance through enhancing employees’ proactive work behavior. Moreover, the positive effect of HIWPs on proactive work behavior was strengthened when CAHR were also perceived. Moreover, there was a significant difference in the model results depending on whether managers or employees rated the HR practices.

Limitations

The cross-sectional nature of the study and convenience sampling approach represents limitations of the study.

Practical Implications

The results show that proactivity is a precursor to enhanced performance which can be instigated through HIWPs. However, it is employees’ perceptions rather than the implemented practices by managers that truly matter.

Originality

The study sheds light on the ‘black box’ of HRM as well as offering unique insights into Human Resource Practices which deliver functional work behavior i.e. proactivity. The study is also one of very few which attempts to directly test the process model that simultaneously emphasizes eliciting
employees’ involvement and achieving their compliance to rules as a means to maximize performance.

398 - COGNITION AND AFFECT ASANTECEDENTS OF SHARED LEADERSHIP

Sebastian Tillmann (1) - Sabine Boerner (1)
University of Konstanz, Department of Politics and Public Administration, Konstanz, Germany (1)

Purpose
Research has neglected the parallel influence of cognitions and affect on shared leadership. We investigate transactive memory systems and trust as mediating factors between information sharing and shared leadership. We also consider the influence of empowering and directive leadership in fostering information sharing.

Design
Fourty-six teams with 346 members answered a survey questionnaire. The data was analyzed using PLS structural equation modelling.

Results
Our hypotheses are mostly supported by our results. We note two things. First, trust has a stronger influence on shared leadership than transactive memory systems. The latter are approaching significance and provide partial support for our hypothesis. Second, empowering leadership has a stronger influence on information sharing than directive leadership, though both are significant. Overall, we can explain large amounts of variance in shared leadership through our parallel mediators.

Figure 1: Path coefficients and explained variance

Limitations
The data collection is cross-sectional in nature, limiting causal conclusions from an empirical standpoint. Common source bias might be present for some measures.

Implications and Originality
Our work is the first to investigate the parallel roles of team cognitions and affect on shared leadership. Our findings show a need for further research in order to replicate our findings. We also demonstrate a need for leaders focus on information sharing in order to build trust and transactive memory systems and, ultimately, shared leadership.
400 - DOES ATHENA SWAN MATTER? THE EFFECT OF ATHENA SWAN INSTITUTIONAL EQUALITY AWARDS ON THE PROPORTION OF FEMALE PROFESSORS IN UK HIGHER EDUCATION INSTITUTIONS

Jagriti Tanwar (1) - Karen Johnston (1) - Darren Van Laar (2)

University of Portsmouth, Portsmouth Business School, Portsmouth, United Kingdom (1) - University of Portsmouth, Psychology, Portsmouth, United Kingdom (2)

Purpose
The UK Higher Education ‘Athena Swan’ Gender Equality scheme has been heralded a great success, with many institutions bidding and receiving recognition awards. This paper examines the extent to which the Athena Swan (AS) award is related to the representation rates of female professors in the UK.

Research Methodology
We use panel data from 126 UK higher education institutions (HEIs) for the years 2012-2016 to analyse the impact of AS award on the proportion of female professors.

Results
Our preliminary findings show that there has been a gradual increase in the proportion of female professors during 2012-2016. For those universities who received an AS award, on average, the representation of female professors increased from 2012 to 2013, however, from 2013 onward non-awarded universities experienced a much more rapid upward trend in increasing female professorships.

Limitations
The present study only employs data from 2012 to 2016.

Research/Practical Implications
We suggest that other countries and perhaps other sectors can potentially use similar practices to increase gender equality in the workplace.

Originality
The extent to which higher education institutions have been able to increase female representation at professor level as a result of the receipt of an AS award has not been studied so far. Our article will address this and show how national level policies affect gender inequality in the context of the HE sector.
Purpose: In 2018, the Department of National Defence (DND) launched a workplace well-being survey in order to collect baseline data on the well-being of its personnel (i.e., Regular Force members, Primary Reserve members and civilian personnel) and inform actions for positive change.

Methodology: A stratified random sample of 42,150 DND personnel received this survey, resulting in 13,197 respondents (overall response rate: 31.31%). The present study sought to identify profiles of respondents based on their scores on five outcome variables: Morale, Job Engagement, Burnout, Psychological Distress, and Turnover Intentions.

Results: Four profiles emerged from the data: A Functioning (41% of the sample) profile, a Thriving Stayers (16%) profile, a Thriving Movers (24%) profile, and an At-Risk (18%) profile. Designated group (i.e., women, indigenous people, persons with disabilities, and members of visible minorities) membership was related to these profiles in turn. The results showed that, controlling for status (i.e., Regular Force member, Primary Reserve member, civilian employee), indigenous people and persons with disabilities had greater odds (i.e., 1.12 and 1.81, respectively) of being at-risk relative to non-indigenous people and persons without disabilities.

Limitations and Originality/Value: The limitations of this research (e.g., self-report data, cross-sectional design, unweighted data) notwithstanding, it utilized a state-of-the-art approach to identifying workplace well-being profiles of respondents and linking membership in these profiles to designated group membership.

Research/Practical Implications: I will discuss the research implications of these findings, as well as their practical implications for inclusive organizations in general and for the DND in particular.
Purpose

This paper presents an interpretative investigation into how the external coaching contributes to the process of change in the organisation; focusing on the identification of change resistance and successful factors to facilitate an effective process.

Design/Methodology

This research adopted critical realism methodology to clarify the theoretical knowledge and existing business practices. A total of 21 in-depth interviews were conducted with external coaching practitioners.

Results

In general, this research demonstrates that coaching is a valuable approach to cope effectively with individuals’ resistance in the changing process. The causes of resistance can be sorted into three areas: the coaching recipients themselves, and the relationship with their colleagues and environment. Several behavioural indicators (verbal and non-verbal) are identified to diagnose resistance in coaching recipients, such as being silent and touchy. This study confirms that an open and detailed communication for achieving transparency about the change is critical when it comes to resistance. Moreover, an effective coach-coach relationship, coaches’ advanced interpersonal skills and a supportive workplace environment are distinguished as successful factors in a resistant context.

Limitations

This study only includes coaches in Germany due to the first author’s work location.

Research / Practical Implications

This study offers a new insight in coaching and change management literature as well as provides practical guidelines for future coaching training and development programme.

Originality / Value

This is one of the pioneering research integrating coaching and organisational change subjective. The study results can be considered being a groundwork for future research duplicating in different cultural settings.
HUATIAN WANG (1) - Jia Li (1) - Evangelia Demerouti (1)
TU/e, Eindhoven, Netherlands (1)

Purpose: Despite the growing attention to top management team (TMTs), relative less attention is given to the influence of TMT knowledge-based diversity (e.g., diversity in functional background, organizational tenure) on firm performance in a dynamic and unfavorable environment. This paper aims to investigate (1) whether TMT variety (i.e. knowledge-based diversity) brings in strategic flexibility and then further improves firm performance, and (2) to what extent the mediating effect of strategic flexibility is amplified or constrained by resources and demands in external environments.

Methodology: We collected the TMT data from 141 Chinese publically listed high-tech firms between 2008 and 2016 from CSMAR database. We performed a moderated mediation analysis with the panel data to test our hypotheses.

Results: TMT variety can benefit firm performance by increasing strategic flexibility. The benefit is stronger if firms have greater government resources and lower financial demands.

Limitations: A single industry context may imply context-specific findings.

Research/Practical Implications: The study provides insights into the beneficial effects of variety-diverse attribute under a dynamic and competitive circumstance. Our findings call for managers to optimize TMT composition with more variety-diverse characteristics.

Originality/Value: We extend previous studies by addressing role of TMT variety-related attribute that plays in a dynamic and competitive environment. We outline a framework of external resources and demands to research TMT issues in such environment.
Purpose: Psychological distress has been linked to negative work-related outcomes such as burnout, job dissatisfaction, and reduced job commitment (e.g., Demerouti et al., 2001; Rodwell et al., 2009). Based on conservation of resources theory (e.g., Hobfoll, 2001), we hypothesized that, over time, negative work experiences deplete employees’ resources resulting in an increase in psychological distress. Moreover, we hypothesized that increased psychological distress also depletes employees’ ability to cope with workplace stressors, leading to negative work outcomes.

Methodology: The associations between psychological distress (Kessler-10, [K10]) and individual workplace outcomes were evaluated in a longitudinal sample of Canadian Armed Forces (CAF) members. Data was matched across five datasets between fall 2015 and spring 2017 (n = 169, n = 182, n = 342, n = 310, n = 95).

Results: K10 demonstrated good test-retest reliability over two years. Six months apart, work-family conflict, morale, and role overload predicted K10. One year apart, role conflict predicted K10. In turn, four months apart, K10 predicted morale, job satisfaction, identification, role insufficiency, role conflict, and intentions to stay. A year and a half apart, K10 predicted morale.

Limitations: Samples sizes were small, and not all participants completed measures at all time points.

Research Implications: K10 was a stable measure of psychological distress, suggesting work experiences may impact psychological distress, but psychological distress may also impact personnel’s experience of their workplace.

Originality/Value: This adds to our understanding of how psychological distress unfolds over time. The military sample is unique, and the non-clinical context is understudied.
Purpose: Previous studies of career self-management have focused on predictors at the between-person level. In order to capture the self-regulatory processes underlying career self-management, we supplement this approach by taking a within-person perspective. We test whether within-differences in proximal supports (e.g., work social support) and stressors (e.g., work role overload) predict fluctuations in weekly, multi-dimensionally assessed, career self-management, and whether these relations are mediated by within-differences in social-cognitive variables (i.e., self-efficacy and outcome expectations). We further examine the moderating effect of dispositional and contextual variables on these relations.

Design/Methodology/Approach/Intervention: We test our hypotheses using multilevel analyses on a sample of Swiss employees participating in a weekly survey for seven consecutive weeks.

Results: The results clarify the hypothesized moderated mediation model and which variables predict weekly engagement in career self-management behaviors.

Limitations: The observational design, although longitudinal, is not suited for making causal inferences. Future studies should also sample specific subgroups of employees to explore potential boundary conditions.

Research/Practical Implications: The study contributes to our understanding of the predictors of career-self management and therefore facilitates the construction of effective career interventions.

Originality/Value: Our study is the first to examine the career self-management of employees in a design that allows distinguishing between- and within-person-level effects, and provides novel insights into career-related self-regulation by combining social cognitive career theory and proactivity motivation models.
Purpose: This study focuses on the dynamics of intrinsic motivation and their influence on performance. Its purpose was threefold: to study changes in motivation over time; to investigate if different patterns of motivational dynamics can be distinguished; and to study if such patterns influence subjective and objective performance.

Design/Methodology: The data were collected longitudinally, once a week, during a period of 10 weeks. Participants were 291 university students, with a total of 2110 questionnaires collected. Data analysis was conducted using, among others, multilevel analysis and latent process mixed models.

Results: The main findings showed that the participants experienced dynamics of motivation over time and they could be grouped according different patterns of these dynamics. Moreover, the participants whose motivation clearly increased over time tended to achieve better performance (subjectively and objectively measured), compared with those whose motivation increased mildly.

Limitations: Student sample, which limits the generalizability. Performance was treated as an outcome, not as a process, and was measured only once.

Research/Practical Implications: The study confirms that motivation is a highly dynamic process, thus the future research in this field should focus on within-, not only between-person differences. Moreover, the results provide a better understanding of how intrinsic motivation influences performance, what may help develop interventions which aim to improve people’s results.

Originality/Value: The study of the association of motivation and performance considers different patterns of motivational change, not a measure of motivation only at one point in time.
Purpose: Researchers have long studied the consequences of being demographically dissimilar from others on the team on absenteeism. Yet the empirical findings are rather inconclusive, with small effects ranging from nonsignificant to positive. While temporal dynamics might be an explanation for the inconclusive effects, little is known about how demographic differences play out over time.

Design/Methodology: Using a sample of 2,711 newcomers to 820 blue-collar teams tracked over seven consecutive years we employ growth curve modeling in a multilevel count framework.

Results: Gender and age dissimilarity effects on absenteeism are not constant over time; rather, dissimilar individuals increase their absences more strongly over the years. Particularly, women and older employees in predominantly male and younger teams show a steeper increase in absenteeism over time and, accordingly, higher absolute absenteeism at later stages of team membership than do their less dissimilar counterparts.

Limitations: The generalizability of our findings might be somewhat limited because they are based on blue-collar workers employed in one organization in Switzerland.

Research/Practical Implications: Our findings challenge classical social contact arguments of decreasing demographic dissimilarity effects over time. Consistent with our integration of social identity and anchoring events theory, our results instead suggest that demographic dissimilarity effects typically surface only later in time after team entry. For practitioners we estimate the costs of the dissimilarity dynamics and discuss implications for diversity management.

Originality/Value: We add a temporal perspective to previous static theories of relational demography and employ one of the most extensive longitudinal analysis on this topic.
Traditionally, research on job insecurity (JI) has focused on organizational consequences and employees’ psychophysical well-being. However, some recent studies found that job insecurity is also associated with extraorganizational outcomes related to saving/spending decision-making. A simulation experiment research design (Lozza et al., 2017) on 377 Italian participants (53.8% females, mean age = 25.5, s.d.=3.5) found that subjectively insecure workers are less willing to engage in daily consumption (e.g., buying food, clothing, etc.) and major life decisions (e.g., buying a house, getting married, etc.). A replication study was performed with the aim to explore the cross-cultural generalizability of the original Lozza et al. (2017) findings in the Slovakian context. Using a sequence of two different scenarios, 361 Slovakian participants (75.6% females, mean age = 28.0, s.d. = 9.0) were asked to evaluate their JI and their inclination towards daily consumption and some major life decisions. Findings confirm that changes in JI affect such extraorganizational outcomes in both contexts. Nonetheless, some differences can be detected in terms of intensity of the studied effects, which can be explained by the different socio-economic background of the two countries (i.e. different employment protection legislation, effects of the global financial crisis).
Purpose

Destructive and constructive workplace deviance (WD) are acts that significantly counter organizational norms and harm/support the organization and/or its members. Despite norms being an integral part of the definition, WD research typically fails to account for the more proximal social influence of an employee’s work group norms (WGN) toward WD. When in conflict with organizational norms, these proximal WGN can supersede the behavioral impact of organizational norms and facilitate WD. Adapting a theoretical integration of social exchange, social identity, and social information processing, we postulated that one’s justice perceptions increase organizational identification (OI). This, in turn, strengthens adherence to organizational norms and inoculates against the potentially conflicting WGN to predict both, destructive (CWB) and constructive deviance (OCB).

Design/Methodology

Two time-lagged field studies surveyed (1) 244 employees nested in 82 work groups, and (2) 296 employees.

Results

We used Bayesian (1) multilevel and (2) regression analysis. A consistent pattern of results supports our hypotheses regarding the direct and indirect effects. Yet, we did not find evidence of a moderating association of WGN regarding the association of OI with CWB and OCB.

Limitations

Limitations include (1) causal interpretations are not feasible, (2) potential nonresponse bias, and (3) not all known predictors of WD were included.

Research/Practical Implications

Strengthening employee OI and monitoring work group norms appear to be promising ways to prevent destructive deviance and foster constructive deviance.

Originality/Value

To our knowledge, our studies are the first to empirically demonstrate OI and WGN as central predictors of both forms of deviance.
Purpose: In a sample of job applicants, we investigated the relationship between interview anxiety and interview faking, and what type of faking is more strongly predicted by interview anxiety. Finally, we ask whether anxiety can explain the relationship between personality traits and faking.

Design/Methodology /Approach/Intervention: Participants (N=202) were recruited after completing an employment interview for a paid research assistant position.

All participants completed the Measure of Anxiety in Selection Interviews (McCarthy & Goffin, 2004), the Honesty-Humility and Extraversion measures from the HEXACO-PI-R (Lee & Ashton, 2004), and the Interview Faking Behavior Scale (IFB; Levashina & Campion, 2007).

Results: Interview Anxiety scores were positively related to overall faking (r = .30), with the strongest facet correlations between anxiety and image protection. Furthermore, anxiety mediates the association between personality and faking, such that individuals who are low in Honesty-Humility (indirect effect = -.04, CI = -.08 to -.01), and those who are low in Extraversion (indirect effect = -.13, CI = -.21 to -.07) score higher on anxiety, which leads to more faking.

Limitations: While the study took place in a field setting, all measures were based on self-reports.

Research/Practical Implications: The results suggest that faking can be used as a protective mechanism to maintain self-esteem or to avoid the loss of rewards (Leary & Kowalski, 1990). Interviewees who are low on Honesty-Humility and Extraversion are particularly likely to become more anxious and engage in faking.

Originality/Value: This paper is the first to demonstrate the role of anxiety in interview faking.
Purpose: Gamification and serious games found their way in today’s workplaces (e.g., for game-based training, assessment). Therefore, there is growing interest in the way individual differences affect outcomes of game-based approaches. Especially videogame experience (VGE) may influence learning or performance in game-based approaches. This study created and validated the VGE scale – a psychometrically sound measure of VGE for future research.

Design: We followed guidelines for scale development and conducted three studies. The first two samples were drawn from Amazon’s MTurk. Participants responded to the VGE items and we conducted an exploratory and confirmatory factor analysis. The third sample consisted of undergraduate students responding to the VGE items, to items aimed at supporting construct validity, and played three games in order to support criterion-related validity of the VGE scale.

Results: Study 1 revealed four subdimensions of VGE. Study 2 confirmed one latent VGE factor with four subdimensions. Study 3 demonstrated convergent, divergent, and criterion-related validity with VGE predicting videogame performance and scores on a game-based knowledge assessment.

Limitations: There was no high-stake game-based assessment or training of relevant workplace variables.

Implications: VGE is an important variable in the realm of game-based assessment and training as it predicts individuals’ game-based performance and learning. This contributes to research and practice highlighting potential advantages for gamers within game-based approaches and the need for research on individual variables impacting such approaches.

Value: Validation of a video game experience scale is valuable for future studies to predict individual outcomes in game-based training, assessment and education.
DOES SHOWING INTEREST IN ACHIEVING WORK-LIFE BALANCE HARM YOU? AN ANALYSIS AMONG NEWCOMERS

Massimo Bergami (1) - Gabriele Morandin (1) - Marcello Russo (1)
University of Bologna, Management, Bologna, Italy (1)

Purpose – This research examines whether openly disclosing interest in Work-Life Balance (WLB) can be harmful for newcomers during their organizational socialization, particularly leading to a supervisor's negative evaluation. Moreover, drawing on gender role theories, arguing that the interest in WLB can be a higher source of stigma for men than for women, we test if the effects of publicly disclosing interest in WLB on supervisors’ evaluation differ by gender.

Design/Methodology/Approach/Intervention – We use a between-subject design with vignettes and a post-scenario survey wherein we ask supervisors to evaluate the newcomer on several socialization outcomes. We randomly propose different scenarios of newcomers (male vs female) disclosing different levels of interest in WLB (newcomers highly interested in WLB vs. newcomers ready to sacrifice personal life in favor of work) to supervisors.

Results – The research is currently in the data collection phase and preliminary results will be available in the Fall.

Limitations – The use of between-subject design reduces internal validity of scenarios but, given the high number of scenarios proposed to the same participant in the within-subject design, it could have reduced their objectivity in answering the post-scenario questions.

Research/Practical Implications – Our research can help newcomers to figure out what is the better strategy to navigate successfully their organizational socialization according to supervisors' attitudes towards the WLB.

Originality/Value – We believe this research addresses an unexplored topic about the potential negative implication of disclosing WLB interest during organizational socialization.
Purpose: To investigate a new way of assessing different levels of workplace bullying including cut-off scores, frequencies and self-labelled victimization. Further, to use this to clarify the escalation process in terms of onset of different negative bullying behaviours.

Methodology: The study was based on a representative sample of the Swedish workforce collected the autumn of 2017 (n = 1856). Workplace bullying was measured using NAQ-R (Einarsen, Hoel, & Notelaers, 2009) and self-labelling based on a definition of bullying. Other measures were taken from the PSYWEQ questionnaire (Rosander & Blomberg, 2018).

Results: Five levels (three main levels) were proposed, (a) risk for bullying, (b) incipient bullying, (c) ongoing bullying, (d) severe bullying and (e) extreme bullying. For central factors, including e.g. individual work experience, organizational conditions for work, roles in the organization, quality and efficiency, joint job satisfaction, and negative exposure at work, the result showed differences between levels. Using the levels, a pattern of onset for different negative bullying behaviours was found.

Limitations: As with any method to categorize victims of bullying there are potential problems of accuracy dealing with an individual as categorization is based on averages for the many and the escalation process is not always linear.

Implications: We believe the levels of bullying and onset of negative bullying behaviour presented can have a widespread practical application as it highlights exposure at varying stages and that a probable course of events can be identified.

Value: There have been previous attempts to classify victims of bullying. In this presentation we believe we have an original approach to the issue that have great potential both scientifically and practically.
440 - WELCOME DR. WATSON: NEW ROLES AND RESPONSIBILITIES IN AI-SUPPORTED HEALTHCARE TEAMS

Nadine Bienefeld (1) - Gudela Grote (1)

ETH Zurich, Management Technology Economics, Zurich, Switzerland (1)

Purpose: The introduction of artificial intelligence (AI) in the workplace is said to initiate a paradigm shift from “mind to machine” that will fundamentally change the way humans work. We do not know, however, how this change will affect professional roles, teamwork, and the distribution of control and responsibility between humans and AI within these new socio-technical-systems.

Methodology: We address these questions by (1) exploring the changing roles and responsibilities in healthcare professionals (HCPs, i.e., physicians and nurses) by observing their day-to-day activities in six Intensive Care Units (ICUs) at a large teaching hospital (N = 60). Furthermore, to explore opportunities and risks from an all-around perspective, we will (2) interview and survey HCPs, patients and other stakeholders in healthcare (N = 600).

Preliminary results from interviews and observations reveal that introducing higher levels of standardization through AI hinders HCPs’ flexibility and autonomy, which in highly dynamic hospital ICUs, can be problematic. Survey results suggest, however, that opportunities outweigh the risks, whereby reduction in human errors is seen as the biggest benefit.

Limitations: Due to the future-oriented nature of these issues, we are required to mainly use prospective exploration techniques.

Practical Implications: This study provides important information about the impending changes of AI in future work systems to all affected parties.

Originality: This study advances the field of WOP by providing novel insights into how AI is transforming professional roles and suggests new design approaches that attain an optimal fit between control and responsibility within these new socio-technical-systems.
WHEN GENDER AND EMOTIONAL INTELLIGENCE MATTERS:
INCIVILITY IN THE WORKPLACE

Isabel Carmona-Cobo (1) - Esther Lopez-Zafra (1)
University of Jaén, Psychology, Jaén, Spain (1)

Purpose
Currently research shows the type of behaviors, the targets, the favoring conditions and the effects that incivility has (Cortina et al., 2017), but we hardly know about the observers’ reactions depending on its gender, who commits the incivility and whether the gendered context or other personal resources (i.e. emotional intelligence EI) matter. In this study, we analyze gender differences in tolerance towards subtle incivility, we explore whether observers’ EI could also help to avoid incivility and consider the gendered context (masculine vs. feminine).

Design
183 workers (53.5% women) completed a questionnaire in which they read about a situation (randomly distributed). Then responded to a tolerance scale, PANAS and WLEIS scales. Experimental conditions include a male employee suffering from subtle incivility by their supervisor (male or female) in a gendered context (nursing vs. engineering).

Results
ANOVA results yielded gender differences. Women showed less tolerance than men when a leader (regardless their gender) performed incivility in a masculinized context. In addition, women workers with high IE, compared to men, indicated that incivility triggered greater negative affect in the victim (employee), therefore, showing higher perception and less tolerance.

Limitations
Future studies should include episodes with women as target and also overt behaviors to make reasonable comparisons.

Research/Practical Implications
EI acts as a prevention mechanism, stopping the harmful effects of incivility.

Originality/Value
Very few studies focus on observers and their reactions in different incivility at work situations. Thus, this study is a promising and original starting point.

Key words: Gender, emotional intelligence, incivility.
Purpose

Stewardship theory has comprised situations in which managers or employees are motivated to act in the best interests of their principals for the greater collective good (Davis et al. 1997). While previous research has emphasized the structural and psychological antecedents of stewardship (e.g. Hernandez 2012), we explore the dynamics of (failing) organizational objectives and development of stewardship. To our knowledge, this has not been investigated despite the emphasis on stewards’ motives being aligned with the objectives of the organization.

Design/Methodology

The study is based on 1 ½ years fieldwork (interview and participant observation) in the IT department of a Danish bank

Results

Our results show that employees and middle managers’ deployment of stewardship were complicated by failing and conflicting objectives of taking risks to deliver and compliance with regulations. Nevertheless, the managers and employees executed stewardship as collectivistic behaviors towards re-defining and aligning novel objectives to avoid future failure.

Limitations

Our results are limited to a single organization. Future studies should test the generalizability of our results. Furthermore, comparisons of stewardship under successful and failed organizational objectives could be relevant.

Research/Practical Implications

More attention should be paid to employees’ opportunities of not merely aligning with objectives but rather aligning and prioritizing organizational objectives as an execution of strategic stewardship

Originality/Value

To our knowledge, the study is the first to investigate the development of stewardship in times of failing and conflictual organizational objectives
Purpose

In this paper we present a model of trust motivation, defined as ‘an intra-individual psychological state that represents a desire to be vulnerable to another in order to build or maintain a trusting relationship’. Drawing on self-determination theory (Deci & Ryan, 1985), we seek to explore why individuals may be motivated to trust some more than others within the context of leader-follower relationships.

Methodology

Utilizing a 3x2 experimental vignette design we investigate how trust motivation (intrinsic, extrinsic controlled, or extrinsic autonomous) interacts with trustworthiness (high vs low) to influence trust in a hypothetical leader. Participants (N= 181) were randomly assigned to one of six conditions.

Findings

Results revealed that the presence of trust motivation significantly increased a participant’s willingness to be vulnerable, even when trustworthiness was low. This was particularly the case for the experience of intrinsic motivation.

Limitations

Participants in this research responded to a hypothetical vignette which may impact the external validity of our findings.

Research/Practical Implications

Through our focus on motivation, our model seeks to compliment traditional models of trust, which typically portray trust as based predominantly on the conscious consideration of trustworthiness information (e.g., Mayer, Davis, & Schoorman, 1995).

Originality

This is the first of a series of experiments to test the role of motivation in our decision to trust. These initial findings provide support for the view that trust motivation can influence trust decisions alongside trustworthiness assessments.

OPTIMAL DISTINCTIVENESS AT THE WORKPLACE: HOW THE DESIRE TO BE SIMILAR OR UNIQUE AFFECTS WORKPLACE BEHAVIOUR

Tobias Stadler (1) - Eva Selenko (2) - Malcolm Patterson (1)
University of Sheffield, Institute of Work Psychology, Sheffield, United Kingdom (1) - Loughborough University, School of Business and Economics, Loughborough, United Kingdom (2)

Purpose
To investigate the extent to which employee’s perception of themselves in relation to others in their environment affects their workplace behaviour. Drawing upon Optimal Distinctiveness Theory (Brewer, 1991) we propose that if people feel too similar or too different compared to others, their need for uniqueness or belongingness, respectively, will be activated. These needs, in turn, will motivate employees to engage in either deviant (constructive and destructive) or organisational citizenship behaviours (OCB).

Design/Methodology
A two-wave longitudinal survey study with 217 full-time employees over the course of three months was conducted, assessing their behaviour, needs and perceived similarity/uniqueness.

Results
Mediation analysis showed that employees, who felt too similar to their colleagues had a higher need for uniqueness and, subsequently, engaged in destructive, but not in constructive deviant behaviour. However, we did not find that employees, who felt too different to their colleagues engaged in OCB to satisfy their need for belongingness.

Limitations
Limitations of this study include its convenience sample and that the analysis is based on self-report data.

Research / Practical Implication
The findings suggest that organisations might be able to reduce destructive deviance by encouraging employees to express their uniqueness in more productive ways, such as through creative performance and innovation.

Originality / Value
This paper is the first to introduce the concept of optimal distinctiveness to the workplace and shows its applicability to harmful and constructive workplace behaviour. It also constitutes the first study to examine shared antecedents of constructive and destructive deviance at the workplace.
Purpose: The aim of this study is to explore how disputes concerning allegedly unfair career advancement appointments are susceptible to eristic modes of legitimation (preposterous reasoning to win the argument) by managers.

Design/Methodology: 15 independent interviews were conducted with former employees who claimed that their promotions were denied unfairly. These interviews were accompanied by 21 interviews with HRM (Human Resources Management) professionals who had experience addressing employee complaints. Argumentation analysis is employed to analyse the interview accounts.

Results: The consequent rhetorical analysis indicates that raising unfairness concerns can be futile and destructive when managerial authorities are in an eristic mode of discussion that instigates malevolent political strife within organizations. This study reveals that eristic legitimation attempts cause increased level of organizational politics, decreased employee motivation and performance, and decreased managerial performance visibility.

Limitations: Since it is a qualitative study, the theoretical findings require further quantitative studies to establish their empirical generalizability.

Research/Practical Implications: It can lead to questioning of specific managerial behaviours in response to unfairness accusations.

Originality/Value: It introduces the idea of eristic legitimations into the literature.
Copious studies have validated work meaningfulness (WM) and perceived organizational support (POS) as antecedents of concepts such as work engagement (WE), perceived stress (PS) or life satisfaction. However, scholars have looked at WM and POS separately without considering that in complex work environments and shifting employee priorities these two constructs can have an impact on each other. We explore these effects on a sample of 3767 employees in several organizations in France who participated in a consulting project on perceived stress between 2014 and 2016. In order to conduct multivariate analyses including principal component analysis and structural equation models with an adequate number of respondents, we limit the study to a random sample of 200 respondents. The results show that in direct relationships, WM has a stronger impact on WE than POS ($\beta=0.750$, $p<0.01$ versus $\beta=0.114$, $p<0.05$) but lower on professional life satisfaction (PLS) than POS ($\beta=0.178$, $p<0.05$ versus $\beta=0.555$, $p<0.01$). At the same time, POS moderates the relationship between WM and WE ($\beta=0.565$, $p<0.05$) and between WM and PLS ($\beta=0.415$, $p<0.10$). Our findings contribute to work psychology literature by confirming a moderating role of POS on the relationships between WM and WE as well as PLS. Implications for practice include that organizations should focus on work design around personalized intrinsic meaningfulness if they want to foster engagement. Differences in variables such as gender, age, tenure, industry sector or organizational rank are discussed.
Purpose

The purpose of this research was to examine the joint effects of leaders’ achievement goals (mastery-approach vs performance-approach goals) and leaders’ identification with the target of voice on voice utilization via perceived usefulness. Drawing on associate evaluation theory, we posit that leaders’ achievement goals result in differences in the perceived usefulness and subsequent utilization of the voiced ideas, but only when leaders identify weakly with the target of voice.

Design/Methodology

In two experimental studies (Study 1, N=66; Study 2, N=161), participants were assigned a leadership role and performed an in-basket task in which they had to respond to emails from their subordinates. We experimentally induced a performance-approach or a mastery-approach goal, and measured participants’ voice target identification, perceived usefulness and voice utilization (i.e., budget allocation).

Results

Leaders with performance-approach goals (vs. mastery-approach goals) exhibited lower levels of perceived usefulness and voice utilization. Further, the indirect effects of leader achievement goal on voice utilization via perceived usefulness were no longer significant when leaders’ voice target identification was high.

Limitations

The generalizability of our findings may be limited.

Research/Practical Implications

To enhance utilization of voiced ideas, organizations may benefit from creating an environment in which mastery-approach goals are stimulated among their leaders. Further, strong leader identification with a target overrides the negative effects of performance-approach goals.
Extending earlier research that highlighted the mixed effects of leaders’ performance-approach goals on voice utilization, this study advances our understanding by investigating when and why performance-approach goal leaders do utilize employee voice.
Purpose

Employee silence, defined as the conscious withholding of potentially important information, suggestions or concerns from those who might be able to act, can have detrimental effects at work. In this article, we apply a person-situation approach and propose that employees’ proactive personality determines whether they choose to remain silent or not. However, we argue that this dispositional tendency might be mitigated by their supervisors through exchange-facilitating factors (i.e., LMX and leader task interdependence).

Design/Methodology

Our hypotheses were tested in a two-wave survey design among 96 employees. Employees’ proactively personality, LMX and task interdependence were assessed at T1, and employee silence was assessed two months later (T2).

Results

Results of multi-level analyses using mixed models confirmed that more proactive employees were less likely to remain silent. However, this effect disappeared when leader task interdependence was high or when LMX was low –suggesting that supervisors have a pivotal role in reducing and/or triggering employee silence.

Limitations

Our two-wave study design does not allow for causal conclusions about the relationship between employees’ proactive personality and employee silence.

Research/Practical Implications

Our results suggest that employees with a proactive personality are less silent. Also, leaders’ exchange-facilitating factors (LMX or task interdependence) can create conditions under which employees’ inclination to remain silent can be broken.

Originality/Value

The role of person-situation interactions in employee silence has received scant research attention. This study extends previous research and contributes to a more comprehensive understanding by showing that interactions between proactive personality and exchange-facilitating factors explain employee silence.
480 - SHEDDING LIGHT ON THE RELATIONSHIP BETWEEN TEAM LEADER COACHING AND TEAM EFFECTIVENESS: THE CONDITIONAL EFFECT OF TASK NON-ROUTINENESS

Claudia Lenuta Rus (1) - Lucia Ratiu (1)

Babes-Bolyai University, Psychology, Cluj-Napoca, Romania (1)

Team coaching has emerged as a growing practice leading to positive outcomes on team dynamics and team performance. However, previous research showed inconsistent and contradictory results. Thus, this study investigated the serial mediating role of psychological safety and team learning behaviors in the relationship between team leader coaching behaviors and team effectiveness. Additionally, we explored the way the task non-routineness moderated the aforementioned mediated relationship.

Cross-sectional data were collected from 50 work teams including 298 members. Fifty team leaders provided data on team effectiveness and team learning behaviors, while 248 team members self-rated team leader coaching behaviors, team psychological safety, team learning behaviors, team effectiveness and task non-routineness. Data were analyzed at team level using serial mediation and conditional process analyses.

Results of the serial mediation analyses showed how team leader coaching behaviors have direct and indirect effects upon performance, viability and satisfaction as criteria for team effectiveness through psychological safety and team learning behaviors. Furthermore, results of the conditional process analyses partially supported the hypotheses that task non-routineness moderated the indirect serial relationship between team leader coaching behaviors and team effectiveness, such that the positive indirect relationships became stronger when task non-routineness was high than when task non-routineness was low.

Even the sample size was rather small, this study stresses the conditions and the mechanisms through which team coaching might facilitate team effectiveness.

Team learning behaviors and team effectiveness were considered separately by team leaders and team members and were investigated both as a global and multidimensional construct.
A FRAMEWORK TO GUIDE WORK AND ORGANIZATIONAL PSYCHOLOGY PRACTICE FOR DEVELOPING COMPREHENSIVE WORKPLACE HEALTH AND WELLBEING STRATEGIES

Kevin Daniels (1) - Sheena Johnson (2) - Sharon De Mascia (3) - Karen Royle (4) - Bridget Juniper (5) - Carly Telford (6) - Carole Watling (7)

University of East Anglia, Employment Systems and Institutions Group, Norwich Business School, Norwich, United Kingdom (1) - University of Manchester, Work and Equality Institute, Alliance Manchester Business School, Manchester, United Kingdom (2) - Cognoscenti Business Psychologists Ltd, Manchester, United Kingdom (3) - Ways to Work, Carlisle, United Kingdom (4) - Work and Wellbeing Ltd, London, United Kingdom (5) - Wrightington, Wigan and Leigh NHS Foundation Trust, Wigan, United Kingdom (6) - Independent consultant, Upminster, United Kingdom (7)

Purpose: Leading organisations on health and wellbeing practice (e.g. Airbus, British Telecom, Santander) appear to implement comprehensive and multicomponent programmes, rather than relying on a single or narrow range of interventions. In this presentation, we will outline an evidence-informed framework to guide work and organisational psychologists engaged in developing, implementing and evaluating integrative, multicomponent workplace health and wellbeing strategies.

Approach: Our approach has three elements. First, examining systematic reviews of workplace interventions that hold promise for improving health and wellbeing. Second, examining case studies and other evidence on how organisations develop comprehensive health and wellbeing strategies. Third, drawing on practitioner expertise and experience to generate guidance and case studies on designing, implementing and evaluating both specific components of a strategy and the strategy itself.

Results: We found evidence that comprehensive strategies need to integrate elements across five key areas: job design and supporting human resource management practices; workplace social relationships; management development; workers who may struggle without specific organisational support (e.g. those with health conditions); and workplace health promotion.

Limitations: Further development and refinement of the framework could focus on developing an array of supporting tools (e.g. diagnostics, evaluation methodologies, cost effectiveness calculators).

Research/Practical Implications: The framework provides guidance and case studies to assist in developing and implementing comprehensive and internally consistent health and wellbeing strategies.

Originality/Value: As far as we are aware, this is the only framework developed that provides guidance on integrative health and wellbeing strategies that is specifically for work and organizational psychologists.
Building upon liminality and related theories, this empirical study attempts to provide a deeper understanding of how disabled individuals experience the liminal experience of transitioning from college to the working life. It looks at how disabled individuals deal with the “limbo risk” during such transition.

Transitioning from school to work life is a challenge that every student has to face to begin his early career life. This moment is critical for every scholar and is even more crucial for disabled individuals. Indeed, because of their stigmatized condition, disabled individuals face a “limbo” risk, which consists in being “no more a student but never a professional”.

Based on qualitative semi-structured interviews with 22 graduated disabled students in transition, the findings highlight that graduated students use strategies to counterfeit the stigmatized aspect of their identity, which consists in protecting or restructuring their identity. Individuals with invisible disabilities additionally play with their disability identity. Finally, the presence or absence of social guidance facilitates or hinders the success of such transition.

This study follows a call for future researches asking academic to have a specific look at disabled people career transition. We answer this call, by looking at the very first step of the career transition, the one allowing starting a career. This research also adds on liminality literature, which recently started to introduce the “limbo” concept. By looking at graduated student, one of the limit of this research is to overlook the liminal experience of non-qualified disabled individuals.

Keywords: disability, liminality, stigma, workplace.
Most studies about online communication (o.c) within working groups have focused on o.c. frequency providing mixed results regarding the effects on group identity. In line with literature recommendation, o.c. quality assessment should be investigated (Marlow et al., 2017). For the first time, this study investigated how perceived quality of online discussion within working groups interacts with collective efficacy and procedural justice in influencing group identity. In three studies (Study 1, N = 151; Study 2, N = 275; Study 3 N = 150) using online questionnaires we analyzed: firstly, the content dimension of online discussion (e.g. how sound the shared argumentations are perceived by the discussants); secondly, its relational dimension (e.g. how civilized the discussion is perceived to be); finally, its perceived cognitive load (e.g. how cognitively demanding the discussion is perceived to be). Moderation analyses highlighted that the effect of collective efficacy on group identity is stronger when participants perceived the content of online discussion as higher in terms of quality and vice versa when they perceived the discussion as cognitively demanding. The effect of procedural justice on group identity is stronger when participants perceived the discussion as not inclusive, nor respectful. This study is explorative and surely a validated scale that assesses perceived quality of online discussion is needed. However, our evidences are relevant especially in contemporary workplace as organizations are becoming more and more oriented to smart environments and smart working, thus increasingly interconnected through online communication.
Purpose. While the experience of job insecurity may impede performance for some workers, it may prompt performance for others. Drawing upon recent theorizing on job preservation motivation, we hypothesize that higher performance in response to job insecurity is a form of active coping, which should only occur among employees who believe that they can control the threat of job loss: those who are not intrinsically motivated to perform to the best of their abilities and those who perceive high distributive justice within their organization.

Design. In a survey study among 103 permanent employees of a company in reorganization, we assessed perceived job insecurity, intrinsic motivation, and perceived distributive justice. Supervisors rated employees’ overall performance (task performance and OCB).

Results. Multilevel analyses showed that job insecurity was only positively related to performance among employees with low intrinsic motivation and, unexpectedly, among employees who experienced low distributive justice.

Limitations. Despite the use of supervisor-rated performance evaluations, the cross-sectional design warrants precaution about drawing causal inferences from the data.

Implications. The results deepen our understanding of when job insecurity may prompt ‘compensatory’ job preservation efforts and call for research to uncover the context-dependent mechanisms underlying employees’ negative and positive responses to job insecurity. Additionally, the results may inform organizations in retaining valuable employees.

Originality/value. By combining threat foci from the job insecurity literature with the compensatory approach from the job search literature, this study solves an important part of the puzzle regarding the inconsistent findings on the job insecurity-performance relationship.
Purpose
This study investigates how bisexual employees manage their identities through co-worker interactions. LGBT+ sexual minorities are under-studied in the workplace (Ragins, 2004), particularly bisexuality (Callis, 2013), despite accounting for thousands of employees in any given country, where many face discrimination and threats to their well-being. The current study therefore explores how bisexual identities are socially constructed in the workplace.

Design/Methodology
In collecting and analysing data, we adopted a qualitative approach, based on semi-structured in-depth interviews with a total of 28 bisexual employees from a wide range of organisations and industry backgrounds.

Results
Qualitative data was analysed with N*Vivo and interpretative phenomenological analysis (IPA), which focused on bisexual employees’ cognition, affect, and behaviour in social interactions. Identity disclosure and experiences of discrimination and stereotyping varied according to types of co-worker interactions – based around resistance, ambivalence, avoidance, humour and learning.

Research/Practical Implications
The research has implications concerning diversity, inclusion, and the well-being of sexual minorities in the workplace. Contributions are made to psycho-social and critical theories of workplace identities – including intersectionality, identity work, and queer theory. Practically, there are implications for bisexual employees and co-workers in shaping workplace cultures inclusive of LGBT+ identities.

Limitations
The research findings presented are from a relatively small, in-depth qualitative sample. Longitudinal designs, case studies and further theory-building and testing are recommended.

Originality/Value
This research has originality/value in highlighting the complexity and distinctiveness of bisexual employees’ identity management experiences in the workplace.
Purpose

Competence beliefs predict many work-related outcomes. However, there is little knowledge about the development of individual beliefs in the occupational domain. Therefore, this study investigates the formation and interplay of competence beliefs for applied tasks and related work demands.

Design/Methodology/Approach/Intervention

We conducted a longitudinal study (8 measurement waves, 6-month intervals) to examine initial levels, growth curves, and cross-lagged relations between competence beliefs and demands for applied tasks. The sample consisted of PhD students and PhD holders from the STEM fields (NT1 = 3,085, 37% women). At study start, 79.7% worked in a scientific setting, 16.1% in industry, and 4.2% in mixed or other fields.

Results

Competence beliefs and demands for applied work were relatively stable. Nevertheless, they predicted each other over time. Demands for applied work increased for young scientists, particularly for those who newly entered into an industrial employment setting during the study period.

Limitations

The sample was restricted to scientists from the STEM-fields. Variance between the constructs might be inflated because of common raters and common item characteristics.

Research/Practical Implications

Universities might consider giving junior researchers more opportunities to face applied tasks (e.g., training assessment center). Furthermore, organizations should implement feedback structures that support employees in building beliefs about own capabilities.

Originality/Value

We implemented a longitudinal design with a large sample size, and expanded the knowledge about growth patterns and reciprocal relations of beliefs and competencies in the work domain.
501 - GENDER DIFFERENCES IN SOME CAUSES OF EXHAUSTION IN MINISTERS, PSYCHOLOGISTS AND TEACHERS IN SWEDEN

Carl Martin Allwood (1) - Martin Geisler (2) - Sandra Buratti (2)

University of Gothenburg, Psychology, Göteborg, Sweden (1) - University of Gothenburg, psychology, Göteborg, Sweden (2)

Purpose: We investigated gender differences in the relationships between personal and work characteristics to exhaustion among three human-service occupations in Sweden.

Design: Self-report questionnaires were sent to ministers (n = 870, 33% response-rate), psychologists (n = 805, 29% response-rate), and teachers (n = 963, 12% response-rate).

Results: Overall, females showed a higher level of exhaustion than men and work characteristics (e.g., workload and role clarity) had a stronger relation to exhaustion among women, whereas emotional demands and family-to-work conflict was more strongly related to exhaustion among men. However, occupational differences with respect to gender were found. Social orientation was related to lower levels of exhaustion - among female teachers and psychologists, and male ministers. Furthermore, workload was most strongly related to exhaustion among female ministers and male psychologists, whereas role conflict and role clarity were only important for female ministers and teachers. Affective rumination and family-to-work conflict were found to have a stronger effect on exhaustion among male ministers and male teachers, as well as among female psychologists.

Implications: Our results show the importance of addressing gender differences in their specific job context in order to understand how personal and work characteristics influence exhaustion.

Limitations and originality: Although the samples are large, the data presented are cross-sectional and not completely representational. Gender equality in Sweden is high compared with other countries. However, little research exists on factors influencing gender differences in the present context.
503 - DID YOU THINK OF YOUR LEISURE TIME TODAY? AN HOURLY STUDY OF THE RELATIONSHIP BETWEEN THOUGHTS OF LEISURE TIME (TOLT) AND WORK ENGAGEMENT

Sebastian Seibel (1) - Judith Volmer (1) - Christine Syrek (2)
Otto-Friedrich University of Bamberg, Psychology, Bamberg, Germany (1) - Bonn-Rhein-Sieg University of applied science, Management Sciences, Rheinbach, Germany (2)

Purpose
During a working day, employees do not only think of their work, but they occasionally think of their upcoming leisure time. We introduce the concept “Thoughts of Leisure Time” (ToLT) which describes employees’ thoughts of their upcoming leisure time while at work. We assume that employees report more ToLT both at the beginning and at the end of the working day (U-shaped time trend), as leisure time is more proximate to work. Furthermore, as ToLT drives attention away from work, we expect a negative relationship between ToLT and work engagement within one hour. Contrary, we assume that ToLT will increase work engagement in the next hour, as ToLT might serve as a reminder of an anticipated resource gain.

Design
We conducted an online survey over one working day (N = 117 employees) with hourly measurement points between 6:00 a.m. and 6:00 p.m. ToLT and work engagement were assessed every hour (442 hourly measurements).

Results
Findings from multilevel modeling revealed the expected U-shaped time trend for ToLT. Within one hour, ToLT was significantly negatively related with work engagement. Contrary to our expectations, ToLT did not have a significant positive effect on work engagement in the next hour.

Limitations
We did not consider possible effects of different working days.

Research/Practical Implications
Our research demonstrates that employees think more frequently of their leisure time at the beginning and at the end of their working day.

Originality/Value
We introduce ToLT as a new concept and expand the research on work engagement and off-task thoughts.
507 - A CROSS-CULTURAL EXAMINATION OF INDIVIDUAL- AND COLLECTIVE-FOCUSED LEADERSHIP – DOES THE LEADER’S COMMUNICATOR STYLE MATTER?

Ute Poethke (1) - Jens Rowold (2)

TU Dormund University, Human Resource Development and Change Management, Dortmund, Germany (1) - TU Dormund, Dortmund, Germany (2)

Purpose

Recent criticism of the operationalization of transformational leadership as well as improvements in leadership research indicate that collective-focused and individual-focused facets of leadership affect leadership outcomes differently. However, underlying mechanisms to explain these differences as well as the robustness of findings across cultures remain unclear. To understand how collective- and individual-focused leadership foster job satisfaction differently, this study utilizes a moderated mediation model to focus on the supervisor’s communicator style as mediator in individualistic and collectivistic cultures. We argue that collective- and individual-focused transformational as well as instrumental leadership behaviors work differently across individualistic versus collectivistic cultures because leaders use different communicator styles.

Methodology

In total, 5,284 employees in Brazil, Cameroon, China, France, Georgia, Germany, India, Iran, Poland, Russia, Spain, Switzerland, Turkey, and the United Arab Emirates were surveyed using validated questionnaires at two measurement times.

Results

Multi-group structural equation modeling analyses revealed first evidence that collective-focused and individual-focused facets of leadership differently affect job satisfaction mediated via the supervisor’s communicator style in individualistic and collectivistic cultures.

Limitations

All data was collected from the same source.

Implications

Our results show that transformational and instrumental leaderships’ effectiveness in different cultural settings depends not only on what the leader is saying, but also on how he or she is saying it.

Originality

The study is the first to provide insights into the mediating role of the leader’s communicator style in leadership processes in a cross-cultural setting. It contributes to the leadership literature particularly by examining the less regarded instrumental leadership style.
COLLABORATIVE AND PARTNERSHIP RESEARCH FOR IMPROVEMENT OF HEALTH AND SOCIAL SERVICES: RESEARCHER’S EXPERIENCES FROM 20 PROJECTS

Monica Nyström (1) - Johan Karlton (2) - Christina Keller (3) - Boel Andersson Gäre (4)

Karolinska institutet, Dep. of Learning, Informatics, Management and Ethics, Stockholm, Sweden (1) - Jönköping University, Dep. of industrial engineering and management, Jönköping, Sweden (2) - Jönköping University, Jönköping International Business School, Jönköping, Sweden (3) - Jönköping University, Jönköping Academy for Improvement of Health and Welfare, Jönköping, Sweden (4)

Purpose

Gain knowledge on the interdisciplinary, collaborative research process by investigating researchers’ experiences and approaches used when participating in a national research program aimed to boost collaborative research while improving ways to lead, manage and develop health and social service practices in Sweden.

Methodology

Interviews conducted with project leaders and/or lead researchers and documentation from 20 projects were analysed using directed and conventional content analysis.

Limitations

Results

Collaboration were achieved by design, e.g. action research, or by involving practitioners in various parts of the research process. Dual roles, e.g. researcher/clinician, designed education or “student researchers” were other ways. The collaborative process provided the main learnings and problems. Difficulties concerned handling complexity and conflicts between expectations and demands in the practitioner’s and in the researcher’s contexts, human resource issues and interactions when forming collaborative, interdisciplinary teams. To handle such challenges required time, resources, knowledge, interactive learning, and skilled project management.

Research/Practical implications

Time, arenas for interaction and project management and communication skills are needed in research collaborations to build support, trust and understanding. For researchers, dealing with this complexity takes energy from the scientific process. For practitioners, this requires understanding a research process and its fit with the organisational agenda and allocating time. Some factors that may be overlooked by funders and stakeholders.

Orginality

Getting research into policy and practice in healthcare is a recognized, world-wide concern and to bridge the gap research funders are requesting more interdisciplinary and collaborative research, while experiences of such processes have been less studied.
Purpose

Inter-organizational collaboration through joint teams with members from multiple organizations has become pervasive. However, mixed and inconclusive findings regarding how diversity faultlines (i.e., the alignment of diversity attributes) within such inter-organizational teams affect their performance accentuate the need for research on the specific contingencies within this relationship. We theorize that the location of such diversity faultlines within versus outside of the core team drives their ambivalent performance effects in such teams.

Design/Methodology/Approach/Intervention

We test our hypotheses with archival sports data of 7,514 individuals from 336 national soccer teams at fourteen FIFA World Cups.

Results

Our results show that faultline strength turned out to be beneficial for team performance when the faultline separated the core team members from the peripheral ones, whereas faultline strength impeded team performance when the faultline existed within the core team.

Limitations

As with any archival sports data, the objectivity of data comes at the expense of not being able to test psychosocial mechanisms underlying the effects of interest.

Research/Practical Implications

Although the forming of subgroups along faultlines is pervasive in the inter-organizational context, we provide a more optimistic view by arguing that, under certain conditions, faultline-induced subgroups may even yield positive effects within inter-organizational collaboration.

Originality/Value

By making use of objective data and abandoning the assumption that team members equally contribute to their teams’ performance, our approach to the study of diversity faultlines considers the organizational reality of the variability of team members’ contributions to, and centrality within, their team and the consequences thereof.
Purpose

While ethical leadership has many beneficial outcomes, less is known about subordinates’ reactions towards transgressions shown by their ethical leader. It also remains unclear how situational circumstances, as for example uncertainty, influence the effect of ethical leadership on subordinates’ behaviour. We hypothesized that subordinates are more sensitive towards transgressive behaviours of ethical leaders than of not ethical leaders. But in uncertain situations, subordinates should be less sensitive towards transgressions by ethical leaders than by not ethical leaders.

Design/Methodology

In study 1, the hypothesis was tested in an experimental setup. Participants’ uncertainty salience (control vs uncertainty) was manipulated before they read a scenario about a leader (ethical leader vs. no ethical leader) showing certain behaviour (appropriate vs. inappropriate) towards an employee. Participants then rated how much deviant workplace behaviour they would show if they were the employee. In Study 2 the appropriateness of current behaviour and the degree of ethical leadership style of their respective leader was assessed in a survey. Uncertainty was measured through perceived current commercial prospect of their company. Affective commitment served as dependent variable.

Results

Both studies showed the proposed three-way interaction supporting the hypothesis.

Limitations

Future research should replicate the current findings in other situational settings and identify mediators.

Research/Practical Implications

Results imply that outcomes of ethical leadership depend on the current situation, e.g. companies’ current commercial situation.

Originality/Value

This study is the first to demonstrate how transgressions by ethical leaders trigger different reactions in subordinates based on the current situation of their organization.
AN EXPLORATION OF HOW NEOLIBERALISM IN A UK UNIVERSITY INHIBITS THE VOICE OF THE ACADEMIC

Bernadette Ryan (1)
University of Greenwich, HROB, London, United Kingdom (1)

Purpose
This study aims to explore how the introduction of neoliberalism and new public management techniques (NPM) in the University sector relate to a culture of silence amongst academics and the implications for the academic emotionally and on professional practice.

Design/Methodology/Approach/Intervention
The study is based on 10 one hour semi structured interviews with middle ranking academics with a minimum of five years’ experience of teaching.

Results
There is evidence to support the view that a number of academic staff have withdrawn from engagement with the University management hierarchy in the belief that their views are not welcomed.

There is fear that to challenge the dominant discourse of marketization may result in becoming more marginalised at work.

The emotional impact on the academic is increased levels of stress, depression, loss of purpose and a crisis of academic identity.

The audit culture that accompanies NPM uses surveillance to manage the academic population and this inhibits voice.

Limitations
This is a small scale case study in a single university and, as with any explorative study, it is limited with regard to generalizability.

Research/Practical Implications
This research will have substantive implications for improving employee relations in UK universities and empowering the marginalised academic.

Originality/Value
The study adopts a Foucauldian perspective that provides new insights into how the neoliberalist agenda impacts on academic voice and subsequently professional practice and emotional well-being.
Purpose

Workplace team resilience may serve as a potential asset for work teams to maintain performance in the face of adverse events. To address the conceptual and methodological inconsistencies of previous research, this paper provided an integrate review to identify the conceptual nature of team resilience and its unique value beyond individual resilience. In addition, methodological approaches to team resilience were reviewed to provide recommendations for a common operationalisation of team resilience.

Design

A systematic review of published research on individual or team-level workplace resilience was performed. For the conceptual review, thematic analysis techniques were applied to synthesise definitions and conceptualisations of workplace resilience. For the methodological review, the psychometric properties of existing team resilience measures were evaluated using current guidelines for best practice.

Results

A final set of 127 articles was reviewed. Based on the conceptual synthesis, a comprehensive multi-level framework was developed that draws on the IMOI model (Ilgen et al., 2005) to categorise multi-level input factors, processes as well as outcomes associated with workplace resilience. The evidence from the methodological review suggest several methodological shortcomings of previous team resilience measures.

Limitations

Strict inclusion criteria were applied that may have led to the exclusion of other relevant research on workplace resilience.

Practical Implications

The results offer a starting point for new empirical research examining ways of improving teams’ adversity management in the workplace.

Value

This paper adds value by conceptually clarifying the multi-level nature of workplace team resilience and by assessing the quality of team resilience measures in a systematic manner.
527 - WORKPLACE BULLYING IN HIGHER EDUCATION IN PORTUGAL

Ana Verdasca (1) - Ana Verdasca (2) - Ana Verdasca
University of Lisbon, SOCIUS, Lisboa, Portugal (1) - SOCIUS / University of Lisbon, SOCIUS, Lisboa, Portugal (2)

Purpose
According to the V European Working Survey (Parent-Thirion et al, 2012), the risk of experiencing bullying and harassment at work is greatest in education and health sectors. Other studies, namely Hubert & Veldhoven (2001) and (Zapf, Einarsen, Hoel & Vartia, 2011), report similar data on the incidence of bullying in these sectors. In Portugal there is scarce evidence about workplace bullying in this sector. Besides some empirical data collected in the University of Coimbra Hospital (Serra et al, 2005), there is no empirical data on this subject. Hence, we intend to fill this gap and map the occurrence of the phenomenon in the higher education in Portugal.

In order to further the research about workplace bullying in higher education we have realized a study in the main private and public Universities of Portugal. We contact all the academic and researchers and collected 1182 valid responses (response rate is 20%, roughly). The sample is 61% female and 37% male. The majority of respondents are assistant professors (29%) and 19,42% are assistants; 37,4% did not specified their position.

Design / Methods
The occurrence of workplace bullying was measured both trough a definition and a list of behaviours because we want not only to identify the subjective perception of being bullied according to the definition (i.e. self-labeling method) but simultaneously tap the occurrence of bullying behaviors by means of a list of predefined negative acts (i.e. behavioral experience method)(see Einarsen et al., 2011; Nielsen et al., 2010).

Results
According to the definition, 5,9% of respondents have been frequently bullied and 24,1% occasionally bullied. The most frequent bullying behaviours are: “You are exposed to an unmanageable workload”, “You are humiliate and ridiculed in connection with your work” and “You are systematically required to carry out tasks which clearly fall outside your job description”. The majority of respondents (72,7%) consider bullying a relevant organizational problem. For those who consider themselves bullied at work, the experience has lasted between 1 and 3 years (26,9% of bullied people); the majority was bullied alone by a superior (64%). The gender of the bully was reported both as male and female (33,2% versus 34,7%). As reported by bullied respondents, the experience has damaged their health, namely mental health (47,1%) and their familiar and social life (38,6% versus 32,9%).These results are in line with previous research in higher education, namely the results reported by Lewis (2002) in a study conducted in further and higher education in Wales.

Originality / Value
Research about Workplace bullying is scarce in Portugal; hence the study has a real contribution to the existing research, in a sector where there is no previous research in this field.
EXAMINING RECOVERY EXPERIENCES AMONG WORKING COLLEGE STUDENTS: A LATENT PROFILE INVESTIGATION

Charles Calderwood (1) - Allison S. Gabriel (2) - Jason J. Dahling (3) - Andrew A. Bennett (4) - John P. Trougakos (5) - Elena M. Wong (2)

Virginia Tech, Psychology, Blacksburg, United States (1) - University of Arizona, Management and Organizations, Tucson, United States (2) - The College of New Jersey, Psychology, Ewing, United States (3) - Old Dominion University, Management, Norfolk, United States (4) - University of Toronto - Scaraborough, Management, Toronto, Canada (5)

Purpose. There is limited research on the post-work recovery experiences of working college students. The overarching goals of this project were to examine profiles (i.e., combinations) of recovery experiences and potential well-being correlates (e.g., emotional exhaustion, engagement, somatic complaints) in working college students.

Methodology. Working college students (N = 520) completed an online cross-sectional survey.

Results. Three post-work recovery profiles were detected using latent profile analysis: (1) recovering ponderers (low psychological detachment, high on all other recovery experiences), (2) leaving work behind (high psychological detachment with low problem-solving pondering), and (3) detach, low relaxation (high psychological detachment with low relaxation). Recovering ponderers reported higher work engagement than the other profiles, but no other relationships of recovery profile membership with work-related well-being emerged.

Limitations. Our emphasis on work-related well-being led us to de-emphasize school-related well-being (e.g., school engagement, work – school conflict). We are currently finishing a conceptual replication of this study focused on school-related well-being.

Research / Practical Implications. Despite replicating recovery profiles observed in full-time workers in working college students, outcomes associated with recovery profile membership diverged from findings in full-time worker populations. While there are communalities in the recovery profiles of full-time employees and working college students, outcomes of profile membership may differ dramatically.

Originality / Value. This is the first direct empirical research targeted at quantifying the recovery experiences of working college students. Our results undermine the direct translation of recovery research conducted with full-time workers to the working student context, suggesting new directions for future recovery research.
Purpose. Many employees work during off-job time (e.g., nights, weekends), but little is known about employee perceptions of this after-hours work. We applied the construct of situational strength (felt pressure to enact specific behaviors; Meyer et al., 2014) to the after-hours work context to predict strain criteria.

Methodology. Employees (N = 496) completed a new measure of after-hours situational strength and measures of job stress, emotional exhaustion, and work anxiety.

Results. After-hours situational strength was defined by perceptions of clarity (available information about after-hours work), consistency (compatible cues from others about after-hours work), constraints (forces that limit responses to after-hours work demands), and consequences (outcomes stemming from after-hours work decisions). Consistency predicted diminished strain criteria (z = -2.43 - -2.52, all ps < .01), while consequences predicted elevated strain criteria (z = 1.67 – 5.21, all ps < .05).

Limitations. Our survey design did not allow the prediction of actual behavioral compliance. We are conducting an experimental follow-up that includes both subjective and behavioral criteria.

Research / Practical Implications. In addition to extending situational strength perceptions to the after-hours work context, our results suggest that some aspects of after-hours situational strength (e.g., consistency perceptions) are associated with greater well-being, perhaps due to the removal of ambiguity surrounding after-hours work expectations.

Originality / Value. This study yields a theoretically-grounded measurement tool that will allow future researchers to explore predictors and outcomes of after-hours situational strength. Results indicate that alternative components of after-hours situational strength may have diverging implications for job strain criteria.
Purpose. Citizen participation in public social housing is known to have great benefits, both for residents (e.g. empowerment) and organizations managing housing units (e.g. efficient managerial decisions). This qualitative study is intended to document the processes linking organizational culture (Schein, 1985) to citizen participation development of social housing residents.

Methodology/Approach. This case study was conducted in an Office d’habitation (OH) in Quebec, Canada. Semi-structured (N = 21) and group interviews (N = 8) were conducted with managers, employees, residents and partners. Observations in different settings (N = 39) and documents complete the data set, which was analyzed using Grounded Theory (Glaser & Strauss, 1967).

Results. One of the main characteristics of the OH culture studied is the strong commitment of employees toward their social mission. This has implications for citizen participation through two processes: the vocational valorization process and the goodwill acting process.

Limitations. The dependability of the results (Lincoln & Guba, 1985) is limited because of the complex and dynamic nature of the phenomena studied. Further studies are required to determine the transferability of the results to other contexts.

Research/Practical Implications. A culture characterized by goodwill can be either beneficial or harmful to citizen participation, depending on the conditions in place. The examination of those conditions leads to the identification of potential levers.

Originality/Value. This study contributes to the WO psychology field in terms of research methodology (i.e. including citizens’ perspective) and could lead to the definition of a specific type of recognition at work.
PURPOSE: While people constantly talk about the importance of stepping outside of one’s comfort zone, there has been a lack of research in the construct as an individual difference. The current study develops a measure for a willingness to expand one’s comfort zone, examines its relationships with the Big Five, and investigates its associations with student, work, and life outcomes.

METHODOLOGY: Two survey studies were conducted via Amazon Mechanical Turk.

RESULTS: Factor analyses revealed that the 17-item Comfort Zone Scale yields two factors: 1) Comfort Zone–General measures the broad tendency of taking risks and being comfortable with challenges, and 2) Comfort Zone–Contextual measures a willingness to try specific activities and be in certain unnerving circumstances. Results demonstrate that high comfort zone is associated with high Intellect, Openness, and Assertiveness, and low Politeness and Orderliness. Individuals who were more willing to step outside of their comfort zone reported higher quality of life, higher job performance, and higher frequency of engaging in important student behaviors like taking challenging courses.

IMPLICATIONS: The overlap with personality aspects suggests that comfort zone may be a compound trait with contextual features. The associations with important outcomes empirically support its predictive validity.

LIMITATIONS: It would be valuable for future research to examine the extent to which the level of comfort zone remains stable and predictive across different circumstances.

VALUE: Current study is the first to explore the construct of a willingness to expand one’s comfort zone. Findings testify to its importance for students and employees.
A COMPARISON OF PERSONALITY FACTOR STRUCTURES IN CHINA: APPLICANTS VS. NON-APPLICANTS

Charlene Zhang (1) - Ronald Page (2) - Jinyan Fan (3)

University of Minnesota, Industrial and Organizational Psychology Program, Minneapolis, United States (1) - Assessment Associates International, Minnetonka, United States (2) - Auburn University, Department of Psychology, Auburn, United States (3)

PURPOSE: Past findings with regards to whether the five-factor personality model fits across selection contexts have been inconsistent. The current study examines how well the five-factor structure describes large Chinese samples of applicants and non-applicants using the Work Behavior Inventory (WBI), a contextualized personality instrument.

METHODOLOGY: Data was collected from 10,588 Chinese applicants and 8,284 Chinese non-applicants, spanning more than 150 organizations across different industries and job levels.

RESULTS: When comparing mean differences, Cohen’s d’s in personality facet scores between applicants and non-applicants ranged from .13 to .92. When examining factor structures of both groups with confirmatory factor analysis (CFA), the oblique, five-factor baseline model produced acceptable fit for both applicants ($\chi^2(179) = 16,891.842$, RMSEA = .094, CFI = .905, TLI = .889) and non-applicants ($\chi^2(179) = 14,189.788$, RMSEA = .100, CFI = .875, TLI = .853). Compared to the fit indices of other well-known personality inventories such as the Revised NEO Personality Inventory, those of the WBI with Chinese samples were comparable, if not superior.

IMPLICATIONS: Findings demonstrate that although the high-stakes context drives up self-reported personality scores, the personality factor structures of Chinese applicants and non-applicants both conform to the five-factor model.

LIMITATIONS: Large mean differences suggest that a potential shortcoming of the WBI may be its susceptibility to faking and therefore raw scores should be interpreted with caution.

VALUE: The stability of WBI’s factor structure across assessment settings among Chinese individuals supports its utility as a selection and evaluation tool as well as its cross-cultural generalizability.
Purpose

This study examines the effectiveness of internet-based cognitive interventions on employees’ well-being such as workplace stress, job satisfaction, and workplace social connectedness.

Methodology

One hundred and twenty full-time working Malaysians were randomly assigned to one of three online cognitive interventions (Gratitude – write a thank you to a co-worker, Three-Good-Things – write down three good things that happened at work, or Social Connectedness – engages in additional social activities at work). Participants completed workplace stress, job satisfaction, and workplace social connectedness questionnaires at three time points: pre-intervention, and two times post-intervention. Each testing was 1-week apart.

Results

Using Mixed ANOVAs, the study found that all three interventions were effective in reducing workplace stress as well as increasing job satisfaction and workplace social connectedness over time. Specifically, Gratitude intervention was found to be the most effective intervention for reducing workplace stress and increasing job satisfaction. While the Social Connectedness intervention improved relationship with co-workers after the intervention, the effectiveness did not differ significantly from other interventions at Time 3.

Limitations

A control group was not included in the design. However, random assignment was successful as there were no baseline differences among groups.

Implications

These interventions, guided by approaches from Positive Psychology show preliminary evidence of the effectiveness of short-term online interventions. Potentially, organizations could implement online cognitive interventions to effectively improve their employees’ well-being.

Value

Interventions guided by theoretical underpinnings can be effective to address employee well-being. These interventions show potential for implementation online or through mobile phone applications.
554 - LEADERSHIP STYLES, WORK-FAMILY ENRICHMENT AND WORK-LIFE BALANCE: A MEDIATION STUDY AND DOMINANCE ANALYSIS

Jarrad Haar (1) - Anja Schmitz (2)

Auckland University of Technology, Management, Auckland, New Zealand (1) - University of Applied Sciences Pforzheim, Human Resources, Pforzheim, Germany (2)

Purpose: Multiple leadership styles (ethical, servant, authentic, transformational and leader-member exchange [LMX]) were tested towards work-life balance (WLB), with work-family enrichment (WFE) as a mediator. We add insight through multiple styles and utilise a dominance analysis to determine the more important leader style/s.

Design/Methodology /Approach/Intervention: Self-reported survey of 249 New Zealand employees rating their manager’s leadership styles and their own WFE and WLB. Analysis in SPSS with dominance analysis in excel.

Results: All constructs significantly correlated, with some strong levels between leadership styles. However, regression analysis showed that LMX was the dominant predictor of WFE and WLB. The mediation analysis showed that WFE fully mediated the influence of LMX on WLB. The models accounted for a modest 17% variance for WFE and a stronger 36% for WLB. Given the regression analysis found the LMX dimension to be the only significant leadership style, and this finding was reiterated by dominance analysis.

Limitations: Self-reported data, although analysis showed common method variance was not present.

Research/Practical Implications: Understanding the influence of leadership styles on WFE and WLB highlights the importance of leadership in shaping and aiding follower work-family and life roles. The importance of LMX might highlight the vital nature of the intertwined nature of relationships between supervisor and subordinate as well as the importance of negotiated role responsibilities.

Originality/Value: WLB studies typically underplay the influence of leadership, and this study highlights the importance of one leadership style over others.
Miriam Dishon-Berkovits (1)
Ono Academic College, Faculty of Business Administration, Kiryat Ono, Israel (1)

Purpose:
This study proposes and empirically investigates, using Structural equation modeling (SEM), a unique dual path coping mechanism of how employees respond to lack of organizational justice.

Design/Methodology/Approach/Intervention
Questionnaire data were collected from 90 IT professionals, assessing (Cronbach alpha values are in parentheses) emotional exhaustion (0.71), cynicism (0.84), personal-accomplishment (0.75), organizational justice (0.75) and stress (0.87).

Results
SEM indicated very good fit for the model: \( \chi^2 = 9.93 \text{ df} = 9; \chi^2/ \text{ df} =1.10 = .593, \text{ NFI} = .94, \text{ RFI} = .80, \text{ IFI} = .99, \text{ TLI} = .98, \text{ CFI} = .99, \text{ RMSEA} = .024, \text{ PCLOSE} = .66. \) Low levels of perceived justice were associated with higher emotional exhaustion (\( \beta = -.43 \)). Next, a parallel mechanism unfolds: High levels of exhaustion are directly related to low levels of personal-accomplishment (\( \beta = -.65 \)). At the same time, high levels of exhaustion are associated with high levels of cynicism (\( \beta = .23 \)), which are associated with higher levels of self-accomplishment (\( \beta = .23 \)). Bootstrapping indicated that all mediation paths were significant.

Limitations
Future investigation should test the model within additional professional groups and with a larger sample size.

Research/Practical Implications
The study extends the literature on organizational justice and stress by incorporating a key, yet understudied, way of viewing cynicism. This view could also assist work-related counseling.

Originality/Value
This study shows how cynicism has a functional role, helping employees preserve their sense of professional-worth. Findings lend support to the idea--grounded in self-construct and emotion regulation theories--that cynicism is a way of emotionally regulating individuals’ adverse reactions to organizational injustice and stress, thereby allowing them to maintain a positive self-image.
Knowledge hiding – an intentional attempt to withhold or conceal knowledge from others (Connelly et al. 2012) – has been reported by recent studies to be a negative phenomenon in the workplace (e.g. Cerne et al. 2014). Considering the importance of knowledge for organizational performance, this study intends to advance understanding by investigating the mediating role of knowledge hiding on the relationship between perceived organizational support and affective commitment as predictors and organizational citizenship behaviors and turnover intentions as outcomes.

Using a cross-sectional design, the study was conducted in emergency ambulance healthcare settings on 305 medical or paramedical professionals. The variables of interest (perceived organizational support (POS), affective commitment (AC), knowledge hiding (KH), organizational citizenship behavior (OCB) and turnover intention (TI)) as well as demographic information were measured using self-reported questionnaires. Given that the variables are at the level of psychological perception, the self-reported measurement method is accepted to be appropriate.

In line with SEM results, POS and AC positively predicted OCB but negatively predicted TI. Also, KH was negatively associated with POS, AC and OCB and positively with TI. Moreover, KH mediated the relationship between POS and AC as predictors and OCB, respectively TI, as dependent variables.

Preventive actions could potentially impact negative acts and knowledge hiding by focusing on increasing the social exchange quality at work unit level.

We largely accept that knowledge hiding is not beneficial for the organizations at all levels, including individual and team levels, but we need to deepen understanding of its specific correlates within organizations.
Purpose: Employee perceptions of pay as fair have been suggested to be important for motivation and performance. This circumstance, together with an increase in pay-systems where annual pay raises in part are based on employees’ performance, has directed attention to the justice of pay. The aim of this systematic literature review was to describe research focusing on (1) what contributes to perceptions of pay justice and (2) the potential consequences of pay justice.

Methodology: Literature search in large databases were performed. Major search terms were “pay justice” and “pay-related justice”, supplemented with searches of concepts that emerged as important such as “performance evaluation” and “feedback”. Priority was given to studies published in the year 2000 and later.

Results: In terms of predictors, performance assessments, knowledge of pay-setting criteria, feedback, performance appraisal and the supervisor’s ability to fulfil the requirements as pay-setters, were important for employee perceptions of pay justice. Consequences of pay justice were less studied but a positive relation with pay satisfaction was reported.

Limitations: The literature search was done on pay justice specifically. This means that studies focusing on organizational justice were generally not included, even if such studies could include pay.

Research/Practical Implications: The results provide insights regarding how different aspects of the pay-setting process relate to pay justice and indicate that less is known about the consequences of pay justice.

Originality/Value: Although several reviews and meta-analyses concerning organizational justice in general exists, to our knowledge, this is the first review focusing on pay justice specifically.
569 - INDIVIDUAL WORK OUTCOMES FOLLOWING PRIDE EXPRESSIONS

Prisca Brosi (1)
Kühne Logistics University, Hamburg, Germany (1)

Purpose
Current research on discrete emotions either applies an intrapersonal perspective, i.e., emotion experiences relate to own work outcomes, or a social perspective, i.e., emotion expressions affect others’ work outcomes. Adding a new perspective, we examine how pride expressions influence own work outcomes by eliciting reactions from others.

Design
We applied two critical-incident studies, in which we combine different sources (Study 1) and randomly assign participants to report on pride events in which they expressed or did not express pride (Study 2).

Results
Study 1 showed the positive relations of pride expressions with work outcomes over and above the effect of pride experiences. Study 2 replicated these effects and additionally showed that colleagues’ active-constructive reactions in response to pride expressions fully mediated them.

Limitations
Questions about internal validity may remain due to our effects in Study 1 being stronger for self-reports than for coded expressions and the relation between colleagues’ active-constructive reactions and work outcomes being correlational in Study 2. Furthermore, with pride expressions being subject to influences by age, gender, and culture, future research needs to test the generalizability of our results.

Practical Implications
Aiming to create cohesive and energetic workplaces, this research demonstrates how pride expressions can help to build social bonds that foster work outcomes in organizations.

Originality
We show that emotion expressions not only influence others’ but also expressers’ work outcomes and highlight the social function of an emotion expression, i.e., pride, that is often assumed to be antisocial.
Purpose

Abusive supervision behaviors, such as lying to or ridiculing subordinates, harm individuals and organizations, however, the implicit assumption that abuse is unacceptable to anyone under any condition has not been challenged. Drawing upon attribution and moral exclusion theories, we propose that abuse is perceived to be more acceptable when attributed to the victim, and less acceptable when attributed to the perpetrator (H1). Furthermore, we propose that these attributions affect how third-party-observers react to abusive supervision, such as leaving the victims alone or filing formal complaints (H2).

Design

The first study is a vignette-based experimentation, where the participants will read a story of an abused worker, and then respond to the scales of attributions (to victim or manager) and acceptability of abuse (H1). In the second study, the participants will be asked to remember a specific incident where they observed abuse in workplace, and then fill-out the same scales for this situation (H2).

Results

The study is work-in-progress. A pilot study was conducted with 180 participants. The preliminary results support H1; abuse was found more acceptable when attributed to the victim, and less when attributed to perpetrator. Data collection for further steps will be completed by March 2019.

Limitations

There is risk of common method variance due to reliance on cross-sectional survey data.

Implications

Results of this study are expected to shed light on how observers judge abusive supervision situations.

Originality

The study represents the first comprehensive analysis of attributions, acceptability and reactions in this domain.
Purpose

Extant work-family research predominantly focused on role incompatibilities as theorizing is rooted in resource depletion mechanisms derived from the conservation of resources (COR) theory. However, researchers have neglected resource accumulation processes also proposed in COR, in part we believe, due to the lack of appropriate operationalization of resource accumulation (vs. resource depletion). In this research, we propose emotional resource accumulation as a distinct mechanism from emotional resource depletion in explaining work-family linkages, develop an emotional resource procession scale (ERPS) to capture the acquisition of emotional resources, and examine its psychometric properties.

Design/Methodology

Items of the ERPS scale were generated using a deductive approach and its nomological network was examined using data collected from MTurk. The roles of emotional resource accumulation in work-family linkages were examined through a two-wave survey study in the US and an experience sampling study in China.

Results

Emotional resource acquisition is indeed a distinctive mechanism from emotional resource depletion in linking work and family lives. The ERPS scale demonstrates both good psychometric properties and good utilities in studying work-family linkages.

Limitations

As all the four studies relied on self-reported data, common method bias is still a limitation of this research, which may have inflated some of the effects.

Research/Practical Implications

This research contributes to theory in its supporting the distinctiveness of the emotional resource acquisition mechanism from the emotional resource depletion mechanism.

Originality/Value

This research establishes a psychometrically sound scale of emotional resource procession, which could help researchers to better capture resource dynamics in work-family processes.
Purpose: We evaluate current attitudes towards and experiences with publishing research in Work and Organizational Psychology (WOP), and propose an alternative system. Our main hypothesis is that WOP researchers tend to become institutionalized, such that they are generally discontent with the current system, but that this dissatisfaction fades over time as they become older.

Design/Methodology: We distributed a survey to the first authors of papers published in the last two issues of top-15 WOP journals and asked them to participate. Questions focus on experiences with publishing (e.g., publishing time, quality of reviews), demographic information (e.g., age, hierarchical rank), and satisfaction with the publication process.

Results: Our preliminary findings support our expectations: We find that the time it takes to publish a manuscript is negatively associated with whether authors perceive this time to be justifiable and worthwhile relative to the amount their manuscript has changed, while age is only negatively associated with justifiability.

Limitations: It’s a cross-sectional, retrospective survey.

Research/Practical implications: The findings suggest that researchers are dissatisfied with the publication system of WOP research, which is in line with wider calls for changing the publication system in academia. Based on a recently proposed alternative publication system (Hartgerink & van Zelst, 2018), we provide specific recommendations to improve the WOP research publication system.

Originality/value: Among (WOP) academics, there is much talk about the flaws of the system, but little empirical research exists that showcases the dissatisfaction, and alternatives are also hard to find. We fill those two gaps.

Word count: 247 words

577 - SEXUAL ORIENTATION DIVERSITY AND INCLUSION IN THE WORKPLACE

Ashley Williams (1) - Neill Thompson (2) - Binna Kandola (3)

The University of Manchester, Alliance Manchester Business School, Manchester, United Kingdom (1) - Northumbria University, Psychology, Newcastle Upon Tyne, United Kingdom (2) - Pearn Kandola, Oxford, United Kingdom (3)

Purpose

Inclusion is recognised as a key component of successful approaches to organisational diversity management. To date, inclusion literature predominantly uses quantitative methodology to investigate visible forms of diversity such as ethnicity and gender. Invisible forms of diversity, such as sexual orientation, have received little research attention, despite Lesbian, Gay and Bisexual (LGB) employees facing significantly higher rates of workplace bullying and discrimination than heterosexual colleagues.

Design

The paper uses nine semi-structured interviews and template analysis to investigate LGB employees’ experiences of inclusion within their organisation.

Results

Findings demonstrate that LGBs share many experiences of exclusion with other minority groups, however they are not often regarded as exclusionary or the result of one’s sexual orientation. Such experiences are either overlooked due to membership of other minority groups which hold greater significance, or downplayed due to membership of other majority groups.

Limitations

Participants demonstrated a lack of variability in occupations, for example, most participants held a management or professional role. This may impact the variability of experiences of the participants, or it may suggest that those interviewed were not the most significantly affected by exclusive work environments, as they had already experienced promotion.

Implications

The unique experiences of LGB individuals support the use of intersectional research, considering the way in which minority statuses are interconnected, when investigating experiences of an individual.

Originality/Value

Exploring the experiences of LGB individuals using qualitative design allowed for identification of differences in experiences compared to other minority groups, which commonly used quantitative measures may not identify.
THE BUFFERING EFFECT OF FUTURE TIME PERSPECTIVE ON THE RELATIONSHIP BETWEEN WORKLOAD AND WELL-BEING: EVIDENCE FROM A 20-YEAR LONGITUDINAL STUDY

Yukun Liu (1) - M.K. Ward (1) - Sharon Parker (1)
Curtin University, Future of Work Institute, Perth, Australia (1)

Purpose
A considerable body of research on work design has demonstrated that exposure to high workload could have detrimental effects on employees’ well-being. Yet, the undesirable strain-inducing effects of high workload may not necessarily be observed among all employees. In this research, we propose that individuals’ future time perspective, a relatively stable tendency to adopt a future temporal mindset towards life, may buffer the relationship between workload and well-being, such that employees with a future time perspective may discount their high workload and thus shield themselves from being badly affected by the high workload.

Design/Methodology
Hypotheses were tested using data from a 20-year longitudinal study conducted in the United States. Multilevel modelling was employed as the analytical approach.

Results
Within individuals, workload indeed related negatively to employees’ well-being. This negative effect was observed among employees with lower levels of future time perspective, but not among those with higher levels of future time perspective.

Limitations
This research is mainly limited in its inability to draw strong conclusions regarding the direction of the relationships between future time perspective, work demands, and well-being. There was a lack of objective measures for well-being outcomes.

Research/Practical Implications
This research enriches our understanding of work design indicating potential lifetime effects of workload. Additionally, we point to potentially different effects for individuals depending on the extent to which they have a future time perspective. The insights from this research may help employees to better manage their workload and well-being.

Originality/Value
This research is valuable in its connection between research on temporal perspectives with research on work design. Furthermore, our utilization of longitudinal modelling makes this one of the few papers to empirically test lifetime effects of work design.
Purpose

Although established models of training transfer include individual trainee characteristics as predictors of training outcome, training group composition to date has received little attention. The present study aims to explore implications of both surface- and deep-level diversity (cultural background, prior knowledge) in workplace training groups.

Design/Methodology/Approach/Intervention

Semi-structured interviews were conducted with 24 German and Israeli managers who participated in a 16-days training program with a thematic focus on innovation and entrepreneurship. Interviews addressed participants’ experience of the learning process and were analyzed with qualitative content analysis.

Results

Training design characteristics that have been established as generally favorable in workplace training (e.g., active experimentation, reflection) prove to be particularly important for heterogeneous training groups.

Differentiating types of learning (learning about vs. from one another; Meese, 2005), we find a sequential process in which a trustful atmosphere and identifying individual expertise (learning about one another) are pre-conditions for successful knowledge-sharing (learning from each other).

Limitations

Due to the specific training setting, generalizability of our findings may be limited. Moreover, data was gathered only from training participants’ perspective.

Research/ Practical Implications

Future studies should include trainers’ perspective in addition to the perspective of training participants. Our study provides in-depth insight into actual learning processes in heterogeneous training groups that can be followed up with more large-scale, quantitative studies. Our sequential model helps training practitioners to time their interventions.

Originality/ Value

The study identifies learning processes associated with deep- and surface-level diversity of workplace training groups.
583 - THE SCIENCE OF ASSESSING POTENTIAL: AN EVIDENCE-BASED APPROACH TO HIGH POTENTIALS IDENTIFICATION

Lorenzo Gallì (1) - Alan Bourne (2) - Massimo Posarelli (1) - Iulia Alina Cioca (3) - Silvia Vanini (1)
Mercer, Talent Strategy, Milan, Italy (1) - Sova Assessment, London, United Kingdom (2) - ScienceForWork, Timisoara, Romania (3)

Purpose

Organizations use many assessment processes to identify high potentials, but those assessments differ greatly in the attributes they evaluate and, most importantly, in the strength of their supporting research base. Determined to take an evidence-based approach (Barends, Rousseau and Barends, 2014), we decided to carry out a critical review of the scientific evidence on the topic.

Methodology

A Rapid Evidence Assessment (Barends, Rousseau and Barends, 2017) was carried out to identify the most reliable predictors of all job performance, leadership effectiveness and learning dimensions in leadership roles. More than 700 studies were critically appraised.

Results

The final framework is based on the collective evidence of 87 meta-analyses, summarizing over 2,500+ studies with 500,000+ people. The 22 most reliable and predictive indicators of potential were grouped in three categories: Stable Potential, Malleable Potential and Contextual Factors. A series of assessment tools were then developed accordingly, and applied with success in real organizational settings.

Limitations

REAs aims to be rapid, not as exhaustive as Systematic Reviews, so there is a possibility that not all research is represented.

Practical Implications and Value

Widespread adoption of an evidence-based approach to high potential identification can have a number of significant benefits. For example, it can reduce the number of cases where someone is promoted into a job where they fail. It also enables a targeted approach to people management, as it outlines which characteristics are highly stable (to hire for) and which can be learned (where to focus your development programs).

FORCED UNPLANNED CHANGE: ACTIVISM INFLUENCING SHIFTS OF INSTITUTIONAL LOGIC

Natasha Winkler-Titus (1) - Anne Crafford (1) - Karel Stanz (1)
University of Pretoria, Pretoria, South Africa (1)

Institutional logics are socially constructed and historically contingent systems of meaning by which organisations make sense of everyday activities and organise them in time and space. The paper will explore the way in which institutional logics, located in the macro environment, informed practices guiding management when framing knowledge in change-related decision-making processes, and explain the role of activism in shifting these logics, resulting in unplanned change.

This paper is based on an embedded, single interpretivist case study in the South African higher education sector. Data was gathered by means of interviews, observations and document analysis, and was analysed using constructivist grounded theory in the tradition of Charmaz.

This study found that there were two different logics informing management decision to in- or outsource (the practice) at two different points in time over a period of 17 years. Central to the shift in logics is the role of activism located both within the organisation and outside of the institution, in societal structures.

The study contributes to our understanding of unplanned organisational change and the role of institutional logics in framing change decisions. In addition, it adds to our understanding of social movement theory, explaining the role of activism in shifting institutional logics framing organisational practices. This shift is demonstrated in the diagram below.

Figure 1: Outsourcing in HE over time and space

Purpose Recent research has explored the role of HR attributions and employees’ perceptions about why they believe HR practices have been adopted. It has been proposed/found that when benevolent motives are ascribed to management, this is associated with positive employee outcomes; the opposite is the case with respect to motives designed to increase control over employees. Attribution theory distinguishes between internal and external attributions, considering both to be important. In the context of HR attributions unions are defined as external and are expected to have little or no effect on employees. This paper challenges this assumption and re-considers what might constitute ‘external’ in this context. In addition, it goes on to explore the role of union influences on HRM.

Design Two quantitative cross-sectional studies are presented. The first, conducted in a large airline, explored the extent to which the association between attributions to the union and employee outcomes differs between blue-collar and white-collar workers. The second, conducted in a large bank, explored the role of union membership and union commitment in influencing the link between union attributions and employee/branch outcomes.

Results Findings show that union attributions have a significant impact on employee outcomes which is stronger among blue-collar workers and those who are members and more committed to the union.

Limitations Research is cross-sectional.

Research/Practical Implications The paper calls for a fuller consideration of external attributions.

Originality/Value First study to focus on the outcomes of union attributions.
Since 2013, more than 70,000 Syrian refugees have found shelter in the Netherlands. They are now trying to build a new life, and work is important for that. However, research shows that it takes a long time before refugees integrate into the labor market and there is not much research on how this process works. With this research project we aimed to improve the process of integration by studying what facilitates and hinders this process.

We conducted a longitudinal qualitative field study in ten Dutch organizations that employ Syrian refugees. We interviewed ten refugees, their co-workers and supervisors and/or employers and interviewed them again after six months. The interviews were analyzed and the results were discussed in a series of focus groups with Syrian refugees, employers, coaches etc. and the results were used to write an e-book with guidelines for employers that want to work with Syrian refugees.

Results show that integration takes more time than both the organizations and the refugees expected and this causes disappointment. Support systems, e.g. as organized by the government, only cover the first period, and thus language and cultural differences, trauma’s and loss of status and perspective take their toll.

This research is valuable because there is very little research on the position of refugees in organizations and we used multi source data to better understand the complexity of integration on the workfloor. Limitations are the limited number of cases and the absence of data on longer term developments.
THE EFFECTS OF COACHING ON INDIVIDUAL OUTCOMES: A MEDIATION MODEL BY PSYCHOLOGICAL CAPITAL

Andrea Fontes (1) - Silvia Dello Russo (2)

ISCTE-IUL, Centre for Social Research and Intervention (CIS-IUL), Lisbon, Portugal (1) - ISCTE-IUL, Business Research Unit (BRU-IUL), Lisbon, Portugal (2)

✓ Purpose

Coaching is a developmental intervention often implemented in organizations to improve individual attitudes and behaviors. However, few studies have empirically investigated these assumptions and even fewer looked at explaining mechanisms (Jones et al., 2016). We propose psychological capital (Psycap), a set of positive individual resources, as possible mediator. We intended to investigate whether: 1) coaching is effective in improving Psycap; 2) coaching impacts positively the individual outcomes; 3) Psycap works as mediator; 4) coaching effects maintain over time.

✓ Design/Methodology/Approach/Intervention

We conducted an experiment with 56 employees in marketing company, who were either assigned to a coaching intervention or a wait-list control group.

Before the program started (T1), Psycap and other measures (job attitudes and other-rated individual performance) were collected, being measured again (T2) after the coaching intervention that lasted 4 months. Four months later (T3), the same variables were measured for the experimental group.

✓ Results

ANOVA showed coaching was associated with increases in Psycap, job attitudes, and two dimension of performance. The mediating role of Psycap, analyzed with PROCESS (Hayes, 2016) was supported. The effects on Psycap and job attitudes lasted over time, as revealed by within-subjects repeated measures analyses.

✓ Limitations

The sample size is relatively small and the data was collected only in one company.

✓ Research/Practical Implications

This study fills a gap in our knowledge of the underlying mechanisms behind coaching effectiveness.

✓ Originality/Value

This is one of the few experimental studies on coaching effectiveness that used a control group as well as a longitudinal design.
Purpose - In this study, we investigated how negative work- and person-related behaviors from colleagues affect psychological distress among university scholars. We also examined the moderating role of gender and support from significant others.

Design/Methodology - The data were obtained using questionnaires completed by university employees in Norway (n = 212). Hierarchical multiple regression analyses were run using the statistics package SPSS.

Results - Supporting previous research, the most frequently experienced negative behaviors were reported to be work-related. However, results from the present study showed that person-related negative acts were the strongest predictor of psychological distress, explaining 32 % of variance, followed by work-related negative acts, explaining 24 % of variance in psychological distress. Our findings showed that support from a significant other reduces the negative effect of negative behaviors on psychological distress. Men, compared to women, experienced slightly but significantly more mental and physical consequences when being bullied.

Limitations - The generalizability of the results may be limited.

Practical implications - As person- and work-related negative behaviors were related to reduced psychological wellbeing, the necessity to protect employees should come first. This may be reached by creating awareness among employees of possible forms of negative behaviors, its consequences, and coping techniques. Leadership development programs that help both line managers and project leaders to prevent and manage negative acts would be instrumental.

Originality/Value - Earlier research on workplace bullying has primary concentrated on bullying forms and frequencies of exposure to negative acts, which may be insufficient when assessing predictors of workplace victimization.
Purpose. This study tests an interpersonal model of work-family spillover. We examine how social stressors at work (i.e., workplace incivility, abusive supervision, interpersonal conflict) influence marital behaviors at home on a daily basis.

Design/Methodology. We used experience-sampling methodology with daily surveys at work and at home over a two-week period. Eighty-one employees participated and yielded over 700 data points. We collected spousal ratings for employees’ marital behaviors in the evening.

Results. Within individuals, social stressors at work were associated with depersonalization and citizenship fatigue, both of which mediated the effect of stressors on social-based work-family conflict. In line with congruence response models, we observed that those who are trusting (agreeableness facet) and those who are gregarious (extraversion facet) were more negatively affected by social stressors at work. On evenings when employees experienced social-based work-family conflict, their spouses reported more withdrawn and angry behaviors and less supportive behaviors shown towards them.

Limitations. We relied on a rather small sample (n = 69) for testing cross-level interactions. Our measurement for social-based work-family conflict was self-constructed and not yet validated.

Research/Practical Implications. We showed that job-related strain resulting from social stressors at work spills over to the family domain and influences marital behaviors that are important for an individual’s functioning at home and the couple’s well-being. We also showed that individual differences in personality influence daily responses to social stressors.

Originality/Value. This paper presents an interpersonal model of work-family conflict and uses new items specifically developed to assess this form of work-family conflict.
Purpose
Drawing on the work-home resources model, we propose that proactive study behaviors (i.e. study crafting – proactively changing study demands and resources) are positively related to sport performance (i.e. self-reports), through personal resources such as positive affect. Resources created in the study domain are added to the personal resources supply, which may be used in the sport domain. We aim to show how experiences in the study domain can contribute to study-to-sport enrichment, thereby extending the work-home resources model to a study-sport environment.

Design/Methodology
In this two-wave study, student-athletes (N = 117) completed two questionnaires on study behavior, personal resources, and sport performance.

Results
Preliminary results show an indirect relationship of study crafting behavior (T1) with self-rated sport performance (T2), through positive affect (T1). Specifically, study crafting was positively related to positive affect, which was, in turn, positively related to athlete’s sport performance.

Limitations
The sample size is small. We are collecting more data to test a more elaborate model.

Research/Practical Implications
We advance the literature on role enrichment by testing the work-home resources model in a study-sport environment. Furthermore, we show the value of study behavior for a student-athlete’s sport performance – student-athletes who take control over the study day (i.e. engage in study crafting), may boost their personal resources and benefit in terms of enhanced sport performance.

Originality/Value
Our study illuminates the value of a proactive attitude for student-athletes in the study context: Taking control over the study day might go beyond the study domain.
Purpose

The UK Higher Education sector employs a gender equality scheme called, ‘Athena Swan’ (AS) Gender Equality with many universities applying for recognition awards. This paper examines the extent to this gender equality scheme is related to the representation rates of female professors in the UK.

Research Methodology

We use panel data from 126 UK higher education institutions (HEIs) for the years 2012-2016 to analyse the impact of AS award on the proportion of female professors.

Results

Our preliminary findings show that there has been a gradual increase in the proportion of female professors during 2012-2016. For those universities who received an AS award, on average, the representation of female professors increased from 2012 to 2013, however, from 2013 onward non-awarded universities experienced a much more rapid upward trend in increasing female professorships.

Limitations

The present study only employs data from 2012 to 2016.

Research/Practical Implications

We suggest that other countries and perhaps other sectors can potentially use similar practices to increase gender equality in the workplace.

Originality

The extent to which higher education institutions have been able to increase female representation at professor level as a result of the receipt of an AS award has not been studied so far. Our article will address this and show how national level policies affect gender inequality in the context of the HE sector.
Purpose: We investigated whether the risk for sickness absence (SA) due to musculoskeletal and mental health diagnoses is lower over time for workers with higher levels of work-time control (WTC).

Design: We used data from the Finnish 10-town study. After exclusion of respondents with any pension or SA of ≥ 12 days during the baseline year (2004) and those working part-time the final study sample comprised 22,599 employees. Statistical analysis were performed separately for SA 2005-2011 due to musculoskeletal disorders and due to mental disorders. Data were analysed using factor analysis and Cox proportional hazard models.

Results: Factor analysis resulted in two factors, control over daily hours and control over days off. After adjusting for possible confounders low control over daily hours was related to SA due to musculoskeletal disorders (HR=1.23; 95% CI=1.12-1.33), but not due to mental disorder. Both moderate (HR=1.10; 95% CI=1.02-1.20) and low control over time off (HR=1.22; 95% CI=1.13-1.33) were related to SA due to musculoskeletal disorder, while only moderate control over time off was associated with an increased risk for SA due to mental disorder (HR=1.13; 95% CI=1.02-1.25).

Limitations: Only baseline WTC was included in the analyses, generalizability is questionable.

Practical Implications: WTC may be a beneficial target for reducing SA.

Originality: The association between WTC cause-specific SA has not been investigated previously.

Conclusion: Results from this study suggest that low WTC is related to an increased risk for subsequent sickness absence due to musculoskeletal, and to a somewhat lower degree due to mental disorder.
Purpose

Besides work characteristics, stable personality characteristics have been shown to affect employee health and motivation. We investigated the role of core self-evaluations (CSE; integrating self-esteem, generalized self-efficacy, locus of control, and emotional stability) as a person-related resource within the job demands-resources model.

Design/methodology/approach/interventions

Study 1 focused on the motivational process, with a sample of 135 German employees, former cancer patients who had returned to work after treatment. Study 2 focused on the health impairment process, with a sample of 330 employees from a Dutch semi-governmental organization. Online surveys were employed in both studies.

Results

As hypothesized, CSE was found to be positively related to work engagement, directly, and indirectly via job crafting (Study 1). Contrary to expectations, CSE did not moderate the relation between job crafting and work engagement.

The hypothesized negative relation was confirmed between CSE and the exhaustion dimension of burnout, directly, and indirectly via psychological detachment (Study 2). CSE was not related to the disengagement dimension of burnout and CSE did not moderate the relation between psychological detachment and disengagement.

Limitations

The cross-sectional nature of our two studies precludes drawing causal conclusions. Other (job-related) demands and resources were not included.

Research/practical implications

This research provides evidence for the role of CSE in explanatory processes of central work-related outcomes. Practical interventions may focus on supporting low-CSE employees in job crafting or detachment.

Originality/value

To our knowledge, this study is the first to systematically investigate the role of CSE in both the motivational and the health impairment process.
Purpose

Research on job crafting (JC) has flourished in recent years and constantly new models and measures are being suggested. However, it remains largely unclear how these models are related, what constitutes the core of the construct, and which dimensions are valuable in predicting work outcomes. Therefore, we compared the operationalizations for the two original JC models by Wrzesniewski and Dutton (2001) and Tims, Bakker, and Derks (2012). First, we examined the different subscales on the construct level. Second, we compared their predictive power for work engagement.

Design

We conducted a cross-sectional study with German employees (N = 305) who completed respective scales for the two JC models and the UWES-9 (Schaufeli & Bakker, 2003) for work engagement.

Results

Our findings indicate that the two models only share 18% of variance, with correlations between the subdimensions not exceeding r = .31. Regarding work engagement, only JC conceptualized by Tims et al. (2012) was a significant predictor.

Limitations

Our findings may be limited due to the cross-sectional data collection, and recent adaptions of the JC scales have not been taken into account.

Research/Practical Implications

Our findings indicate that there seem to be fundamental differences between the two JC models. Therefore, further research concerning the nature of the construct is needed and interventions should be handled with caution, as outcomes may vary depending on which models they are based on.

Originality/Value

Our study is the first to empirically compare different JC models and their relationship with outcome variables at work.
Purpose: The amount of influence an individual exerts at work is likely to be associated with their stress levels in different ways. Inspired by the Job-Demands Resources model, we advance that influence at work may simultaneously bring more responsibility, (adding to work-related stress), as well as more control over other aspects related to one’s work, (which may actually buffer stress). This means that the balance between influence and stress will be different for different people. Our study aims to identify those profiles.

Design/Methodology: Following the idea of moving from mean-based to variance-based measures, we conducted a latent profile analysis with MPlus8 to identify different profiles of workers from nine British Universities (n=3315). Multinomial logistic regression was used to analyse different predictors of class membership.

Results: A 4-class structure fitted our data best (class 1 = high stress/high influence; class 2 = low stress/high influence; class 3 = high stress/low influence; class 4 = low stress/moderate influence). We found that favourable perceptions of working conditions, work-life balance and job satisfaction, as well as overtime were important predictors of class membership. Individual’s role at the University was not as important. Class membership also had implications in terms of sick leave taken.

Limitations: The data was cross-sectional.

Implications: Given the interplay between class membership and aspects such as overtime and sick leave, our findings have important implications for management in the Higher Education sector in the UK.

Originality/Value: This study brings a multifoci, person-centred perspective to influence at work and stress.
IMPACT OF DIGITIZATION ON JOB SATISFACTION, STRESS AND ORGANIZATIONAL COMMITMENT IN SERVICE COMPANIES

Henning Hummert (1) - Anne Traum (1) - Philipp K. Goers (1) - Friedemann W. Nerdinger (1)

University of Rostock, Senior Professor of Business and Organisational Psychology, Rostock, Germany (1)

Purpose:
Digitization and its impact on the world of employment is one of the hot topics in work and organizational psychology. Especially employees in knowledge-intensive service industries face rapid and profound changes in the way they work. Prior research primarily focused on the creation and loss of jobs on a meta-level, we focus on these changes from an individual’s perspective. In order to design future workplaces, we developed and tested a theoretical model to assess the impact of digitization on stress factors and organizational commitment.

Design/Methodology:
Data was collected from 457 employees of various small to medium sized tax consultancies in a cross-sectional study. The online survey included scales to measure the perceived degree of digitization of their work place, work characteristics, job satisfaction, organizational commitment and well-being.

Results:
Contrary to our hypotheses and to results from prior interviews, digitization had a positive impact on job satisfaction and well-being and no impact on the experienced qualitative workload. For highly skilled employees, digitization led to a lower organizational commitment. These results were valid for all age groups.

Limitations:
Generalization to additional service sectors should be done carefully at this point as we used our own sector specific questionnaire to assess the degree of digitization.

Research/Practical Implications:
General perception is that service providers perceive digitization as a negative development or even a threat. We show that this might be not the case.

Originality/Value:
To our knowledge, previous research did not systematically analyze the impact of digitization on employees in knowledge-intensive service industries.
HOW DO UK POLICE OFFICERS CHALLENGE UPWARDS IN FORMAL SITUATIONS?

Sarah Brooks (1)
University of Sheffield, Sheffield, United Kingdom (1)

Purpose: This paper addresses the research question “how does perceived formality shape upward challenge in a UK police force? Upward challenge describes a situation where a subordinate voices a disagreement or difference of opinion with their superior.

Design/Methodology /Approach/Intervention. Results published previously (Brooks, 2017) showed that upward challenge was considered a highly risky activity when using formal voice mechanisms. Building on those findings, the current paper presents further results of 19 semi-structured interviews and one focus group with four ranks of police officer to explore the way in which officers navigated formality and decided how and when to engage in upward challenge.

Result: A thematic analysis identified that officers developed a number of strategies to minimise risk when challenging upwards, highlighting a preference for challenging informally. However, not all officers were able to create an opportunity to challenge informally, suggesting that in formal circumstances, upward challenge may not take place.

Limitations. Data were collected in one UK police force so it cannot be assumed that the conditions that limited upward challenge here are the same in other forces.

Research/Practical Implications: The findings build on existing theoretical knowledge about the efficacy of voice mechanisms for encouraging upward challenge. From a practical perspective, the police force has a greater understanding about the ways in which they can manage upward challenge.

Originality/Value. These findings contribute to a nascent area of research exploring the differential values of formal and informal voice mechanisms (Klaas, Olson-Buchanan, & Ward, 2012; Mowbray, Wilkinson, & Tse, 2014).
Purposes – Employee development is a crucial strategy for organizations to remain competitive in the global market. However, whether the organizational support for development (OSD) can motivate employees to stay in the organization or equip them with skills to leave for other jobs remains unclear. The present study aims to investigate the relationship between OSD and employee’s turnover intention, with focuses on the mediating role of perceived insider status (PIS) and the moderating role of employability.

Design/Methodology – We used two-wave survey data from 404 employees of a Chinese manufacture company with a three-month interval.

Results – Results showed that changes in PIS mediated the relationship between OSD and change in turnover intention. Furthermore, employability moderated the mediation effect such that change in PIS mediated the relationship only for employees with higher employability.

Limitations – Data from employees of one company in one country limit the generalizability of our findings.

Research/Practical Implications – The findings suggest that OSD can result in the decrease of turnover intention through increasing employees’ PIS. The effect becomes particularly salient for employees with higher employability. These results signify the important role of OSD in retaining highly employable employees under the highly competitive labor market.

Originality/Value – This study provides evidence for explaining the inconsistent results about OSD–turnover intention relationship by considering the role of PIS and employability.
616 - IN-GROUP AND OUT-GROUP SALARY COMPARISON: RELATIVE DEPRIVATION, DISTRIBUTIVE JUSTICE AND ORGANIZATIONAL OUTCOMES

Xiaomin Xu (1) - Changqin Lu (2)

University of Edinburgh, Business School, Edinburgh, United Kingdom (1) - Peking University, School of Psychological and Cognitive Sciences, Beijing, China (2)

Purpose – Over the years, fair pay has increased its importance for management around the world. Although the perceptions of salary are affected by the comparisons of employees’ salary relative to others’, how they process different comparisons (e.g. with someone in the same company vs. a different company) to generate justice judgements remains unclear. Based on the relative deprivation theory, this study tested how congruence and incongruence of in-group vs. out-group salary comparisons affect employees’ distributive justice perceptions and subsequent organizational outcomes.

Design/Methodology - Two-wave survey data were collected from 252 employees in an education enterprise with a three-month interval. We used polynomial regressions to test our hypotheses.

Results – Results showed that the congruence line slope and incongruence line curvature of in-group vs. out-group salary comparisons were negatively related to employees’ perceptions of distributive justice. Distributive justice mediated the relationship between salary comparisons and organizational outcomes (deviant behavior, turnover intention).

Limitations – Data from employees of one company in one country limit the generalizability of our findings.

Research/Practical Implications – Our research suggests that employees perceive less distributive justice when their in-group and out-group salary comparisons are aligned at a less (vs. more) level. Moreover, as the degree of discrepancy between in-group and out-group salary comparisons increases, employees’ distributive justice perceptions decrease. The less distributive justice perceptions are harmful for organizational outcomes.

Originality/Value – This study contributes to justice research by considering the inconsistent information between in-group and out-group salary comparisons in emerging distributive justice perceptions.
Purpose: Previous studies on job rotation are mostly correlative and lack a theoretical basis. In the current study, we investigated the causal relationships between job rotation and employee-related outcomes. Drawing on the Job Characteristics Model and Self Determination Theory, we examined three work design characteristics and the need for competence satisfaction as mediators. As work will often be structured by technologies in the future, we let a digital assistance system dictate the rotation at the investigated workplace. Methodology: We conducted an experimental online vignette study. The 131 participants read a vignette about a workplace where they either rotated (n = 58) or not (n = 73). Afterwards, they rated the work design (task variety, skill variety, task identity), the need for competence satisfaction and the outcomes (work satisfaction, intrinsic motivation, subjective performance, affect). Results: We conducted regression-based mediation analyses. Job rotation had direct effects on satisfaction, motivation and positive affect and indirect effects on all outcomes except negative affect. The strongest mediator was skill variety. Limitations: The participants’ education level was relatively high. It is unlikely that this group of people would work at the described workplace. Research/Practical Implications: Future studies should investigate possible moderators (e.g. occupational self-efficacy) and target employees from technical professions. When implementing job rotation, companies should make sure that the tasks require a diverse set of skills. Originality/Value: We found evidence for the mediating function of the work design characteristics and the need for competence satisfaction. The results allow for a theoretical framework for job rotation.
619 - STEREOTYPE THREAT IN EMPLOYMENT TESTING FOR GMA: COMPARING MALE AND FEMALE TEST SCORES ACROSS TWO SAMPLES

Peter Hausdorf (1) - Alexandra Chris (1) - Kelsea Beadman (1)

University of Guelph, Psychology, Guelph, Canada (1)

This study assessed sex-based stereotype threat effects among women taking general mental ability (GMA) tests in “high stakes” employment selection.

Archival data were obtained from job applicants in testing situations. We argue that contextual conditions including male dominance of the jobs, female under-representation in testing situations, test content favouring “male strengths,” and timing of demographic questions, would evoke stereotype threat, thereby influencing females’ performance on GMA tests. In study 1, we examined whether males outperformed women on GMA tests. In study 2, we examined whether sex predicted GMA tests scores, after controlling for a prior measure of GMA.

Study 1 consisted of 1396 police officers applicants. Results of t-tests demonstrated that males scored significantly higher than females on the spatial subtest but not on numeric and verbal subtests.

Study 2 consisted of 386 bus driver applicants. There were no significant gender differences on a prior GMA test, thus supporting its use as a covariate. Sex significantly predicted numeric subtest results but not verbal.

Due to ethical and practical concerns, we were not able to directly manipulate or confirm the presence of stereotype threat.

From a research perspective, these results suggest that stereotype threat may influence GMA test scores for female applicants, although the effect may be moderated by test content.

There has been little research assessing stereotype threat in “high stakes” employment selection. These results suggest that there may be multiple factors affecting the impact of stereotype threat on GMA test scores.
621 - PERSONALITY STRUCTURE: DIFFERENTIATION BY THE COGNITIVE ABILITY LEVEL, JOB COMPLEXITY AND GRADE LEVEL

Alina N. Stamate (1) - Pascale L. Denis (1)

Université du Québec à Montréal / École des sciences de la gestion, Organisation et ressources humaines, Montréal, Canada (1)

The personality structure as conceptualized by the five-factor personality model (Digman, 1990) has been replicated using a variety of measures and instruments across different samples and in many cultures (Murray, Booth & Molenaar, 2016). However, more than 20 years ago, Brand, Egan & Deary, (1994) suggested that the personality structure might vary according to the intellectual capacity level, higher general cognitive ability (GCA) individuals presenting a more differentiated personality structure than the lower GCA ones. Because only few researches have already shown that personality dimensions are correlated with cognitive ability level (Allik and Realo, 1997; Beer and Ackerman, 2001; Paunonen and Ashton, 2001), there is a clear need for more studies to examine how cognitive ability can affect the number of personality factors found according to different GCA levels (McLarnon and Carswell 2013) and to identify potential consequences in selection context. Consequently, this correlational study aimed to clarify this issue, using two different samples and different instruments: 1) 14 464 candidates from a real selection context and 2) 602 employees from an organizational context. The preliminary results (exploratory factor and mean difference analyses) showed support for a more complex personality structure for higher GCA group. These findings are important, given that accurate personality measurement is essential for construct validity and for the ability to draw valid inferences in research or practice (McLarnon and Carswell, 2013) and to take some decisions based on these inferences. Scientific and practical implications, as well as the limits of this study will be discussed.
Purpose: The introduction and operationalization of a new individual leader difference construct, leadership signatures, based on the “If this, then that” contingency relationships from the CAPS framework (Mischel & Shoda, 1995), which capture variability in leadership responses as a function of the properties of situations.

Design/Methodology: Individual leadership signatures were estimated for the relationship between self-assessments of leadership capability and leader identity from self-reported longitudinal measures of situations and individual responses over a 36-week period from 227 participants assigned to, initially leaderless, groups (n=37). The criterion was emergence as a leader, based on peer ratings.

Results: Leadership signatures were relatively stable over time, were stronger for those with past leadership experience, and differed significantly between individuals. The strength of leadership signatures for individuals positively predicted their emergence as leader of the dormitory group, based on peer ratings.

Limitations: Study tests and demonstrate predictive validity for one leadership signature and one criterion in university dormitories, a setting without any formal authority structure. It provides a partial model for the natural occurrence of emergent leadership. A fuller model within a formal organization structure is yet to be tested.

Research/Practical Implications: The results show that leadership signatures provide an explanatory mechanism for leader behavior and resulting outcomes plus an approach for more rigorous testing of contingency models of leadership. Leadership signatures allow for more targeted development interventions.

Originality/Value: Leadership signatures solve two extant problems in leadership research. They integrate measures of situations and behavior and explain why leaders engage in certain behaviors.
Counterproductive Work Behaviors (CWB) have been the object of interest for researchers and practitioners for many years. Above all, it is interesting what drives employees to take them. One of the more popular and well-documented hypotheses speaks of the need for a rematch, which manifests itself in taking revenge behavior as an uninteresting and unsatisfactory job or any kind of abuse by the employer.

However, we should not overlook potential personal sources that are in the characteristics or needs of an employee who decides to be counterproductive. In this area both the basic personality traits (e.g. low conscientiousness) and more narrow (e.g. high boredom proneness) are indicated.

In the presented study, both perspectives were combined. On a group of 428 employees of various occupations, a study was conducted using the boredom proneness scale, the CWB questionnaire and the scale of routine at work.

A moderation analysis was conducted, which showed that in group with low boredom proneness the relationship between the sense of routine at work CWB is significantly weaker than in group with high boredom proneness. These results show that low-stimulating work leads to the CWB of those people who are sensitive to external stimulation and are looking for it in the environment.

The most important conclusion from the study shows the need to match the employee's tendency to the nature of work in order to reduce the likelihood of CWB.
A SYSTEMATIC LITERATURE REVIEW ON SUPPORT MECHANISMS FOR WORK–LIFE BALANCE

Yuyang Fan (1) - Kristina Potočnik (1) - Sara Chaudhry (1)
The University of Edinburgh, Business School, Edinburgh, United Kingdom (1)

Purpose
The changing nature of work poses greater work and family demands on employees. Hence, external support by the state, the workplace, and the personal connections becomes increasingly crucial for working people to achieve a good work–life balance. Although considerable research has been done on work–life balance support mechanisms, the evidence has been fragmented lacking a strong conceptual and methodological rigour. This systematic review aims to outline the research trends of work–life balance support mechanisms.

Methodology
“Work”, “life” and “support” were entered as keywords in titles for literature search in six major databases. The final sample included 79 papers published in English between 1990 and 2018 in top tier journals.

Results
The extant literature mostly investigated employees’ perceived availability of rather than their demands, utilisation, or perceived usefulness of support mechanisms. We also found that cross-national research rarely addressed national or cultural differences. Finally, although being theorised as a multi-level concept, support mechanisms were only rarely analysed as such.

Limitations
We focused only on top tier journals to manage the large volume of published research. We could have missed out on good quality papers published in lower tier journals or in language other than English.

Research Implications
Future research should explore more dimensions of support mechanisms and bridge the gap between conceptual and operational levels in empirical studies.

Originality
To the best of our knowledge, this is the first systematic review of work–life balance support mechanisms, which critically reflects on the research trends of extant literature.
629 - BETTER ATTENTION AFTER STOCHASTIC RESONANCE WHOLE-BODY VIBRATION – A RANDOMIZED CONTROLLED TRIAL

Yannik Faes (1) - Achim Elfering (1)
University of Bern, Work and Organizational Psychology, Bern, Switzerland (1)

PURPOSE To investigate the acute effects of stochastic resonance whole body vibration (SR-WBV) on attention. It is expected that cognitive functioning improves when assessed immediately after SR-WBV.

METHODOLOGY Thirty-six healthy participants were assigned randomly to a verum (6Hz) or sham condition of SR-WBV (2Hz). Attention (i.e. inhibitory control) was measured with a color-word interference paradigm (stroop-test). At baseline participants answered a questionnaire and were doing the stroop test. After the training (5 x 1min exercise with 1 min break in between) participants repeated the stroop test and answered a second questionnaire.

RESULTS Nonparametric sign test showed significant improvement of correct answers at incongruent items after the verum condition (p = .025) and no significant improvement after the sham condition (did not differ from 50% chance expectation; p = .424).

LIMITATIONS Participants were students who attended to gain mandatory hours as participants. Only acute effects are measured in this study. In a next step longitudinal studies in a working context are planned.

PRACTICAL IMPLICATIONS An improvement of attention after SR-WBV makes it an ideal option for a break at work.

VALUE: SR-WBV has many benefits for the working context (increase of musculoskeletal well-being, decrease of backpain, increase of balance) and is easy to carry out (no change of clothes or shower afterwards are needed).
Purpose: Body art – tattoos – are increasingly common in Western societies. This study investigates whether the presence of visible body art biases employee selection decision-making, and whether the impact of such bias varies as a function of job type.

Design/Methodology/Approach/Intervention: We used a 2 (Job type: blue-collar vs. white-collar) x 2 (Body art: visible tattoo vs. no tattoo) within-subjects experimental research design. Participants were presented with job applications, with applicant photographs included. Some candidates had a visible tattoo photoshopped into the photograph, whereas others did not. Participants evaluated each candidate based on selection criteria.

Results: Results showed a significant job type x body art interaction, such that the job applicant with a visible tattoo was preferred for the blue-collar job, while no difference in applicant evaluations were found for the white-collar role as a function of body art.

Limitations: We used a student participant sample. While most participants had work experience (and the extent of this experience did not influence the findings), the findings should be replicated with a managerial and/or HR sample.

Research/Practical Implications: This research suggests that body art may be becoming more accepted in employment contexts, and that negative biases towards applicants with body art may not be present as widely as previously suggested.

Originality/Value: Our findings would suggest that in fact, visible body art may work in a candidates favour in certain roles. These novel findings suggest a change in attitudes towards body art in an employment context.
636 - SUPERVISORY COACHING AND PERFORMANCE FEEDBACK AS MEDIATORS OF THE RELATIONSHIPS BETWEEN LEADERSHIP STYLES, WORK ENGAGEMENT, AND TURNOVER INTENTION

Michelle Chin Chin Lee (1) - Mohd Awang Idris (2) - Michelle Tuckey (3)

Sunway University, Department of Psychology, Petaling Jaya, Malaysia (1) - University of Malaya, Department of Anthropology and Sociology, Kuala Lumpur, Malaysia (2) - University of South Australia, Asia Pacific Centre for Work Health and Safety, Adelaide, Australia (3)

Purpose

This study compared the effects of transformational and transactional leadership styles on employee attitudes (i.e., work engagement and turnover intention) through leaders’ behaviors (i.e., supervisory coaching and performance feedback) in an Asian setting.

Design/Methodology/Approach/Intervention

This study used a multilevel approach (i.e., matching leaders to multiple subordinates) with 500 employees, nested in 65 workgroups from private organizations in Malaysia.

Results

We found a link between transformational (but not transactional) leadership and higher levels of supervisory coaching and performance feedback, and that these job resources mediate the relationship between transformational leadership and work engagement. Furthermore, we found that work engagement mediates the relationships of both supervisory coaching and performance feedback to turnover intention.

Limitations

The causal direction remains unclear due to the study’s cross-sectional design. The study also did not include job demands, which are closely related to job resources in the job demands-resources (JD-R) theory.

Research/Practical Implications

Overall, the study results reveal one way in which Asian leaders can effectively facilitate some aspects of HRD through development-focused behaviors which serve as job resources to boost work engagement and reduce turnover intention.

Originality/Value

Our study was conducted in Malaysia which, being a collectivist culture, is characterised by emphasis on the quality of relationships, but also with high power distance and subordination of the individual.
Constance Leineweber (1) - Paraskevi Peristera (1) - Claudia Bernhard-Oettel (2) - Constanze Eib (3)

Stockholm University, Stress Research Institute, Stockholm, Sweden (1) - Stockholm University, Department of Psychology, Stockholm, Sweden (2) - Uppsala University, Department of Psychology, Uppsala, Sweden (3)

Purpose: The aim of the current study is to investigate associations between justice perceptions and turnover behavior over time. We focus on interpersonal justice, which captures the respectful and dignified treatment from the supervisor, because it evokes strong emotional reactions. We relate interpersonal justice to two aspects of turnover (group, employer) over time.

Design: The project is based on data collected in the Swedish Longitudinal Occupational Survey of Health (SLOSH) 2012-2016 (n=2450). We used autoregressive cross-lagged models within a multilevel structural equation modeling (MSEM) framework to address reciprocal influences on justice perceptions and turnover behavior.

Results: We found that high interpersonal justice at t_{n-1} was associated with a decreased risk of having left the employer at t_{n} (B=-.037 p≤.001) and having changed the workgroup (B=-.067 p≤.001). Having changed the employer during the past two years was related to higher perceived interpersonal justice at t_{n} (B=.220, p≤.001). Also, having changed the workgroup was related to increased interpersonal justice (B=.082, p≤.017).

Limitations: Causality cannot be proven despite the longitudinal design.

Practical Implications: Interpersonal justice is a potential target for interventions in order to keep employees in the organization.

Originality: We investigate cross-lagged associations between justice perceptions and two aspects of turnover behavior taking four repeated measurements into account.

Conclusion: Poor interpersonal justice is a risk factor for leaving the group and organization.
639 - WORK, PHYSICAL ACTIVITY, AND WELL-BEING: AN AMBULATORY ASSESSMENT STUDY

Jan Häusser (1) - Sascha Abdel Hadi (1) - Stefan Krumm (2) - Andreas Mojzisch (3)

Justus-Liebig-University Giessen, Psychology, Giessen, Germany (1) - FU Berlin, Psychology, Berlin, Germany (2) - University of Hildesheim, Psychology, Hildesheim, Germany (3)

Purpose

In the physical activity mediated Demand-Control model (Häußer & Mojzisch, 2017), we argue that leisure time physical activity is an important mediator of the relationship between job demands and job control and well-being. Building on self-regulation research and self-determination theory, we assume that job demands and job control predict leisure time physical activity, which in turn is positively related to well-being.

Design

We conducted a 14-days ambulatory assessment study with an objective measure of physical activity. 207 employees (8,059 observations) wore an accelerometer and reported three times each day day-specific job demands, job control, self-regulatory capacities, feelings of self-determination and psychological well-being (stress, mental fatigue, mood).

Results

Job demands were negatively and job control was positively related to well-being. Physical activity partially mediated the relationship between job demands and well-being. Furthermore, we found evidence for the predicted two-step mediation of the relationship between job demands and well-being via impaired momentary self-regulation capacities and reduced physical activity, as proposed by our theoretical model. Against expectations, there was no positive relationship between job control and physical activity.

Limitations

As we used a mediation-by-measurement design, causal directions of the effects need further investigation.

Research/Practical Implications

Our findings help to understand the importance of physical activity for employee well-being and furthermore, point to opportunities to promote physical activity by creating more healthy workplaces.

Originality

To our knowledge, this is the first ambulatory assessment study testing physical activity as a mediator of the relationship between work and well-being relationship that uses accelerometry.
HEALTH AND WORK-LIFE BALANCE ACROSS TYPES OF WORK SCHEDULES: A LATENT CLASS ANALYSIS

Corinna Brauner (1) - Kilian Frank (1) - Anne Marit Wöhrmann (1) - Alexandra Michel (1)
Federal Institute for Occupational Safety and Health (BAuA), Dortmund, Germany (1)

Purpose:
Duration and timing of work play an important role for employees’ wellbeing. Drawing on the demand-control model (Karasek, 1979), this study aims at exploring how shift work, weekend work, overtime, overlong working hours, changes in working time, control over begin and end of workday, and control over taking hours off can be classified into distinct types of work schedules and how these types are differentially associated with health and work-life balance.

Approach:
Data of 13,540 full-time employees from the BAuA-Working Time Survey 2015 – a representative survey of the German working population – was included in the present study. Distinct types of work schedules were extracted by means of latent class analysis. Relationships with satisfaction with the work-life balance and subjective health status were examined using ANOVAS and Wald-tests.

Results:
Analyses pointed towards a 6-class-solution (flexible extended, extended shift, rigid standard, flexible standard, rigid all-week, and rigid extended). Classes characterized by high working time demands and low work time control (extended shift, rigid extended, rigid all-week) showed the strongest impairments of health and satisfaction with the work-life balance.

Limitations:
All analyses are based on cross-sectional self-report measures with data collected exclusively in Germany.

Research/Practical Implications:
This classification approach may help researchers and practitioners evaluate work schedules with regard to their effects on health and work-life balance.

Originality/Value:
The study allows the identification of risk groups concerning work schedules on the basis of a representative sample of full-time employees in Germany.
Purpose: The aim of the study is to explore the possible indirect effect of subjective career success in the relationship between work-family enrichment and positive work-related outcomes (job satisfaction, affective commitment and engagement).

Methodology: A cross-sectional, quantitative research design approach was followed and a convenience sample of 334 participants was obtained. Structural equation modelling was employed to achieve the objective of the study.

Results: Results yielded significant relations between the variables. It was found that work-family enrichment affected affective commitment (with a small effect) as well as job satisfaction and work engagement (both with a medium effect) indirectly via subjective career success.

Limitations: The use of self-report measures could be subject to common method bias. No causal relationships could be drawn due to the use of a cross-sectional design.

Practical implications: Organisations can gain various benefits (committed, satisfied and engaged employees) when they foster work environments (e.g. by providing relevant resources) which are conducive to work-family enrichment and by implication subjective career success. Should employees experience work-family enrichment enhanced feelings of career success will follow. Interventions should be aimed at work-family enrichment to enhance employees’ feelings of career success, and ultimately positive work-outcomes.

Value: The findings add new insights into the processes and mechanisms relating to work-family enrichment and how employees reciprocate positive actions towards organisations (that being the indirect effect of subjective career success). By incorporating recently developed new measurements for work-family enrichment and subjective career success, this study adds to literature of career success and work-family interface measurements.
Psychosocial safety climate (PSC) - a specific dimension of organizational climate - is assumed to shape an organization’s psychosocial working conditions. Even though the construct is assumed to cover four distinct, yet related domains it is usually applied as a combined score in practical research settings. Furthermore, while it is an established construct in Australia and several Asian countries (i.e. Malaysia), its application in Europe has been rare. Consequently, our research aims at (i) applying a revised and translated instrument to assess PSC in the European, i.e. German, context, (ii) investigating the instrument’s structure, (iii) its assumed multi-level nature and (iv) its relation with other psychosocial working conditions as well as health-related outcome measures.

After translating the PSC tool and revising the items following a cognitive pretest we have applied this version - along with the Copenhagen Psychosocial Questionnaire - among n ≈ 2000 employees of different organizations from diverse sectors in a cross-sectional design. With confirmatory factor analysis, we will model the instrument’s structure, applying appropriate methods for the data’s multi-level nature. Furthermore, we will investigate PSC’s relations with other psychosocial working conditions as well as health-related outcomes, applying both correlation analyses as well as structural equation modelling.

With our results we will be able to appropriately describe the PSC instrument’s dimensionality, essential for understanding its role as a precursor of psychosocial working conditions and health outcomes, and to illuminate its potential for both research and as a future screening instrument for practical application, e.g. in psychosocial risk assessment.
Purpose

The preparation of future leaders has been central to the mission of business schools since their inception. Recently however, business schools have been criticized for inadequately preparing students for the complex leadership challenges ahead in the workplace. At the same time, leadership identity has been positioned as pivotal to leadership development. To assist business schools in strengthening the leadership development in their programs, the aim of this study is to explore key learning experiences for student leadership identity development. We examined the type of experiences, developmental features, and learning outcomes.

Design/Methodology

Through structured, open questions we collected qualitative data from 485 first-year bachelor students studying international business at a Northern-European university.

Results

Findings of our in-depth qualitative analysis show that in-class and out-class experiences that contain four specific developmental features can be related to affective/motivational, behavioral, and cognitive learning outcomes that may contribute to student leadership identity development.

Limitations

Further research is necessary to examine generalizability to other groups and settings.

Research/Practical Implications

Insights from this study can provide business schools with suggestions for key learning experiences to strengthen student leadership development and better prepare students for entry to the workplace.

Originality/Value

This study is among the first to analyze empirical data on key learning experiences for student leadership identity development using a large qualitative dataset.
652 - TRIGGERS AND CONSEQUENCES OF THREAT TO PROFESSIONAL ROLES IN CRITICAL TEAM WORK SITUATIONS

Mona Rynek (1) - Thomas Ellwart (1)
University of Trier, Business Psychology, Trier, Germany (1)

Evaluative feedback is essential for team learning, especially after critical non-routine situations. However, feedback might act as a threat to the professional identity (role threat).

Purpose: In the present study, we examine (1) the effect of feedback-styles on perceived role threat, (2) the moderating effect of high/low team responsibilities, and (3) the effects of role threat on motivational and affective variables in following team tasks.

Method: We conducted a longitudinal, randomized experiment with three phases. First, role-responsibility was manipulated by role-assignments (senior team member: high responsibility, junior team member: low responsibility). Then, teams (N=60 dyads) experienced a successful mission, followed by an unsuccessful critical mission in a computer simulation task. Feedback-style was manipulated after the critical mission-phase (G1-threat condition: negative, non-specific feedback; G2-non-threat condition: negative, specific feedback; G3-control condition: no feedback). Validated scales measured role threat, motivational losses, self-esteem, and negative affect before the final mission.

Results: Results indicate role threat in G1 and G2, independently of feedback-specificity. More responsible team members report higher levels of role threat. Moreover, role threat is related to low self-esteem ($r=-.46$), negative affect ($r=.48$), and high fear of failure ($r=.50$).

Limitations: External validity is restricted due to the laboratory setting.

Implications: Feedback can trigger threat to roles during reflection of previous critical situations. In turn, motivational losses, low self-esteem, and negative affect might hinder team learning and adaptation in subsequent tasks.

Value: Understanding triggers and consequences of role threat will be used to develop appropriate strategies for dealing with and learning from critical situations.
It has been increasingly acknowledged that psychological capital (PsyCap), defined as positive psychological state of hope, efficacy, resilience and optimism, is an important intangible resource, which positively influences work satisfaction and well-being (Luthans, Avolio, Avey, Norman, 2007; Chen, Lim, 2012). Yet, the nature of its underlying mechanisms is subject of continued debate (Newman, Ucbasaran, Zhu, Hirst, 2014). Drawing from research on positive organizational behavior, which successfully established the mediating role of positive affect (Rego, Sousa, Marques, Pina e Cunha, 2012a, 2012b, Baron 2008), we introduce entrepreneurial passion as underlying mechanism of PsyCap (Cardon, Wincent, Singh, Drnovsek, 2009). The purpose is to promote PsyCap as untapped resource and important antecedent to develop passion and persistence (Cardon, Foo, Shepherd, Wiklund, 2012).

This study is based on a national sample of social entrepreneurs, from which 177 qualified responses were gathered via an empirical online survey. Validated scales were used for PsyCap (Luthans et al., 2007) and entrepreneurial passion (Cardon, Gregoire, Stevens, Patel, 2013).

We expect results to prove a positive mediating effect of the three dimensions of entrepreneurial passion on the relationship between PsyCap and persistence. To postulate these relationships our study is theoretically based on the broaden and build theory (Fredrickson, 2001).

Preliminary results seem promising, even though the study is limited to a narrow sample of social entrepreneurs from Germany.

Our study substantially contributes to the understanding of mechanisms through which PsyCap influences work outcomes and thereby answers research calls to examine its interplay with passion (Newman et al., 2014). While PsyCap seems especially relevant for entrepreneurs (Hmieleski, Carr, Baron, 2015), to our understanding no study ever focused on its relevance for the emerging field of social entrepreneurship (Dacin, Dacin, Tracey, 2011). Hence the value of our study is to help (social) entrepreneurs and practitioners to understand PsyCap as important intangible resource to foster passion and persistence.

Word count (excl. title, authors and citations2): 250

________________________________________________________________________________________

2 Reference list upon request
It has been increasingly acknowledged that psychological capital (PsyCap), defined as psychological state of hope, efficacy, resilience and optimism, positively influences employees’ performance (Luthans, Avolio, Avey, Norman, 2007; Newman, Ucbasaran, Zhu, Hirst, 2014). Interestingly, Chen and Lim (2012) found this positive effect also holding true for displaced employees, for whom PsyCap increases perceived employability and job search. Until now however, the question remains unanswered on how PsyCap can be enhanced among job seekers. As findings in positive organizational behavior research suggest a contagious effect of PsyCap (Luthans, Youssef-Morgan, 2017; Peterson, Luthans, Avolio, Walumbwa, Zhang, 2011), it needs to be tested whether job seekers benefit from their counselors’ PsyCap. This study’s purpose is to demonstrate a potential contagious effect of counselors’ PsyCap on job seekers’ PsyCap.

The sample is drawn from a national unemployment agency in Germany. Data will be gathered until November 2018 via empirical online surveys to 180 employees and paper-based surveys to their job seeking clients. Response-rate is currently 52%.

We expect results to prove a positive effect of counselors’ PsyCap on a) job seekers’ level of satisfaction and b) job seekers’ PsyCap.

Results however, are limited being solemnly based on one unemployment agency.

This study will contribute first by answering the research question by Chen and Lim (2012) regarding antecedents of job seekers’ PsyCap, thereby providing practical implications for federal agencies to systematically build counselors’ PsyCap. Second, it will provide theoretical support for contagious effects of PsyCap, being the first study to include the counselor—client level.

The value of our research is to close the gap between research on contagious effects of PsyCap and research on reemployment.

Word count (excl. title, authors and citations): 250

Purpose
The main aim of this study was to contribute to the development and Italian validation of the Multi-
dimensional Interview Self-efficacy scale (MDISE). Following the assumptions of social-cognitive
theory, self-efficacy is a more robust predictor of human behaviour and performance when it is
assessed at high level of specificity (Bandura, 1997). Thus, Interview self-efficacy (I-SE) could be
considered a major predictor of performance in the selection interview (Tay, Soon & Van Dyne, 2006)

Methods
MDISE, General and job search self-efficacy, personality traits and interview performance were
measured in a sample of 170 graduates from one of the largest Italian universities, involved in a
simulation of a selection interview.

Analyses and results
Exploratory factor analysis showed a 5-factor and 26-item structure for MDISE (preparation for
interview, self-promotion, anxiety management, relation, logistic). Furthermore, analysis showed a
good reliability and criterion validity.

Limitations and Implications
Future studies may involve a larger sample including more experienced job seekers.
On the practical side, MDISE scale offers an accurate tool for training activities aimed in develop I-SE
and provides guidance practitioner with the opportunity to assess and develop specific facets of I-SE.

References
success: A longitudinal study of the mediating effects of interviewing self-efficacy and the moderating
Purpose and originality. The topic of organisational justice and its relationship with wellbeing and mental health of employees has garnered immense attention. Although justice research has linked organizational injustice to stress-related outcomes, very few have investigated the intervening mechanisms underlying the justice-burnout relationship. Adopting a newly developed justice scale by Colquitt, Long, Rodell, & Halvorsen-Ganepola (2015), which is first to measure both justice rule adhere (i.e. justice) and justice rule violation (i.e. injustice), this study investigated the extent to which employee’s overall justice perceptions (i.e. distributive, procedural, interpersonal and informational justice) impact on their burnout level. Specifically, the empirical study investigated if emotional labour (i.e. surface acting) mediates the process of which organizational injustice influences worker’s level of burnout, and whether emotional intelligence, act as a moderator that attenuates the injustice-burnout relationship.

Design/Methodology /Approach/Intervention. A cross-sectional survey design was used. A total sample of 188 employees (i.e. in China and the United Kingdom) completed the survey and Partial least squares (PLS) was used to analyze the data.

Results. PLS path modeling analysis indicated that justice perceptions were negatively related to burnout and emotional labour partially mediated the justice-burnout relationship. Interestingly, emotional intelligence moderates the relationship between organizational justice and job burnout in such a way that emotional intelligence strengthens the influence of organizational unfairness on burnout.

Limitations. This study used a cross-sectional survey design.

Research/Practical Implications. Our findings have implications for research on organizational justice and essential for informing best practices and interventions to improve employees’ mental health.
TRUST AND SAFETY PARTICIPATION: CO-WORKERS’ SAFETY CLIMATE MATTERS

Anna Paolillo (1) - Silvia A. Silva (2)

Kingston University - Kingston Business School, Management, Kingston upon Thames - London, United Kingdom (1) - ISCTE-IUL, Human Resources and Organizational Behavior, Lisbon, Portugal (2)

Purpose

Previous research found that if employees trust their leader, the first ones believe the information they are given, and are more likely to reach positive conclusions about the importance of safety. The aim of the present study was to add the role of co-workers to the above finding, by exploring the mediating role of group safety climate (supervisor and co-workers) in the relationship between trust in communication and safety participation behaviours.

Methodology

A total of 430 blue-collar workers in 35 departments answered a questionnaire covering trust in communication, supervisor’s and co-worker’s safety climates and safety participation behaviour. Data were analysed with structural equation modelling, using the group level of analysis.

Results

Results showed that group safety climate partially mediates the relationship between trust in communication and safety participation behaviours, but the effect of co-workers’ safety climate is stronger than the one of supervisor’s safety climate.

Limitations

The first limitation of the study was the cross-sectional measurement; a second limitation was the single source nature of the data.

Practical implications

Organisations should build trust within their communications towards employees and among peers if they want to improve their safety cultures; in doing so, the role of co-workers should be more explicitly considered to make the employees put an extra effort and actively promote safety instead of solely adhering to accident preventing measures.

Originality

This is the first study to explore the role of co-workers as a possible link between trust and safety instead of focusing on the supervisor’s role only.
663 - JOB BOREDOM AND THE NEGATIVE EFFECT OF INTELLIGENCE ON JOB SATISFACTION

Konrad Kulikowski (1) - Yoav Ganzach (2)

Jagiellonian University, Institute of Psychology, Kraków, Poland (1) - Tel Aviv University, Coller School of Management, Tel Aviv, Israel (2)

Purpose

The negative effect of intelligence on job satisfaction when control for job complexity is well documented (Gonzalez-Mulé et al., 2017, JVB) but the reason of its occurrence is still not clear. The most popular explanation for this effect is that it is due to unmet occupational aspirations (Converse et al., 2016 JOOP; Ganzach, 1998, AMJ; Gonzalez-Mulé et al., 2017). We advocate a different explanation suggesting that this effect is due to of a positive effect of intelligence on job boredom.

Approach

SEM and bootstrapping were used to test the direct and indirect effects of intelligence on job satisfaction, as jointly mediated by job complexity, job boredom and occupational aspirations. We used data of 1319 participants of the Longitudinal Study of American Youth: intelligence and occupational aspirations data collected when participants were finishing high school (age about 18 y/o) and job complexity, job boredom and job satisfaction data from last available point of measurement in 2011 (about 40 y/o).

Results

Job boredom but not occupational aspirations mediates the negative effect of intelligence on job satisfaction.

Limitations

Our analysis based on data collected from only high school graduates from one country.

Research Implications

Our findings help to understand the role of intelligence in formation of job satisfaction, a topic of particular importance as contemporary workplace becomes more and more cognitively demanding.

Originality

To the best knowledge this is the first empirical test of the joint role of job boredom and occupational aspirations in the negative effect of intelligence on job satisfaction.
The purpose of this study was to investigate factors that might influence the experience of conflict between work and private life, among younger employees within local public authorities, primarily the welfare sector. Many of its occupations are quite demanding and but often regarded as low status jobs. The majority of employees are women. The experience of conflict between work and private life is nowadays acknowledged as an important factor related to well-being. The study was carried out as a web-based questionnaire to 440 employees up to the age of 30 years, containing questions about work-life conflict, various work-related factors, as well as if, and how, stereotypic views of their occupations from society was experienced. Women displayed more work-life conflict than men did, but having children had no effect. Although the other factors did not display any gender differences, how these factors related to work-life conflict differed, with a greater dispersion of factors of importance among women. Noteworthy is that different aspects of stereotypic views in society was related to work-life conflict for men and women. The study took place in a relatively sparsely populated region in Sweden, and among fairly young people, which is of course a limitation. However, as there are significant challenges to find qualified staff in such regions the present results shed some light on what young men and women need in order to feel comfortable at work in such places.
665 - THEORETICAL AND PRACTICAL PERSPECTIVES ON DIGITAL LEADERSHIP DEVELOPMENT

Ann-Louise Holten (1) - Anne Bøllingtoft (2) - Mari-Klara Stein (3)
University of Copenhagen, Department of Psychology, Copenhagen, Denmark (1) - Aarhus University, Department of Management, Aarhus, Denmark (2) - Copenhagen Business School, Department of Digitalization, Copenhagen, Denmark (3)

Purpose
Our study investigates two questions: (1) which skills are relevant for leaders to learn in a time of digitalization and rapid change and (2) which leadership development processes can overcome traditional learning barriers of transfer, contextualization, and personalization. In response to these questions, we propose a digital leadership development programme containing both novel content and methods.

Design/Methodology/Approach/Intervention
Building on recent leadership development research, the content of our training programme focuses on the development of open meta-skills (reflection, transfer, feedback, and informing). As opposed to closed skills, meta-skills are adaptable to the individual leaders’ specific situations and therefore relevant in increasingly volatile and digital environments. With regards to methods, the training programme offers contextualized and personalized training through various learning mechanisms.

Results
The digital leadership training programme will be implemented during the spring of 2019. Leaders in SMEs (10-250 employees) are the target group for the first implementation.

Limitations
All intervention studies have potential selection and attrition biases, which we address through purposeful randomization and statistical control.

Research/Practical Implications
Our study provides both a practical tool and theoretical advances for leadership development in the digital age. We investigate how digital tools can be used to effectively train leaders in relevant and adaptable leadership skills.

Originality/Value
Little is known about (1) how to develop leadership skills relevant for the digital age and about (2) the potential impact of digital training methods on leader performance. Our study offers new theoretical insights regarding the former and empirical evidence regarding the latter.
667 - REDUCTION OF WORKING HOURS AND ITS RELATION TO HEALTH, EFFICIENCY, AND COMPANY ATTRACTIVENESS

Ulrika Danielsson (1) - Ingrid Zakrisson (1)
Mid Sweden University, Department of Psychology, Ostersund, Sweden (1)

The aim of this study was to evaluate an organizational development intervention in a housing company through the reduction of working hours, and how this relate to health, efficiency, and company attractiveness. The working hours were reduced from eight to six hours a day, with retained salary, but without increasing the workforce. The project runs for 18 months during 2018-2019. It is well known that work-life imbalance effects individuals’ health, such as stress and sleeping problems. Another ambition with the project is to increase the efficiency as well as the attractiveness of the company. The main collection of data will generate longitudinal data through questionnaires before, midway, and at the end of the project period. These are accompanied with interviews on specific topics emerging under ways and other data, for example company statistics. The presentation will report results after the first year of the project. Among other things, the sick leave rate decreased dramatically during the first half year. To date, knowledge in this area is limited. However, people in modern society seem to value life outside work more. At the same time, increasing use of information and communication technologies (ICT) presumably makes it possible to work more efficiently, making reduced working hours possible. Although the limited scope of the present study, investigating a single company with only about 60 employees, against this background the results may shed light on an important shift in how to think about working life.
671 - THE DEVELOPMENT OF PERCEIVED EXTERNAL EMPLOYABILITY:
DOES A MATTHEW EFFECT BETWEEN LESS AND HIGHER EDUCATED EMPLOYEES REALLY OCCUR?

Ellen Houben (1) - Ilke Grosemans (1) - Eva Kyndt (1) - Nele De Cuyper (1)
KU Leuven, Leuven, Belgium (1)

Purpose. Perceived employability (PE) entails an individual’s perceived chance of employment in the external labour market. Previous research found that less educated individuals perceive themselves as less employable, while they are increasingly vulnerable for precarious employment and working conditions. As PE might change over time, the concern about potential growing inequities between less and higher educated individuals (i.e., a Matthew effect) arrises. Accordingly, the current study investigates whether a gap between less and higher educated individuals concerning PE exists and whether this gap increases over time.

Method. We conducted multiple group analyses with latent growth modeling, based on three-wave self-report survey data spread over one year. The sample consisted of 1316 Dutch wage earners and was stratified based on educational level and age.

Results. Consistent with broader literature, lower educated individuals experienced lower PE than higher educated individuals. Yet, against expectations, their PE increased more rapidly than the higher educated employees’ PE.

Limitations. This study does not explain why PE increases more rapidly for less educated individuals. Yet, in a next step, their work-domain goal orientation will be accounted for to obtain better insight in the explanatory mechanisms of this phenomenon.

Conclusions. This study contradicted the risk for a Matthew Effect of growing inequities in PE between the less and higher educated, as the initial gap between these groups reduces over time.

Originality. Although previous research hinted at significant, and increasing, differences between specific labour market groups, this study actually addresses the potential Matthew effect in employability between less and higher educated individuals.
Purpose: The purpose of the study is to contextualize the concept of engagement as a situated practice. We examine employees experiences of engagement in a technology firm ‘Techco’. Such work environments are designed to be fun, highly engaging and productive. We explore what engagement means, and what performances are required – both in terms of behaviours and related identities, in such contexts. We conclude by reflecting on ideals for engagement and related identities in contemporary workplaces.

Design/methodology: A mixed methods study involving qualitative interviews and use of the Utrecht Work Engagement Scale within one company. Interviews were analysed using discourse analysis to explore how employees construct their experiences of engagement and disengagement at work paying particular attention to how ‘ideal’ performances of engagement are experienced, enacted, or resisted.

Results: Our analysis uncovers how ‘engagement’ is discursively constructed and how that functions to normalize particular work practices and expectations for work performances. We explore how individuals fulfill expectations for, and identities around, being an ideal engaged worker in contemporary workplaces.

Limitations: This study is situated in one company and thus the findings are specific to that context. However, our conceptual argument is to present a situated account of engagement which may then be used as a lens for looking at other occupational groups/organisations.

Research/practical implications: Moves the theoretical focus on ‘being’ engaged to ‘performing’ engagement in situated contexts. Thus addressing recent calls for a better understanding of the construct of engagement (see Bailey et al 2017; Truss et al 2013).

Originality/value: To consider engagement not just as a psychological state but as a situated performance.
The 4th Industrial Revolution revamped the discussion about the future of work and its impact on human capital. Even the most conservative industries, such as the legal sector, are forced to move towards disruptive innovation to meet customer and market demands (Harper, 2013, Mottershead, 2010).

The application of Data Analysis and Artificial Intelligence (AI) in the legal sector can contribute to a paradigm shift on how the work can be performed. AI platforms can replace analytical and routine tasks and increase efficiency.

A case study of AI implementation in a Portuguese law firm will be presented. We analyze the total amount of billable hours registered, from 2015 through 2017. Subsequently, those hours were categorized in routine or non-routine tasks.

Data visualization techniques, such as tree maps, were used to support the analysis and establish the full potential of automation of lawyer’s tasks. Additionally, data was grouped according to lawyers’ professional levels to assess the degree of impact of automation in different career stages.

Will lawyers be fully replaced by automated machine learning algorithms? Some studies have shown that the impact on lawyers' functions is non-significant (Remus & Levy, 2016). But there is literature that suggests a set of tasks that can be fully automated, impacting the nature of working hours and employability substantially (McKinsey Global Institute, 2017; Susskind, 2008).

This communication explores the changes occurring in the legal profession, in relation to the reshaping of work, career prospects, and skills required for career success.
Annemiek van der Schaft (1) - Xander Lub (1) - Beatrice Van der Heijden (2) - Omar Solinger (3)

Breda University of Applied Science, Breda, Netherlands (1) - Radboud University, Institute for Management Research, Nijmegen, Netherlands (2) - Vrije Universiteit Amsterdam, Amsterdam, Netherlands (3)

This paper explores the socially oriented employee sense-making process, influencing psychological contract evaluations throughout a process of emerging organizational change. Although social relations are a key focus in the original social exchange theory as described by Peter Blau (1964), this aspect is largely overlooked in the psychological contract literature. This qualitative study explores the recollection of events over time in the context of digital transformation (a so-called ‘bricks-to-clicks’ revolution) in Dutch travel organizations. Our aim is to gain more insight into the social complexity of change in the psychological contract. The findings of this empirical study provide new insights into how employees collectively make sense of this digital revolution resulting in an ongoing adjustment of the psychological contract at individual, relational, and collective levels. In particular, they reveal how social context takes center stage in the unfolding psychological contract evaluations throughout change. Social exchange evolves across a sequence from community-based interactions (i.e., kindness and sharing as the dominant interactions), to equity-focused interactions (i.e., vigilance about equity in social exchange), to interactions aimed at personal gain or aversion of loss.
SENSE OF DUTY AND WELLBEING: THE EFFECT OF CULTURE AND RELIGION ON THE QUALITY OF WORKING LIFE OF TURKISH WORKERS

Zeynep Mercan (1) - Darren Van Laar (1) - Simon Easton (1) - Zarah Vernham (2)

University of Portsmouth, Psychology, Portsmouth, United Kingdom (1) - University of Portsmouth, Psychology, Portsmouth, United Arab Emirates (2)

Purpose – In this paper the factors affecting the perceived Quality of Working Life (QoWL) in Turkey, a Muslim majority, and community based culture are explored. This research was undertaken to understand how the QoWL Turkish employees might differ from the prevalent Anglo-American conceptualisations.

Methodology – Semi-structured focus group interviews were conducted with 42 people in six groups, from a large city council in Turkey. Data collection followed the directions of Glaserian grounded theory and data were analysed using applied thematic analysis with an inductive perspective.

Result – Two main religious/cultural factors were found to have a significant positive effect on the QoWL of Turkish council workers: Sense of duty and Religion as a source of support. One further factor was found to have a significant negative effect: Religiosity as a source of Stress.

Limitations – The study was conducted in a single, medium sized city council where most participants shared a similar cultural identity.

Research/Practical implications – This study suggests that the current Anglo-American conceptualisation of QoWL is not sufficient to assess the wellbeing or stressors in Muslim based or non-western cultures. Any organisations wishing to optimise the experience of employees in such contacts need to fully appreciate this.

Originality/value – This is the first qualitative paper on the QoWL of employees in Turkey that has explored the effect of culture and religion on QoWL within a theoretical framework. A new factor underpinning QoWL in such contexts was identified, which will be of interest to international employees.
Social enterprises are typical organizations working for ‘the greater good’. The definition used here is that these organizations have as primary goal to generate social impact rather than profit for the company’s owners or shareholders (Sacchetti and Campbell, 2014).

The number of such enterprises is growing. In the Netherlands alone, research estimated a growth from 4000 social enterprises in 2011 to 6000 in 2016 (McKinsey, 2016). But despite their upcoming number, many of these enterprises experience difficulties in scaling-up and expanding their impact (eg Clark 2012). 70% of the social enterprises in the Netherlands is in a seed or start-up phase, and only 30% reached the later stages of growth (McKinsey 2016). This study explores why so little social enterprises are able to scale-up.

This presentation summarizes findings from 20 interviews with social entrepreneurs, that were held in 2017 and 2018 as part of three different projects. The interviews focused on barriers that were experienced in practice. The study is limited to enterprises that aim to create job prospects for vulnerable groups. In the Netherlands, 60% of the social enterprises fall into this category.

The results show many barriers, some of which are similar to barriers in ‘regular’ small businesses. But whereas in regular businesses much could be gained by increasing efficiency, this contradicts with the social mission of many enterprises in this study, where they want to allow people to (re)start working on their own pace. We’ll present barriers in relation to: the entrepreneur and his/her skills, the business model and the workforce.
Purpose: To describe and explore emotional leadership meta-resources based on traits (self-esteem, emotional intelligence, leadership intelligence, empathy, Big Six, narcissism) and coping resources (e.g. cognitive), using Hobfoll’s motivational Conservation of Resources (COR). Our hypothesis was that leadership resources would be positively related to work engagement and negatively to perceived stress.

Methodology: Participants (N = 344) were leaders aged between 23 and 65 years (M = 49, SD = 8.6; 58% women) who completed an online questionnaire including measures of common traits and coping resources. Work engagement was measured by Utrecht Work Engagement Scale (UWES-9; Schaufeli & Bakker, 2004), and stress by Perceived Stress Scale (PSS-10; Cohen & Williamson, 1988). We used an exploratory factor analysis approach to describe and structure our data, and structural equation modelling (SEM) to test whether an emotional leadership meta-resource factor would be positively related to work engagement and negatively to perceived stress.

Results: The investigated traits and resources could be described along four broad emotional leadership resource factors: (1) Externalizing; (2) Moral goodness; (3) Destrudo; (4) Rational mastery. As expected, the emotional leadership meta-resource factor showed a strong convergence (~.80) with both work engagement (positively) and perceived stress (negatively).

Research/Practical Implications: The results imply that organizations may strengthen work engagement and reduce stress by recruiting leaders possessing valuable emotional leadership resources.

Originality/Value: Our study is the first to describe emotional leadership resources based on traits linked with work engagement and perceived stress in a novel fashion (meta-traits, based on structural trait analysis).
681 - DESTRUCTIVE LEADERSHIP IN CRISIS MANAGEMENT

Maria Fors Brandebo (1)
Swedish Defence University, Department of Security, Strategy and Leadership, Karlstad, Sweden (1)

Purpose
This paper reports the results of a qualitative study aiming to increase the knowledge of destructive leadership in crisis management. The specific research questions were (1) What kind of destructive leadership behaviors can be identified in leaders in crisis management?, and (2) Is there a difference between destructive leadership behaviors during everyday conditions compared to during accidents and crisis?

Design/Methodology
Data were collected by interviews. Twenty-one individuals involved in crisis management in Sweden at a regional (county administrative boards), local (municipalities), and operative (police, emergency service) level participated in the study. Data were analysed using a Grounded theory-approach.

Results
The results show that seven destructive leadership behaviors can be identified in the crisis management context: (1) Over controlling, do not involve others, (2) Lack of decisiveness, avoids responsibility, (3) Unclear, (4) Becomes stressed, (5) Egocentric, (6) Threatens, punishes, and (7) Do not show respect and understanding. Destructive leadership behaviors are present during everyday conditions but appears, in some cases, to intensify during crisis management (stressful conditions). Behaviors that are considered constructive during everyday conditions may be perceived as destructive during crisis management, and vice versa. The results also show that it is difficult for subordinates to destructive leaders to gain organizational support if their leader is a recognized and efficient crisis manager.

Research/practical implications
The results presents behaviors that are considered destructive in the crisis management context. The results also shed light on how subordinates interpretation of the leader’s intent influences their interpretation of the leader’s behavior as destructive or constructive. The study also contributes with context-specific knowledge on what and why certain behaviors are considered destructive in the crisis management context. Another conclusion is that leadership ideals in the crisis management context may contribute to leaders using destructive leadership behaviors.

Originality/Value
Most studies on leadership in crisis management has focused on how well leaders collaborate and solve the crisis. This study focuses on how the relationship between the leader and his/her subordinates is affected by the leader’s destructive leadership behaviors.
CAREER PROFILES OF EMPLOYEES: HOW TO CREATE SUCCESSFUL, SATISFYING AND HEALTHY CAREERS USING CAREER RESOURCES

Madeleine Haenggli (1) - Andreas Hirschi (1)
University of Bern, Work and Organizational Psychology, Bern, Switzerland (1)

Purpose: Nowadays, careers are less structured and predictable due to changes in the work environment. Thus, personal resources become more important because employees need to actively manage their careers. In this study we aim (1) to identify different profiles of career resources, (2) to examine patterns of resources that typically occur together, and (3) to investigate the effect of the specific career resources knowledge and skills, motivation and environment on outcomes.

Design: We conducted a longitudinal study with 1'570 employees at T1 and estimated 350 employees at T2 one year later. To validate the profiles, we use a cross-sectional dataset. To test our hypotheses, we used latent profile analysis.

Results: Results show that different profiles of career resources exist. Further, these career resource profiles can be predicted by personal and contextual antecedents. Additionally, the identified career resource profiles predict career-related outcomes, such as career and life satisfaction as well as perceived stress and exhaustion.

Limitations: We exclusively relied on self-reports and cannot claim causality based on our longitudinal data.

Implications: We discuss theoretical as well as practical implications that further advance our understanding on “when, how, and for whom” different career resources are developed and result in successful careers. Moreover, assessing probable resource caravans seems to be an important step for further research and practice.

Originality: This study adds to the conservation of resources theory on career resources by taking a person-centered approach as a complement to the more traditional variable-centered approach.
Purpose: The aim of this presentation is, by showing the results from interviews with line managers and safety representatives within one large university in Norway undergoing an organizational health intervention process, to suggest what the line managers and safety representatives need and has to provide for a successful intervention project using the IGLO-model. We would like to contribute to more understanding of how the line managers and the safety representatives experience their own role, cooperation and intervention behavior, and finally how they are influenced by the context. Nielsen and Miraglia (2016) suggest that a more in-depth understanding of the content and process mechanism of interventions could help improve the outcomes related to employees’ wellbeing and health, and that the context would determine if these mechanisms are triggered or not. We will therefore use the IGLO-model to understand how the line managers and safety representatives are influences by the context throughout the five phases of the ARK-intervention.

Design: Findings are based on results from 20 semi-structured qualitative interviews with line managers and 14 safety representatives in one large Norwegian university. ARK is a comprehensive research based plan and tool for 1) systematic mapping of the psychosocial work environment and 2) development and implementation of interventions for improving well-being, health and performance (Innstrand et al., 2015). ARK is built on the suggested five phases of Nielsen et al (2010) as a framework for the processual work with organizational development including 1) initiation, 2) screening, 3) development of interventions, 4) implementation of interventions, and 5) evaluation of interventions.

Results and conclusions: The line manager is important and crucial for successful interventions in all the five phases. Line managers can make or break an intervention, but they might not always be the villains of the piece. The line managers underlined the importance of the cooperation and trust between the safety representative and themselves in a successful process. The respondents reported challenges working with a bottom-up profile trying to develop concrete interventions based on assessments of abstract psychological concepts in survey measures. Context plays an important role, and resources at all four IGLO-levels: 1) The leader’s and safety representatives own personal resources, 2) the resources inherent within the work group 3) the support of senior management and 4) the organisational context. A more in-depth understanding of how the context influences the actions of the line managers and the safety representatives will make it easier to develop the most constructive framework regarding training, tools and support systems for organizational health intervention processes.
Keywords: Occupational health interventions, participation, psychosocial work environment, safety representatives, line managers

References:

This paper studies the phenomena of ‘gay and lesbian entrepreneurship’ by showing how gay and lesbian entrepreneurs engage in complex identity work within their entrepreneurial contexts. The outcomes of our empirical work demonstrate that the sexuality of lesbian and gay entrepreneurs is an important aspect in their entrepreneurship and vice versa. Sexuality plays a significant role in terms of their motivations, the entrepreneurial key success factors and barriers that homosexual entrepreneurs experience. Analysing life-stories from an intersectionality perspective, we are able to illustrate how such entrepreneurs conduct their entrepreneurship in relation to their sexual identity and vice versa. The outcomes of our analysis demonstrate how these minority entrepreneurs in our study have to react to dominant societal ideas concerning ‘the entrepreneur’, being masculine, heterosexual and male, and ‘the homosexual’, being feminine, weak and different.

Our study contributes to the scholarly literature on entrepreneurship and sustainable careers in several ways. First, very few studies have been devoted to this particular group of minority entrepreneurs to date. Second, it does not only cross-validate earlier findings on homosexual entrepreneurship, it also adds knowledge on how homosexual entrepreneurs develop their entrepreneurial careers and how this is being done at the intersections of sexuality and other important social identities. Finally, this study adds to insights concerning inclusive workplaces and the literature of sustainable careers, by demonstrating how a group which is often excluded in society as well as on the workplace takes agency to actively participate as self-employed workers.
Purpose

It has been suggested that leaders are able to transfer their emotions to their followers and that this can account for a range of important organisational outcomes, including leader effectiveness and follower performance. However, to date there has been little understanding of the processes through which leader emotions are able to diffuse to followers. This project aims to address this lacuna by examining whether social appraisal processes can account for the leader emotion diffusion.

Design/Methodology

This longitudinal study was conducted with employees of a manufacturing organisation in China. On 3 occasions over 2 years, 100 team leaders and 457 team members were asked to rate their appraisals of, and emotional responses to, ongoing organisational change. They were also asked to their rate their perceptions of the appraisals and emotions of their team leader or team members (as appropriate).

Results

We found evidence that team leaders and team members were reasonably accurate in their perceptions of their respective appraisals and emotions. Importantly, there was evidence that leaders’ emotions diffused to their followers via social appraisal. Specifically, team members’ appraisals of the change were influenced by those of their leader, and over time this resulted in an increased alignment in their emotions.

Limitations

The longitudinal design is limited by endogeneity issues.

Research/Practical Implications

Through this programme of work, we hope to understand how leaders influence the emotions of their followers and why this matters for organisations.

Originality/Value

This is the first test of the role of social appraisal in leader-follower emotion diffusion.
THE IMPORTANCE OF EMPLOYEES’ JOB-RELATED PSYCHOLOGICAL NEEDS FOR BLENDED WORKING

Burkhard Wörtler (1) - Nico W. Van Yperen (1) - Kiki M. M. De Jonge (1) - Eric F. Rietzschel (1)
University of Groningen, Groningen, Netherlands (1)

Purpose
The opportunity to seamlessly blend on-site and off-site working (i.e., blended working) is enabled by the availability of continuously improving ICTs that provide employees with almost constant access to job-relevant information and coworkers. The aim of our research was to examine when blended working is likely to entail desirable outcomes by focusing on the role of employees’ job-related psychological needs.

Design/Methodology
We conducted two independent cross-sectional survey studies. We recruited a sample of 348 and 657 employees for the first and second study, respectively.

Results
In the first study, we found that employees low in need for relatedness and structure, and high in need for autonomy, tend to perceive blended working to be effective for them. In the second study, we obtained evidence that the perceived opportunity for blended working can maintain employees’ intrinsic work motivation when quantitative job demands are high, given that employees have a strong job-related need for autonomy.

Limitations
The design of both studies denied conclusions about causal relations between the variables.

Research/Practical Implications
Our findings contribute to the literature by highlighting the importance of fit between work context and employees’ psychological needs. We recommend to practitioners in organizations to consider employees’ psychological needs to decide for whom blended working is likely to be advantageous, rather than adopting a ‘one-size-fits-all approach’ by offering the opportunity for blended working to the entire workforce.

Originality/Value
We provide evidence that blended working may be a contemporary resource for employees, yet individual differences in job-related psychological needs are likely to influence its usefulness.
Purpose: Based on premises from socioemotional selectivity theory (Carstensen et al., 1999), this study investigates the salience of distributive, procedural and interactional justice to three different age groups: younger (20-34), middle-aged (35-49), and older (50+).

Methodology: We conducted semi-structured interviews of 56 employees: 21 white-collar employees of a multinational company, 17 teachers from an international school, and 18 blue-collar workers from several occupations. The interviews were content analyzed using MaxQDA.

Results: The age groups differed in the salience of justice and its specific dimensions: 1) the older group mentioned justice the most; 2) interactional justice was the dimension mentioned most by all age groups, followed by procedural justice, with distributive justice mentioned the least frequently; and 3) interactional and procedural justice were mentioned more with increasing age, whereas distributive justice was mentioned more by younger employees.

Limitations: As differences among age differences are measured as a snapshot, we cannot infer lifespan changes in the salience of organizational justice and its specific dimensions.

Research / Practical Implications: Workforce ageing has made it paramount to understand what motivates older employees. As fairness perceptions are a key influence on work attitudes and behaviors, understanding how they differ among age groups can allow better tailoring of organizational practices and managerial behaviors.

Originality: This is among the first studies to focus on age differences in the salience of organizational justice concerns. The results are strengthened by the fact that participants responded to questions regarding motivation in general and were never specifically asked about justice perceptions.
Purpose

Law Firms feel increased pressure for adopting innovative practices that set them apart from their competitors. Advances in information technology, with emphasis on the use of 'Big Data' and Artificial Intelligence (Susskind, 2008; Lopes et al., 2016), propelled Law Firms to a spiral of development and permanent innovation. However, lawyers’ profile can be characterized as analytical, skeptical, introspective (Richard, 2010). Innovation is not among their strengths.

Design/Methodology /Approach/Intervention

For creating awareness in relation to innovation and to identify each lawyer strengths that can be assembled into an innovation cycle, a model that allows the identification of lawyers’ innovation role was developed.

Results

The proposed Innovation model is an orthogonal model consisting of two matrix axes: Ideas-Action and Individual-Interaction. The model is underlined by 36 competencies present in the Saville Focus Style Questionnaire, which is anchored in the Big Five model. Linear equations were used to obtain the four major innovation roles: Imaginative, Propeller, Intrapreneur and Implementer.

Limitations

The model is a theoretical approach. Further studies and statistical analysis are necessary.

Research/Practical Implications

This model has the advantage of creating lawyers’ awareness in relation to innovation and supporting balanced working groups that effectively lead innovation.
Purpose

The purpose of this study was to investigate the extent to which follower engagement is influenced by leader burnout, and to test the moderating role of followers’ psychological flexibility.

Design/Methodology

We collected data from different sources in a Norwegian public organization, resulting in 186 leader-follower dyads. The hypotheses were tested with multilevel analyses.

Results

Results indicated that follower engagement was influenced by leader burnout only when accounting for the moderating role of follower psychological flexibility. The form of the moderation suggests that followers with high (low) levels of psychological flexibility experience reduced (enhanced) engagement as a result of high leader burnout. High leader burnout may thus be particularly detrimental for followers engagement among the followers with high levels of psychological flexibility.

Limitations

Although we applied data from different sources, the data are still cross-sectional and it is not possible to draw causal inferences.

Implications

While high levels of psychological flexibility is usually considered positive, leaders should be aware of the complexity of the concept. Although high leader burnout seems to reduce engagement for highly psychological flexible followers, the findings may indicate the importance psychological flexibility places on accepting ongoing processes and acting according to ones values. Consequently, psychological flexible employees would adjust their behaviors according to situational demands.

Originality/Value

This study contributes to the stress and well-being literature by adding to the understanding of how leader strain influences follower well-being. Accordingly, our study contributes to clarify how the leader burnout–follower engagement relationship is contingent upon followers’ psychological flexibility.
ORGANIZATIONAL CLIMATE FOR SUSTAINABLE COMMUTING: THE ROLE OF PERSONAL AND ORGANIZATIONAL FACTORS IN SHAPING COMMUTING BEHAVIOURS

Marco De Angelis (1) - Guido Martinolli (1) - Gabriele Prati (1) - Luca Pietrantoni (1)
University of Bologna, Psychology, Bologna, Italy (1)

Purpose

Universities hold a crucial role in reshaping community behaviours and awareness in promoting sustainable transportation, promoting a sustainable organizational climate can support employees towards more sustainable behaviours, thus benefiting in terms of personal as well as organizational well-being.

The organizational climate for sustainable commuting (OCSC) is defined as the shared perceptions of and the meaning attached to the policies, practices, and procedures for sustainable commuting that people belonging to a same organization experience and the sustainable commuting behaviours they observe getting rewarded, supported, and expected (Schneider and Barbera, 2014).

In this study, we focused on deepening the understanding of how sustainable commuting behaviours are shaped by organizational and personal factors, focusing on organizational climate and identification.

Design/Methodology /Approach/Intervention

A sample of 3850 participants of a large Italian academic community responded to an online survey measuring attitudes, modal choice and perceived organisational climate and organisational identification. The research design is cross-sectional.

Results

Results highlight how personal factors (personal values, work-family aspects) are significant antecedents of sustainable commuting. Sustainable commuting behaviours are associated with organizational factors which in turn plays a crucial role in terms of personal well-being and satisfaction. Sustainable organizational climate may foster a modal shift across different commuting distances.

Limitations

Measures were self-reported and may be subject to reporting bias. The cross-sectional design precludes from causality or a chronological order of changes.

Research/Practical Implications

The present paper thus provides valuable knowledge on how to design tailored and diversified organizational strategies that favour sustainable commuting mode choices and organizational identification.

Originality/Value

In studying sustainable commuting to work, only a reduced number of studies have analysed the relationship between organizational climate, organizational identification and their corresponding behaviours in the field of sustainability.
Purpose: Gratitude, defined as a positive affective state in which an individual experiences general thankfulness and appreciation, has been linked to positive outcomes for individuals in a (i.e., well-being) across a wide array of contexts. Yet, we know very little whether and why gratitude may affect outcomes important for careers such as job search.

Design/Methodology/Approach/Intervention: Drawing on broaden and build theory and job search scholarship, the present study investigated the process through which gratitude influences job search behavior. One hundred and thirty-eight university students approaching the job market completed measures of state gratitude, perceived employability and job search behavior at the beginning and end of their last semester of school.

Results: As hypothesized, job seekers approaching the job market experiencing gratitude were more likely to hold positive perceptions of employability and subsequently engaged in more preparatory job search behavior. However, gratitude and favorable perceptions about employability are not enough on their own to predict active job search. Counterintuitively, post-hoc analysis revealed that high levels of gratitude can weaken the participatory to active job search.

Limitations: The 2-wave data consisted of self-reported measures.

Research/Practical Implications: Gratitude appears to be integral to the job search process through building individuals’ positive perceptions about employability. At the same time, at high levels, gratitude appears to hold individuals back from moving from preparatory to active job search.

Originality/Value: We extend research on gratitude by highlighting its applicability to careers and specifying its role in job search processes.
Purpose. Social inequalities in health are well documented in the epidemiological literature. There is overwhelming evidence that morbidity and mortality rise steadily with gradually decreasing social or socio-economic status. This inverse and graded relationship in individuals is consistently observed both with educational and occupational status and is commonly known as the social gradient (Hämming and Bauer, 2013). However, there are, to our knowledge, no studies on the social gradient in bullying at the workplace. Thus, it seems to us interesting to study the existence of socioeconomic inequalities in exposures to bullying at the workplace. The main aim of the study is to test the existence of a social gradient in bullying exposures. It is also to investigate the contribution of a wide range of physical and psychosocial work factors including work organization, working conditions, social relationships and job resources in decreasing or increasing social inequalities to bullying exposures.

Methodology. We base our work on a French occupational hazards survey known as SUMER 2010 (Surveillance Médicale des Expositions aux Risques Professionnels; Medical Surveillance of Exposure to Occupational Hazards), conducted from January 2009 until mid-2010. It surveys 2,400 occupational physicians (equal to more than 20 percent of occupational physicians working in France) and 56,314 randomly selected employees, of which 47,982 responded to the questionnaire. We use a step by step forward procedure with binomial logistic regressions.

Results. A strong social gradient is observed for the three forms of bullying. Work contract had a role on the association between occupation and bullying. The inclusion of work organization variables showed that the most important changes in ORs were observed after controlling for autonomy and skill varieties. These results have important theoretical and practical implications about the role of organizational initiatives for decreasing socioeconomic inequalities in exposures to bullying.

Limitations. The main limitation pertains to the cross-sectional nature of the study.

Research/Practical Implications. The results contribute to the debate on the consequences of HR practices on employees (Guest, 2017), providing some evidence on the conflicting results approach (e.g., Legge, 1995). Moreover, they have clear practical implications for the application of PM tools and practices and their effect on employee wellbeing.

Originality/Value. This is among the first studies to uncover the relevance of management practices for attendance behavior, especially for presenteeism that has mainly been studied from an individual-centric perspective.
708 - WORK PRECARIOUSNESS AND MISTREATMENT AT WORK

TAPAS RAY (1) - ANASUA BHATTACHARYA (1) - PAULA GRUBB (1)

CDC, NIOSH, CINCINNATI, United States (1)

Purpose

We investigated whether workers experiencing a high level of work precariousness were disproportionately exposed to stressors and at higher odds of being mistreated by coworkers or supervisors.

Design/Methodology/Approach

We used data from the Quality of Work life (QWL) module of the General Social Survey (GSS). We analyzed pooled cross sectional data from 2002, 2006, 2010, and 2014 (weighted sample of 5911 observations), and generated a work precariousness index by classifying variables into four components including temporariness, disempowerment, vulnerability, and wages. We used factor analysis to construct the work precariousness index. Based on the score from the index, we classified workers in three levels of precariousness including low, medium, and high. We used multinomial logistic regression to assess the relationship between mistreatment at work and level of work precariousness. Covariates included age, gender, marital status, race/ethnicity, education, overall health status, industry, and work arrangement type.

Results

Approximately ten percent of workers reported being mistreated at work. Controlling for covariates, we found that the likelihood of being mistreated at work was three times higher for workers experiencing a high level of work precariousness.

Practical Implications

We demonstrated a statistically significant positive association exists between work precariousness and mistreatment at work.

Originality/Value

As far as we know, this is the first study on this topic in the US context. Our findings are relevant for stakeholders, including policy makers.
Purpose. To investigate the relationship between the types and strength of organizational culture and the levels of staffs' ambiguity intolerance in educational organizations. The research was based on the S.Budner’s concept of ambiguity tolerance, Ch.Handy’s typology of organizational culture and L.Karamushka’s concept of psychological support for educational organizations.

Design. The investigation was conducted on a sample of 508 secondary school teachers from the central regions of Ukraine in 2017 using S.Budner’s Ambiguity Tolerance Scale, Ch.Handy’s Organizational Culture Type and Organizational Culture Strength questionnaire.

Results. The investigation found statistically significant relationships between the types of organizational culture and the components of teachers's ambiguity intolerance: a) a positive relationship(p <0.01)-between power culture and the levels of intolerance for complexity; between role culture and intolerance for insolubility; between task culture and intolerance to insolubility; b) a negative relationship(p <0.001)-between task culture and the levels of intolerance for complexity, power culture and intolerance for insolubility.

It was established that strength of organizational culture affects different components of ambiguity tolerance in different ways: a)negatively - on the ambiguity intolerance index (p<0.05) and on intolerance for complexity (p <0.001); b)positively - on intolerance for insolubility (p <0.05).

Limitations. The investigation included only secondary school teachers and its findings may be inapplicable to other professionals.

Practical implications. The obtained results can be helpful for organizational culture counseling and developing ambiguity tolerance training programs.

Originality. It was the first investigation in Ukraine into the relationship between secondary school teaching staff’s ambiguity tolerance and different types of organizational culture.
Purpose
We assessed the prevalence of work flexibility by work arrangement type among US workers during 2002-2014. We further investigated whether work flexibility was associated with work related well-being – job satisfaction, job stress, and health related quality of life.

Design/Methodology/Approach
We used data from the Quality of Work life (QWL) module of the General Social Survey (GSS). We analyzed pooled cross sectional data from 2002, 2006, 2010, and 2014 (weighted sample of 5911 observations). To understand work flexibility, we used the following variables: 1) Work schedule; 2) Telework; 3) Ability to take time off work for non-work matters; 4) Work demands; 5) Productivity-conducive work conditions; 6) Opportunity to develop special abilities; 7) Availability of help and equipment at work; and 8) Freedom to decide. We assessed the effect of work arrangement on work flexibility and the association between work flexibility and work related well-being.

Findings
Overall work flexibility changed minimally during 2002-2014 in the US, although some individual flexibility variables followed cyclical trends. Work arrangement was an important determinant of work flexibility. After controlling for demographics and overall health status, work flexibility was positively associated with well-being.

Practical Implications
The study demonstrated the importance of work flexibility for well-being and provided valuable information about flexibility by work arrangement type.

Originality/Value
As far as we know, this is the first study on this topic in the US context. Our findings are relevant for stakeholders, including policy makers.
RESISTING A REST: A SOCIAL-COGNITIVE APPROACH TO UNDERSTANDING WHY EMPLOYEES FORGO THEIR PAID VACATION DAYS

Melissa Stiksma (1) - Lauren Kuykendall (1) - Katie Guarino (1) - Karyn Warner (1) - Linden Hughes (1) - MJ Kolze (1)

George Mason University, Psychology, Fairfax, United States (1)

The purpose of this research was to test a social cognitive model of why employees use (or do not use) paid vacation days. While a meta-analysis demonstrates vacations provide physical and mental benefits (Bloom et al., 2009) and can reduce the risk of cardiovascular-related death (Gump & Matthews, 2000; Strandberg et al., 2018), approximately 52% of Americans had unused paid vacation days in 2017, forfeiting 212 million days (Project: Time Off, 2018). Very little is known, however, about why employees might forgo their paid vacation time.

Across three studies, we developed a model to explain why people do not take vacations. We drew upon social-cognitive theory to hypothesize that employees forgo vacations because of self-efficacy beliefs (i.e., their ability to detach from work while on vacation and to work effectively without rest) and outcome expectations (i.e., emotional, interpersonal, financial, and productivity-related consequences of vacation). We developed measures in Studies 1-3 to assess the relevant social-cognitive variables. In Study 4 we will test the model, and its organizational antecedents, in a 3-wave longitudinal study (final wave in January 2018). Preliminary results indicate our model, particularly detachment self-efficacy, explains a significant amount of the variance in proportion of vacation days used. Although this study only includes employees in the United States, these individuals demonstrate especially poor vacation-taking behavior compared to those in other nations (Ray, Sanes, & Schmitt, 2013). We expect our study, the first to comprehensively study this issue, will inform occupational health policies in government and companies around the world.
721 - DECISION-MAKING PROCESS OF CORRUPT BEHAVIOUR

M. Untung Manara (1) - Annika Nubold (1) - Suzanne van Gils (1) - Fred Zijlstra (1)
Maastricht University, Work and Social Psychology, Maastricht, Netherlands (1)

Purpose
Past research has mainly focused on demographics, personality, attitudes, or morality related variables to study the individual level of corruption. Based on normative decision-making theory, the present qualitative study aimed to identify the decision-making process of corrupt behaviour.

Design/Methodology
We conducted semi-structured interviews with 38 participants being convicted of corruption and imprisoned in Indonesia. The interview guide was developed based on a normative decision-making process: problem recognition, information search, evaluation, and choice (behaviour). Three coding steps from a grounded theory approach were applied to analyze the data.

Results
Results revealed that ‘assisting the corruption processes’ and ‘embezzlement’ were the most common corrupt behaviours. In the problem recognition process, the benefits of their corrupt behaviour were for the organisation, the general community, and their personal gain. In the information search process, participants mainly searched for information about the best way to engage in corruption among their colleagues in other organizations. In the evaluation process, ‘considering the corrupt behaviour as safe’ was the main reason why participants chose corrupt behaviour.

Limitations
Participants reported about their past corrupt behaviour. Therefore, we cannot rule out that cognitive reappraisal and justification processes lead to answers that differ from the original decision process.

Research/Practical Implications
Integrating the decision making literature into research on corruption can lead to new insights for corruption research.

Originality/Value
There are few studies about the steps of decision-making in corruption. Our study revealed these steps as a whole that could lead to a better understanding of corrupt behaviour.
723 - ENTREPRENEURSHIP AND ENTREPRENEURIAL EMOTIONS: A GENDERED PERSPECTIVE

Ingrid Chadwick (1) - Alexandra Dawson (1)
Concordia University, Montreal, Canada (1)

Purpose
Women are increasingly choosing to start their own business today, yet we know relatively little about the process through which female entrepreneurs pursue entrepreneurial opportunities. Our purpose is to understand how emotions affect the way female entrepreneurs perceive and manage the opportunities and challenges inherent in entrepreneurship, and what lessons can be learned for women aspiring to become entrepreneurs.

Design/Methodology/Approach/Intervention
Using a narrative method of collecting rich contextualized stories through interviews of female entrepreneurs (12 to date; 15 more planned), we systematically analyze our narratives through Burke’s (1968) framework that considers the act (what takes place?), agent (who acts?), agency (how is the act carried out?), scene (where does the act take place?), and purpose (why does the agent act?).

Results
This research sheds light on the double-edged sword of emotions in entrepreneurship whereby entrepreneurial emotions have both positive and negative implications for how women pursue entrepreneurship. Our results emphasize the need for scholars to think beyond the traditional entrepreneurial emotions that have mostly focused on male entrepreneurs.

Limitations
The inductive nature of our design prevents us from generalizing our results across populations.

Research/Practical Implications
Our results contribute to theory development on female entrepreneurship and offer insights regarding how emotions can influence entrepreneurs’ psychological and financial health.

Originality/Value
There is limited awareness of how emotions influence the entrepreneurial process in general and from a gendered perspective in particular. Our research contributes to this domain as one of the only process studies on female entrepreneurs’ perceptions and management of emotions.
Introduction: Challenges within the automotive industry make leadership styles a key factor, determining either the success or failure of a project. This study seeks to explore the effect of leadership program development for a group of manufacturing team leaders of an Italian factory.

Aim: We aimed to investigate team leaders’ responses to the leadership program such that team leaders continue to develop successfully new organizational strategies while reinforcing transversal skills and knowledge.

Methodology: To empirically evaluate this argument, we used a mixed method approach combining quantitative data with focus-group and interviews data. 28 supervisors were asked to fill online survey questionnaire to assess team’s effectiveness of 149 team leaders, 68 of them were on specific leadership training courses. Data were collected in four waves in 2017 and analyzed with SPSS 23.

Results: Pearson correlations were tested and Cronbach’s alpha coefficient was calculated to test the reliability of each scale. Independent T-test highlighted the difference between the two groups (p=0.00) and it shows the leadership development program had not a positive effect on team leaders. We founded that the effect of the leadership intervention on employees’ job performance indeed is lower.

Limitations: All data were collected within a single organization, which limits the observed variability and decreases external validity.

Practical implications: From a practical point of view the study results may inform the practices that organisations are developing.

Originality: We know especially too little about the significant limitation in leadership training.
Purpose. Employee physical activity is widely recognized to affect employee health and wellness, but there has been limited work to evaluate the implications of physical activity for job performance. We examined daily physical activity as a predictor of daily perceptions of personal initiative, creativity, and goal progress at work.

Methodology. University staff employees (N = 54) continuously wore research-grade actigraph devices tracking physical activity across a ten-day daily survey period. Daily personal initiative, creativity, and work goal progress were measured via a self-report afternoon survey that arrived each weekday at the end of the workday.

Results. Participants reported greater personal initiative ($z = 2.73$, $p < .01$), creativity ($z = 2.61$, $p < .01$), and work goal progress ($z = 7.47$, $p < .01$) on days in which they were more physically active (i.e., expended more kilocalories).

Limitations. Our model was statistically underpowered to explore lagged effects, which precluded our ability to evaluate mechanisms, such as work recovery, that may link daily physical activity to job performance.

Research / Practical Implications. The results of this study suggest that organizational efforts to increase employee physical activity may have consequences not just for health and wellness, but also for job performance.

Originality / Value. This is one of the first studies to evaluate how employee physical activity influences job performance. Furthermore, our emphasis on intra-individual relationships allowed us to gain a more nuanced view of the day-to-day co-variation of physical activity and job performance indicators than has been explored in past research.
Purpose

Workplace aggression is not confined to relations with colleagues or supervisors. It has been recognized that such behaviors can also emerge from customers, especially in service contexts. Previous studies indicate that customer aggression adversely affects employees’ moods, generating anger and depression. This study contributes to existing knowledge by investigating how employees’ personality traits relate to perceptions of customer aggression, testing as well the mediating role of customer orientation.

Design/Methodology

The study relied on a survey to collect information from high-school teachers. We distributed 794 questionnaires, which generated a 24.4% net response rate.

Approach/Intervention

The scales used in the study revealed good psychometric properties.

Results

The structural equation estimation provided substantial support to the research model. Specifically, the results revealed that customer orientation partially mediates the relationship between personality traits and customer aggression.

Limitations

The cross-sectional nature of the study and the reliance on a single source. Notwithstanding, we note that we applied procedural and statistical remedies, which suggest that common method variance is not a relevant issue.

Research/Practical Implications

The results suggest that organizations can rely on personality traits to select frontline employees in order to mitigate customer aggression problems, thus obtaining a better work environment and delivering a better customer service experience.

Originality/Value

This study innovates by relating the personality of frontline employees with customer aggression, and by considering the mediating role of customer orientation.
In terms of organizations has increased the debate on the importance of symbolic aspects need to humanize, based on trust (Antonello & Godoy, 2010). This way, the quality of an organization relies on collaborators, on the way they feel the company as their own. The changes imposed on public higher education institutions try to fit some management practices of the private sector, to the public organizations (Gioia & Thomas, 1996). Currently, all efforts are developed to increase competitiveness and promoting a better organizational performance, which leads to an increased awareness of the importance of human assets in organizations. A particular interest is the internal marketing, since it plays a relevant role in the motivation and personal development of employees, and contributes to an effective organizational communication. The work environment and the implications that this may have on the relationship between the worker and the organization. It is therefore important to understand the relationships between these themes and individual characteristics that promote better organizational performance. This research aimed to describe and identify how internal marketing contribute to explain organizational commitment. A quantitative analysis was developed with a sample of 600 workers from public organizations, collected through a questionnaire composed of two scales that allowed the analysis of each of the constructs. The results show explanatory contribution of internal marketing practices on affective and normative commitment, through written information. By the results workers are committed to the organizations, so interventions should be developed improving the affective commitment of employees.

Design/Methodology

In response to these urgent concerns of the Portuguese higher education institutions, we tried to deepen the understanding of organizational reality in the context of the Portuguese Public Higher Education.

Firstly, we considered a structural variable of the institutions, the Organizational Culture. We also examined the Perceived Organizational Support. The impact of these variables can be noticed at different levels, so the outcome variable considered is Organizational Commitment.

600 professionals of public higher education institutions compose the sample.

Results

Hierarchical multiple linear regression analyses revealed that internal marketing has a contribution on organizational commitment: affective (R² = 32.4%), instrumental (R² = 5.3%) and normative (R² = 14.1%).

Limitations

More studies are necessary to better understand the relationship between this variables in different areas

Research/Practical Implications
Further studies imply an increase of the sample and confirmatory analysis should be performed.

Originality/Value

The observed relationship between variables under study allowed us to better understand the realities that exist in Portuguese Public Higher Education.

Keywords: Internal Marketing, Commitment, Higher Education Institutions.
755 - WHY TWO BIRDS REQUIRE TWO STONES: PSYCHOLOGICAL SAFETY AND IMPACT AS DIFFERENTIAL PREDICTORS OF VOICE AND SILENCE

Elad N. Sherf (1) - Michael R. Parke (2) - Sofya Isaakyan (3)
University of North Carolina, Chapel Hill, United States (1) - London Business School, London, United Kingdom (2) - Rotterdam School of Management, Erasmus University, Rotterdam, Netherlands (3)

Purpose:
The literature on voice and silence often conceptualizes these behaviors as opposite ends of the same continuum. We challenge this conceptualization and argue that the two behaviors are distinct. That is, across issues and over times, employees have opportunities to speak up with ideas and concerns while also withholding other ideas and concerns and thus, they can have differing levels of voice and silence independent from one another. We further theorize that two core antecedents, psychological safety and impact, relate differently to voice and silence.

Method:
We provide support for our hypotheses across two studies. In Study 1, we test the between-person relationships among our four variables using meta-analytic techniques. In Study 2, we test our hypotheses at the within- and between-person levels, using panel data across 6 monthly measurement points.

Results:
Our results support the distinctiveness of voice and silence: (a) they correlate at a level indicative of independence (i.e., less than .30) and (b) psychological safety relates more strongly to silence than to voice, while impact relates more strongly to voice than to silence.

Limitations:
One limitation is that most of the studies in our meta-analysis did not include all four relevant constructs.

Research / Practical Implications:
Our paper shifts the conversation in the voice and silence literature from a discussion of whether voice and silence are distinct, to how and why voice and silence differ.

Originality / Value:
We provide a new perspective about the likely nature and causes of voice and silence.
HOW AMBIDEXTROUS LEADERS FOSTER TEAM INNOVATION: THE MEDIATING ROLE OF TEAM CLIMATE FOR INNOVATION

Josef Heribert Gammel (1) - Katharina Kugler (1) - Felix Brodbeck (1)
Ludwig-Maximilians-Universitaet Muenchen, Psychology, Munich, Germany (1)

Purpose
When working on innovations, teams require the support of their leaders. In our study we intended to better understand the team processes and emergent states underlying the relationship between leaders’ behaviours and team innovation. Following the concept of ambidextrous leadership, we suggested that ambidextrous leaders (i.e., leaders that show opening behaviour, closing behaviour, and temporal flexibility) foster a team climate for innovation (i.e., vision, participative safety, task orientation, support for innovation), which in turn increases team innovation.

Design
To test our mediation model, we conducted a field study with 47 teams and applied a Monte Carlo method for assessing mediation effects. Independent and mediating variables were rated by team members; dependent variables were rated by team leaders.

Results
In support of our hypothesis, team processes and emergent states that characterize a team climate for innovation mediated the relationship between ambidextrous leadership and team innovation.

Limitations
The results are limited due to a relatively small sample size and a cross-sectional design.

Research/Practical Implications
Future research should further investigate specific influences of ambidextrous leadership on different phases of the innovation process in teams and also identify key moderators. In practice, leaders should establish a climate for innovation through displaying ambidextrous leadership behaviours when supporting their teams to be innovative.

Originality/Value
Our research shows the value of the concept of ambidextrous leadership and contributes to a better understanding of the team-level mechanisms initiated by ambidextrous leadership.
759 - PREDICTIVE VALIDITIES OF PERSONALITY FACETS FOR LEADERSHIP ACROSS LEADERSHIP LEVELS

Jiayin Qu (1) - Ronald Page (2)
University of Minnesota, Psychology, Minneapolis, United States (1) - Assessment Associates International, Minneapolis, United States (2)

PURPOSE
The study examined the predictive validities of Big Five factors and 21 personality facets for leadership effectiveness among 371 leaders to examine the importance of assessing personality and the predictive power of personality facets across leadership levels.

METHODOLOGY
Leaders’ personality was measured by the Work Behavior Inventory (WBI) and their leadership effectiveness was rated based on five behavioral competencies by three internal and external raters at a later point in time.

RESULTS
The results suggest that (1) personality facets like Achievement can yield higher predictive validity than the Big Five factors, (2) the importance of assessing personality increases moving up the organizational hierarchy, and (3) the predictive power of both personality factors and facets varies across levels: for example, Openness only predicts effective leadership for top-level leaders and Agreeableness only predicts that at bottom-level.

LIMITATIONS
The study only measured leadership effectiveness at the individual level and future study should evaluate leadership performance from a team perspective.

RESEARCH/PRACTICAL IMPLICATION
These results emphasize the different predictive power of the personality facets on leadership effectiveness that should be considered and utilized in research and practice.

ORIGINALITY/VALUE
Studies of predictive validity like this one usually yields more powerful results than concurrent validity studies. Researches have shown that personality facets that are thoughtfully chosen can have more power in predicting workplace outcomes compared to Big Five factors, but limited research has been done examining the relationship between personality facets and leadership effectiveness. The study addresses this gap.
WORKING WITH DEPRESSION IS EXPERIENCED AS A CONSTANT BALANCING ACT THAT INCLUDES PRESENTEEISM

Angelique de Rijk (1) - Lotte Keijsers (1) - Inge Houkes (1) - Stephanie Stock (2)

Maastricht University, Social Medicine, Maastricht, Netherlands (1) - University Hospital of Cologne, Cologne Institute for Health Economics and Clinical Epidemiology, Cologne, Germany (2)

BACKGROUND: Depression is an important reason for work disability, but employees diagnosed with depression continue working as well. An estimated 7-10% of the Dutch working force suffers from depression. Research shows increased sickness absence and increased sickness presence (presenteeism) in employees with depression. Research tends to emphasize the costs of productivity loss of those with long-lasting medical conditions when compared to healthy employees rather than the advantages of participating in paid work. The aim was to study how employees with diagnosed depression experience presenteeism and absenteeism, and to what extent the Health Productivity Questionnaire (HPQ) taps their experiences.

METHODS: Semi-structured interviews were held with a purposive sample of 13 employees diagnosed with depression, transcribed verbatim and analyzed thematically.

RESULTS: Having depression is experienced as a constant balancing act around three decisions: (1) to seek help for depression or not, (2) to disclose about depression or not, and (3) to be present at work or not. Decisions are made in the context of workplace support. The balancing act affects the depression and work functioning. Presenteeism reflects either ignoring symptoms or a deliberate decision supported by the workplace. Workplace support includes: 1) supervisors creating work adjustments (work structure, content and social environment); 2) occupational physicians advising about work adjustments, and monitoring and supporting the employee. The HPQ is easily misunderstood by these employees with depression, leading to distortion or social desirable answers.

CONCLUSION: Workplace support for employees with depression requires work adjustments and a positive social environment, but cannot remove the burden of the constant decision-making nor presenteeism. The study sheds new light on the experiences and the productivity measurement in employees diagnosed with depression.

Main message: Employees with depression require work adjustments and a positive social work environment, and not a focus on reducing the costs of presenteeism.

Main message: The Health Productivity Questionnaire was easily misunderstood by employees with depression, leading to distortion or social desirable answers.
769 - GETTING WHAT THEY HAVE ASKED FOR: TESTING A PROACTIVITY INTERVENTION AMONG TEMPORARY AGENCY WORKERS

Manuela Morf (1) - Anna Sender (1) - Nele De Cuyper (2)

University of Lucerne, Center for Human Resource Management, Lucerne, Switzerland (1) - KU Leuven, Research Group Work, Organizational and Personnel Psychology, Leuven, Belgium (2)

Getting what they have asked for: Testing a proactivity intervention among temporary agency workers

Purpose: Using social exchange theory, we investigate whether proactive support seeking of temporary agency workers (temps) pays off. Specifically, we explore whether temps who seek more support obtain more support from the agency and client and thus reciprocate with higher intentions to stay with them. Additionally, we examine whether prospects for permanent employment moderate the studied relationships.

Design: We randomly assigned temps who started their assignments into a control and intervention group. The intervention group was encouraged (SMS and Email) to seek support. After one week on assignment we collected survey data (N = 152).

Results: Temps in the intervention group who read the intervention material engaged more in support seeking. Temps who sought more support from client obtained more support, especially when their prospects for permanent employment at the client were high. The relationship between client support and intention to stay was positive and stronger for less employable temps (i.e., temps with less outside options). Analyses for the agency suggested that providing support in problem solving increased perceptions of agency support and thus intentions to stay with the agency.

Limitations: Manipulation checks revealed that we cannot exclude a selection bias.

Practical Implications: Findings suggests ways how temps can attract support and agencies can build a committed workforce.

Originality: We add to literature on non-standard work by examining how social exchange can be initiated by temps and is shaped by employment prospects.
The unemployment situation has deleterious consequences for individuals, affecting their mental health (Paul and Moser, 2009). To account for these effects, some theories have proposed that this low mental health is due to the deprivation of a series of individuals' needs. Indeed, employment makes it possible in one hand, to earn a living, but, in the other hand, to satisfy some psychological needs (structuring time, purpose,...) (Jahoda, 1981). Completing this individual perspective, other studies have underlined that unemployment is an inherently social phenomenon involving intergroup relations. However, until now, no study has been done combining the individual and intergroup perspectives to assess the mental health of the unemployed. The goal of this presentation is to remedy to this lack by presenting a study conducted on unemployed people (N=302) and including scales coming from the individual perspective (Muller & Creed, 2005), from the literature on intergroup relations and well-being scales. Results support the role played by three individual variables in accounting for well-being: time structure, activity and financial stress. In addition, group discrimination and identification with the unemployed group have an additional explanatory effect. These results emphasized the importance of combining individual and intergroup perspective in order to explain the low mental health of the unemployed.
Purpose: Psychological entitlement is predominantly seen as a vulnerability to psychological distress. Psychological entitlement not only predisposes individuals to the experience of disappointment. It also entails a tendency to interpret unmet expectations in ways that foster a sense of injustice. To illuminate the psychological processes that explain this tendency, we referred to relational models of fairness. We hypothesized that psychological entitlement is associated with defensive interpersonal strategies that undermine perceptions of fairness in the workplace, namely avoidant attachment behavior.

Design: We used structural equations modeling of three waves of data to test whether attachment insecurity mediated the effects of psychological entitlement on fairness perceptions (n = 339 employees).

Results: Results showed that a greater tendency to activate avoidant attachment behavior fully mediated the negative effects of psychological entitlement on judgments of workplace fairness.

Limitations: It is difficult to accurately assess what percentage of variance in employees’ fairness perceptions is based on cognitive biases versus actual unfair behavior, such as actually poor interpersonal treatment that may have been provoked by entitled attitudes and behaviors.

Implications: Theory-driven interventions designed to make a person feel more secure, as well as the presence of a responsive leader or a supportive and cohesive group, can help entitled employees to function more securely, and thus to maintain more positive perceptions of fairness at work.

Originality/value: Negative perceptions of fairness appear to be central to understanding why psychological entitlement harms individuals and organizations. Yet, the relationship between psychological entitlement and negative perceptions of fairness is poorly understood.
Purpose: Nowadays there is an ever-increasing interest in bioethical issues and further evidences about moral and ethical distress of healthcare professionals who manage end-of-life are needed. The aim of this study is to analyze the experience of palliative care professionals, focusing on protective and risk factors for bioethical-related stress.

Methodology: 19 one-to-one audio-recorded semi-structured interviews were conducted with palliative care nurses and physicians, asking for work difficulties, self-perceived risk and protective factors, social support, conflicts with colleagues and caregivers. Grounded Theory was used to data collection and analysis.

Results: 28 main themes emerged, subsequently summarized in 10 categories, describing stressors (6 categories) and protective factors (4 categories). Stressors reported were: management of emotions regarding death and dying (17%), conflicts (16%), relation with both patients (10%) and caregivers (10%), discrepancies between patients and caregivers’ needs (4%), complexity of the patient’s management and acceptation of poor diagnosis and prognosis (4%), experience negative influence (4%). As protective factors, emerged: social support (20%), positive approach and experience worth (8%), recognised value and passion towards professional work (4%), work-family balance (3%).

Limitations: These findings need to be confirmed by further quantitative investigations to be fully generalizable.

Research/Practical Implications: These preliminary results may provide cues for future research and tailored interventions improving the wellness of healthcare systems characterized by ever-growing bioethical issues.

Value: The findings bring out the providers’ prospective and underline the importance of social support to respond to ethical distressing situations, in the aim of promoting individual and collective wellbeing in the work place.
787 - ASSESSING AWARENESS OF EMPLOYEE WORK HEALTH AND SAFETY (WHS) IN THE BANGLADESH READY-MADE GARMENT (RMG) INDUSTRY

Fazluz Zaman (1) - Soleman Mozammel (2) - Masoom Ahmed (3)

Federation University, Faculty of Business, Sydney, Australia (1) - Arab Open University, Faculty of Business, Manama, Bahrain (2) - Kingston University London, Faculty of Business, Kingston upon Thames, Australia (3)

Assessing Awareness of Employee Work Health and Safety (WHS) in the Bangladesh Ready-Made Garment (RMG) Industry

The awareness of health and safety among employees play a significant role in any industry as it results in saving life. Therefore, the management of any organization must provide a healthy and a safe workplace for their employees. According to the Trading Economics website, 80% of the key exports revenue of $210 billion of Bangladesh are mainly garments related products. However, a major problem still lies in keeping workers both healthy and productive through a proper health and safety accommodation. A quantitative survey was conducted using a sample comprising 21 export-oriented garment factories of Bangladesh. Respondents of 315 out of the 508 employees from around 20 factories provided their responses in this survey research that was analyzed using Likert scale. The scope of the research was limited to analyzing the awareness of the workplace health and safety measures on the employer and the employees. Cronbach's Alpha was used to test reliability of the constructed used in this study. All scales have achieved more than 0.7 alpha values. The results demonstrated the positive influence of safety practices had on the actual levels of safety in the RMG factories that were studied. The outcomes of this study is expected not only improving awareness of the underlying WHS problems affecting the RMG industry in Bangladesh, but also expected to act as a guide for subsequent researchers to develop strategies for the ultimate improvement of WHS.

Keywords: Ready Made Garments (RMG) industry of Bangladesh, Work Health and Safety (WHS)
Expanding upon Steiner and Gilliland’s selection fairness research, we examined applicant reactions to online information (i.e., using information presented on applicants’ personal webpages and social networks profile, such as LinkedIn.com, Facebook.com, Twitter.com, to assess their fit with the job or/and company) compared to other 20 selection methods.

Cross-sectional data were provided online by 280 Romanian undergraduates enrolled in a semester course including topics on personnel selection (thereof, 22.1% were also employees), using an updated version of the Steiner and Gilliland’s (1996) methodology to measure process favorability and seven procedural justice dimensions of selection methods.

Online information had a significantly lower process favorability compared to most of the selection methods (e.g., interview, situational judgment tests). It was perceived as more favorable only than graphology and ethnicity and similar to personal contacts and unproctored Internet testing. On all seven procedural justice dimensions, online information was also perceived as significantly less fair method than most of the selection methods studied.

As limitations, we mention non-differentiation between types of online information and cross-sectional design.

Online information as an informal selection method might threaten the fairness of personnel selection. Implications for the design of selection systems in companies from Romania and future research into applicant reactions are considered.

By employing a well-established methodology to investigate fairness reactions, this study extends the knowledge about applicant reactions to online information as selection method and contributes to a more fine-grained and comprehensive understanding of the generalizability and situational specificity in applicant reactions to selection methods in Eastern Europe.
Tell me my weaknesses (strengths): Regulatory focus effect on feedback preference and the paradoxical effect of the given feedback

Feedback seeking, namely, individual actions to gather information relevant to one’s own behavior, have become a major topic of research in the organizational sciences (Anseel et al., 2015). However, to date there has been only few studies on the type of feedback that people prefer (e.g., Finkelstein & Fishbach, 2011). We suggest that regulatory focus (Higgins, 1997) is related to the type of feedback that people would prefer to have. According to regulatory focus theory, promotion motivational focus is related to growth needs and to the willingness to make a change, whereas, prevention motivational focus is related to security needs and to the willingness to keep the status quo and avoid changes. Thus, we hypothesized that promotion-focused individuals are more likely to seek for negative feedback (e.g., weaknesses) that implies the need of change. In contrast, prevention-focused individuals will seek positive feedback (e.g., strengths) that indicate that things are good as they are.

Moreover, based on previous literature on the interactive effect of feedback sign and regulatory focus on motivation (e.g., Van Dijk & Kluger, 2004; 2011), we suggest that the type of feedback preferred by prevention- and promotion-focused individuals will be paradoxically the opposite of the type of feedback that will actually increase their motivation. Specifically, while promotion-focused individuals prefer negative feedback, positive feedback is the one that will enhance their motivation. Similarly, while prevention-focused individuals prefer positive feedback, negative feedback is the one that will enhance their motivation.

Three experimental studies (n=120, N=150, N=175) showed that promotion-focused individuals preferred negative feedback; and prevention-focused individuals preferred positive feedback. In addition, two of the three studies showed that paradoxically the type of feedback that was actually increase motivation was the opposite of the one that was preferred. We further dices the theoretical and practical implications.
The distinction between intrinsic and extrinsic motivations (Ryan & Deci, 2000) has some important implications for understanding motivation at work. Although this topic has been widely studied, a number of controversial issues remain. We tested two questions in the current study, with regards to employees’ intention to leave their job: First, does intrinsic motivation better predict employees intention to leave? Second, do extrinsic rewards (e.g., monetary incentives) attenuate the effect of intrinsic motivation on intention to leave?

We conducted a telephone survey among 966 Israeli physicians (51 women, mean age 36.5, mean seniority 7 years). Our findings show that the intrinsic factor of job satisfaction (e.g., meaningfulness, interest) was the strongest (negative) predictor of intention to leave while the extrinsic and social factors were the weaker. When analyzing active steps toward leaving (e.g., going to a job interview), extrinsic and social factors become insignificant while the intrinsic and job prestige factors remain significant. These findings suggest that the level of meaningfulness in physicians’ job are perceived as more important than the level of salary and physical conditions, in forming intentions to stay or leave the medical profession.

Additionally, among the physicians who work in the private sector in addition to their job at the hospital (n=143), we found less intrinsic satisfaction, as predicted by the Self-Determination theory (e.g., Deci & Ryan, 2012; Ryan & Deci, 2000). Practical and theoretical implications are further discussed.
SOCIALIZATION AS AN IDENTITY TRANSITION PROCESS: THE INVESTIGATION OF UNDERLYING MECHANISMS AND BOUNDARY CONDITIONS

Karine ESPLAN (1) - Assâad EL AKREMI (1)
University of Toulouse Capitole, TSM Research - HRM and OB, Toulouse, France (1)

Purpose
There is a dearth of research on the patterns of newcomers’ identity transitions over milestones of entry, socialization, and adjustment. The aim of this study is to develop and test a model that integrates the organizational, social, and personal factors of socialization, explores the role of identification as a mediating mechanism, and investigates boundary conditions such as the need to belong and social validation from the supervisor and coworkers.

Design and Methods
We collected multiwave data from 537 French newcomers during the first four months of employment. We used bootstrap procedures to test the moderated-mediation effects.

Results
Our three-wave results show that organizational identification mediates the impact of socialization tactics on newcomers’ adjustment. This impact is stronger for newcomers who have low need to belong. Social validation has a direct effect on identification but does not moderate the impact of socialization tactics.

Limitations
Despite our longitudinal design, our measures were self-reported, raising the possibility of common method variance.

Research and Practical implications
This study contributes to the understanding of the mechanisms linking socialization tactics to newcomers’ adjustment through identification processes and the role of social and personal factors as moderators. Managers should intervene to adapt their feedback depending on newcomers need to belong.

Originality
This study integrates social identity and socialization perspectives in order to better explain the complexity of the processes of newcomers’ adjustment.
The purpose of the study was to investigate the moderating role of a perceived ethical leadership style in the relationship between employees’ workaholism and occupational burnout.

The study involved 302 employees working in different Lithuanian organizations. A perceived ethical leadership style was assessed with the help of Brown et al. (2005) questionnaire. The 10-item Dutch Work Addiction Scale developed by Schaufeli et al. (2009) was used for the measurement of workaholism. Occupational burnout was measured using Copenhagen Burnout Inventory by Kristensen et al. (2005).

The results revealed that workaholism, personal and work-related burnout of employees who consider their leaders as more ethical is lower than of those who consider their leaders to be less ethical. Relationship between client-related burnout and excessive work of the employees who consider their leaders as more ethical is weaker than of those who consider their leaders to be less ethical.

Rather homogenous and small sample size, as well as the cross-sectional nature of the study are the major limitations. Moreover, other organizational and personal factors may contribute more in the relationship among perceived ethical leadership, workaholism and burnout. This should be addressed in future studies.

This study extends the leadership literature to better understand the effects of ethical leadership on workaholism and occupational burnout. Ethical behavior should be emphasized in planning and designing interventions for managing employees’ workaholism and burnout.

An empirical examination of how ethical leaders’ behaviour can influence the link between employees’ workaholism and the level of burnout that previously have been overlooked.
802 - CULTURE IN THE JD-R MODEL? A META-ANALYSIS

Lucy Rattrie (1) - Markus Kittler (2) - Karsten Paul (3)

University of Stirling, Management, Work and Organisation, Stirling, United Kingdom (1) - Management Center Innsbruck, Innsbruck, Austria (2) - Freidrich-Alexander-University, Nurnberg, Germany (3)

Purpose: Despite increasing application across cultures and a need to better understand why, when, for whom workplace factors affect well-being, previous research has not yielded a clear understanding of whether the Job Demands-Resources (JD-R) theory responds to cultural variations. We therefore assess the moderating role of national culture in the JD-R model.

Design: Meta-analysis of 86 independent samples from JD-R research (health impairment/motivational pathways with burnout/engagement), representing 2001-2011 and 6 global regions (n = 52,380) using Hofstede’s 5-dimensional national cultural values to assess moderating effects.

Results: Masculinity/femininity strengthened the health impairment pathway. Hints were present for moderating effects of individualism/collectivism, uncertainty avoidance, and long-term/short-term orientation, yet unstable across analysis. It was also found that employees from or within different cultural contexts respond to demands/resources differently.

Limitations: Analysis limited to first decade, albeit authors are currently undertaking analysis from 2001-present. Potential bias stemming from specific features of primary studies and Dutch prominence.

Research/Practical Implications: Findings suggest extending the JD-R model to incorporate culture and conducting JD-R studies in under-explored cultures. Managers could expect job characteristics to affect burnout/engagement differently for employees within/from different cultures.

Originality/Value: This meta-analysis is the first to address the impact of culture, offering a more comprehensive assessment of the model. The importance of this topic emerged from the increasing application of the JD-R model across different nations in response to a globally intensified need to enhance burnout/engagement), without consideration for whether it adequately responds to cultural variations.
Purpose: To describe the actions carried out by Italian organizations participating in the Economy for the Common Good (ECG) movement. The ECG is an economic system that is built on values promoting the common good, namely human dignity, solidarity, social justice, environmental sustainability, transparency and co-determination. The Common Good Balance Sheet (CGBS) measures how these key values are practiced by organizations. To make the CGBS more transparent a Common Good Matrix was built combining the values and the stakeholders. At the intersections seventeen Common Good indicators are measured.

Design/Methodology /Approach/Intervention: A documentary analysis was conducted on 14 common good reports written by the Italian organizations that joined the ECG movement concerning the common good indicators. The qualitative data was collected and qualitative content analysis was performed using Microsoft NVivo 12.

Results: The results describe all the actions that were undertaken by the organizations for each indicator and which indicators are more or less addressed in the Italian organizations. Both strategic and operational actions are reported.

Limitations: The low number of Italian organizations participating in the ECG movement. Research/Practical Implications: The results are helpful as inputs for designing interventions in organizations that intend to strengthen the involvement in the ECG movement. Further studies can research the enablers and barriers which help or prevent the compliance with the ECG values.

Originality/Value: Contributes to identify the Common Good values harder and easier to comply with by the organizations and the strategic versus operational levels of the undertaken actions.
WORKING HOURS, AFTER-WORK RECOVERY, AND WELLBEING IN VETERINARY SURGEONS

Elinor O'Connor (1) - Suzanne Williams (1)

Alliance Manchester Business School, Manchester, United Kingdom (1)

Purpose: Effective after-work recovery supports wellbeing, even in the face of stressful work experiences. Sonnentag and Fritz (2015) presented evidence that recovery experiences (particularly psychological detachment) can both moderate and mediate the relationship between work stressors and strain. In a recent review of evidence regarding long working hours and wellbeing, Ganster et al (2018) proposed that because longer hours result in less time away from work for recovery, impaired recovery might mediate the relationship between long working hours and strain. The present study tested the mediating role of recovery in the relationship between working hours and wellbeing in veterinarians, an occupational group reported to work long hours (O’Connor, in press) and to experience poor psychological health (e.g. Platt et al, 2012).

Methodology: 307 veterinarians completed an online survey, providing details of work patterns and completing the Recovery Experience Questionnaire and GHQ-12.

Results: Multiple regression indicated that longer working hours predicted poorer recovery (beta = .24, p < 0.01) and lower wellbeing (beta = .14, p < 0.05). Recovery fully mediated the relationship between working hours and wellbeing (beta = .42, p < 0.01).

Limitations: The design was cross-sectional.

Research/Practical Implications: The findings add to evidence on the mediating role of after-work recovery in the relationship between stressors and wellbeing. Practical implications include the development of guidance for the veterinary profession on optimising recovery to enhance wellbeing.

Originality/Value: The study provides support for Ganster et al’s proposal that impaired recovery mediates the relationship between long working hours and strain.
Developing Employability and Sustainable Careers: A Learning-Centred Model Based on Individual Agency and the Support of the Employer

Nikos Bozionelos (1) - Cai-Hui Lin (2) - Kin Yi Lee (3)

Queen's University Belfast, Lyon, France (1) - Queen's University Belfast, Belfast, United Kingdom (2) - The Open University of Hong Kong, Hong Kong, Hong Kong (3)

Drawing on data from multiple time points, this study developed and tested a learning-based model for employability and job performance, which are key elements of sustainable careers. In particular, the model incorporates individual agency in the form of the personality trait of openness, contextual factors in the form of supervisor support for training, and organizational support in the form of formal training. It was tested in 334 salespersons who attended an in-house training program. Employability and job performance, as assessed by line managers, after the training were higher than before the training, essentially implying that organizational intervention in terms of training contributes to career sustainability. Learning as a result of the training mediated the relationship of openness and supervisor support with employability and with job performance. Finally, in contrast to expectations, a substitution effect was found between openness and supervisor support for learning and subsequently job performance and employability. The study highlights the importance of employer contribution for sustainable careers in the form of opportunities and support for formal learning, but also the fact that individual agency in the form of appetite and preparedness for learning is needed for maximization of the probabilities to sustain careers.

Keywords: Sustainable careers; employability; job performance; transfer of training; openness; supervisor support
DEVELOPING LEADERSHIP COMPETENCE: A LONGITUDINAL STUDY OF INDIVIDUAL- AND TEAM-LEVEL CHARACTERISTICS

Judith Ainsworth (1) - Anjali Chaudhry (2)

Fox School of Business, Temple University, Marketing and Supply Chain Management, Philadelphia, United States (1) - Brennan School of Business, Dominican University, Management, Marketing and International Business, River Forest (Chicago), United States (2)

Purpose

This study investigates students’ leadership development as a function of individual-level characteristics such as age, gender, work experience, ability, and motivation as well as team-level characteristics such as team composition and cohesiveness.

Design/Methodology /Approach/Intervention

The study is being conducted in two undergraduate business programs that employ Team-Based Learning methodology. 120 students at two universities in the USA are being sampled. Using online survey software, each student rates his/herself and his/her team members at three time points during a 16-week semester. We employ hierarchical regressions for the quantitative data and thematic coding for the content analysis of students’ self-reflection to assess individual motivation as well as team cohesiveness.

Results

The findings of this longitudinal study will help identify individual-level characteristics (e.g., gender) as well as team-level differences (e.g., team composition) that are critical for students’ leadership development.

Limitations

As an exploratory study, there may be few drawbacks that we have not anticipated.

Research/Practical Implications

The results will help identify which individual and team-level characteristics are critical for leadership development. The study also sheds light on the efficacy of Team-Based Learning in developing students’ leadership.

Originality/Value

By incorporating all the key variables in one study that have previously been researched separately, we are able to identify what factors (e.g., gender) explain variance over and above other factors (e.g., ACT) in leadership development. This study contributes to leadership self-awareness by identifying how peer feedback influences self-ratings over time and may suggest ways to improve the effectiveness of feedback through coaching and debriefing.
Purpose Demographic and technological changes demand for sustainably employable employees. Various organizations therefore encourage participation in training through voucher programs. Most voucher programs offer money to cover training costs, but employees may also need time to participate in training. The present paper uniquely compares the effectiveness of four types of vouchers with different combinations of money and time as well as different (i.e. firm internal and external) governance on training participation.

Design To this end, 230 employees of a large Dutch insurance company were randomly assigned to one of the four voucher types or a control group. For eleven months, training participation was monitored and a concurrent questionnaire measured several personal characteristics as potential covariates and moderators.

Results The voucher type that allows employees to freely choose between a training budget and training days most strongly encourages training participation. Vouchers that provide employees with either working days or a training budget did not improve training participation significantly compared to the control group. Moreover, moderation analyses suggested that the training participation of employees provided with non-flexible vouchers appears to depend more strongly on personal characteristics.

Discussion These findings suggest that to encourage training participation organizations could best offer flexible vouchers with a free choice between money and working time to spend on training. Moreover, providing training vouchers via a committed external training seems effective. A limitation is that the study is conducted in a single organization. Therefore future research should investigate whether similar effects are found in different organizations.
PURPOSE: Young people are increasingly using apps and the internet to source information about health. However, the range of online sources available are inconsistent in their reliability and trustworthiness, and young people are not always able to translate advice and information into improved health behaviors (health literacy). In this study, we evaluated whether a new clinically-approved NHS health app for young people can improve health literacy.

DESIGN: Semi-structured interviews and focus groups were conducted with 26 young people in the target age and demographic ranges. The technology acceptance model (TAM) was used to frame the research.

RESULTS: Using thematic analysis, young people reported that across 4 subthemes, the app had good ‘perceived usefulness’ and was credible and trustworthy. This positively influenced uptake, although social influences were under-developed in influencing acceptance. The app lacked ‘perceived ease of use’ across three themes, which limited the impact on health literacy and improved health behaviors.

LIMITATIONS: Turnout at the focus groups was low, suggesting sample confounds for motivation.

IMPLICATIONS: Empowering young people to take control of their health literacy is a key concern for health service providers (such as the NHS) who need to provide cost-effective ways of addressing emerging health needs. Our research indicates how future health apps can be designed to optimize this.

ORIGINALITY/VALUE: This is the first qualitative study to demonstrate how a general, free health app can be actively adopted by young people to optimize health literacy.
THE INTERPLAY BETWEEN MORAL SELF-EFFICACY AND MORAL DISENGAGEMENT IN UNDERSTANDING COUNTERPRODUCTIVE WORK BEHAVIOUR

Roberta Fida (1) - Marinella Paciello (2) - Carlo Tramontano (3)

University of East Anglia, Norwich Business School, Norwich, United Kingdom (1) - International Telematic University UNINETTUNO, Rome, Italy (2) - Coventry university, Centre for Advances in Behavioural Science, Coventry, United Kingdom (3)

Counterproductive work behaviour (CWB) is a reality in organisational life, with an incidence that is other than rare. The moral agency theory (Bandura, 1991) has offered a relevant framework for understanding how otherwise good employees misbehave. Indeed, moral disengagement - the set of mechanisms aimed at bypassing the internal moral control - is strong antecedent of CWB. However, this theory also describes the proactive capabilities of human mind that actually allow individuals to keep their conduct in line with norms and standards, but to the best of our knowledge this has been overlooked in the literature. We have hence developed a measure of moral self-efficacy and investigate the role it plays in: a) reducing CWB, and b) moderating the relationship between moral disengagement and CWB.

Design. The present study is part of a longitudinal research on a sample of 1308 employees (51% males) who have been assessed monthly three times.

Results. Findings show that moral self-efficacy can be described considering 3 dimensions of the moral self-regulatory process: moral self-reflection, moral behavioural control and reparation. Moderation analyses showed that both moral self-efficacy and moral disengagement affect CWB directly, however moral disengagement becomes not significant for high level of moral self-efficacy.

Limitations. Analyses rely only on self-reported data. Data were collected only in one country.

Research/Practical Implications. Trainings should be designed to strengthen the employees’ perceived competence in the moral domain.

Originality/Value. This is the first study examining moral self-efficacy and its role in hindering moral disengagement and its effect on CWB.
818 - ALWAYS ON? OR ARE WE? AN INVESTIGATION INTO THE MODERATING EFFECT OF BOUNDARY MANAGEMENT STRATEGIES ON THE RELATIONSHIP BETWEEN AFTER-HOURS WORK AND WELL-BEING

Emma Russell (1) - Kerisha Laing (2) - Christine Grant (3)

Department of Management, University of Sussex (1) - Kingston University, WWK Research Group, Kingston Business School, London, United Kingdom (2) - Coventry University, Psychology, Coventry, United Kingdom (3)

PURPOSE: The aim of this research was to investigate the moderating effect of boundary management strategies on after-hours work, with daily well-being, using a boundary-fit perspective.

DESIGN: A daily diary survey captured data over 4 days from N=41 workers at a multi-national telecommunications organization. This was analysed using hierarchical linear modelling.

RESULTS: We found that the more time people spent on after-hours work, the lower wellbeing was for people with higher segmentation preferences, but the higher wellbeing was for people with higher integration preferences. Those who engaged in more after-hours work also (i) had employers who expected after-hours working, (ii) were more likely to operate from multiple locations, and (iii) had lower levels of psychological detachment. Further, those who had higher levels of daily psychological detachment engaged in significantly lower levels of out-of-hours work connectivity.

LIMITATIONS: Data was self-report and collected on a small sample size. Some essential controls (e.g. hours worked per week) were not collected.

IMPLICATIONS: Organizations need to take into account that those with high segmentation preferences may be negatively impacted if expected to work after-hours. Normative influences and individualised job design should be attended to by organizations who wish to promote healthy workplaces for employees with different boundary preferences.

ORIGINALITY AND VALUE: Daily fluctuations in work activity interact with stable individual preferences to impact well-being in today’s agile-working environment. This is important for employers to consider in designing work and promoting cultures that facilitate secure boundary fit.
Xavier Parent-Rocheleau (1) - Kathleen Bentein (2) - Gilles Simard (2)

University of Quebec in Montreal, Montréal, Canada (1) - University of Quebec in Montreal, Montreal, Canada (2)

Purpose: The positive psychology literature provides evidence for the beneficial effects yielded by both employees’ and leaders’ positive resources comprised in their psychological capital (psych cap: optimism, resilience, hope, and self-efficacy). However, despite the growing stream of research focusing on the importance of person-supervisor fit or deep-level similarity, the interplay of leaders’ and followers’ psycap has been overlooked. Drawing on similarity-attraction theory, we hypothesize that similarity in either high or low levels of psycap will be associated with higher leader-member exchange and supervisor-rated service-oriented citizenship behaviors, whereas dissimilarity will lead to less positive outcomes. Moreover, based on interaction ritual theory, we examine the role of frequency of interaction as a boundary condition in these relationships.

Methodology: We collected quantitative data among 420 leader-follower dyads in a Canadian public services setting. Polynomial regressions and response surface analyses were performed to test our hypotheses.

Results: Overall, the results support the model. However, the effects of dissimilarity were asymmetrical, such that the lowest levels of LMX and OCB are observed when leader’s psycap is high and follower’s psycap is low, particularly when leader and follower interact frequently.

Limitations: The cross-sectional design is a limitation, although multi-source data largely overcomes this limitation and reduces the possibility of common method variance.

Implications and novelty: The findings contribute to the advancement of knowledge on person-supervisor fit and deep-level similarity by suggesting that the direction of the influence (dis)similarity in psychological resources might asymmetrical, and by providing new insights into LMX and OCB research regarding the effects of leaders’ greater psychological resources.
Purpose:
Employees’ motivation to show proactive work behaviours and thereby contribute to organizational improvement depends on their anticipation whether this behaviour will be appreciated by their organization and, specifically, by their supervisor. We propose cross-cultural differences in these anticipations: Proactivity is of future-oriented, improvement-oriented, and agentic nature. Thus, it should be evaluated more positively in cultures characterized by high future orientation, high performance orientation, and low power distance.

Methodology:
We conducted an experiment with N = 1222 employees from Germany, Austria, France, and Spain. Participants read four scenarios that described inefficient or problematic work situations. In each scenario, participants were assigned to one of two experimental conditions that described their own behaviour in that situation as “proactive” versus “passive”. Following this manipulation, participants rated their anticipated emotions in the respective situation and their supervisor’s anticipated reaction to their proactive versus passive behaviour.

Results:
All participants anticipated more positive emotions (e.g., pride) and less negative emotions (e.g., frustration) in prospect of proactive rather than passive behaviour. This effect was stronger in Germany and Austria compared to France and Spain. At the same time, participants expected more negative reactions from their supervisors for proactive rather than passive behaviour, particularly in Austria.

Limitations:
Despite the strength of the experimental design, the external validity of scenarios is limited.

Implications:
While we observed some similarities in employees’ anticipated reactions to proactive work behaviour across cultures, some processes seem more pronounced in specific cultures. The configuration of values within one culture might even produce conflicting anticipations.
Purpose. This study aims to investigate whether scales typically used in psychosocial risk assessment surveys can be meaningfully used among low-educated workers. Low education may act as a confounding factor in survey assessments by inducing measurement errors due to lower cognitive competences and lower commitment to the topic. Here, we evaluated the construct validity and reliability of five scales (i.e., work pressure, social support, emotional exhaustion, work engagement, exposure to workplace bullying) among low-educated workers.

Methodology. Measurement (i.e., multi-group Confirmatory Factor Analysis) and structural invariance tests (i.e., multi-group Structural Equation Modeling analyses) were conducted across a sample of 3063 low-educated workers (up to lower secondary grade) and a sample of 6594 high-educated workers (Bachelor’s or higher level), which acted as the reference group.

Results. Construct validity (full configural, full metric and partial scalar invariance), reliability (internal consistency) and concurrent validity (invariant regression paths from work pressure/social support to emotional exhaustion/work engagement/bullying, and from emotional exhaustion/work engagement to bullying) of the five scales were comparable across low- and high-educated workers.

Limitations. A cross-sectional design was used, preventing us from making causal inferences.

Practical implications. Our results demonstrate that the five scales can be meaningfully used as part of a psychosocial risk assessment or other types of survey research in low-educated workers.

Originality/Value. While previous studies have examined measurement errors related to low education for scales tapping into social attitudes (e.g., political tolerance), this study is among the first to test this for occupational psychological scales.
Investigation of potential factors behind managers’ attitudes towards workplace information and consultation (I&C) for employees has received relatively little attention thus far, with some exceptions (Dundon et al., 2005), despite recognising that such attitudes are important to the existence of highly developed and sustainable employee participation practices (Hall et al., 2013). However, interest in the concept of I&C for employees and voice remains significant (Marchington, 2015), with more recent studies, especially in non-union organisations, showing these systems as rather shallow (Dundon et al., 2014) and less effective as a form of mutual gains collaboration (Cullinane et al., 2014). Implications for employers remain under-explored, with almost a non-existence of managerially focused studies (Butler et al., 2015). Using evidence from a two-year qualitative study of I&C participants in two organizations in the UK (a Housing Association and a Professional Services firm), we focus on the management perspective and argue that trust facilitates managers’ perceptions of I&C bodies’ effectiveness, influencing their approach to consultation. Findings illustrate that management representatives rely on elements of trustworthiness to assess employee representatives. Moreover, the degree of risk the Decision-Making Teams (DMT) are willing to take when deciding whether to consult with and I&C body is found to be influential. The findings also reveal that the relationships between DMTs and the I&C Chair with employee representatives are highly segmented, with parties constantly monitoring their vulnerability. In an I&C context, this is quite important as it suggests volatile levels of management trust depending on the situation.
827 - MONEY MONEY MONEY MUST BE MOTIVATING AND ENHANCE PERFORMANCE? RESULTS FROM A LONGITUDINAL STUDY IN A SWEDISH INDUSTRIAL COMPANY

Johnny Hellgren (1) - Anders Eriksson (2) - Magnus Sverke (3)

Stockholm university, psychology, Stockholm, Sweden (1) - Stockholm university, Psychology, Stockholm, Sweden (2) - Stockholm University, Psychology, Stockholm, Sweden (3)

The private sector in Sweden is rapidly moving towards more performance-oriented pay systems in order to increase employees’ work motivation. In the research literature there has been a long lasting debate on whether pay for performance increases or decreases motivation, especially in relation to intrinsic motivation (the crowding-out effect), and scholars are still debating the effects of pay-for-performance systems on employee motivation and performance. The overall aim of this study is to contribute to an increased understanding of how pay relates to employee motivation and performance within the context of a pay-for-performance system. More specifically, drawing on self-determination theory (SDT) and goal setting theory this study investigates how psychological needs (autonomy and feedback), goal setting (goal clarity), pay level and performance-based pay raise (assessed at Time 1) relate to subsequent motivation (intrinsic and extrinsic) as well as self-rated and supervisor-rated performance (assessed at Time 2), after controlling for demographic factors (age and sex). Questionnaire data was collected in 2015 and 2016 among all employees in a private Swedish industrial company (N=512, response rate approximately 40 percent). This was supplemented with register data on monthly pay level and individual pay raise along with performance ratings from their pay-setting managers. The findings indicate that pay for performance may have a positive impact on employee motivation and performance but that psychological need satisfaction and goal-setting also seems to be crucial for motivation and job performance. The study gives an input to the pay-motivation-performance puzzle with implications for managers and organizations.
Purpose: Most research in the work-family literature has used self-report work-family conflict and work-family enrichment measures to analyze their statistical relationships with other variables. One issue about these survey measures is that they intend to capture causal relationships between domains in the item formulation. Therefore, we adopted the process view of the W-HR model to investigate the antecedents, outcomes, mechanisms, and conditional factors of interference and enrichment, instead of integrating causes and outcomes in the measurement of work-home interface concepts.

Design: We conducted a series of diary studies that examine the W-HR model regarding home-to-work interference and enrichment processes.

Results: Our findings suggest that negative trigger events in the home domain, including family hassles and major life events, influence work processes through the depletion of cognitive and affective personal resources. In addition, positive trigger events in the home domain, including positive personal events and child-related events, increase work functioning through behavioral and affective mechanisms. Moreover, personality traits, such as emotional stability, openness, and optimism, serve as key resources and attenuate the interference process and facilitate the enrichment process.

Limitations: We only used a within-person home-to-work spillover approach, and we neglected potential crossover effects to coworkers or romantic partners.

Implications: By illustrating causal relationships between what happens in the home domain and consequently in the work domain, we provide a better understanding of home-to-work interactions.

Originality: We examined interference and enrichment between domains in an unobtrusive way and found robust evidence for the W-HR model with a series of studies.
836 - JOB DEMANDS AND INCREASE IN INNOVATION BEHAVIORS AS PREDICTORS OF WELL-BEING: THE ROLE OF INNOVATION CLIMATE.

José Ramos (1) - Eva Lira (2) - Pilar Martín-Hernández (3) - Ana Zornoza (4) - José María Peiró (5)

IDOCAL (Research Institute of Human Resources Psychology, Organizational Development and Quality of Working Life) and IVIE, University of Valencia, Social Psychology, Valencia, Spain (1) - Faculty of Humanities and Education, University of Zaragoza, Psychology and Sociology, Huesca, Spain (2) - Faculty of Human and Social Sciences, University of Zaragoza, Psychology and Sociology, Teruel, Spain (3) - IDOCAL (Research Institute of Human Resources Psychology, Organizational Development and Quality of Working Life), University of Valencia, Social Psychology, Valencia, Spain (4) - IDOCAL (Research Institute of Human Resources Psychology, Organizational Development and Quality of Working Life), and IVIE, University of Valencia, Social Psychology, Valencia, Spain (5)

Purpose: Research on innovation showed mixed results regarding its relationships with job demands and well-being. Innovation behaviors had been considered as an additional source of demands increasing workload of workers (Shalley, Zhou & Oldham, 2004), as well as a coping strategy when facing high job demands (West, 2002). Present paper analyzes the joint influence of job demands and the increase of innovation work behaviors (IWB) in well-being (burnout and engagement). We also analyze if the effects of job demands and IWB on well-being are moderated by the individual perceptions of support for innovation climate (CSI).

Methodology: In a two-panel survey among 221 employees working in 15 Spanish organizations from different sectors, moderation models were tested using the process macro for SPSS.

Results revealed that: (1) increases in IWB predict work engagement (positive) and burnout (negative); (2) increases in IWB moderate the impact of past job demands on engagement and burnout. Under high job demands, workers who performed their jobs more innovatively were more engaged and suffered lower burnout; (3) CSI moderates the joint effect of job demands and IWB increase on well-being.

Research implications: workers receiving high job demands increase their engagement (and decrease burnout) when IWB increase from T1 to T2. The effect is stronger when team support innovation is high.

Originality/value: Our findings support the value of innovative behaviours as coping strategy for high job demands. Supportive climate stimulates the positive role of IWB. This paper contributes to deep analyse the “innovation maximization fallacy” and potential “dark side” effects of innovation (Anderson et al. 2014; Ramos et al., 2016).
Key words: innovative work behaviors, job demands, burnout, engagement, support for innovation, team climate, change analysis, panel design.
STAY OR LEAVE THE POLICE? A LONGITUDINAL EXAMINATION ON TURNOVER AMONG YOUNGER POLICE OFFICERS IN SWEDEN

Stefan Annell (1) - Magnus Sverke (2) - Petter Gustavsson (3) - Petra Lindfors (2)

Stockholm University and Swedish Defence University, Department of Psychology and Department of Security, Strategy and Leadership, Stockholm, Sweden (1) - Stockholm University, Department of Psychology, Stockholm, Sweden (2) - Karolinska Institutet, Department of Clinical Neuroscience, Stockholm, Sweden (3)

Purpose

Turnover increases among Police officers in Sweden. This is coupled with the Police force facing higher demands. The resulting recruitment of new officers is time-consuming and expensive, and also indicates the need to reduce turnover rates. Thus, increasing turnover rates are important, but knowledge regarding police turnover is limited. This study aims to understand voluntary police turnover among younger officers in a European setting.

Design/Methodology/Approach/Intervention

Using a sample of Swedish police officers (N = 720) and data from three time-points (application to the police education–2008, first work year–2011, and seven years of work–2017), we followed a two-step approach. First, we performed univariate comparisons between stayers and leavers. Then we predicted turnover-status by hierarchical logistic regression.

Results

Findings revealed low but increasing annual turnover rates. Some differences emerged between stayers and leavers. Regression analyses showed organizational commitment to be the most important long-term predictor of turnover, outperforming predictors such as educational level, job satisfaction, and turnover intention.

Limitations

Since data were not originally designed to examine turnover, not all potentially relevant variables were included.

Research/Practical Implications

This study emphasizes early career organizational commitment as an important predictor of long-term retention among police officers. Low associations between turnover intention and actual turnover suggest a need to address reluctant stayers. Further, findings suggest selection being of limited value in preventing police turnover.

Originality/Value

This is the first larger study that examines turnover among police officers in Sweden.
Purpose – Operative executives are confronted with contradictions in organizations (Simon, 2009). If they fail to overcome these in a constructive way, the risk of mental strains increases (e.g. Gerlmaier, 2013). Initial findings focusing on executives in industry (Bossmann, Schweitzer, Ditzen, 2016) identify the setup of dilemma competency in organizations to prevent stress-related diseases.

The project researches if a training on dilemma competency in organizations helps to maintain the operational executives’ mental health under difficult working circumstances. An already successfully implemented training (Zwack & Bossmann, 2017) of resilience for executives will be adapted to the working conditions in clinics, with an ongoing evaluation of the project.

Design/Intervention

A training with n=68 senior physicians, head nurses and executives in service, administration/IT was implemented as 8 modules (à 3 h) within 10 months at 4 clinics. In a mixed method design the intervention will be evaluated by conducting longitudinal analyses. Pre-& post qualitative data will be examined by structural content analyses.

Results – The sample showed less irritation and perceived stress reactions mediated by more ambiguity tolerance over time. Qualitative analyses explain this process by advanced mental- and behavioral capability in dilemmatic situations.

Limitations – Given the limited study funding it was not possible to conduct a randomized control trial.

Research/practical implications – We expect the training to broaden the individual scope of action by enhancing mindfulness towards contradictory organizational demands and self- efficacy through negotiation and decision processes.

Originality/value – This project contributes to the prevention of stress-related diseases and the promotion of executives’ experience of sense of meaningfulness. In times of an increasing aggravation of working conditions due to financial restrictions in the health care system dilemma management supports executives at daily work strains.

Sylvia Manchen Spoerri (1)
University of Applied Science Chur, 7000 Chur, Switzerland (1)

Due to immigration Swiss companies today employ on all hierarchy levels people with different mother tongues and cultural backgrounds. Thus, multicultural teams using English or German as “lingua franca” are becoming more common. Therefore we want to know which linguistic challenges multicultural teams face and which strategies they employ to master their leadership and communicative tasks efficiently.

The design of the research project is a multi-level case study approach with two medium-sized companies. The investigation combines qualitative and quantitative linguistic and socio-scientific methods such as document analysis, expert interviews, conversation analysis (functional-pragmatic analysis of videotaped team meetings) and interviews with team leaders and members concerning their linguistic strategies.

Data shows that the multicultural teams can partly not master communicative challenges appropriately. Language policy, linguistic strategies and communicative leadership behavior have unexpected and unintended impacts on communication e.g. passiveness of the team members, hindrance of participation in decision making, incompletion of collective planning tasks.

We recommend the development of trainings that sensitize for the communication challenges in linguistically diverse teams. E.g. how to develop a language policy that fosters participation and inclusion, how to give clear and activating instructions, how to paraphrase orders without creating misunderstandings and how to encourage team members to participate in decisions.

The research findings of the transdisciplinary approach (combining linguistic and organizational psychology in field studies) are promising and have the potential to foster inclusion in teamwork.
Purpose: To investigate if long working hours and excessive commuting time are associated with worsening of depressive symptoms.

Methodology: In a random sample of 1,729 employees in Germany, personal interviews were conducted in 2011/12 (AAPOR baseline participation 36%) and 2017 (AAPOR follow-up participation 69%) on age, gender, occupational grade (ISCO-based), quantitative demands, influence at work (both from COPSOQ), working hours and commuting time. In addition, depressive symptoms (PHQ-9 ≥10) were assessed by paper questionnaires not in the presence of the interviewer. Multiple logistic regression was employed to estimate the associations of working hours and commuting time at baseline with depressive symptoms at follow-up, while controlling for baseline depressive symptoms, age, gender, occupational grade, quantitative demands and influence at work.

Results: Baseline working hours were associated with depressive symptoms at follow-up (p=0.018); commuting time was not (p=0.520). Long working hours (≥60 hrs vs. 35-39 hrs per week) were associated with increased risk of depressive symptoms (OR: 3.13; 95% CI: 1.38-7.12).

Limitations: Information was self-reported. To reduce self-report bias, information on depressive symptoms was collected in paper questionnaires not influenced by the interviewer. In order to reduce same method bias, the endpoint used was measured 5 years after baseline interviews.

Research/Practical Implications: Long working hours seem to increase the future risk of depressive symptoms in Germany. We could not confirm that commuting time was associated with depressive symptoms. Selection processes into long working hours and commuting time should be investigated.

Originality/Value: This study is the first of its kind in Germany.
Purpose – Team reflection is one of the most significant and most studied team learning behavior. Current research proves that reflection help teams to adapt to changing circumstances and to improve performance. However, there are only few insights in to effects on cognitive change processes, particular on adapting and modifying team members’ shared knowledge structures. The current study contributes to close this gap by investigating the effects of team reflection on content-related und structural changes of team mental models over time.

Design/Methodology – The present study based on an experimental control group design with repeated measures. Sample consists of 30 student teams (15 each in reflection- vs. control condition) working on a problem-solving task. Team members’ mental models were recorded by means of open questioning on task relevant aspects. Using text analyses technique individual models were coded as cognitive maps and analyzed regarding changes in content, scope, structural extend and similarity over time.

Results – Findings prove that reflecting teams developed larger and more elaborated mental models over time and showed more content-related changes within their models compared to non-reflecting teams. That is, they used more and different concepts as well as more statements for describing task processes. Furthermore, reflecting teams showed a higher degree of similarity of their models.

Limitations – Limitations are the short study period and low external validity because of investigating student teams.

Research/Practical Implications – The current findings indicate that collective reflection processes helping teams to adapt their mental models and to develop a larger and more comprehensive common understanding of the task.

Originality/Value – The Study proves the significant role of team reflections for changing and expanding team members’ shared knowledge structures.
Purpose

What are the predictors of health-related behaviors like physical activity? The physical activity-mediated Demand-Control (pamDC) model (Häusser & Mojzisch, 2017) proposes that occupational stressors like high job demands partially account for the lack of leisure time physical activity. Furthermore, we state that this effect is driven by impairing self-regulatory capacities.

Design

To test the causal relationships of job demands, physical activity, and self-regulatory capacities, we conducted an experimental study. 101 participants completed a simulated call-center activity that was followed by an ergometer task. All participants were randomly assigned to one of two experimental conditions that differed in the emotional and cognitive demands (high vs. low).

Results

Our analyses revealed that high job demands have a negative impact on psychological well-being (stress and mood). Furthermore, we found a negative effect of high demands on physical activity, as participants in the high demands condition spent less time on the bicycle ergometer, as compared to participants of the low demands conditions. High job demands also impaired self-regulatory capacities. However, the indirect effect of job demands on physical activity via self-regulatory capacities was not significant.

Limitations

A limitation of the study is the use of a student sample.

Research/Practical Implications

Our findings point to the importance of job demands for the engagement in physical activity after work.

Originality

The present study provides first time experimental evidence for the causal impact of job demands on physical activity.
853 - ADULT ATTACHMENT AS A PREDICTOR OF INTERPERSONAL DOMAIN OF JOB PERFORMANCE

Jan Střelec (1) - Martin Seidl (1)
Pallacký University Olomouc, Department of Psychology, Olomouc, Czech Republic (1)

Purpose
The purpose of this contribution is to present results of a new study about relations between attachment and interpersonal relationships as a component of job performance in a predictive design.

Methodology
Our study examines the relation between self-reported attachment dimensions and supervisory rankings using interpersonal facilitation as a contextual job performance facet. Self-report data were collected from 166 employees from an engineering division of a production company. Experiences in Work Relationships - Individual (EWR-I) was used as a measure of attachment at work. Supervisory rankings were collected 6 months after self-report measures.

Results
Interpersonal deactivation as one of the EWR-I dimensions was negatively related to supervisor-rated performance. Interpersonal hyperactivation showed the same trend, but the association was nonsignificant.

Limitations
Due to every employee being rated by one supervisor, the data might be biased by supervisor-ratee interpersonal relationship factors. Our data come from single organization. Future research should investigate these variables in other organizations and industries.

Research Implications
Results indicate that attachment should be considered an important personality predictor that has valuable implications for employees. Attachment security appears to contribute to overall performance through helping others or cooperating effectively.

Value
There has been a number of studies applying attachment theory in organization using self-reports. Our study contributes to organizational attachment research by using predictive design and reporting results based on biodata.
Practitioners and academics consider effectiveness of various approaches to recruitment for companies having low and high level of firm reputation, with reducing costs of compensations in firms with strong employer brands as a possible strategy. Business practice, as well as academic research demonstrate that both pay and perception of employer brand are predictors of attractiveness of organization, however their relative importance depends on additional circumstances including the personal characteristics. We extend existing research by investigating the impact of employer brand (EB) psychological meaning. Despite the recent interest in individual differences in psychological meanings of consumer brands, the concept of psychological employer brand meaning as factor independent of particular brands was not examined yet. Drawing from instrumental-symbolic framework, person-organization fit literature, theory and research on pay and materialism, and combining the consumer brand approaches with Motivated Identity Construction Theory, we examine the role of materialism and of identity-motives-based inclination for the Self-Employer Brand Relationship (S-EB-R) in the situation of dilemma between two job offers – the offer of the job proposed by a subjectively strong EB with the unattractive salary and the job offer of weak brand with the attractive salary. In a quasi-experimental study, homogenous sample of 101 students in fields of studies fitted to financial job position participated. We found that participants preferred rather the offer of weak brand with the attractive salary than the offer of strong employer brand with the unattractive salary, although – supporting the hypothesis – supporters of this offer anticipated the lower job satisfaction about the preferred offer. The results confirm the role of materialism in job preference, and add the inclination to develop identity-motives-based relationship with employer brand as important factor in the reactions toward different employer branding strategies of recruitment, although not all the detailed hypotheses were supported.. We discuss findings in the light of previous theories and research on Person-Organization fit, on materialism and brand effects, and consider potential short- and long-term outcomes of strategies of recruitment.
Both practitioners and academics emphasize the growing importance of enhancing employer brands, targeted both to potential and to actual employees. The perception of brand image may include overall evaluation and specific knowledge on satisfaction for functional and psychological needs including satisfaction of basic identity needs. Also the literature on determinants and outcomes of employee work has been growing. Our study extends the earlier findings by examining whether the overall perception of employer brand strength and the sense of satisfaction of identity needs by employer brand are predictors of work attitudes such as citizenship organizational behaviors and counterproductive work behaviors and whether the work satisfaction is a mediating process within these relationships. In a regression-correlational study with 110 employees, we found two various patterns of relationships depending on a type of attitude. The perceived employer brand strength was a negative predictor of counterproductive work behaviors, while the sense of satisfaction of identity needs by employer brand was positive predictor of citizenship organizational behaviors. The mediator of both relationships was work satisfaction regarding both eudemonic and emotional components. Thus, the positive overall perception of employer brand strength enhanced the sense of well work prosperity, it enlarged number of positive experience and reduced the number of negative experience and as a result it reduced the number of counterproductive behaviors, but not determined the citizenship organizational behaviors. In turn, the sense of satisfaction of identity needs by employer brand facilitated the citizenship organizational behaviors via higher psychological prosperity, more often positive and rarer negative experience, but it did not reduced the number of counterproductive behaviors. The practical and theoretical discussion include the importance of developing the multifaceted structure of employer brand knowledge among employees.
Purpose

If workers enter occupations deemed congruent with their individual work personalities, Holland’s (1997) Vocational Choice Theory predicts positive work outcomes. However, empirical research provides limited support for this prediction. The experiences of workers who find themselves unhappy in occupations despite apparent good fit, or happy in occupations that look like a poor fit, remain unexplained. Possible explanations have been offered (Arnold, 2004), but few have been investigated systematically. This research provides new insight into these cases. The aims are to improve existing person environment fit theory and career guidance practice based upon it.

Method

Selection of participants is based on vocational fit and career satisfaction; Self-Directed Search (Holland & Messer, 2013) and Subjective Career Success Index (Shockley et al., 2016) are used respectively. Repertory Grids and semi-structured interviews are then used to explore participants’ attitudes towards occupation/work, career decisions and perceptions of fit.

Results

Results from 20 participants will be presented, revealing how people explain contrasts between their apparent fit and their career satisfaction, and thereby highlighting what current measures are missing.

Limitations

Although this research includes a range of occupations, the generalisability of the findings would need to be explored further.

Practical Implications

This research will identify how to enhance career guidance practice through improved matching tools and better understanding of how workers experience their careers.

Originality

Uniquely, this research examines qualitatively the experiences of workers who misalign with the predictions of Holland’s theory, thereby increasing understanding of theory and practice through anomalous cases.
This paper focuses on second-generation Dutch-Chinese entrepreneurs who have engaged in transnational entrepreneurship, paying particular attention to how they construct their multiple identities at the intersection of ethnicity and generation in different entrepreneurial contexts. Keeping in touch with two countries and absorbing information from two channels, second-generation transnational entrepreneurs are in a unique position to exploit business opportunities. However, these entrepreneurs, who are embedded within two social contexts with different cultures, have to deal with different social regulations and role expectations in two different entrepreneurial contexts. The question is how transnational activities shape their multiple identities. In this paper, we use the intersectionality approach to understand the dynamics of identity construction over time and location.

The revised McAdams Life Story Interview (McAdams, 2008) was adopted to collect data. The findings reveal that the Dutch-born second-generation entrepreneurs of Chinese background experience a strong sense of difference when doing business with China and they try to adapt by behaving more like Chinese in China with the help of Chinese family members or friends. This paper contributes to transnational entrepreneurship literature by revealing the multiple identities construction processes via dynamic interactions between two countries. This paper demonstrates that entrepreneurship study can benefit from the insights of intersectionality, especially when multiple identities are invoked in a specific context. This paper also contributes to the theory of intersectionality by considering generation as a social identity marker in this process. With increasing international mobility and transnational business activities, it is important to understand the varied processes that explain how entrepreneurs come to make sense of their identities and the roles of such identities in their entrepreneurship.

Keywords: transnationalism; identity; second generation; ethnic minority entrepreneurship
Choosing Personality Assessments for Employee Development: Should Practitioners Forget (Almost) Everything They’ve Been Told?

John Hackston (1) - Penny Moyle (2)
OPP Ltd, Thought Leadership, Oxford, Regno Unito (1) - Meyler-Campbell, London, Regno Unito (2)

Purpose
Personality assessments are frequently utilised in organisational learning and development, yet the instruments most often used are much criticised by academics, who have typically focused on selection. Reviews thus use criteria relevant for this purpose rather than the additional and different criteria important for development interventions. This paper proposes additional forms of evidence to inform practice in evaluating personality assessments used in employee development and emphasises the centrality of the test taker to the validity of development interventions, introducing a new concept, ‘experiential validity’.

Approach
The (much maligned) MBTI questionnaire is used to illustrate how evidence-based practice in choosing and using assessments for development could be improved. Following the recommendations of Barends et al (2014), we will discuss the wide range of evidence that should inform practice, emphasising the importance of not only the scientific literature, but also evidence from organisations, practitioners and other stakeholders.

Limitations
The session is not intended as an in-depth review or defence of the MBTI; we will draw out lessons for increasing the experiential validity and ‘stickiness’ of all personality questionnaires in development, and discuss ways to bridge the gaps between academics, practitioners and test takers.

Practical Implications
We will introduce and apply a checklist that practitioners can use to help in considering all the available evidence in choosing assessments for development interventions.

Originality/Value
Introduces a new direction for research, ‘experiential validity’.
LATENT PROFILES OF ORGANIZATIONAL, OCCUPATIONAL AND SUPERVISOR COMMITMENT AMONG NURSES AND THEIR EFFECTS ON EMPLOYEE WELL-BEING AND HEALTH

Jonas Konrad (1) - Joerg Wombacher (2) - Nathalie Amstutz (1) - Christoph Minnig (3) - Tilmann Raff (4)

University of Applied Sciences and Arts Northwestern Switzerland, School of Business, Institute for Human Resource Management, CH-4600 Olten, Switzerland (1) - University of Applied Sciences and Arts Northwestern Switzerland, School of Business, CH-4002 Basel, Switzerland (2) - University of Applied Sciences and Arts Northwestern Switzerland, School of Business, Institute for Nonprofit and Public Management, CH-4002 Basel, Switzerland (3) - Duale Hochschule Baden-Württemberg, International Business Management, D-79539 Lörrach, Germany (4)

Purpose

Demographic changes have led to a shortage of nurses in the healthcare sector. Nursing staff and patients are getting older and nursing cases are becoming increasingly complex. As a result, nurses’ workloads and stress levels have increased, and employee turnover has risen. Adopting a person-centred perspective, this study examines the effects of nurses’ commitment profiles on their physical and emotional well-being and other work-related outcomes. The profiles will be extracted based on nurses’ affective, rational, and normative commitment to their organization, occupation, and supervisor.

Design and Methodology

A survey was conducted among 1029 nurses from all public hospitals, nursing homes and outpatient care services from the Swiss Canton of Solothurn. A latent profile analysis using Mplus was performed to extract the commitment profiles and examine their associations with the outcome variables.

Results

Four commitment profiles were found that differ both quantitatively (in terms of commitment levels) and qualitatively (in terms of shape). Results show, among others, that nurses with a high affective but low rational and normative commitment to all three foci (occupation, organization, supervisor) show higher levels of emotional strain than other profiles (e.g., low commitment levels) but also greater levels of work-life-balance and health.

Limitations

The cross-sectional nature of the survey precludes causal inferences. Because all data were self-reported, the associations found between profiles and outcomes may be inflated.

Implications for research

The person-centred approach allows an examination of complex interaction patterns among commitment foci and dimensions and their associations with work-related outcomes. A longitudinal study is in order to better understand causal directions and the development of complex commitment profiles over time.

Practical implications
The study results are relevant to practices in human resource management and retention in the healthcare sector. Because the commitment profiles refer to a broad, within-person observation of nurses, it is important to address the whole individual in interventions targeted at the improvement of unbeficial commitment profiles. A strict focus on single commitment foci or dimensions may not be enough.

Originality, Value

To our knowledge, this is the first comprehensive exploration of complex commitment profiles and their association with employee health and well-being in the nursing profession.
Purpose: The aim of this study was to investigate how e-working can impact on an individual’s resilience, with a specific focus on the knowledge, skills, abilities and behaviours needed to build ‘digital resilience’ in a large telecommunications organisation.

Design: A mixed methods approach was employed, with 345 participants undertaking an online survey, three validated scales were utilised measuring: (i) resilience, (ii) e-mail overload and strain, (iii) technostress. E-competencies were measured based on a previous study (Grant, 2015). Respondents’ mean age was 35-44 with a near 50% gender split covering a variety of job roles, this was supported by 12 qualitative semi-structured interviews. Thematic analysis and regression analysis methods were utilised.

Results: Participants indicated that building competence in self-management and self-discipline, motivation and time management were key for successful e-working and to ameliorate technostress. Participants also indicated that whilst e-working was viewed as a necessity and benefit more support was needed to understand e-working tools provided by organisations.

Limitations: Individuals self-selected and the data is self-reported; only one organisation was employed in this research.

Research/Practical Implications: These findings can help organisations to mitigate risks associated with e-working and an always-on culture. Digital resilience was found to comprise key competencies for e-workers, which can enable greater e-working efficacy.

Originality/Value This study indicates that developing ‘digital resilience’ can ameliorate the negative impacts of e-working, leading to increased employee wellbeing, job satisfaction and performance.

Word count: 230
Purpose The proliferation of “bad jobs” in contemporary labor markets has generated a growing academic interest in “dirty workers”, intended as those stigmatized for physical, moral or social reasons. While researchers mainly focused on the coping strategies employed by dirty workers to normalize taint and maintain a positive sense of self, the organizational and managerial roots of dirty work have been poorly explored. The article aims to fill this gap illustrating how organizational and managerial practices contribute to workers’ perceptions of occupational taint.

Methodology Semi-structured interviews were conducted with 61 employees working at different levels and in different divisions of one of the major Italian banks, triangulated with 250 company documents, observational data and informal conversations gathered at the workplace.

Results Enhanced sales targets and digitally supported procedures lead front-line employees to be stigmatized by customers from the moral (as ‘vendors’) and social (as ‘servants’) points of view, diminishing their self-valued professional identity of ‘expert consultants’. Furthermore, they generated ingroup-outgroup dynamics for which different groups of employees reciprocally stigmatized each other.

Limitations Being a single-case study aimed at theoretical development, the scope of results has to be extended with further research in other sectors and occupations.

Practical implications Managers need to be aware that the activated organizational model and managerial practices can involuntarily contaminate certain jobs and occupations.

Originality The dirty work literature assumes that occupational taint is normally generated by external societal attributions. Our study shows that the dirtying of an occupation is a process that can be fostered by internal managerial strategies and practices.
Purpose: Determine the impact of breaks during work hours on the performance and mental health of knowledge workers.

Design: Medline, PsychInfo, Web of Science, Embase, Scopus, Business Source Complete, ABI Inform were searched using key search terms for breaks within work (e.g., coffee breaks, booster breaks), terms for mental health (e.g., stress, burnout), and terms for performance (e.g., productivity, risk of error) followed by a grey literature search. Quantitative studies were captured.

Results: Breaks during work hours have modest but consistent benefits for performance measures and mental health. More quality research is needed in this area to draw conclusive results on the timing and frequency of breaks and suggested activities to pursue during break time.

Limitations: Limitations to the review include the heterogeneous measures of both breaks and outcomes used in this research with a greater similarity within discipline (e.g., nursing) and difference in workers in an office setting (e.g., finance workers).

Practical Implications: This review could aid corporate leaders as they establish work break policies and normative behaviours, aiding them in constructing the ideal daily work structure.

Originality/Value: To our knowledge, this is the first systematic review of breaks within work hours for knowledge workers. The present review can be used to inform future directions for research in recovery during work.
Purpose: Long-term care raises unique ethical issues (dementia, end of life...), impacting quality of care and caregivers’ psychological health (stress, burnout...).

This survey was designed to map ethical-reflection bodies, stakeholders and topics in nursing homes (NHs), and to identify what deliberation arenas are used, depending on the kind of ethical questions NH staff faces.

Design/Methodology: A 14-item questionnaire was sent to 225 French NHs, belonging to the same European group. Responses were sought from 4 key respondents (medical director, coordinating nurse, facility manager, and psychologist).

Results: 433 anonymised questionnaires were received. Preliminary results show that: i) most often, multidisciplinary bodies work as non-formal ethics committees; ii) respondents express a need for awareness-raising and training in clinical ethics.

Limitations: Several selection biases may affect our results, in particular i) this survey was made in a single, private-owned NH group; ii) data were collected on a voluntary basis.

Research/Practical Implications: Our findings will help adjust the reflection and action of the owning Group to the ethical questionings and circumstances NHs experience: should an ethics committee be created in every facility? should cooperations with external ethical bodies be encouraged? Should additional training be implemented, and on what topics?

Originality/Value: Little data are available on how ethical questioning is experienced and ethical discussion, implemented in NHs.

Conclusion: Preliminary results advocate for the professionalization of the clinical-ethical approach in NHs. Definitive results will be available by March 2019, and will refine the trends described.
Purpose: Scholars coined intragroup conflict as a dynamic process, studied in the research lines on conflict escalation and transformation from task conflicts to person conflicts (e.g., Greer et al., 2008). However, literature investigating the reversed transformation from person conflicts to task conflicts is lacking. Therefore, we explore the dynamic nature of intragroup conflict by analyzing the transition probabilities from one type of conflict to another over time.

Design/Methodology: Longitudinal data from 300 Romanian workers were collected at 8 time points (time lag of 3 weeks). A dual process latent Markov model (Collins, 2006) in Latent Gold 5.1 (Vermunt and Magidson, 2017) estimated participants' probability to switch between latent states over time within and between types of conflict.

Results: Our findings revealed a bidirectional relationship between task and person conflicts. Within a certain type of conflict, de-escalation was far more prominent than escalation. Finally, the transition parameters between the processes showed that it was more probable that person conflicts become task conflicts than vice versa.

Limitations: Our study should be replicated in other samples to inspect the generalizability of our findings.

Research/Practical Implications: The results further knowledge on conflict escalation over time and challenge the dominant task-to-person angle on conflict transformation. This calls for more research and yields relevant implications for effective conflict management.

Originality/Value: It is the first study examining probabilities of conflict transformation from both task-to-person and person-to-task conflicts over time, applying latent transition analyses.
Purpose
In organizations using individualized pay setting, where pay raises are based on job performance and the quality of work, managers have a central role as they execute the organizations’ pay systems. The present study aims at increasing the understanding of pay-setting managers’ beliefs and perspectives on their role in connection to pay setting.

Design/Methodology
The study is based on seven focus group interviews with pay-setting supervisors from four different companies in the Swedish private sector. In the past few years, all four companies have implemented new pay-systems with a greater focus on employee performance. The semi-structured focus group interviews were analyzed with an inductive thematic analysis.

Results
Data analysis is ongoing. A preliminary thematic analysis revealed several tentative themes. These concern difficulties in assessing employee performance and in ensuring that employees fully understand the pay setting process (especially the performance assessments), the importance of regular constructive feedback, need for guidance and support, and lack of resources to reward high performing individuals.

Limitations
While focus groups with managers from four organizations provide a wealth of perspectives, individual interviews may have allowed for more in-depth insights. The results also need replication using questionnaire data to examine how wide-spread various experiences are.

Implications
This study contributes to a better understanding of the challenges that pay-setting supervisors perceive. This knowledge could be used by organizations to facilitate the pay-setting process for managers.

Originality
This is one of few studies focusing on pay-setting managers, who are the ones executing organizations’ pay setting systems.
897 - THE POSSIBLE ROLE OF INTELLIGENCE IN THE MOTIVATIONAL PROCESS OF THE JOB DEMANDS-RESOURCES THEORY

Konrad Kulikowski (1)
Jagiellonian University, Institute of Psychology, Krakow, Poland (1)

Purpose

The Job Demands–Resources Theory (JD-R) is one of the most influential theoretical framework explaining employee well-being (Bakker, Demerouti, 2017, JOHP). JD-R inspired hundreds of empirical studies but the role of intelligence is so far overlooked, however intelligence by determining success in dealing with cognitive complexity of work might influence job resources and wellbeing. Intelligence enhances gravitation toward complex, thus more resourceful, jobs and might also affect effectiveness of acquiring job resources in a context of given job (e.g. by learning new skills). On the other hand intelligence is known to have direct negative effect on employee well-being (Gonzalez-Mulé et al., 2017, JVB). Therefore we take a closer look at the role of intelligence in a motivational process of JD-R.

Approach

We use SEM with latent variables on data from 7583 participants of The National Longitudinal Survey of Youth 1979. Intelligence and personal resources data were collected in 1980 and job satisfaction, job resources, job complexity, age and education data were collected in 1988.

Results

Intelligence has direct negative effect on well-being, but has positive indirect effect via increase in job complexity and job resources. Intelligence is more strongly related to job resources than personal resources.

Limitations

We have analysed archival data what limits a possibility to capture a wide range of job resources.

Research Implications

These findings suggest that intelligence might play a role of cognitive resource in JD-R.

Originality

We have integrated previous findings to create one model highlighting a role of intelligence in JD-R.
TO LEAD IS NOT TO WORRY? LEADERS’ WORRIES ABOUT LEADERSHIP PATTERNS AND EMPLOYEES’ LEADERSHIP EVALUATIONS

Heidi Tsupari (1) - Elina Auvinen (2) - Mari Huhtala (2) - Taru Feldt (2)

University of Jyväskylä, Psychology, Jyväskylä, Finland (1) - University of Jyväskylä, Jyväskylä, Finland (2)

Purpose: We investigated leaders’ patterns of worries about leadership (WAL) and how these patterns associate with their subordinates’ leader perceptions (WAL spillover, satisfaction, and leader integrity).

Design and methodology: Latent Profile Analysis was conducted to identify WAL patterns in a sample of Finnish managers (N=1031). WAL was measured by a new scale developed by Aycan and Shelia (2018). In the following analyses, we included only those leaders in these WAL-patterns whose subordinates participated in the study (233 leaders and 990 subordinates). Subordinates assessed their leaders’ WAL spillover, satisfaction with their leader, and moral behavior. The relationship between leader’s WAL pattern and subordinates’ leader perception was analyzed with ANCOVA.

Results: Three WAL-patterns emerged in whole sample, which were replicated in the smaller subsample data: Average worries, n = 109, Low worries, n = 114 and High worries, n = 10. The follower ratings of WAL spillover where highest among the High worries-leaders. Followers were more satisfied with their Average worries-leaders than with Low worries-leaders. However, followers rated their Low worries-leaders to be less moral compared to the followers of Average worries-leaders.

Limitations: Cross-sectional design allows no causal inferences.

Research/practical implications: Our research provided pioneering empirical evidence on how to define the optimum level of WAL, which is important for leadership effectiveness. Future research should investigate the processes that could explain how an ideal amount of worries relates to more satisfied employees.

Originality/value: To our best knowledge, this was the first time to examine employees’ leadership perceptions in the WAL-context.
Purpose

Job crafting has many positive consequences for employees and organizations. Therefore, scholars and practitioners are investigating factors promoting job crafting behaviors. To better predict job crafting, we introduce the concept of Job Crafting Self-Efficacy (JCSE). We define JCSE as an individual’s beliefs about their own capability to modify demands and resources present at their job. A set of studies was designed to develop and evaluate the JCSE Scale.

Design/Methodology/Approach/Intervention

We conducted a qualitative study to design and four quantitative studies to test the psychometric properties of the JCSE Scale among Polish and American employees.

Results

Exploratory (N = 364) and two confirmatory (N1 = 434; N2 = 414) factor analyses demonstrated a 3-factor solution comprising JCSE beliefs about (1) increasing structural job resources, (2) increasing social job resources, and (3) increasing challenging job demands. These dimensions are reliably measured with 9 items. The JCSE shows convergent validity when correlated with occupational self-efficacy and relevant job crafting dimensions. In addition, JCSE explains unique variance in job crafting behaviors over and above occupational self-efficacy. We also found that the importance of organizational factors (e.g. perceived opportunity to craft) ceases when JCSE enters the equation.

Limitations

Psychometric evaluation was based on self-report measures and studies were conducted only in two cultural contexts.

Research/Practical Implications

This project demonstrates the importance of cognitive resources in shaping job redesign behaviors and provides a tool that may be used to evaluate effectiveness of interventions dedicated to empower JCSE.

Originality/Value

We introduce a new concept and a well-validated instrument to measure JCSE.
902 - JOB RESOURCES AND AN OPEN OCCUPATIONAL TIME PERSPECTIVE TO SUSTAIN IN HEALTHCARE WORK? RESULTS OF THE LONGITUDINAL HEALTHY HEALTHCARE PROJECT

Annet de Lange (1) - Karen Pak - Karen van Dam - Marit Christensen - Lise Lovseth - Eghe Osagie - Tjerry Verhoeven - Trude Furunes

Open university, Psychology, Heerlen, Netherlands (1)

Purpose:
Due to the ageing and dejuvenization of the western workforce, employers in these countries face a challenge to enhance a sustainable working life to maintain older workers (De Lange et al., 2015). As a result, there is accumulating research attention for the question how to effectively retain older workers in the labour market. Likewise, there is an increased practical as well as scientific interest in interventions that facilitate a prolonged working life of employees (Kooij, 2015). One of these research lines focuses on the positive effects of job crafting at work to enhance work ability (e.g., Kooij, Tims, & Kanfer, 2015). According to Tims, Bakker, and Derks (2012), job crafting can be defined as the self-initiated changes that employees make in the demands and resources of their job to attain or maintain a balance with their personal abilities and needs. However, few empirical studies have examined the relations between job crafting at work and indicators of sustainable work ability (measured with the work-ability index; Ilmarinen, Tuomi, Klockars, 1997). This study therefore aims to fill this research gap by examining relations between aging (measured as calendar age and future time perspective), job crafting and sustainable work ability. Based on earlier research, we tested the following hypotheses:

Calendar age is negatively related to indicators of sustainable work ability
Job crafting is positively related to indicators of sustainable work ability
Future time perspective is positively related to indicators of sustainable work ability

Design:
We will present results of a 2-wave complete panel study (the “Healthy healthcare” project) on the sustainable work ability and employability of a panel of 1474 Dutch healthcare workers (mean age= 46.8; SD= 11.62; mean job tenure= 13.2 years; 83.6% is female).

Results:
Results of our hierarchical regression analyses using data from Time 1 and Time 2 for the outcome work ability (controlling for job tenure and gender), revealed a significant negative relation with calendar age (β= -.09; p<.05), a positive cross-lagged relation with future time perspective (β= .10; p<.01), but no significant effects of job crafting in predicting work-ability of healthcare workers across time. In the presentation we will also discuss the interaction effects found.

Conclusions:
Our preliminary results indicate significant relations of future time perspective in predicting across-time changes in the work ability of healthcare workers, indicating the importance of taking a life-span perspective in relations between aging and work ability.
Limitations:

We only focused on data of healthcare workers and therefore cannot generalize the results to other professions or sectors.

Originality/Value

Few studies to date have been able to examine relations between aging, job crafting and work ability at work. As a result, the results of our complete panel including 2 waves can bring important new insights to the question how to sustain ageing workers in the labour market.

Key words: job crafting, successful aging, work ability, future time perspective

References:

The Cairnmillar Institute, Hawthorn East, Australia (1)

Purpose
Postgraduate psychology courses aim to develop student competency, that is, teach and assess the knowledge, skills, and behaviors required of registered psychologists. Competencies are often taught as a discrete set of skills embedded in different coursework units. However, these discrete skills and competencies may not reflect the interrelated and complex nature of the practice of psychology required at a postgraduate level. This project sought to determine the key competencies required to practice psychology, and to demonstrate how these competencies are melded together to better reflect authentic, real world practice.

Methodology
The methodology comprised two stages, the first recruiting eight Subject Matter Experts (SMEs) comprising both academics and practitioners who participated in a Delphi process, with the aim of developing a draft psychology competency model. During the second stage of the study, practitioners and academics from various areas of psychology practice participated in a series of workshops to further refine the competency model.

Results
A draft competency model for psychology was developed which demonstrated an explicit scientific-practitioner process, incorporated meta-competencies, and then highlighted how these components intersect.

Limitations
The model was developed within Australia and may not be generalisable to other audiences.

Practical implications
This model provides educators with a clearer understanding of how the competencies meld together in actual psychological practice and may guide course pedagogy.

Originality
This research generated a novel competency model for psychology, and meta-competencies were highlighted within the psychological competency model.
Purpose

Cohesion enhances positive workplace outcomes, including job satisfaction, team performance, and productivity. Despite the importance of cohesion, definitions, factors, and measures of cohesion are used inconsistently. For example, the contribution of both task and social cohesion has been highlighted in previous research but ignored by some cohesion researchers. This study is part of a broader cumulative research program exploring the factors of cohesion. Our aim was to cast a net broadly and identify potential candidate factors that might be part of the cohesion construct.

Methodology

The Repertory Grid Technique was used to explore the conceptual framework constructed about cohesions by each participant (n=26). The instruments included a Repertory Grid Technique interview guide and 14 cohesion element cards. A triadic method was used to elicit the constructs and data were analyzed using weighted multidimensional scaling.

Results

Findings supported cohesion being a multidimensional construct with six cohesion dimensions, comprising one task and five social elements, revealing some areas of overlap with previous research. There was no support for group versus individual components of cohesion.

Limitations

Methodological limitations included the random assignment of elements to triads. This resulted in some elements or combinations of elements being presented to participants more frequently than others.

Practical value

Shared understanding of cohesion will only be developed through purposeful cumulative research and will inform an instrument that measures the six cohesion components.

Originality/Value

The use of a lesser-utilized technique may elucidate the nature of cohesion.
Purpose: In this paper, we try to learn and share lessons from the creation and deployment of an International Scientific & Ethics Council (ISEC) by the ORPEA Group (854 health facilities in 13 countries), opening up avenues for improving the dissemination of an ethical culture throughout a multisite organization, and the response to the Senior Management’s referrals about ethical implications of strategic and tactical choices.

Design/Methodology: We use the classical framework of organizational learning, defined as the process of creating, retaining and transferring ethical knowledge, and a reflective approach to learn from our own experience, successes, mistakes and errors.

Results: A common theoretical background was developed. Initial train-the-trainers courses were organized, and national/regional ethical referrers were appointed. Excellence Awards are granted every year, with a trebling number of applications in 4 editions.

Limitations: Main limitations concern the constant effort needed to sustain the consistency, homogeneity and adjustment between the headquarters’ and the local facilities’ expectations.

Research/Practical Implications: Being focused on the development of a vivid ethical culture throughout the organization, the ISEC develops resources to improve quality of care, working conditions and organizational performance.

Originality/Value: Clinical ethics is a key concern in health organizations, and can be considered both a specific dimension and an inspiration for CSR. This unique return of experience is therefore of interest for most industries, not limited to healthcare.

Conclusion: The ISEC was successfully implemented. Improvement areas were identified. A survey is currently being undertaken to identify the facilities’ ethical needs and adjust ISEC’s activities.
910 - DEVELOPMENT AND VALIDATION OF A MULTIDIMENSIONAL MEASURE FOR PLANNING IN TEAMS: FIRST RESULTS

Martina Oldeweme (1) - Udo Konradt (1)
Kiel University, Kiel, Germany (1)

Purpose
Theoretical (e.g., West, 2000) and empirical evidence (e.g. Mathieu & Schulze, 2006) suggest a positive relationship between team planning and team performance. However, a closer examination of the results shows that prior research is lacking comparability and content validity due to the use of many different and very specific measures. To address these limitations, we developed and validated a multidimensional team planning measure.

Design/Methodology
Based on theoretical assumptions from prior work, we distinguished the four planning dimensions of exploration, strategic planning, detailed planning, and prognosis. We developed a corresponding set of 16 items and examined the construct, discriminant and convergent validity in a student sample (N = 206) and an employee sample (N = 210) using quasi teams. The criterion-related validity was tested in a laboratory-based complex problem-solving setting in ad-hoc teams (N = 40).

Results
Results indicated sound psychometric quality (i.e., reliability, convergent, and divergent validity) across all studies. Confirmatory factor analysis and Bayesian analyses support construct validity. Linear regressions also demonstrated criterion-related validity of the multidimensional measure.

Limitations
The use of quasi teams in the first two samples and the laboratory setting limit the external validity and generalizability of findings.

Research/Practical Implications
The results suggest that planning is a multi-dimensional construct that represent the complexity and diversity of behaviors that constitute team planning.

Originality/Value
The multidimensional measure is a useful step forward in uncovering the different processes involved in team planning and more deeply understanding how they are related to processes, action, and outcomes in teams.
The phenomena of Ostracism is a form of social exclusion, or even expelling someone from the workplace, using strategic ignoring, silent treatment and making someone invisible. The phenomena is sometimes described as The Social Deathpenalty. Ostracism is suggested to be highly connected to the research of Social Pain, due to the findings that Social Exclusion has a devastating impact for the individual who’s being ostracized. According to scholars in the field, it is one of the most stressful experience to endure.

The aim of this research project is to explore how ostracism is related to workplace bullying and other overlapping phenomenon and how it is unfolding within the context of Human Service Organizations. What is the motive for ostracise an individual within the work organization? Who is gaining something and what? What sets it off? What organizational processes enhance this kind of behaviour and how is it rationalized?

The cases will be recruited from workplace settings within Human Service Organizations. The method used for doing the study will be narrative case-studies.

Keywords: Bullying, Ostracism, Social Pain, Work Environment, Aggressive behaviour, Human Service Organizations.
Purpose

In the present study we focus on the role of employee authenticity (EA), i.e. the subjective experience of alignment between employee's internal experiences and external expressions, in decreasing job burnout and enhancing job performance. After exploring the relationship between employee authenticity and burnout and job performance, we test this relationship in a lab study.

Design

In Study 1 we performed a cross-sectional survey study on 456 Chinese employees to test the relationship between EA and job burnout;

Study 2 tested the suggested causal relationships by laboratory experiments among 76 Chinese employees (Ne=40, Nc=36) to see whether the activation of different levels of authenticity (Fleeson & Wilt, 2010) would have an impact on employees' cognitive ability, burnout and job performance.

Results

1) Employee authenticity reduced job burnout through a decrease of ego-depletion (Study 1);

2) Activating higher levels of employee authenticity produced higher levels of employees' cognitive (conversion) abilities, which subsequently significantly decreased burnout and enhanced job performance (Study 2).

Limitations

The study was conducted in a Chinese setting, which may limit its generalizability to other cultural settings.

Research/Practical Implications

There is value in supporting and enhancing employee authenticity as a means toward increasing job performance and reducing job burnout.

Originality/Value

To our knowledge this study is the first to study employee authenticity in relation to job burnout and job performance and to show the beneficial effects of higher employee authenticity by means of a lab experiment.
Purpose. Current research shows that mindfulness as well as vigor are important personal resources that have a positive impact on various organizational outcomes. Both fluctuate on a daily basis and therefore influence our day-to-day workability. In this study, we examine how daily fluctuation in employee’s mindfulness and vigor effect daily task performance. Additionally, we investigate potential synergy and/or compensation effects between the two resources.

Design/Methodology. To test these assumptions, we conducted an online diary study on five consecutive workdays with 100 participants. Directly at the end of the workday, participants had to indicate their state mindfulness and vigor at the workplace and additionally estimated their own task performance.

Results. Multilevel analyses showed that both daily mindfulness and daily vigor positively predict task performance. The interaction between mindfulness and vigor was significant but no synergy effects were found. Results indicate that high mindfulness can compensate low vigor – and vice versa.

Limitations. Common method variance might confound the results because all variables were self-reported. Further, we assessed all relevant variables at the same measurement point.

Originality/Value. Looking at the interplay between personal resources at work might offer a valuable starting point for individual- tailored interventions that allow people to unfold their full potential. The development of mindfulness of employees may not only directly increase well-being and job performance but also enable workers to compensate for low energetic states.
Purpose: The impact of robotization on the experiences of employees in the workplace requires more attention than it has received so far. Seeing how work or specific tasks are increasingly performed by robots or computers could be seen as both a threat and an opportunity for the experience of meaningful work. On the one hand, robotization potentially destroys work, leaving employees unemployed or performing (a limited set of) meaningless tasks. Moreover, robotization may hinder the social aspects of work that are seen as meaningful by employees. On the other, the robotization of routine, tedious, strenuous, or unenjoyable tasks may help to create more meaningful jobs, in which the most (socially) complex and significant tasks are performed by employees rather than robots.

Design/Results: Based on interviews held with employees faced with robotization of their work activities in the logistic sector, we explore how such changes affect their experience of meaningfulness at the level of specific tasks and what factors contribute to their perceived loss or gain in meaningfulness.

Limitations: Studies beyond this exploratory research on employees in logistic warehouses in the Netherlands are needed to fully understand the influence of robotization on employees.

Research/practical implications: A better understanding of how robotization influences the experience of meaningful work could help mitigate the potential risks of robotization for employee well-being and performance.

Originality: Research on robotization in the workplace is scarce. To our knowledge this is the first attempt to look at the relation between robotization and meaningful work.
MORE THAN ONE STRATEGY: A CLOSER EXAMINATION OF THE RELATIONSHIP BETWEEN DEEP ACTING AND KEY EMPLOYEE OUTCOMES

Merve Alabak (1) - Ute R. Hülsheger (1) - Fred R. H. Zijlstra (1) - Philippe Verduyn (1)
Maastricht University, Work&Social Psychology, Maastricht, Netherlands (1)

Purpose
The relationships between emotional labor strategies (i.e., deep acting and surface acting) and employee outcomes are well-researched. Yet, while the role of surface acting for employee well-being is clear, findings regarding deep acting have been inconsistent. In the present study, we propose that this may be explained by the multi-dimensional nature of deep acting which subsumes different specific emotion regulation strategies.

Design/Methodology
With a 5-day diary study we therefore investigated the links of subtypes of deep acting (i.e., perspective taking, positive reappraisal and attentional deployment) with key employee outcomes (i.e., mental fatigue, self-authenticity and rewarding relationships) in a sample of 244 employees.

Results
Multilevel analyses confirmed that different emotion regulation strategies underlying deep acting were differentially related to employee outcomes, which may explain the mixed results of past research examining deep acting as a uniform construct. More specifically, unlike two other deep acting strategies, perspective taking was not associated with mental fatigue and lack of authenticity. Furthermore, it was associated with increased rewarding relationships.

Limitations
Since our data do not allow for strong causal conclusions, future studies using an experimental approach would be beneficial

Originality/Value
The present findings therefore extended the emotional labor literature by showing that different deep acting strategies may be differentially related to key emotional labor outcomes.

Practical Implications
Given that perspective taking appeared to be more effective than other two deep acting strategies, training programs may focus on enhancing employees’ comfort with perspective taking rather than all deep acting strategies.
924 - THE IMPACT OF EMPLOYEE SUPPORT ON EMPLOYEE ABSENTEEISM: THE MODERATING EFFECT OF PATIENT MISTREATMENT

Nate Zettna (1) - Helena Nguyen (1) - Anya Johnson (1) - Karyn Wang (1)
The University of Sydney, Work and Organisational Studies, Business School, Sydney, Australia (1)

Purpose

This paper examines the relationship between different sources of employee support (i.e. manager support, peer support) and employee absenteeism, and the moderating role of patient abuse.

Design/Methodology/Approach/Intervention

We collected surveys from nurses working in a public hospital in Australia. Specifically, we asked nurses about the level of support they received from their managers and peers, and their experience of patient abuse. Absenteeism data from the organisation was collected over a period of 12 months following survey completion.

Results

Analyses revealed that patient abuse moderated the relationship between different sources of support and absenteeism. When patient abuse was low, the relationship between manager support and absenteeism was negative. Interestingly, we found that when patient abuse was high, the relationship between peer support and absenteeism was negative.

Limitations

Our sample size was relatively small, and we also only focussed on one type of mistreatment - patient abuse. Different sources of mistreatment and abuse may be associated with different patterns of outcomes.

Research/Practical Implications

Findings indicate that the different sources of support from within the organisation can be associated with decreased absenteeism depending on the pattern of abuse exhibited by patients. Whilst managers can decrease absenteeism when patient abuse is low, their support does not seem to be effective when patient abuse is high. However, peer support can reduce absenteeism under conditions of high patient abuse.

Originality/Value

This research expands on the support-absenteeism relationship, examining the role of broader support networks, and how abuse from those outside the organisation affect these relationships.
Purpose: Mergers and acquisitions (M&A) occur often between asymmetric partners. Lower-status partners frequently perceive lower prototypicality (representativeness) in the new organization, therefore identify and commit less to the changes. The research conducted aimed at identifying and testing the effect of functional indispensability (instrumental contribution of the ingroup for a superordinate outcome) on merger support. More precisely, testing whether indispensability leads to change commitment via relative ingroup prototypicality and post-merger identification.

Methodology: Five experiments manipulating functional indispensability (N’s= 479, 150, 266, 113 and 229 respectively), examined how it influences perceptions of relative ingroup prototypicality, post-merger identification and change commitment in low-status merger partners (with status also manipulated in Studies 3-5). Additionally, the potential moderating role of information processing (heuristic vs systematic) was explored.

Results: Results indicate that functional indispensability impacts prototypicality (Studies 1-5), and this may be moderated by information processing (Study 2). Moreover, prototypicality and post-merger identification mediated the causal relation between functional indispensability and change commitment (Studies 1-3).

Limitations: The experiments used scenarios. Although considered realistic by participants, they could fail to elicit the same emotional responses as studies conducted in a real situation/organization.

Implications: This research has important repercussions for both theory and practice. It contributes to the Ingroup Projection Model, social cognition, minority behaviour and organizational change state-of-the-art. Moreover, it provides managers with important tools for better M&A practice.

Originality/value: This research integrates different scientific models and tools from fundamental social psychology, addressing them in a common framework and applying them in a management context.
An important transition in the life of an employee is when he/she accepts their first leadership role. Although transitions into leadership positions are constantly occurring in organizational life, there is a conspicuous lack of literature focused on the effects of this evolution for novice leaders. Therefore, the purpose of this study was to understand the consequences of assuming a leadership position on the individual’s performance using the lens of hindrance/challenge stressors. In order to achieve this goal, we analyzed archival data from 28 newly appointed National Hockey League (NHL) captains between 2007 and 2013. A dataset was compiled with performance data (Corsi) of these captains as well as performance data from a control group of comparable non-captain players (contemporary players with a similar age, playing style, position on the ice, and level of responsibility). We tested our hypotheses using a Dynamic Random effect model. Our results suggest that leadership appointment bolsters the individual performance of the captains. This increase in performance is unique to newly appointed captains (the performance of comparable players has a decreasing slope) and the performance boost lasts between 6 months to a year before it returns to pre-captaincy levels. The findings of this study suggest that leadership appointments may not be perceived as a hindrance stressor, but rather as a challenge stressor and therefore as an opportunity for growth and personal improvement. Limitations as well as implications for research and practice are discussed in detail.
935 - PREDICTING EMPLOYEE JOB BEHAVIOR: THE ROLE OF CALCULATIVE MINDSET AND BOTTOM-LINE MENTALITY

Brigitte Steinheider (1) - Tom Stone (2) - Brandon Ferrell (3) - Vivian Hoffmeister (1) - Joongseo Kim (4) - Jim Jawahar (5)

University of Oklahoma-Tulsa, Psychology, Tulsa, United States (1) - Oklahoma State University, Management, Tulsa, United States (2) - Hogan Assessment, Tulsa, United States (3) - Penn State Behrend, Management, Erie, United States (4) - Illinois State University, Management and Quantitative Studies, Bloomington/Normal, United States (5)

Purpose
Employee job behavior can be categorized into in-role performance and extra-role positive (organizational citizenship, OCB) and negative (counterproductive work, CWB) behaviors. Personality factors have been identified as antecedents to OCB and CWB. Research has shown that a bottom-line mentality and a calculative mindset predict unethical work behavior; however, as newer measures their incremental validity over established personality measures has yet to be determined as well as their prediction of in-role behavior and OCB.

Design/Methodology
Data were collected from 374 respondents from a larger M-Turk sample. Besides the Hogan Personality Assessments (HPI, HDS, and MVPI), we assessed calculative mindset (10 items, Kim, 2017, α=.95), bottom-line mentality (4 items, Greenbaum, Mawritz, & Eisser, 2012; α=.94), CWB (32 items, Fox & Spector, 2002; α=.92), OCB (Lee & Allen, 2002, α=.93) and in-role performance (5 items, Lynch et al., 1999, α=.89).

Results
Stepwise regression analyses established incremental validity over the personality assessments for calculative mindset which significantly predicts in-role performance ($\Delta R^2 = .063$, $p < .001$, negative relationship) and CWB ($\Delta R^2 = .074$, $p < .001$, positive relationship), but not OCB ($\Delta R^2 = .00$, ns). Bottom-line mentality did not explain additional outcome variance, indicating considerable overlap between both measures.

Limitations
The cross-sectional design and the use of self-report data are limitations.

Research/Practical Implications
This research helps employers to identify and predict problematic employee mentalities and behavior.

Originality/Value
This is the first study to examine incremental validity for both measures and to analyze the relationship with positive and negative employee job behavior.
In these turbulent times, organisations are more and more frequently confronted to organisational pathologies. The organisational trauma (OT) is one of them. In order to gain a better insight of this organisational pathology, OUDITO, a recently validated diagnosis tool, has been created. OUDITO allows the measurement of the impact of an organisational potentially traumatic event for an organisation. This tool is composed by 48 items subdivided in 6 dimensions.

The purpose of this study is to analyze the capacity of OUDITO to diagnose a work-related psychological disease. It will provide a better understanding of how the individual impacts of such organisational pathology are possible.

The burnout is one of the diseases that has the largest effect on workers. Relating the burnout to the OT could open new perspectives of its prevention by assessing an organisational treatments.

This study was carried out among 7226 employees from a large Belgian governmental institution. Both OUDITO and OLBI were administrated. The diagnostic analyze that was carried out was the ROC curve. The results show that the OUDITO has a good specificity and sensibility when it comes to diagnosing the burnout with an index of .747 and a p-value < .05.

Nonetheless, the study has some limitations. Indeed, both questionnaires were submitted in the same time, therefore some biases may interfere with the results. However, the introduction of such organisational diagnosis tool and the ROC curve analysis shed a new light on this study. Additionally, relating OT to burnout opens new perspectives for burnout prevention.
Purpose
Understanding occupational turnover is a critical endeavor in career mobility research. As the current skill shortage cannot be absorbed by additional hiring, maintaining trained employees in their respective occupations is essential.

Design
We investigated occupational change in vocational careers based on a longitudinal data set from Switzerland (N = 905), highlighting the formative context of vocational education and training (VET) and its predictive power for occupational turnover. A combination of quantitative methods was used, addressing prior methodological shortcomings.

Results
Results indicate that early, occupation specific work experience has a strong impact: Work characteristics from VET predicted satisfaction with trained occupation which in turn predicted occupational change, up to ten years after finishing VET. Satisfaction with trained occupation mediated this relation. The same effects were observed for work characteristics and work satisfaction during later career, tested with a subsample.

Limitations
The main limitation concerns attrition bias among the subsample. Although nonrandom attrition occurred, the findings still indicate that occupational change is predictable through dissatisfaction, the hypothesized relationship thus holds true.

Implications
Our findings contribute to a better understanding of occupational mobility. Learning that early work experience has the power to predict the change of one’s occupation, that may also be linked to human capital loss, informs practitioners on how undesired mobility could be reduced. Early career experience should be integrated in established career change models.

Originality/Value
A better understanding of the factors triggering and preventing occupational turnover supports the objective of keeping individuals interested and employable in relevant vocational occupations.
Purpose: This study addresses the effect of depressive symptoms on participation in work five years later. It is based on the longitudinal Study on Mental Health at Work (S-MGA), which had started with a representative sample at baseline.

Methodology: The panel of N=4,511 was sampled from all employees in Germany being subject to social security contributions at the date of sampling from the register and born between 1951 and 1980. The current analysis is based on n=2485 employees who completed the interview at baseline and at follow-up five years later. Non-participation in work was classified with reference to ILO by less than 1 hour/week in gainful employment and depressive symptoms by the Patient Health Questionnaire (PHQ) with a cutoff ≥10. The longitudinal associations were investigated by logistic regression analysis.

Results: 11.2% were not employed at the follow-up. Depressive symptoms at baseline were associated with a lack of employment five years later by a crude OR=1.7 (95% CI: 1.12 – 2.58). The association attenuated to an OR of 1.5 (95% CI: 1.00 – 2.31) by an adjustment for chronic diseases and injury.

Limitations: Only subjects in employment at baseline were included.

Research/Practical Implications: We conclude that depressive symptoms are an issue for exit from the labor force that is relevant for longer periods of employment.

Originality: The first nationwide longitudinal study on mental health at work in Germany starting with a representative sample at baseline.
Orientation: Organisations face the necessity to adapt to the challenges of globalisation and as a result employees can face downsizing, layoffs, and retrenchments. Subsequently an increase in levels of job insecurity and decrease levels of performance as well as perceived lower performance can prevail.

Research purpose: This study had three objectives: 1) to determine the relationship between job insecurity, perceived performance and managerial communication; 2) to determine whether job insecurity predicts outcomes such as perceived performance and managerial communication separately; and 3) to determine whether managerial communication plays a moderating role between job insecurity and perceived performance.

Motivation for the study: To gain more knowledge on the limited research done on the relationship between job insecurity, perceived performance and managerial communication, specifically in the mining industry.

Research design, approach and method: A cross-sectional research approach was used. An availability sample (N = 137) of office-bound employees in the South African mining industry participated. Structural equation modelling was used to test the moderating effect of managerial communication on job insecurity and perceived performance.

Main findings: The results revealed that job insecurity had a negative relationship with perceived performance and managerial communication. It was found that managerial communication moderated the relationship between job insecurity and perceived performance.

Practical implications: Improvement in managerial communication improves an employee’s perceived performance when experiencing levels of job insecurity. Managerial communication moderates the relationship between job insecurity and perceived performance.

Contribution of the study: Empirical value indicated that managerial communication could contribute to lower job insecurity and higher perceived performance.
Introduction: Psychological Violence in the Workplace (PV) is defined as the experience of intimidation and negative acts among workers (harassment, offense, exclusion) with a certain frequency and duration, where one of the parties is inferior. This negatively affects both the exposed individual, as well as the organization. The leadership of the immediate superior, including their support and ability to resolve conflicts is crucial for the violence emergence (or not) and its resolution in organizations.

Objective: The objective of this study was to identify consequences of the PV to workers exposed to it, and to the organization where this took place. The incidence in the damage was analysed, from the organizational contexts (changes in the organization, type of leadership of the immediate superior, conflict management) and the individual factors of the exposed workers (stress situations, type of contract, social support and boss support). The existence of differences in the magnitude of the damage caused to both the exposed workers and the organizations was also analysed depending on who was the perpetrator of the mistreatment (Boss or Non-Boss).

Methods: The method used for data collection was mixed; both quantitative and qualitative data were collected. Data were collected using a questionnaire called "Interpersonal relationships at work" and group meetings called Life History at Work. Interpretive analysis was used to the narrative of group sessions and structural equation modelling was also used for the quantitative data.

Procedure: Qualitative: 49 participants exposed to PV in six Life History at Work groups, eight sessions each one. Quantitative: 256 valid respondence. The model has six constructors (here we present the relations of three of them: Psychological Violence (PV), Personal Consequences (PC) and Organizational Consequences (OC).

Results:

In groups: all the participants showed difficulties in expressing their emotions and increasing anxiety when expressing their discrepancies.

General results allowed us to confirm that organizational factors have both personal and organizational consequences. These were more important when the perpetrator is the immediate boss.

Conclusions: Thus, we can conclude that when the perpetrator is the immediate boss, his leadership style is perceived as authoritarian. However, when the perpetrator is another worker (non-boss) the deficient conflict management by their own boss is perceived.
Yvonne Garbers (1) - Udo Konradt (1)
Kiel University, Work and Organizational Psychology, Kiel, Germany (1)

Purpose
Based on the theory of leader distance and the dispersed leadership theory in teams, we examined the effects of zero and destructive leadership on performance. According to the approach of negative leadership, we compared the negative influence of volitional and unintentional lack of leadership.

Design/Methodology
We conducted two policy-capturing studies. In Study 1 (N = 133), we manipulated team-based leadership (zero vs. transformational) and interactional leadership (zero vs. passive-avoiding vs. destructive). In Study 2 (N = 170), the construct of zero interactional leadership was additionally separated into volitional (vacation) and unintentional (illness) missing. Dependent variables were work performance and extra role behavior.

Results
Results of Hierarchical Linear Modeling showed for both dependent variables (1) stronger negative effects for destructive leadership than for zero leadership, (2) no differences between volitionally missing and destructive leadership, and (3) a compensatory effect of team leadership on zero interactional leadership.

Limitations
As we used scenario-based quasi-experimental designs with individual assessments, external validity is the main threat. Thus, it is difficult to generalize the results to organizational teams.

Research/Practical Implications
Destructive and volitionally missing leadership have even greater negative effects than a complete absence of a formal leader. To prevent these negative effects, organizations should use forms of dispersed leadership and strengthen the selection and development of leaders.

Originality/Value
We provide first results on the negative consequences of zero leadership compared to destructive leadership. The distinction between volitional and unintentional lack of leadership is essential both for leadership theory and practice.
Supported Employment (SE) is a methodology for helping the disadvantaged people to enter the competitive work environment and enhancing the diversity at work. SE Specialists play a crucial role in the success of SE process. They consult the clients from job searching to adjusting to their jobs and workplaces. SE for People with Disabilities is a new concept for Turkey and SE applications are still in need of improvement in countries like Bulgaria, Slovenia and Portugal. As a result of that, an Erasmus Project was conducted by the partners from these countries.

In this project training materials were developed to improve the competencies of the SE specialists for PwDs. A 6-module training program was developed as a results of the needs analysis conducted in these countries. Pilot training sessions were completed with 196 trainees in 4 countries. Training evaluation was conducted using Training Satisfaction Questionnaires, Module Evaluation Questionnaires, an Assessment Questionnaire (a 37-question multiple choice exam) and E-Learning Satisfaction Questionnaires.

The results showed that the trainees and trainers were content with the training program and the results of the assessment exams showed that the trainees in Turkey and Portugal achieved to learn the concepts and applications appropriately: the mean of correct answers for Portuguese trainees were 30.90 and for Turkish trainees 26.90.

Besides this project there is a lot to do for the development of SE in these countries for the employment of PwDs as SE is a serviceable and a practical tool for the rehabilitation of PwDs and for the integration of disadvantaged people with the society.

Key Words: Supported Employment, Employability of People with Disabilities, Diversity, Integration, Training Evaluation
Purpose: Concerns have been raised that high performance work practices (HPWPs) may negatively impact upon interpersonal relations. In response to this, our aim is to examine if HPWPs are associated with increased levels of competition in the work group. Moreover, laissez-faire leadership is studied as a possible moderator.

Methodology: A survey was conducted in Belgium (n=421), among employees belonging to a variety of sectors. Validated measures were used to measure HPWPs (Chuang & Liao, 2010), competition (Fletcher & Nusbaum, 2010) and laissez-faire leadership (Notelaers et al., in press). A moderation analysis using SEM was conducted in Mplus.

Results: While the overall results fail to find a positive relationship between HPWPs and competition, the results show that HPWPs are associated with increased competition under conditions of high laissez-faire leadership.

Limitations: The cross-sectional nature of the design does not allow for conclusions about causality.

Research/Practical Implications: The results point to the importance of studying interactions between HR practices and leadership when predicting employee outcomes. More precisely, the results suggest that HPWPs may be detrimental to interpersonal relations if leaders adopt a laissez-faire approach.

Originality: While many scholars have argued that HPWPs may have a “dark side”, we know little about when such detrimental outcomes are likely to manifest themselves. This study points to the role of laissez-faire leadership in explaining when HPWPs may have negative outcomes for employees and groups.
Purpose: Human error in the quality control checking of fresh produce labels costs the UK supermarket industry millions of pounds per year in product replacement and wastage. A greater understanding of the contributors to human error could help to reduce the frequency of such mistakes occurring. To this end, the current research sought i) to identify the challenges presented by the production environment in which label-checking takes place and ii) to explore the influence of individual differences in cognition on label-checking. Design/Methodology /Approach/Intervention: Interviews were conducted with quality control operatives at packhouses of varying sizes and complexity, asking them to identify the main contributors to human error in label-checking. A laboratory-based simulated label-checking task assessed label-checking accuracy in professional quality control staff and university students. Key measures of cognitive ability were also taken. Results: Information processing speed and the executive function of inhibition predicted better overall accuracy and higher levels of label error detection but other measures of executive functioning did not. Limitations: While being complimented for its verisimilitude by participants, the simulated label-checking task was performed in a controlled laboratory environment, devoid of the typical potential distractors experienced in the real-life packhouse setting. Research/Practical Implications: A greater awareness of the situational factors affecting performance can be used to reduce their impact. Individual differences in cognition should be considered in the selection, training, and support of quality control staff. Originality/Value: Across manufacturing sectors, there is potential for large financial and environmental savings by reducing error and waste arising from it.
HR-PRACTICES FOR ALL: WHAT DRIVES THE INCLUSION OF INDEPENDENT PROFESSIONALS IN THE WORKPLACE FROM AN HR PERSPECTIVE?

David Stuer (1) - Ans De Vos (1) - Sabet Van Steenbergen (1)
Antwerp Management School, Next Generation Work, Antwerp, Belgium (1)

Purpose

Organisations affect employee outcomes using HR-practises. Traditionally, research investigates the effects of these practises towards employees on the payroll. These are however not the only stakeholders in an organisation that might benefit from such measures. One of these possible beneficiaries are independent professionals (IPROS), who are underrepresented in research, whilst not being a marginalised group in organisations.

Currently, we do not know what drives organisations to target IPROS with HR policies and whether these HR-policies are transactional or inclusive in nature. We expect that this depends on ‘why’ an organisation works with IPROS: for solving short-term workforce needs or by taking a more proactive approach. We expect that this in turn is affected by organisational strategy. Innovation-oriented organisations are expected to be more proactive in their use of independents compared to exploitation-oriented organisations. Finally, we expect that ambidextrous organisations, balancing innovation and exploitation, will employ independents more proactively.

Methodology

Responses were collected using an online panel of 687 HR-managers or CEO’s from companies in five countries: Belgium, France, Germany, The Netherlands and the UK. Latent congruence modelling was used to analyse the data.

Results

Initial analyses show mixed support for the model. The components of strategy affect both reactive and proactive use of independents and the inclusiveness of HR-policies. Ambidexterity affects the inclusiveness of HR policies.

Limitations

It is a cross-sectional panel, so we cannot imply causality.

Research implications

Organisational strategy seems key in understanding how independents are treated and used in organisations.
Much attention has been given to determining enabling factors of resilience, but not to what might also harm or thwart it (Fossion et al., 2013). This paper focuses on employee resilience (Kuntz, Malinen, & Näswall, 2017) in the public sector context, and presents an in-depth analysis of behaviours by leaders that either enable, or inhibit resilient behaviours in employees. This mixed method study first quantitatively identifies leadership behaviours expected to antecede resilience (n=233) (Kottke & Sharafinski, 1988; Zhang, Waldman, Han, & Li, 2015). It then qualitatively explores, through interviews and focus groups (n=33), other leadership behaviours and their possible consequences for employee resilience.

Six categories of resilience-enabling leadership behaviours were identified and consolidated through this research. These consist of leading for: collaboration, self-management, career and growth, learning, support, and individual contributions. Findings also reveal particular leadership behaviours that are harmful for employee resilience. The impact that these behaviours have on employees is captured in an explanatory framework for resilience-enabling and -inhibiting leadership behaviours. Some of these behaviours appear to be particularly unique to the public sector, whilst others are applicable to other organisations as well.

This paper enhances our understanding of resilience capacity in employees, and highlights the critical role that leaders can play in both enabling and inhibiting this capacity. Although this study is situated in the public sector, the explanatory framework provides valuable insights for all organisations on how employee resilience can be fostered and developed, but also harmed, by leaders.

Purpose: Recent research demonstrates a growing interest in video game-based training methods. One concern for this trend is the conflation of different measures to evaluate the motivational effects of video games. Given the unique intended applications of these measures, it may be misleading to use a measure of motivation outside of its intended context. Furthermore, inconsistent research findings on these effects may be attributed to the misapplication of different measures of motivation and other similar constructs. The purpose of this study is to evaluate different types of motivation-like measures (i.e., motivation to learn, voluntary task re-engagement, and engagement), demonstrating their unique relationships with video game-based training.

Design: Participants were assigned to a computer-based or video game-based training group. Pre-test and post-test measures of motivation to learn were obtained, in addition to post-test measures of engagement. Participants were also given free time to examine voluntary task re-engagement through their resumption in the training activity during free time.

Results: Motivation to learn did not differ for learners receiving training across different training modules (i.e., computer-based vs. video game-based training). However, voluntary task re-engagement and engagement differed significantly between the two groups.

Limitations: A university student sample was used. The video game-based training featured outdated gaming technology with limited ludic properties.

Implications: Implications for research support the further examination of differences between measures of motivation and other motivation-like constructs.

Value: These findings indicate the importance of selecting a context-appropriate measure of motivation when investigating differences between training conditions.
Purpose: There is presently a dearth of research investigating VR games for selection purposes. In particular, one very common selection method is the cognitive ability assessment. While cognitive ability assessments demonstrate high validity coefficients, validity evidence has not been examined in a VR format. Thus, the purpose of this study is to evaluate validity evidence for assessing cognitive ability using VR game-based assessment scores. Because cognitive ability is associated with adverse impact among demographic subgroups, this effect is also explored in the VR format.

Design: Participants completed a VR game-based assessment, self-report cognitive ability assessment, and additional scales. Content validity was evaluated through subject matter experts ratings in cognitive psychology. Construct validity was evaluated through convergence and divergence between VR scores and other measures (i.e., self-report assessment scores, OCEAN personality traits, and demographics). Criterion validity was evaluated through associations between VR scores and performance (i.e., GPA).

Results: Results demonstrated promising relationships between formats, and a full discussion will be provided on the future potentials this may indicate.

Limitations: A university sample was used, with GPA as a proxy for job performance. The VR game-based assessment featured commercial off-the-shelf games with limited customizability.

Implications: The results of this study indicate the need for further research to examine the qualities of VR games that contribute to validity in assessing cognitive ability and other characteristics.

Value: These findings can inform future research and practice in game-based assessment, pertinent to those who seek to examine emergent effects of a VR format.
Purpose: Psychological contract (PC) definitions focus on employee beliefs about the organization and not on the experience of events. An early focus on traumatic breach has meant that everyday experiences of broken and fulfilled promises, and fulfilment generally, received little attention, conceptually and empirically. We apply an emotion lens to explore the everyday experience of both broken and fulfilled promises.

Methodology: Diary study with 350 participants (10 working days), using an event-sampling approach, containing whether a fulfilled and/or broken promise were experienced on a day, followed by reports of emotions, attributions and what the event was about. Also, daily outcome measures.

Results: Breach events (N=252) elicit mainly disappointment and frustration, fulfilment elicited happiness, gratefulness and pride. Broken promises were about unfair treatment and workload caused by senior managers, fulfilment was about support, information and fairness attributed to line managers. Breach predicted negative behaviour only, while fulfilment affected positive behaviour only, accumulating to predict the PC over time.

Limitations: Self-report data only; shortened scales; repeated measures can affect responses.

Implications: Fulfilment deserves to be conceptualised in its own right. Mundane events shape the PC and experience at work in ways that can contradict previous PC research. Managers should pay attention to “the little things”, which significantly impact on change attitudes and behaviours.

Originality/Value: Taking an emotion lens, we shed light on the nature of the experience of broken and fulfilled promises as they happen in situ, and independently of each other, beyond traumatic breach.
Purpose: This study presents a hierarchical/multilevel extension to Vector Autoregressive (VAR) models and examines how different study design parameters influence the accuracy of the results. VAR models are multivariate time series models that can be used to assess the linear temporal interdependencies among multiple variables. However, a limiting factor to their use in diary studies has been that they are only appropriate for single source data (e.g., macroeconomic data from one country or fMRI data from one participant). This paper presents a multilevel extension to VAR models so that it can be used with multiple participants (e.g., diary data).

Design/Methodology:

One hundred datasets were simulated for each of 72 combinations of study design parameters. The total of 7200 datasets were then analysed to examine how the number of (a) variables analysed simultaneously, (b) participants and (c) time points/data waves influence the accuracy of the results.

Results: The results indicate that the multilevel VAR approach is very robust and can accurately recover model parameters even from short time series or when there are very few participants. However, with increased number of variables analysed simultaneously, the results become susceptible to biases. This is potentially because of the large number of parameters needed to estimate the model which grows quadratically with the number of variables analysed.

Implications/Value: This study showcases a data analysis technique that is perfectly suited to diary data. The results can help researchers make informed decisions about how to best design diary studies that can be analysed using hierarchical VAR.
Purpose: The paper challenges the dominant view that psychological ownership is generally a “good thing”. We develop a multilevel model that examines psychological ownership orientations experienced by individuals within teams. This study aims to distinguish between individual-oriented psychological ownership (IOPO) and collective-orientated psychological ownership (COPO) and examines its positive and negative effects on individual and team engagement and creativity.

Design/Methodology: The multilevel model was tested across 172 members and their managers in 43 project teams with data collected across three-time points from multiple countries.

Results: Results revealed that, at the individual level, both IOPO and COPO were positively related to individual engagement which in turn related to individual creativity. However at the group level, group-mean IOPO was negatively related to team engagement while group-mean COPO was positively related to team engagement. Team engagement, in turn, was positively related to team creativity.

Limitations: The time lag between the measurements was three weeks, but data on individual engagement and creativity were obtained at the same point in time.

Research/Practical Implications: Our findings provide a more nuanced understanding of psychological ownership experiences by individuals within teams. Managers who are seeking to enhance team engagement and creativity should focus on promoting the shared team feeling that the project is “ours”.

Originality/Value: This study is amongst the first that tested a multilevel perspective of IOPO and COPO and its simultaneous positive and negative effects on engagement and creativity.
Purpose:
We explore how team members decide upon team goal standards – minimal (i.e. achievable) and maximal (i.e. aspirational) goals – in order to regulate their behaviour towards achieving these standards. We argue that teams will polarise (i.e. tend to set higher goals than the initial inclination of the individual team members) and show more risky, aspirational shifts for the maximal standard versus the minimal one. Consequentially, these shifts positively impact team performance.

Design:
N = 868 undergraduate students were randomly divided into 217 teams of 4 persons, and participated in a study that involved goal standards setting, first individually and then in teams, for their team’s performance on a subsequent brainstorming task.

Results:
Repeated-measures ANOVAs and hierarchical regression analyses supported our predictions: Teams set higher standards caused by team polarisation, with a larger aspirational shift for the maximal goal standard, which translates into a positive effect upon team performance.

Limitations:
Generalisability is restricted due to the specific sample, setting and task.

Research/Practical implications:
We show that the team polarisation process has positive effects for team performance, and should be employed/applied in managerial goal-setting procedures.

Originality/Value:
By combining two theories on goals (i.e. goal-setting theory and boundary standards), we provide a fresh outlook on the goal-setting process on a team level and contribute to a better understanding of how team members integrate their individual ideas on team goals and turn these into unified, shared team goals – through consideration of team polarisation.
Purpose: This paper considers the nature of commitment in microtask crowdwork (microwork) where requesters seek workers for short Human Intelligence Tasks through a digital platform. Unlike some traditional employer-employee relationships, microwork is precarious and not expected to inspire high work commitment. Nevertheless, this study explores multiple targets of commitment which may emerge in this new employment relationship.

Methodology: Data comprised online forum contributions and 31 personal letters aimed at supporting a workers’ campaign to improve conditions on Amazon Mechanical Turk (MTurk). An interpretive analysis was used to map commitment to various targets for these microworkers.

Results: We identified bonds with the dispersed community, a microwork career, the campaign, and the platform. Commitment to the platform was interpreted as reflecting an identity-creation process.

Limitations: The data was unique to MTurk/the campaign. Future studies should explore a wider worker profile and other platforms. Longitudinal designs are required for understanding the dynamics of commitment for this population.

Research/Practical Implications: Microworkers’ strong dispersed community identity may allow them to exert some collective voice to influence working conditions. Commitment towards the platform is also realistic. Platforms could take on more responsibility for work design, shaping the worker-requester-platform relationship. Opportunities for learning, and more transparent performance assessment/feedback could increase satisfaction and, potentially, further enhance commitment.

Originality: Our analysis of this case of collective voice allowed us to propose a model of commitment targets and bonds within microwork despite its precarious nature. This is the first study to examine commitment and its relevance for such workers.
ACTIVE AND PASSIVE WORK BREAK RECOVERY STRATEGIES AND THEIR POST-BREAK EFFECTS ON EMPLOYEE OUTCOMES: A DAILY DIARY STUDY

Maximiliano Escaffi Schwarz (1) - David Holman (1) - David Hughes (1)

University of Manchester, Organisational Psychology, Manchester, United Kingdom (1)

Research shows that employees use various strategies to recover during work-breaks and that these strategies can influence post-break well-being and performance. However, existing research focuses mostly on passive (e.g., relaxation) rather than active strategies (e.g., problem-pondering, support-seeking). As such, we know little about employees’ active attempts to recover during breaks and the relative effectiveness of break-recovery strategies. The aim of this study is to test a model that compares the relative effects of passive and active break-recovery strategies on post-break well-being, performance, and creativity. A diary study was implemented in which 52 participants were asked to respond two surveys over six working-days. The first survey was completed just after their lunch-break and included measures of passive (relaxation) and active break activities (problem-pondering, seeking task-support, seeking emotional-support). The second survey was completed one hour after lunch and included a creativity test, and measures of well-being and performance. Multilevel path analysis showed that problem-pondering and relaxation were positively related to post-break well-being, while relaxation was negatively related to post-break creativity (number of ideas generated). Task-support and emotional-support were unrelated to outcomes. Results in this study broaden the conceptualisation of work-break recovery strategies by showing that, in addition to passive recovery strategies (relaxation), employees engage in active recovery strategies that can also influence their well-being. Additionally, results suggest that passive strategies may not have universally positive post-break effects. Limitations are the cross-sectional design, lack of prior assessment of well-being, and the exclusion of other passive strategies aside from relaxation.
Purpose: Sheltered employment programs are tools to enhance the well-being of vulnerable populations; employees, however, often feel discomfort in working in the organization, affecting their work engagement. Research suggests that promoting a socio-moral climate (SMC) may improve the outcomes of sheltered employment. We hypothesized that SMC fosters a sense of belonging, leading to psychological flourishing and increased work engagement.

Design/Methodology: Data were collected from 92 employees in a non-profit agency focusing on the prevention of mental disorders in the mid-western US. We assessed SMC (21 items; Pircher Verdorfer, Steinheider & Burkus, 2014; α=.92), sense of belonging (18 items; Hagerty & Patusky, 1995; α=.91), psychological flourishing (PWB; 8 items; Diener & Biswas-Diener, 2009; α=.92, and work engagement (OLBI; Halbesleben & Demerouti, 2005, 16 items; α=.91).

Results: SEM indicates a model of full mediation fits the data well ($\chi^2 = 271.19; df = 113; p = < .001; RMSEA = .077 [90% CI: .065,.099]; CFI = .935$), revealing a chain relationship with SMC fostering a sense of belonging ($\beta_{std.} = .53, p < .001$), that, in turn, promotes flourishing ($\beta_{std.} = .87, p < .001$), and eventually work engagement ($\beta_{std.} = .57, p < .001$).

Limitations: The cross-sectional design and the use of self-report data are limitations.

Research/Practical Implications: SMC facilitates well-being variables within organization of sheltered employment by helping vulnerable employee populations to find a sense of belonging.

Originality/Value: This is the first study to examine the effects of SMC as a driver of work engagement via the mechanism of sense of belonging and psychological flourishing in vulnerable populations.
Purpose: To support practitioners to navigate the cluttered landscape of contemporary career development theory, in which new concepts accumulate and few fall by the wayside.

Approach: A selective review of the literature was undertaken, to highlight key issues in contemporary career theory.

Results: A critique will be provided from a variety of perspectives, including research philosophy (epistemology and ontology), levels of analysis, complexity, handling of personal agency and responsibility, use of metaphor, and social justice implications. An argument will be presented that a robust critique is necessary if we are to support practitioners to identify a sound conceptual underpinning to career counselling practice.

Limitations: The perspective presented will reflect a subjective personal viewpoint, albeit views shared by a number of career development academics.

Practical Implications: An approach to addressing the identified limitations will be proposed in the form of a simple but demanding framework that can be used to evaluate career development theory in terms of its value for practice.

Originality/Value: A more detailed specification for practical career theory will be offered than currently exists in the literature. It will highlight characteristics that theory should aspire to in order to support pragmatic practice for a more an inclusive and just society.
Purpose. The economic environment of a country defines a framework, which is likely to shape employees’ career aspirations with regard to their future working life. To advance our understanding of the relation between the macroeconomic context and individuals’ career orientations, the aim of this study was to investigate the kind of career orientations which exist across four European countries: France, Germany, Italy, and Switzerland. Based on social cognitive career theory, we further predicted country-specific differences and similarities in career orientations in relation to the national macroeconomic context.

Design/Methodology/Approach. Based on a sample of N = 4,145 employees in France, Germany, Italy, and Switzerland, we conducted a multi-group latent class analysis in a three-step approach.

Results. The results revealed that country-independent and country-specific career orientations existed across the four countries. In addition to both traditional and new career orientations, mixed forms appeared. In France and Italy, countries with higher job insecurity levels, new career orientations were more present than in the other countries.

Limitations. The major limitation is that no causal inferences can be drawn from the cross-sectional study.

Research/Practical Implications. The findings empirically strengthen the assumptions of social cognitive career theory that macroeconomic factors interfere with individuals’ cognitive career expectation and goal formulation processes. The results suggest that organizations should integrate macroeconomic conditions when designing career paths or implementing career orientations as strategic means into their human resource management to remain or become an attractive employer.

Originality/Value. This comparative study highlights the macroeconomic context in which individual career orientations evolve.
Purpose: A growing number of studies emphasize the working alliance between clients and coaches to be a key factor in coaching. As some studies yielded contradictory results, this meta-analysis systematically investigates the relationship between working alliance and coaching outcomes for clients.

Design: Synthesizing 27 samples (N = 3,563 coaching processes), this study sheds light on the relationship between working alliance and a broad range of coaching outcomes: coaching satisfaction, perceived effectiveness, self-reflection and insight, self-efficacy, goal attainment, and unintended negative effects for clients.

Results: There was a moderate and consistent overall relationship between working alliance and coaching outcomes (r = .41, 95% CI [.34; .48], p < .001). Working alliance was positively related to all outcomes (range: r = .32 to r = .64) with the strongest relationship to coaching satisfaction and perceived effectiveness. Working alliance was negatively related to negative effects of coaching (r = -.29).

Limitations: The studies considered are based on correlational data and do not allow for causality.

Implications: This study indicates that the working alliance between clients and coaches can be effectively used to promote client outcomes in coaching. Similar to other helping relationships like psychotherapy or mentoring, the results support the importance of a high-quality working alliance in coaching.

Originality/Value: This meta-analysis is the first systematic examination of the relationship between the working alliance in coaching and coaching outcomes for clients. It delivers new perspectives on the coaching outcomes that working alliance is actually related to.
EXPLORING ANTECEDENTS OF KNOWLEDGE HIDING FROM AN INTERDEPENDENCE THEORY PERSPECTIVE

Daniela Gutermann (1) - Fabiola Gerpott (2)

VU Amsterdam, Amsterdam, Netherlands (1) - Technical University Berlin, Berlin, Germany (2)

Purpose

Knowledge hiding—the intentional attempt to withhold knowledge that has been requested by others—has severe negative consequences for organizations. Conceptual work has suggested that interdependence theory (Kelley & Thibault, 1978) could deepen our understanding of the antecedents of knowledge hiding. We built on recent theoretical advancements in the measurement of the five dimensions of interdependence (mutual interdependence, power, conflict, future interdependence, information certainty) and investigate their distinct effects on knowledge hiding in teams over time.

Design/Methodology

After the first meetings of 43 newly formed project teams, 114 members reported on their knowledge hiding behaviors and perceptions of interdependence. At the project end, participants reported on these constructs again.

Results

We regressed knowledge hiding on the five dimensions of interdependence theory. Information certainty (the degree to which a participant knows the others’ preferred outcomes) was a significant negative predictor and conflict (the degree to which the others prefer different outcomes than the participant) was as significant positive predictor of knowledge hiding at both time points. The effect became stronger over time. Against our expectations, mutual interdependence, power, and future interdependence did not predict knowledge hiding.

Limitations

Future research could use more time points to investigate fine-grained changes over a team’s lifecycle.

Implications

We integrate management research on knowledge hiding with the social psychology literature on interdependence theory. The findings are useful for preventing knowledge hiding in project teams.

Originality/Value

This research is among the first to investigate antecedents of knowledge hiding in newly formed teams over time.
Purpose: Despite growing research focused on initiatives that organizational leaders (e.g., antidiscrimination policies, diversity training) and individual stigmatized employees (e.g., identity management) can engage in, little research has examined how non-stigmatized “ally” employees can contribute to organizational diversity efforts. In this presentation, I will present the results of a diversity intervention designed specifically to educate and empower allies to provide support for and advocate on behalf of stigmatized employees.

Design/Methodology/Approach/Intervention: Two hundred and eighty-two employees from a non-profit mental health services organization participated in a three-hour skill-building workshop as part of their annual all-staff meeting. Measurements of participants’ knowledge and self-efficacy were taken before and after the workshop.

Results: There was a significant time-related effect of the training, $t(281) = 2.63$, $p < .01$, $d = .16$, 95% CI $[.02, .20]$, such that participants reported more willingness to engage in ally behaviors (knowledge and efficacy) before the workshop than before the workshop.

Limitations: Despite the intervention-based approach to this research, the measurements were limited to self-reported intentions to engage in ally behaviors, instead of actual behaviors. A randomized controlled trial with organizational outcomes would strengthen the veracity of the results.

Research/Practical Implications: The workshop is heavily informed by research on bystander intervention, empathy, perspective taking, social cognition, and training literatures and thus can be characterized with a strong emphasis on blending science and practice. Emboldening allies can create inclusive climates, which are necessary for diversity goals to reach fruition.

Originality/Value: Framing the intervention as a skill-building training for allies (rather than as implicit or subtle bias training) reduces the potential for backlash among majority-group members and provides actionable strategies that participants can implement in their daily lives.
Piotr Prokopowicz (1)
Jagiellonian University, Kraków, Poland (1)

Across decades, Work and Organizational Psychology has been able to establish a respectable body of knowledge with relation to HRM practices. Still, some practitioners seem to have barely noticed. What predicts this research-practice gap? Answering this question was the purpose of this study.

Design/Methodology /Approach/Intervention.
163 HR managers were sent a survey that included test items covering the well-established organizational psychology findings from Rynes et al. (2002) and ten Have et al (2016), supplemented with scientific literacy and critical thinking scales as well as attitudes towards research items. In addition, open-ended questions from the survey were analyzed to deepen the understanding of mechanisms behind the research-practice gap.

Results.
The survey results largely replicated the original studies, with average score of Polish managers being 60% compared to 57% in the American sample. The regression analysis showed that the best predictors of high scores in the test were beliefs about the usefulness of research vs. intuition in management as well as critical thinking skills. No significant link has been identified with scientific literacy.

Limitations.
The study has been conducted in Poland on a limited sample of managers.

Research / Practical Implications.
The study results present a deeper understanding and suggestions for burying the gap between research and practice in HRM. Namely, part of the solution might be developing critical thinking skills and addressing attitudes of the managers.

Originality / Value.
The study is an original contribution to an emerging debate on the origins of the research-practice gap in management.
Purpose. Emotional labor is defined as the management of feelings and emotional expressions as a requirement of the job (Grandey, 2000). Although emotional labor strategies are theoretically assumed to be mutually exclusive, recent research adopting a person-centered approach shows that some employees use both strategies (surface acting and deep acting) in conjunction (e.g., Gabriel et al., 2015). Accordingly, we used latent profile analyses to identify profiles of employees based on their levels of surface and deep acting. We also investigated the role of mistreatment from different sources in the prediction of profile membership, as well as the associations between these profiles and several outcomes.

Methodology. 884 participants completed the survey.

Results. Five profiles were identified (surface actors, regulators, low actors, non-actors, and deep actors). Mistreatment from customers, coworkers, the organization, but not supervisors were associated with profile membership. Particularly, employees facing organizational mistreatment were more likely to be classified as surface actors in comparison with all other profiles. Furthermore, the most positive outcomes were associated with deep actors, while surface actors were associated with negative outcomes.

Limitations. The cross-sectional design makes causal conclusions impossible to establish.

Practical implications. Organizations should be particularly attentive to reduce at maximum employees’ perceptions of organizational mistreatment, and prevent and anticipate perceptions of interpersonal mistreatments by cultivating civility and proposing services aimed at assisting employees with respect to mistreatments (e.g., CREW programs; Leiter et al., 2011).

Originality/Value. This study highlights the effect of organizational mistreatment on emotional labor beyond interpersonal mistreatments within the workplace.
LAUGH SMART: THE IMPLICATIONS OF AFFILIATIVE HUMOR FOR TEAM ENGAGEMENT AND VIABILITY

Oana Cătălina Fodor (1) - Petru Lucian Curșeu (1)
Babeș-Bolyai University, Department of Psychology, Cluj Napoca, Romania (1)

✓ Purpose

Although it has long been argued that (affiliative) humor has a major role in maintaining interpersonal relations at work, the use of humor in groups did not receive substantial empirical attention so far. Moreover, the scant research to date has focused only on the benefits of affiliative humor (AFFHUM), documenting positive effects on cohesion, creativity, performance. Building on the “too much of a good thing” framework and on recent theorizing of humor – effectiveness link in teams, this study aims to shed light on the mixed role of AFFHUM in maintaining the social fabric in real work teams. In particular, we aim to explore the curvilinear relation between AFFHUM and team work engagement (TWE) and the mediating role of TWE in the relation between AFFHUM and team viability.

✓ Design/Methodology

In order to test our hypotheses, we carried out a field study with multi-source data collected on 507 employees nested in 149 real work teams and 149 team leaders.

✓ Results

Our results show that AFFHUM has an inverted U shape relation with TWE. Moreover, TWE mediates the relation between AFFHUM and team viability for low to moderate levels of AFFHUM.

✓ Limitations

Data is cross-sectional and caution is advised in drawing inferences about causality.

✓ Research/Practical Implications

Our findings inform managerial practices such as to foster AFFHUM in teams only up to moderate levels, in order to reap its benefits.

✓ Originality/Value

To our knowledge, it is the first study to highlight the double edge sword effect of AFFHUM on team outcomes.
1027 - THE ROOTS OF THE INNOVATION TREE: PREDICTING INNOVATIVE BEHAVIOR BASED ON ORGANIZATIONAL CLIMATE DIAGNOSIS

Piotr Prokopowicz (1)
Jagiellonian University, Kraków, Poland (1)

Where do good ideas come from in organizations? How are they implemented? Is it possible to predict individual innovative behavior based on a comprehensive diagnosis of organizational climate? The purpose of the study was to explore the relationship between climate, creativity and innovation by developing and applying a new innovation climate diagnosis tool.

Design/Methodology /Approach/Intervention.

Based on a comprehensive review of literature and business case studies, four basic dimensions of innovation climate and 24 detailed sub-dimensions (e.g. creative self-esteem, psychological safety, openness to experience) were identified. 404 employees of companies operating throughout Poland took part in the study, filling out a survey containing 52 items on the 24 sub-dimensions, as well as additional measures for innovative and creative output, job satisfaction and the meaning of work.

Results.

Leadership support for innovative activities, assessment of own expertise of employees, creative self-esteem and autonomy in making decisions have been identified as the most predictive of creative and innovative behaviors. An additional, important dimension allowing understanding employees’ innovation turned out to be the sense of meaning of their own work.

Limitations.

This cross-sectional study has been conducted on a limited, non-representative Polish sample of employees, and measured only subjective innovation and creativity.

Research / Practical Implications.

The study results indicate clear leverages for building organizational climates of innovation.

Originality / Value.

The study is a new and original contribution to a debate on the predictors of innovation, while developing and providing a new and easy way of diagnosing organizational climates of innovation.
EXPLORING THE RELATION BETWEEN TARGET’S TRAITS AND INCIVILITY ENACTMENT

Yannick Provencher (1) - M. Gloria Gonzalez-Morales (1)
University of Guelph, Psychology, Guelph, Canada (1)

Purpose: The purpose of this study is to examine the role of individual differences in workplace incivility. Previous experimental research indicates that negative affectivity, anxiety and depression are not related to higher interpretation of ambiguous situations as more uncivil. The present studies test the perpetrator predation paradigm prediction: a person’s disposition may make them more likely to be targeted by enactors of incivility.

Methodology: University students and an applied sample of employees read vignettes describing ambiguous situations and reported their likelihood in engaging in uncivil behaviors. The target in the vignettes was manipulated to portray behaviors indicating either anxiety, neuroticism or depression, or none of them (neutral condition).

Results: It is expected that individuals will report a higher likelihood in engaging in uncivil behaviors when the potential target show non-neutral behaviors. Data is being collected and analyzed. Results will be presented at EAWOP.

Limitations: Experimental vignettes may dilute the complexities of real-world social interactions, and may not evoke ideal reactions in participants

Research/Practical Implications: Findings will contribute to the knowledge and understanding of how individual differences are related to the experience of workplace incivility, which will help organizations focus on interventions that decrease incivility and promote civility in the workplace

Originality/Value: There is a need to understand the role individual differences on enacted incivility. Additionally, measuring enacted incivility in the workplace through the use of vignettes provides an useful method to explore contextual and individual factors.
Purpose

Sexual harassment is bullying or coercion of a sexual nature, and include a range of actions from mild transgression to sexual abuse or assault, and can cause severe individual or organisational effects (cf. the #metoo campaign). The present study explores whether the sexual harassment phenomenon is gender biased when it comes to social perceptions of the misconduct.

Methodology

Vignette based experiments were conducted, in which the participants read a story of a manager that gave unwanted sexual to a younger employee. The manipulated variable in the experiment was the gender of the manager and employee. Two experiments were carried out, testing moral and emotional reactions, and whistleblowing conduct (respectively N= 146, 59% women and M= 43 years, and N= 136, 54% women, and M= 36 years).

Results

We found a strong interaction effect between the gender of the manager and gender of the participants. All participants perceived the transgressing male manager as equally abhorrent and unacceptable. However, the male respondents response to the female manager was substantially more lenient. By contrast, the female participants saw the behavior of the managers as equally unacceptable, regardless of their gender.

Practical implications

Research into sexual harassment of males are lacking in general. The gender differences revealed may underline the importance of controlling for gender, when the perception of sexual harassment are mapped.
1036 - TEAM OVERALL JUSTICE AND STRAIN: A DAILY DIARY STUDY

Bensemmane Sonia (1) - Marc Ohana (2) - Florence Stinglhamber (3)

Université de Pau et des Pays de l'Adour, Pau, France (1) - Kedge Business School, Talence, France (2) - Université Catholique de Louvain, IPSY, Louvain-la-neuve, Belgium (3)

Purpose

Previous studies have conceptualized workplace justice as a stable variable over time. However, it can be assumed that justice perceptions fluctuate within the same person from day to day due to different events at work. Based on uncertainty management theory, this research investigates the influence of daily overall team justice perceptions on employee’s daily psychological strain.

Design/Methodology /Approach/Intervention

We conducted a daily diary study on a sample of 300 full time employees.

Results

Results show the influence of daily overall team justice on daily psychological strain. Furthermore, our findings indicate that daily psychological safety is a mediator and daily overall supervisor justice a moderator of that relationship.

Limitations

Although the present research demonstrates the mediation through daily psychological safety, other mediating variables should be considered.

Research/Practical Implications

Companies using teamwork should be aware of the fact that, above and beyond the general level of overall justice, individuals may also form daily justice judgments regarding their team and this evaluation may help to prevent from daily psychological strain.

Originality/Value

Our research contributes to the organizational justice literature in several ways. First, the present study responds to the call of scholars for more dynamic conceptualizations of justice (e.g. Fortin et al., 2014). Second, our research contributes to the multi-foci justice approach by studying daily justice coming from the team and its interaction with daily justice emanating from the supervisor. Third, the present study contributes to the growing body of research that is giving significant importance to the role played by justice perceptions in the development of individuals’ wellbeing at work.
There are many phenomena that within specific cultural and social context are ‘sensitive’. This is especially true for phenomena that deal with potential fears of stigmatization or reputational damage. As researchers, we are generally well versed in outlining the importance of protecting participants, the way we intend to this and the possible consequences of the research process upon the lives of those being studies.

Experience clearly indicates that these are not the only participants affected by the research. Especially with regard to investigating sensitive issues within organizational settings, the researchers and non-participating employees may also be placed at risk.

The present paper aims at uncovering a gradually developing ‘spiral of fear’, initiated by organizations’ alleged fear of being publicly blamed, resulting in manifold fears felt by almost all organizational actors as well as the researcher(s). The presentation focuses on the associated implications for field access, methodological concerns, data collection, data analysis and explanatory power. Basis for this is a critical reflection on a research project examining whether social identity is a predictor of employees’ destructive authoritarian obedience within public corporations and agencies in Germany.

Despite the successful agreement on the research cooperation, the research project was steadily doomed to failure, among other things because of a strict organizational governance of the research process. For example, interview partners have been directed with regard to their response behavior.

The outline field experience calls for strategies encouraging the collaboration of research and practice.
1041 - WHY DO INTERVIEWERS LOVE THEIR OWN QUESTIONS? AN EXAMINATION OF THE EFFECTS OF LABOR, EFFORT, AND AUTONOMY

Don Zhang (1) - Edgar Kausel (2)

Louisiana State University, Psychology, Baton Rouge, United States (1) - P. Universidad Católica de Chile, Business Administration, Santiago, Chile (2)

Purpose: Despite a large body of research demonstrating the superior utility of structured job interviews, interviewers still prefer unstructured interviews where they decide what questions to ask, and when to ask them. Given the benefits of structured interviews, why do interviewers persist on improvising and coming up with their own interview questions? The purpose of this paper is to examine the IKEA effect – the increased evaluation people have for self-made products – for understanding interviewer’s over-reliance on unstructured interviewing methods. In doing so, we shed light on why interviewers are reluctant to adopt structured interviews.

Methods. We conducted five randomized experiments with samples of naïve and experienced interviewers. Participants were randomly assigned to provide judgments of questions that they wrote vs. the comparable interview questions written by other participants. We also examine the independent effects of effort and autonomy.

Results. People rated their own as more useful than questions of comparable quality written by others. The main effect was persistent across studies, samples, and time. The main effect is mainly attributed to the increase in autonomy, rather than effort. However, there was also a curvilinear effect of effort on interview valuation.

Limitations. The external validity of our experiments is limited. Future research should examine the observed effects in the field and under realistic hiring situations.

Value. Our study sheds light on why interviewers rely on unstructured interview practices. By identifying the psychological biases, our research can inform practitioners of best practices for introducing structured interview practices to interviewers.
Research on leadership has been focused on the characteristics of leaders, however, there is a growing trend of studying the significance of followership (Collinson, 2006, Carsten et al. 2010, Billot et al. 2013). Blom and Alvesson (2014) argue high skilled professionals might be in less need of managerial leadership, thus reluctant to accept follower identity. We aim to explore the situation of academics, adding to scarce studies focusing on leadership-followership dynamics within higher education (Billot et al., 2013).

Our qualitative study takes place at the Czech public universities and research institutes. During two projects, we have conducted 45 interviews with a diverse group of individuals in the postdoctoral phase. Out theoretical position stems from post-structuralist approaches to identity contextualized within academia (Henkel, 2015).

For the analysis, we follow work of Blom and Alvesson (2014) who differentiated among “followers in less need of managerial leadership” and “(pro)active followers as co-producers of leadership”. Exploring these concepts regarding the situation of postdocs we elaborate different identifications from those strictly focused on independent work to those strongly involved in developing academic places and policies. Results are discussed in the realm of the current development in academic governance.

Limitation of our approach is a focus on accounts on leadership and followership within the interviews, we are not studying the managerial process as such (e.g. observations, real-life conversations). Yet, our project yields practical implications for human resources development within academia with a focus on the demands of the postdoctoral phase.

Resources:

We review and reconceptualize constraints in terms of how they serve to restrict the space of possible creative solutions to a given problem. Specifically, we distinguish between two different functional roles constraints can play—constraints can either direct attention and effort towards a certain subset of solutions (directive role) or they can guide attention and effort away from a certain part of the solution space (indirective role). Using this distinction as our theoretical foundation, we then develop theory as to how constraints may impact individual creativity via two distinct cognitive pathways—cognitive flexibility and perseverance. We add further nuance by considering the ways in which expertise and time alter the use of these pathways thereby shaping individual creativity. In addition, we describe our initial efforts at testing our theoretical propositions of in an experimental lab setting with undergraduate students tasked with developing creative ideas for a movie. In order to complete this task, participants received written, visual, and video training materials to induce either broad or narrow expertise within the domain of film. Further, we manipulated the type of constraint introduced, as well as the timing of introduction. We describe some initial findings and close by suggesting directions for future research on constraints and by offering directions for how constraints can be used to meaningfully enhance individual creativity.
1046 - ORGANISATIONAL TRUST IN VIRTUAL TEAMS

Sarah Fischer (1) - Arlene Walker (1)
Deakin University, School of Psychology, Geelong, Australia (1)

Purpose. This study explored how trust was built and maintained between employees and virtual leaders. Virtual leadership is defined as leading in a non-physical work environment (Williams, 2002), the management of distributed work teams who largely organise their work through electronic media (Hertel, Geister, & Konradt, 2005), or who lead teams that are geographically-dispersed or dispersed by time (Fisher & Fisher, 2000).

Method. A qualitative research design using a grounded theory approach was employed to explore the research aims. Data were collected using critical incident technique (CIT) via interviews. Thematic analysis (Braun & Clarke, 2006) was used to review interview transcripts to derive the themes and subthemes related to employee trust in virtual leaders.

Results. Three themes, with four to five subthemes per theme, emerged from the data: overt behaviours, covert relational factors and the psychological state of trust.

Limitations. Although the participants were from a range of professions, it cannot be assumed that these outcomes are generalisable to all work environments.

Research/Practical Implications. Employee trust in leaders in virtual teams appears to form similarly to employee trust in leaders generally. However, the key factor for virtual team leaders is that the process requires more effort and is less organic for virtual teams. This is primarily due to the decreased opportunities to build strong relationships in a virtual environment.

Originality. This study’s novel contribution is that it explored ‘work-as-done’, as opposed to ‘work-as-imagined’ (Hollnagel, 2015) through its qualitative design to draw conclusions about employee trust in virtual team leaders. Using CIT ensured the findings match the existing practices of employees at work based on their experiences.

Researchers and presenters: Sarah Fischer, PhD candidate at Deakin University, Australia & Dr Arlene Walker, Deakin University, Australia
THE OAK AND THE WILLOW AGAINST THE WIND - GENDERING RESILIENCE

Hope Witmer (1)
Malmö University, Urban Studies, Malmö, Sweden (1)

Purpose: To present a gendering resilience model to challenge current and dominant conceptualizations of organizational resilience in relation to gender by exploring how organizational structures, gendered language, and practices of everyday organizational life interplay and privilege hegemonic masculine constructions of resilience.

Design methodology/approach: The gendering resilience model was developed using Acker’s (1990) model of gendered organizations and other feminist research on gendered organizations to explore structures, action and language within the organizational context during high stress conditions.

Results: A conceptual model for gendering the theoretical development of organizational resilience is presented. The model analyses three different aspects: 1) Structure, to identify which resilient properties receive status based on established gendered organizational hierarchies; 2) Actions, to identify how resilience is enacted through gendered social structures of dominance and submission; 3) Language, to identify how hegemonic masculine discourse restricts what is valued and who gives voice to resilient processes that lead to resilient organizations.

Research/Practical implications: The gendering resilience model offers a process for researchers, managers and organizational leaders to analyze and reveal embedded gendered practices that inadvertently hinder the development of inclusive organizations.

Social implications: The potential use of the gendering resilience model to reveal patriarchal masculine structures that restrict the systemic implementation of gender equal practices.

Originality/value: This paper offers an original perspective on the theoretical development of organizational resilience by proposing a model for analysis using a critical feminist lens to reveal patriarchal structures that perpetuate hegemonic masculine forms of organization and suppress resilient qualities.
Nowadays, adaptive performance is an important concept in many jobs. Organizations expect from their employees that they are able to deal with unforeseen changes at a daily basis. Previous research showed that dealing with changes at work can be stressful, since employees might experience this as a job stressor. However, adaptive performance can also be seen as a proactive coping mechanism in which employees try to find a way to effectively cope with the changes they encounter. Characteristics of the job itself, such as supervisor support, can of course help employees in dealing with unforeseen changes at work. In the current study, our aim was to study the moderating role of perceived supervisor support on the relationship between daily adaptive performance and employees’ wellbeing. 110 employees of various organizations participated in our 5-day diary study. Our multilevel analyses revealed that adaptive performance was positively related to wellbeing. Employees who reported to deal with unforeseen changes on a daily basis, also reported higher levels of wellbeing. As hypothesized, perceived supervisor support had a moderating effect on this relationship, in such a way that the effect was stronger when supervisor support was high. This is in line with the Job Demands-Resource model, which states that job resources, such as supervisor support, can act as a buffer to job stressors.
Purpose: The platform economy is a rapidly growing phenomenon which attracted the attention of both scholars and policy makers in a variety of disciplinary fields. To date however, the work conditions and employment relationship of this type of workers from an HRM point of view are largely unknown. This study investigates the relationship between the amount of hours spent working through platforms and workers’ work-life balance, job satisfaction, and commitment to the platform. Building on conservation of resources theory, we propose a moderation model in which workers’ perceptions of high performance work practices (HPWPs) implemented by the platforms moderate the relationship between the amount of working hours and workers’ attitudes.

Methodology: We collected data among 181 on-location routine platform workers in Europe and USA. Path analysis in MPlus was used to test the model. We extended the study with qualitative interviews to complement the quantitative results.

Results: The results show a negative relationship between hours of gig work and work-life balance and job satisfaction when HPWPs are low, and a positive relationship when HPWPs are high.

Limitations: Use of cross-sectional self-rated data on a convenience sample.

Implications: The results imply that for this type of workers, the amount of hours worked increases or decreases workers’ attitudes and well-being depending on their employment relationship with the platform.

Originality: To our knowledge this study is the first to investigate the characteristics and implications of the employment relationship of this type of workers from an HRM perspective.
MY WORKMATE THE ROBOT: A META-ANALYSIS ON HUMAN-ROBOT INTERACTION AT THE WORKPLACE

Sonja Kristine Ötting (1) - Lisa Masjutin (1) - Günter W. Maier (1)
Bielefeld University, Psychology, Bielefeld, Germany (1)

Purpose
Since robots have been introduced in industry, their number in organizations has multiplied. Although appearing in various forms, most have one thing in common: Humans are interacting with them. The purpose of this study is to meta-analytically review research on the effectiveness of Human-Robot Interaction (HRI) at the workplace and give an overview on robot characteristics influencing HRI.

Methodology
For this, we conducted a systematic literature search in psychology and engineering databases (PsycINFO, Web of Science, IEEE Xplore, and ACM Digital Library) and found 2325 unique papers. We included 50 empirical studies that named the investigated technology “robot”, were conducted at a workplace or represent a workplace task, and report effect sizes for effectiveness of HRI (e.g. performance, satisfaction, workload, or trust).

Results
Preliminary 3-level meta-analytic results for the amount of assistance provided by the robot (based on a subgroup 41 effect sizes in 11 studies) show a medium effect on HRI effectiveness (d = .54). \( \tau^2 \) values show a strong heterogeneity between effects sizes. Moderator analyses show that only effects on performance and satisfaction are significant (d = .65 and .72).

Limitations
Our meta-analytic effects could be biased because original studies often report statistics only for significant results.

Implications and Value
This study combines theory-driven psychological methodologies with empirical research from the field of robotics to approach the question “What makes a robot a good co-worker?” It is meant to foster interdisciplinary research on HRI and provide insight to researchers and robot designers on what makes HRI successful.
Purpose: The aim of this research is to identify the most common psychosocial risks in the service sector and to develop and validate a management tool to monitor these risks.

Design: The research project consists of two phases. First, we performed five focus group interviews with eighteen HSE-representatives from fifteen enterprises to identify what psychosocial risks were perceived (representatives from hotel, food production, cleaning, construction, and supply services). In phase 2, we will develop and test an indicator, which combines tailor made items based on data from focus groups with items from validated scales to reflect the service sector’s psychosocial hazards.

Results: From the focus group data, four expected categories were identified: job demands, job control, role clarity, social support from colleagues and leader. In addition, four unexpected categories emerged from the data: multicultural differences, emotion ventilation, social support from customers, conditional flexibility. Data collection for the quantitative phase is in progress and results will be presented at the conference.

Originality/Value: Irregular working hours, precarious work, low educational levels, and high levels of diversity characterize the service sector. In addition, the sector faces an increasing competition through the new sharing economy. Yet, there is still a lack of empirical knowledge about psychosocial risks related to these work characteristics in the service sector. This study contributes with enhanced knowledge about, as well as with a practical tool for managers to monitor, these psychosocial risks.
Purpose
Considering the costs of stress-related health problems, it seems valuable to develop easily accessible programs allowing individuals to develop their skills in how to think and act around daily life stressors. This study investigated 1) the feasibility of an online stress management training, and 2) its immediate effects on stress-related health outcomes.

Design/Methodology/Approach/Intervention
Working adults (N=138) were invited and then randomized to either of two conditions: an intervention group or a wait-list control group. The online stress management training included seven parts, each estimated to take a week and including sound-clips and film-clips along with exercises. Participants were asked to provide self-reports of stress and stress-related health complaints, before and after the intervention. The follow-up also included asking the intervention group about factors hindering and facilitating their participation.

Results
As for feasibility, the results suggest issues relating to adherence. This seemed associated with the timing of the study but also with user preferences regarding technological solutions. Regarding the effects, there were no statistically significant immediate effects for any of the outcome measures. However, there was a significant effect showed that perceived stress and stress-related health complaints decreased over time in both groups.

Limitations
Limitations involve the short-term follow-up and the focus on self-reports.

Research/Practical implications
Seasonal variations in occupational stress along the use of leisure time hinder participation. Thus, unguided stress management training should ideally be delivered during working hours.

Originality/Value
This is the first study investigating this online stress management training with no guidance.
Purpose

The aim of this paper is to analyse the role performed by work environments variables in the emergence of workplace bullying, namely the occurrence of conflicts, role ambiguity, role conflicts, workload and leadership in a study carried on in the health sector. In Portugal there is scarce evidence about workplace bullying in this sector. Thus, our goal is to further research about workplace bullying in this sector and we have realized a study in the main public hospitals of Portugal, through a snowball process.

Design / Methodology

The occurrence of workplace bullying was measured both through a definition and a list of behaviours. According to previous research in this field we hypothesized that there is a positive relationship between the occurrence of conflicts, role conflicts, workload and bullying; regarding leadership, we hypothesized a positive relationship between autocratic leadership and laissez faire leadership and bullying as well as a negative relationship between participative leadership and bullying. To test these hypotheses we used hierarchical multiple regression.

Results

We collected 598 valid responses and the occurrence of workplace bullying, measured both through a definition and a list of behaviours, was 7.5% and 52.3%, respectively. The majority of respondents (82.7%) consider bullying a relevant organizational problem of contemporary working life. Through multiple regression analysis we found a positive relationship between role conflicts, the occurrence of conflicts, workload and the emergence of workplace bullying. We also found a positive relationship between autocratic leadership and workplace bullying; we found no association between laissez faire leadership and participative leadership and bullying. As such we confirmed our hypothesis regarding autocratic leadership and bullying; the hypotheses regarding laissez faire leadership and participative leadership were not confirmed.

Our results led us to conclude that conflicts as well as leadership behaviour are important variables to consider in policies focusing the prevention of workplace bullying.

Limitations

Our study is limited to the health sector and the nature of the sample.

Originality / Value

Research about Workplace bullying is scarce in Portugal; hence the study has a real contribution to the existing research, in a sector where there is no previous research in this field.
Objectives: Workplace bullying has a high prevalence in organisations and is associated to several mental health problems. However compiled information on its risk factors is needed. Therefore this study aimed to systematically review risk factors for workplace bullying in an epidemiological approach.

Methods: Studies were selected by a systematic search in Medline (PubMed) and BIREME databases. Inclusion criteria were articles, providing statistical analyses on risk factors for workplace bullying, published in English, Spanish or Portuguese. Quality was assessed using an adapted version of the Downs and Black checklist. PRISMA and MOOSE guidelines were used for reporting papers.

Results: 51 papers were included in the review. 70.6% were from European countries. Women were reported to be at higher risk of being bullied in most studies. The association of age, marital status and personality traits with bullying varied across studies. Authoritarian and laissez-faire leadership styles were positively associated to bullying. Several occupational risks related to the work organisation and psychosocial factors were strongly associated to workplace bullying.

Conclusions: Our findings highlight the central role of organisational factors on bullying causation, in which the human resource management is a key distal factor. Policies to prevent bullying must address the culture of organisations, facing the challenge of developing safe psychosocial work environments. A new management and leadership framework is necessary for institutions, what should be based on democratic values and employee participation.

Keywords: Occupational Epidemiology; Occupational Health; Psychosocial Factors at Work; Workplace Bullying.
1067 - BUILDING COMFORT: THE RELATIONSHIP BETWEEN QUALITY OF WORK ENVIRONMENT AND HORMONAL LEVELS

Leander van der Meij1, Mercedes Almela2, Jaap Schaveling3, Mark van Vugt4

1 Department of Industrial Engineering, Eindhoven University of Technology, Eindhoven, The Netherlands
2 EduSolutions, Diemen, The Netherlands
3 Centre for Leadership & Management Development, Nyenrode Business Universiteit, Breukelen, The Netherlands
4 Department of Experimental and Applied Psychology, Vrije Universiteit Amsterdam, Amsterdam, The Netherlands

Purpose
Many people spend a large part of their working life inside a building. It is thus important to know how building comfort differs between employees. We focused on the hormones cortisol and testosterone, since cortisol is related to the experience of chronic stress, whereas testosterone is related to the need for social status.

Methodology
We performed a study in which 118 female and 37 male employees participated (M = 39 yrs., SD = 12). Each participant donated a hair sample for the assessment of cortisol and testosterone levels and they filled in the Building-in-use (BIU) survey questionnaire.

Results
Results showed that hair cortisol levels were unrelated to building comfort (n = 155). In a smaller sample, we found that, in men (n = 35), testosterone hair levels were unrelated to building comfort. However, in women (n = 45), higher testosterone hair levels were related to more building comfort — air, temperature, noise control, privacy, and lighting were all perceived as more comfortable —.

Limitations
Other work-related stressors may have a stronger impact on cortisol levels than building comfort.

Research implications
Our findings could suggest that women with higher testosterone levels are more assertive in acquiring a good office space from their employer. Another possibility is that women with higher testosterone levels choose to work for companies that find status more important as these companies may have better-designed buildings.

Originality/Value
To our knowledge, this is the first study that investigates if baseline hormonal levels relate to building comfort.
THE ROLE OF THE BOUNDARY OBJECTS IN NEGOTIATING NEW MIGRANT CAREER PATHWAYS

Viktoriya Voloshyna (1) - Jelena Zikic (2) - Soodabeh Mansoori (1)
York University, SHRM, Toronto, Canada (1) - York University, SHRM, Toronto, Canada (2)

Purpose: In today’s global environment, skilled professionals are increasingly choosing to migrate and pursue international careers independent of any organizational assistance (Zikic & Richardson, 2016). The purpose of this study is to explore how, despite barriers, skilled migrants manage to achieve certain career milestones in the new host city; by studying the interplay between migrants’ career pathways and the role of the city as the new playing field in which their careers post migration must develop (Bourdieu & Wacquant, 1992). Methodology: this study presents 30 semi-structured interviews of skilled migrants living in Toronto who have received migrant achievement award in the past 10 years. These interviews allowed for a deeper understanding of the adaptation experiences that our participants could reflect upon. The process of data analysis was guided by the grounded theory method (Strauss & Corbin, 1998), which proposes a methodological framework of data analysis as a continuing process, where each stage raises the data to a higher level of abstraction. Results: The analysis reveals the interplay between skilled migrants’ resilience and their use of boundary objects in the host city. Specifically, the construal level theory has been applied to analyse how skilled migrants perceived boundary objects and how this facilitated their integration into the new environment. Research implications: The study expands boundary object understanding by showing how construal level theory and information processing approaches allow us to better understand the perception boundary objects by skilled migrants in the course of their integration. Originality: In this study we focus on understanding the interplay between boundary objects and migrant resilience.

Praja Pituwala (1)
University of Hertfordshire, Hertfordshire Business School, Hatfield, United Kingdom (1)

Drawing on Kahn’s (1990) psychological conditions of personal engagement and disengagement at work and Job Demands Resources model (Schaufeli, 2017), this research extends the previous work on theoretical concepts of antecedents and outcomes of engagement by applying Hofstede’s (1983) four dimensions of culture. It is argued that national culture influences the cognitive and motivational processes of individuals (Jang et al., 2018). As a result, national culture moderates the relationship between engagement and its antecedents (job control, supervisory support and meaningful work). Moderation is studied by measuring outcomes, which are turnover intention and job satisfaction. This is a working progress research and ISA Engagement Scale is used in measuring engagement along with Hofstede four dimensions of culture in order to understand the influence of national culture on engagement in Sri Lankan context.

Both qualitative (structured interviews) and quantitative (survey) are used in collecting data in relating individual experience to wider social context (Clandinin and Connelly, 2000). Banking industry is studied in this research, which consists of both government and private sector. Combination of purposive and convince based sampling methods is used in collection of data. The study offer empirical data which expands the understanding of cultural specificity of engagement and how engagement manifests itself in Sri Lanka. Data is analysed using mediated regression and the qualitative data uses thematic analysis. Recommendations are made in both theory and practice.
Purpose
Leader-Member Exchange (LMX) theory posits that the quality of each leader-follower relationship is unique. Thus, all work teams with at least two members are characterised with some degree of LMX differentiation. Attempts to model this differentiation have been varied in nature and success, with empirical studies producing inconclusive findings. Therefore, this paper reports a systematic review of the literature designed to clarify conflicts regarding the definitions, operationalisations and effects of LMX differentiation.

Design/Methodology
Following PRISMA guidelines, the systematic literature review identified 911 unique records using four distinct databases, which, using predetermined inclusion criteria, were narrowed to a final sample of 136 journal articles, reviews, book chapters, proceedings, and theses.

Results
This paper will provide a conceptual taxonomy of diverse definitions, conceptualisations and operationalisations of LMX differentiation, many of which share little overlap but are treated as synonyms. Additionally, the review will propose a data-driven taxonomy of the antecedents, processes, outcomes, and theoretical mechanisms of LMX differentiation.

Limitations
Despite electronic and manual searches, some relevant literature might have been missed.

Research/Practical Implications
This paper is expected to clarify current conceptual and methodological debates, offer explanations for the conflicting findings regarding the effects of LMX differentiation, and identify opportunities for future research.

Originality/Value
Uniting and extending the foci of existing reviews, this paper will offer the first systematic review of both peer reviewed and grey literature, clarify debates regarding the definitions, conceptualisations and operationalisations of LMX differentiation, and offer a new taxonomy of variables and theoretical mechanisms associated with LMX differentiation.
THE EFFECT OF AN EMOTIONAL MANAGEMENT INTERVENTION ON TEAM RESILIENCE AND RELATIONSHIP CONFLICT IN VIRTUAL TEAMS WITH DIVERSITY FAULTLINES

Vicente Peñarroja (1) - Virginia Orengo (2) - Baltasar González-Anta (2) - Ana Zornoza (2)

Faculty of Economics and Business, Universitat Oberta de Catalunya, Barcelona, Spain (1) - Universitat de València, València, Spain (2)

Purpose: This research aimed to analyse whether an emotional management intervention can reduce the level of relationship conflict in virtual teams with diversity faultlines. To do so, we examined the trajectory of change of team resilience in response to the intervention.

Design/Methodology /Approach/Intervention: Fifty-two 4-person teams participated in a randomized controlled trial design with repeated measures (e.g., three measurement occasions). Teams were randomly assigned to an intervention designed to help teams to manage emotions in virtual teams or a control condition.

Results: Latent growth curve modelling analyses showed that the emotional management intervention had a positive effect on the changing rate of team resilience, and that teams with a higher changing rate in team resilience experienced lower levels of relationship conflict at the end of the study.

Limitations: This study has some limitations in terms of generalizability to organizational settings, because they were obtained from a sample of undergraduate students.

Research/Practical Implications: Our findings showed that emotion management can reduce the level of relationship conflict in virtual teams with diversity faultlines, and that this effect can be explained by the pattern of change of team resilience in response to the intervention.

Originality/Value: Diversity faultlines have potential detrimental effects in teams (e.g., increasing team conflict) (Jehn & Berzukova, 2010). Examining the effectiveness of an emotional management intervention to improve team resilience and reduce relationship conflict in virtual teams with diversity faultlines, this study contributes to past research on identifying ways of preventing or mitigating team conflicts that arise from diversity faultlines (van der Kamp et al., 2015).
1090 - OPTIMAL AND SUB-OPTIMAL BEHAVIORS: WHAT DO THEY TELL US ABOUT ONE'S FUNCTIONING AND PSYCHOLOGICAL HEALTH AT WORK?

Marie-Pier Boivin (1) - Marie Malo (1)
Université de Sherbrooke, Psychology, Sherbrooke, Canada (1)

Purpose - More and more studies are looking at psychological health at work (PHW), but part of this phenomenon remains less well known: functioning at work. This study, based on the two-dimensional conceptualization of health (World Health Organization, 1948), is aiming to identify the characteristic behaviors of suboptimal and optimal functioning. To do so, we proposed a case study design.

Design/Methodology - One-hour semi-directed interviews based on the critical incidents technique (Flanagan, 1954) were conducted with 30 industrial / organizational Quebec psychologists.

Results - The thematic content analysis of the interviews shed light on various themes related to the individual functioning at work. Approximately twenty interactions between the individual and his work environment and seventy behaviors were identified.

Limitations - The interviews were conducted with Quebec psychologists only. Replicating the study with psychologists from other countries would help us understand the cultural variations of the phenomenon.

Research/Practical Implications - From a researcher and a practitioner's point of view, the results provide a better understanding of one's functioning at work and PHW and the behavioral manifestations associated with them. They will serve as a basis for the operationalization of this construct, during the development of a tool allowing researchers and practitioners to appreciate functioning at work.

Originality - To our knowledge, this research is the first to study the characteristic behaviors of one's functioning at work while considering it as a component of PHW. The two-dimensional conceptualization of PHW is also an added value compared to studies focused on suboptimal PHW.
1094 - NARCISSISM AND RESPONSE DISTORTION IN A PERSONALITY ASSESSMENT

Chu-Hsiang Chang, Department of Psychology, Michigan State University
Russell E. Johnson, Department of Management, Michigan State University
Catherine LeBlanc, Department of Psychology, Michigan State University
Sarah Kuang, Department of Psychology, Michigan State University
Jason Way, ACT
Anita Keller, Department of Psychology, University of Groningen

Purpose:
Research on narcissism has focused on its detrimental effects for organizations. The current research explores the effect of narcissism on response distortion during a high-stake personality assessment. Because individuals with high narcissism have an exaggerated sense about their abilities, they may perceive little need to adjust their self-ratings and show less response distortion.

Design:
The research employed a 2 (within-person: pre- vs. post-test) x 3 (between-person: control vs. agentic job vs. communal job) mixed design to collect data from 242 participants. Participants answered the HEXACO and narcissism inventory truthfully at the pre-test. Participants in the control condition answered the HEXACO inventory truthfully again in the post-test. Those in the job applicant conditions read a job description highlighting either the agentic (e.g., competitiveness) or communal job characteristics (e.g., friendliness), and imagined themselves as job applicants while responding to the HEXACO inventory.

Results:
Participants in the applicant conditions reported higher conscientiousness, extraversion and lower neuroticism in the post-test compared to the pre-test. Participants in the communal job condition reported more consistent levels of neuroticism and conscientiousness across pre- and post-tests when they reported high narcissism.

Limitations:
Participants were not real job applicants.

Research/Practical Implications:
Results supported a positive effect of narcissism, where high narcissism was related to less response distortion during a high-stake test. Practitioners may use this information to better detect the suspected response distortion.

Originality/Value:
This study focuses on the novel positive effect of narcissism. It also identifies new ways to detect response distortion.
WHAT CHARACTERIZES CYBERBULLYING IN WORKING LIFE AND HOW CAN IT BE UNDERSTOOD IN RELATION TO FACE-TO-FACE BULLYING?

Rebecka Cowen Forssell (1)
Malmö University, Centre for Work Life and Evaluation Studies, Malmö, Sweden (1)

Purpose
There is an ongoing discussion whether cyberbullying should be seen as a new phenomenon or only as an extension of traditional face-to-face bullying. The purpose of this presentation is to contribute to this discussion by providing new interpretations of what characterises cyberbullying in working life and to consider possible explanations to the phenomenon.

Methodological approach
The study builds on mixed methods research. Data was collected by an online questionnaire distributed to randomly selected individuals between 25-65 years of age living in Sweden (N=3371) and in-depth interviews with eight informants that have been exposed to cyberbullying directed to them in their professional life.

Results
In accordance with the questionnaire study, men and managers reported a higher exposure to cyberbullying compared to women and non-managers. Moreover, previously known predictors of face-to-face bullying (social climate, influence over work, support from manager and colleagues) were in part insufficient in predicting cyberbullying.

Three themes were identified in the interview study. This includes ‘interfaces with physical space’, ‘losing one’s private and professional face online’ and ‘the role of the audience’.

An integration of the results shows that there are overlaps between cyberbullying and face-to-face bullying. The studies also show that cyberbullying has distinctive features that create unique situations for the targeted individuals.

Limitations
The studies are based on a cross-sectional sample.

Practical implications
The results are valuable in order to predict, prevent and mitigate the effects of cyberbullying.

Originality/value
The study contributes to the so far under-researched area of cyberbullying in working life.
Purpose

Ethics can also be understood as a phenomenon on a systemic level within organisations. Ethical infrastructure consists of formal and informal systems that enhance the ethical effectiveness of the organisation. Whistleblowing takes place when someone voices their concern about some wrongdoing to someone in order to terminate the misconduct. The present study explores the link between ethical infrastructure and whistleblowing.

Design

The study used the data from a survey on whistleblowing administered to a random sample of Norwegian taxpayers (n=1602, 52.8 % women, mean age 45.5 years).

Results

Having policies for handling of unethical behaviour and perceiving justice climate as weak, reflecting respectively formal and informal ethical infrastructure, increased the likelihood of whistleblowing behaviour. Whistleblowers’ intention to leave their jobs were associated with weak justice climate. Both formal and informal systems statistically predicted employee silence; lack of sanctions perceived weak justice climate and experiencing retaliation reduced the likelihood of future whistleblowing.

Practical implications

The results illustrate the complexity of the whistleblowing process, suggesting that managers need to take a broad perspective when developing structures to create an environment that utilises reports of observed unethical behaviour in the organisation.

Value

Most whistleblowing research is captured on the individual level, from the perspective of those who blew the whistle. The results showed that the ethical infrastructure may be related to whistleblowing behaviour and that the systemic research level may be fruitful in order to gain further understanding of the whistleblowing phenomenon.
1101 - HOW TO REDUCE CONFLICT IN ASYMMETRICALLY TASK DEPENDENT TEAMS? A FIRST STUDY INTO THE EFFECTS OF EXTRINSIC AND INTRINSIC HR PRACTICES

Simon B. de Jong (1) - P. Matthejs Bal (2) - Florian Kunze (3)

Maastricht University, Maastricht, Netherlands (1) - University of Lincoln, Lincoln, United Kingdom (2) - University of Konstanz, Konstanz, Germany (3)

Purpose: This study integrates recent advances in interdependence theory with the literatures on intra-team conflicts and motivation-enhancing HR practices.

Design and Methodology: We performed multilevel analyses on a dual-source dataset containing 146 employees of 44 teams. CFA’s and alternative model tests showed that our data and findings are robust.

Results: We found a significant three-way interaction, revealing that asymmetry in task dependence within teams negatively related to intra-team conflicts only when extrinsic HR practices were low and intrinsic HR practices were high.

Limitations: We collected data from different sources to reduce CMV concerns and future research could reduce this even more by adding other sources and/or multiple time points.

Research and Practical Implications: We contribute to scientific knowledge in two key ways. First, we tested a key mechanism (i.e. conflicts) which until now had only been (implicitly) assumed. Testing this is important, because without explicit theoretical development and empirical evidence, it remains speculative why asymmetries sometimes have negative effects in teams. Second, we are the first to link the above to the motivation-enhancing HR literature by theorizing that different HR practices might have different effects on the relationship between asymmetries and conflicts. Practically our study contributes by showing how – and why – motivation-enhancing HR can be used for reducing conflict in asymmetrically task dependent teams.

Originality/Value: In short, we contribute by being linking asymmetries to two new literatures and by investigating if ‘soft’ (i.e., intrinsic) HR practices and/or ‘hard’ (i.e., extrinsic) HR practices are better suited to reduce conflicts.
PSYCHOLOGICAL CAPITAL AND WORK ENGAGEMENT: THE MEDIATING ROLE OF JOB CRAFTING

Anna Paolillo (1) - Silvia Platania (2) - Silvia A. Silva (3)

Kingston University - Kingston Business School, Management, Kingston upon Thames - London, United Kingdom (1) - University of Catania, Educational Sciences, Catania, Italy (2) - ISCTE-IUL, Human Resources and Organizational Behavior, Lisbon, Portugal (3)

PURPOSE

Recent literature revealed how employees’ high psychological capital seemed to boost work engagement, but the process through which this effect occurs has not been fully explored yet. Therefore, the aim of the present study is to test whether job crafting can be a mediator of the relationship between psychological capital and work engagement.

METHODOLOGY

Data were analysed with structural equation modelling. Questionnaire were administered to 579 employees (168 Males, 411 Females) belonging to the healthcare sector.

RESULTS

Increasing structural job resources and increasing social job resources partially mediated the relationship between hope and vigor and hope and absorption; increasing challenging job demands partially mediated the relationship between hope and dedication and between hope and absorption. Moreover, increasing social job resources fully mediated the relationship between optimism on one side and vigor, dedication and absorption on the other side; finally, they also mediated the relationship between self-efficacy and absorption.

LIMITATIONS

Cross-sectional measurements (therefore a reverse influence might occur as well) and single source nature of the data were the main limitations.

PRACTICAL IMPLICATIONS

Organisations should be encouraged to support workers in maintaining and strengthening their psychological capital in order to keep high levels of engagement; specifically, this could be done by investing on interventions aimed at facilitating crafting behaviours.

ORIGINALITY

No previous study has investigated the role of individuals’ job crafting behaviours as the explanatory process which translates employees’ psychological capital into work engagement.
1109 - DAILY INTERPERSONAL CONFLICTS AND EXPOSURE TO DAILY NEGATIVE ACTS:
THE MODERATING ROLE OF TRAIT ANGER AND TRAIT ANXIETY

Lena Zahlquist (1) - Jørn Hetland (1) - Ståle Valvatne Einarsen (1) - Arnold B. Bakker (2) - Øystein Løvik Hoprekstad (1) - Roar Espevik (1) - Olav Kjellevold Olsen (1)

University of Bergen, Department of psychosocial science, Bergen, Norway (1) - Erasmus University Rotterdam, Center of Excellence for Positive Organizational Psychology, Rotterdam, Netherlands (2)

Purpose
The aim of the present study was to examine 1) the relationship between daily interpersonal conflicts and exposure to daily negative acts, and 2) the potentially enhancing role of trait anger and trait anxiety.

Design/Methodology
In this quantitative diary study, 57 cadets (6 females) participating in a sail ship voyage from northern Europe to North America, responded to a questionnaire on a daily basis over a period of 30 days – yielding 1533 measurement points. Prior to the voyage, participants also responded to a general questionnaire including the measurement of trait anger and trait anxiety. Data were analysed by multilevel analyses (MLwiN 2.20).

Results
Multilevel analyses showed, in support with our main hypothesis, a significant positive relationship between daily interpersonal conflicts and exposure to daily negative acts. Moreover, in support of the hypothesised moderating effects, trait anger (but not trait anxiety) interacted positively with daily interpersonal conflicts in the prediction of exposure to daily negative acts.

Limitations
Only self-report single-source measures were applied.

Implications
The study suggests that interpersonal conflicts has an immediate effect on exposure to negative acts. The study further contributes to a greater theoretical understanding of the interplay of situational and individual antecedents in predicting negative acts.

Originality/Value
To our knowledge, this is the first study to demonstrate a relationship between interpersonal conflicts and negative acts on a daily basis, and the enhancing role of trait anger.
Organizational change represents a stressful event, generating employees’ uncertainty and concerns, especially when job resources are scarce. Based on the COR theory (Hobfoll, 1989), the purpose of this study is to analyze how one of the most prominent organizational change resource, that is the quality of information about change, could limit the psychological strain generated by concerns, thus sustaining employees’ occupational wellbeing one year later.

A self-reported questionnaire was administered before and one year after the implementation of a reorganization of the administrative sector of a public Italian university. The questionnaire included a demographic section and an Italian adaptation of scales to measure information about change (Wanberg and Banas, 2000), concerns about mastering (MAST) and benefit (BEN) about change (Battistelli et al., 2014), emotional exhaustion (Schaufeli et al., 1996) and work engagement (Balducci et al., 2010). In total, 251 employees filled out the questionnaire at both times.

Structural Equation Modeling (X²=235.36; df=95; CFI=.92; TLI=.91; SRMR=.10; RMSEA=.08[.06-.09]) highlighted the mediating role of both MAST and BEN concerns between information about change and exhaustion. On the other hand, the influence of information about change on engagement was mediated by MAST concern only.

Although past studies focused on the association between change information and attitudinal reactions to change, more attention should be given to its impact on psychological strain and occupational wellbeing. The present study overcomes the extant literature, highlighting how the quality of change information before the change implementation can affect the stress appraisal process represented by concerns, thus favoring employee wellbeing.
Purpose: Dishonest behaviour represents one of the most significant criticalities in organisations. Knowing the norms is not always sufficient to keep the conduct in line with them. Mechanisms like Moral Disengagement (MD) silence the internal moral control and allow individuals to misbehave while preserving their moral Self.

Research has generally relied on self-report measures to assess misconduct and MD. However, they may suffer from systematic response biases such as socially desirability and acquiescence. In addition, in line with the dual process models of social cognition, researchers demonstrated that self-report measures predict only hypothetical moral evaluation, while implicit and indirect measures of cognition were able to predict the actual moral behaviour.

On these premises, we developed implicit measures of MD and tendency to misbehave, and explored their association with actual misbehaviour.

Design: two-study design in samples of university students (respectively 70 and 65). We measured both implicit and explicit measures of MD and two measures of cheating behaviour (self-report and the actual behaviour);

Results: findings confirmed that while the explicit measure was associated only with the self-reported misbehaviour, the implicit measures explain the actual misbehaviour.

Limitations: Convenience and small sample comprising only university students;

Practical Implications: The new implicit measures should be used in the recruitment to capture the activation of mental structures that could lead to a higher likelihood of misbehaving.

Originality: For the first time, this study proposed two implicit measures of MD and tendency to misbehave which uniquely contribute to predict spontaneous moral behaviour.
In industries disrupted by technological innovation, strategic industry change may not only impact individuals’ professional identities, but also a collective’s professional identity. This study explains the dynamic processes through which the professional identity of a collective of professionals is restructured as a consequence of disruption.

We conducted a longitudinal qualitative study of the discursive practices of journalists as these were confronted with the digitization of the profession. In contrast to individual identity work research, which typically gathers qualitative data via interviews, we studied the writings and conversations amongst journalists to capture the collective-level discourse. Results show that journalists engaged in collective identity restructuring processes allowing the development of a new professional identity. Specifically, they collectively renegotiated core elements of their identity by converting old understandings of professional identity into new ones (conversion process) and by expanding understandings of professional identity by means of new elements (expansion process). Hence, our study highlights that collective identity restructuring processes differ from individual identity restructuring processes in the sense that to eliminate an identity threat, conversion processes are supplemented by expansion processes. In doing so, we contribute to identity theory by reinvigorating theory on professions and professionals to better grasp collective-level dynamics.

Key Words Professions, Identity, Collective, Cognition, Disruption
Purpose: This research aimed to analyse whether a team emotional management training (TEM) can enhance team performance through improvement of the team collaboration capability in fragmented virtual teams (activated faultlines). TEM training fosters the capability to build and manage relationships based on trust, communication and commitment. This is known as team collaboration capability (Batarseh et al. 2017).

Design/Methodology /Approach/Intervention: Fifty-two 4-person teams participated in an experimental study with repeated measures (i.e., three measurement occasions). Teams were randomly assigned to an intervention designed to train teams to manage emotions (experimental condition) or a control condition (without training).

Results: Results showed that this intervention had a positive effect on trust and affective commitment, but not on group communication. Moreover, trust and affective commitment fully mediated the effect of this intervention on group performance.

Limitations: This study has some limitations in terms of generalizability to organizational settings because they were obtained from a sample of undergraduate students.

Research/Practical Implications: Our findings showed the relevance of a TEM training to improve the collaboration capability in fragmented virtual teams and through it, group performance.

Originality/Value: This study contributes to the research area about fragmented virtual teams developing a TEM training intervention. Moreover, it analyses the effectiveness of this intervention to enhance trust and affective commitment mitigating the negative effect of faultlines and improving group performance.
Most of the current literature on visual impairment (VI) and employment paints quite a negative picture whilst there has also never been any research into how individuals with VI perform their roles. The objective of this research was to develop an understanding of the daily working lives and careers of individuals who live with a VI and establish if there were any commonalities among participants who had experienced sight-loss in how they go about their role. An adapted version of the Protean Career framework from Hall, Yip and Doiron (2017) was used, where the working day of individuals formed the link between Protean Career Orientation (composing of self-direction and intrinsic work values) and Career Outcomes, made up of subjective career success, objective career success and organizational commitment). Data was collected from 16 participants who work in London and was conducted in the form of 60-minute semi-structured interviews. Analysis revealed several key findings such as embedded routines, coping mechanisms together with an obsession to be as good as if not better than their sighted peers. The results provided support for Protean Career theory and revealed a deeper insight into the meaning of employment to individuals, tensions between the individual and the organisation and how this impacts their disability confidence and workplace identity. This study, which is the first of its kind, makes several key contributions to the literature and has revealed numerous areas for future research within the domain of VI, disability, identity and careers.
1123 - BAD FOR THE LEADER, BAD FOR THE FOLLOWERS – TRICKLE DOWN OF LEADERS’ WORKLOAD TO FOLLOWERS’ EXHAUSTION THROUGH LEADER-MEMBER EXCHANGE: A MULTILEVEL STUDY

Maie Stein (1) - Sylvie Vincent-Höper (1) - Sabine Gregersen (2)

Universität Hamburg, Industrial and Organizational Psychology, Hamburg, Germany (1) - Institution for Statutory Accident Insurance and Prevention in the Health and Welfare Services (BGW), Hamburg, Germany (2)

Purpose. While extensive research has investigated how leaders may foster employee well-being, very little is known about how the context affects the enactment of positive leadership. The aim of this study is to investigate the role of leaders’ workload as an inhibiting factor for experiencing high-quality leader-member exchange (LMX). Drawing upon conservation of resources theory, we argue that leaders’ levels of workload may trickle down to employee well-being by hindering leaders to develop high-quality LMX relationships with their followers. Using a multilevel framework, we propose that leaders’ workload may be indirectly related to followers’ emotional exhaustion through LMX.

Methodology. Multilevel survey data from N = 371 German child care teachers, nested within N = 66 supervisors were collected.

Results. Multilevel analysis revealed a positive indirect effect of leaders’ workload on followers’ emotional exhaustion through LMX when controlling for followers’ levels of workload.

Limitations. The use of cross-sectional data precludes inferences regarding the causality of the effects. The underlying mechanisms explaining why leaders’ workload hinders high-quality LMX need to be further examined.

Research/Practical Implications. Leaders’ workload may not only be harmful to themselves but may also have detrimental effects on their followers’ well-being. Organizations should provide leaders with sufficient resources (e.g., time) which enable them to develop high-quality LMX relationships with their followers.

Originality/Value. Previous research has focused on investigating leaders’ personal characteristics as antecedents of LMX. In this study, we broaden the perspective and examine leaders’ workload as a contextual factor that may constrain the enactment of positive leadership in terms of high-quality LMX.
Purpose. Although leadership is considered one of the most important determinants of innovation in organizations, findings on this relationship are far from conclusive. To obtain an in-depth understanding of how leaders contribute to innovation, we integrate leadership and the innovation process and develop a measure for assessing a variety of leadership behaviors that facilitate the multiple activities required for innovation.

Methodology. The Leadership for Innovation Questionnaire (LIQ) was validated using survey data from employees in Germany (N = 1,062) and South Africa (N = 129).

Results. Confirmatory factor analyses revealed three dimensions constituting leadership for innovation: generation, promotion, and implementation of ideas. However, strong intercorrelations provide only weak support for the three-factor structure. Substantial correlations with individual and organizational innovation demonstrate adequate construct validity. The LIQ explains unique variance in innovation beyond that explained by transformational leadership and leader-member exchange.

Limitations. The use of cross-sectional data does not allow inferences regarding causality. Future research should be devoted to further examine the distinctiveness of leadership behavior that taps the different stages of innovation.

Research/Practical Implications. Linking leadership and the multiple tasks required for innovation more directly to each other matches the complexity of innovation processes. The LIQ is a theory-based and valid tool that enables more rigorous research on the role of leadership in enhancing innovation.

Originality/Value. Previous studies using traditional leadership approaches have produced a considerable heterogeneity in findings on the relationship between leadership and innovation. In this study, we developed an integrative framework for defining and organizing leadership behaviors specifically fostering innovation that may guide future research.
DO ALL EMPLOYEES BENEFIT EQUALLY FROM TRANSFORMATIONAL LEADERSHIP? – INVESTIGATING THE MODERATING ROLE OF WORKAHOLISM ON THE RELATIONSHIP BETWEEN TRANSFORMATIONAL LEADERSHIP AND EMPLOYEE WELL-BEING

Sylvie Vincent-Höper (1) - Maie Stein (1)
Universität Hamburg, Industrial and Organizational Psychology, Hamburg, Germany (1)

Purpose
In recent research on leadership and employee well-being, transformational leadership conceptualized as an important job resource has received considerable attention. However, boundary conditions that may explain differential effects of transformational leadership on employee well-being have been widely ignored. In this study, we argue that the effects of transformational leadership may be contingent upon individual characteristics of the follower. Drawing upon the notion that workaholism is a personal risk factor for impaired well-being, we hypothesize that workaholism may attenuate the negative relationship between transformational leadership and impaired well-being.

Design/Methodology /Approach/Intervention
To test the proposed interaction effect of workaholism and transformational leadership on psychosomatic complaints, we collected data from 250 employees with managerial responsibility working in various sectors.

Results
The results revealed a moderator effect of workaholism, indicating that those employees with low levels of workaholism benefit more from a highly transformational supervisor in terms of lower levels of psychosomatic complaints.

Limitations
Because the analyses were based on cross-sectional data, it may also be conceivable that employee well-being influences employees’ perceptions of leadership behavior.

Originality/Value
This study is a first step to examine how personal demands regarding the interplay between leadership and employee well-being. We advance the understanding of boundary conditions that influence whether transformational leadership may unfold its health-promoting potential.

Research/Practical Implications
The findings suggest that employees may not benefit equally from transformational leaders. We recommend future research to integrate and test multiple different contextual factors that may influence how leadership is related to employee well-being.
Wilken Wehrt (1) - Anne Casper (1) - Sabine Sonnentag (1)
University of Mannheim, Work and Organizational Psychology, Mannheim, Germany (1)

Purpose: The organizational self-control literature commonly applies resource perspectives explaining undesirable workplace behaviors due to depleted self-control resources (e.g., willpower) neglecting the role of self-control motivation. In this study, we investigated self-control motivation, self-control demands, and depletion of resources in the morning as predictors of self-control effort on a daily level and examined if self-control effort mediates the relationship of self-control motivation with counterproductive work behavior towards the organization (CWB-O). Additionally, we investigated if self-control effort represents a mediating mechanism linking self-control demands with depletion at the end of work (while controlling for baseline depletion levels).

Design: We analyzed data from 155 employees in a two-week diary study with two measurement points per day.

Results: Multilevel structural equation modeling showed that self-control motivation and self-control demands, but not depletion in the morning predicted self-control effort. The relationship of self-control motivation with CWB-O was mediated by self-control effort. Self-control effort, however, did not mediate the relationship between self-control demands and depletion at the end of work.

Limitations: Data was self-reported. Objective depletion markers and more measurement points within the day would have increased the methodological rigor of the study.

Implications: Findings underscore the importance of considering daily self-control motivation as a mechanism explaining self-control failure at work and cast further doubt on the idea that effort is the mechanism leading to self-control resource depletion.

Originality: This is the first diary study explicitly addressing daily self-control motivation as a predictor of self-control failures at work besides self-control demands and self-control resources.
Purpose
The purpose of the study is to explore how boards of directors can contribute to a sustainable work life in terms of occupational health and safety.

Methodology
Twelve boards were recruited, representing large private companies in the trade, industry, manufacturing, and health care/welfare sector. In total 32 interviews were conducted with chairmen, board members, and CEOs. The data is analyzed using a hybrid thematic analysis.

Results
Preliminary results indicate that the view of health and safety varies from a purely operative issue, to an integrated part of the business strategy. The boards exert influence in different ways, for example through the board meeting structure, by tailor-made key performance indicators, and in interaction with the CEO. Example of a reason for the board to prioritize health and safety is the need to attract competent staff. A reason not to prioritize it was when there are more urgent issues combined with a sense that employee wellbeing is already satisfactory well.

Limitations
The sample may be skewed towards boards who view health and safety as important. Also, data may be biased due to idealized verbal descriptions.

Research/Practical Implications
Knowledge about the role boards may play for a sustainable work life can contribute to illuminating how occupational health and safety is governed in companies. The study can inform boards how to influence these issues.

Originality/Value
This is the first study to explore the role of boards of directors in relation to physical and psychological health and safety in work life.
Resumés are important tools for selection and recruitment of job applicants (Piotrowski & Armstrong, 2006). Because recruiters have limited time in resumé screening, their evaluations are prone to cognitive biases (Derous, Nguyen & Ryan, 2009). Studies showed that characteristics of the employees such as age, ethnicity and gender influence recruiters’ decision about job applicants. Although these characteristics’ are not related to the job, recruiters’ decisions are influenced by these factors. The aim of this study is to examine the interactive effects of applicant gender and marital status on recruiters’ decisions. Another aim of this study is to focus on the recruiters’ ambivalent sexism on resumé screening. With this aim, we designed a 2×2×2 experimental study to test the effects of applicant gender, marital status, and recruiter’s ambivalent sexism. Different versions of resumés were presented to 60 Turkish university students. The participants were told to think themselves as if they were recruiting a job applicant for a law company. The dependent variable was calling for the second evaluation process namely the interview. Repeated measures analyses were conducted by entering gender and marital status as within factor variables. Ambivalent sexism were entered as a covariate. Results showed that married men were called for the further interview process. This effect was stronger for the participants who had high ambivalent sexism scores than who had low ambivalent scores. The findings will be discussed within the context of Turkish society where gender equality is low.
Purpose. Despite a big buzz around robots in businesses and academia with some anecdotal evidence and speculative predictions, we still know very little about the actual change which robotization brings to workplaces. We take up a call to advance our understanding of this complex phenomenon (Phan, Wright, & Lee, 2017), and explore how introducing human-robot-interaction (HRI) changes work design, and how does it affect the subsequent work-related outcomes, such as knowledge-sharing and relationships at work.

Design/Methodology. We conducted 60 qualitative interviews with employees working with robots (robot operators), their managers, training specialists, HR managers, and general managers in two manufacturing companies in Eastern Europe. We analyze them by employing inductive coding (Gioia, Corley, & Hamilton, 2013) and construct a model of change of work design in response to workplace robotization.

Results. The introduction of HRI changes motivational, social, and physical work design characteristics (e.g., increased autonomy), which are followed by the change of knowledge sharing and mutual helping behavior. These changes contain a significant qualitative shift of existing tensions besides the changes of the work design itself.

Research/Practical Implications. Our findings help to explain how changes in work design due to an introduction of HRI affect knowledge-sharing and mutual helping behaviours among employees.

Limitations. The findings are limited to industrial robots operated in manufacturing.

Contribution/Originality. Our study provides new insights about the effects of HRI for individual workers and therefore enriches our understanding on this increasingly important topic for organizations.
1137 - HOW PERCEPTIONS OF BEING IDENTIFIED AS A TALENT INFLUENCE INTENTION TO STAY WITH THE ORGANIZATION?

Olivier Doucet (1) - Marie-Ève Lapalme (2) - Alain Gosselin (3)

HEC Montréal, Département de gestion des ressources humaines, Montreal, Canada (1) - ESG-UQAM, Département d'organisation et ressources humaines, Montréal, Canada (2) - HEC Montréal, Département de gestion des ressources humaines, Montréal, Canada (3)

Purpose: Talent management is a critical challenge for most organizations operating within a competitive business environment. Although research has provided useful insights on how to identify and develop potential talents, we still know little about the impact of talent identification on individual outcomes. In this study, we test a moderated mediation model that assesses the indirect effect of the perceptions of being identified or not as a talent on intention to stay with the organization via organization-based self-esteem (OBSE) and distributive justice (DJ), and the moderating effect of self-efficacy perceptions on this relationship.

Design/Methodology: We collected data from 390 managers from four large Canadian organizations who had a formal talent management program.

Results: Results indicated that both OBSE and DJ mediated the relationship between perceptions of being identified as a talent (or not) and intention to stay. The results also show that the indirect effect of perceived talent identification via DJ was stronger when perceived self-efficacy was high.

Limitations: The cross-sectional and self-report nature of our study limits inferences of causation and raises issues of common method variance.

Research/Practical Implications: Understanding how being perceived as a talent or not is related to employee’s intention to stay allows for identification of key measures to address employee retention.

Originality/Value: This is the first study to examine the mechanisms explaining the relationship between perceptions of being identified as a talent and intention to stay in the organization.
Purpose

Organizations face tremendous pressure to maintain performance amidst rapid and unpredictable change. The dynamic capabilities literature suggests that organizations’ effectiveness in dealing with these challenges depends on their ability to (1) sense evolutions in the environment; (2) seize opportunities; and (3) transform the organization accordingly. While the literature emphasizes that SST processes involve the distribution of strategy efforts throughout the different organizational leadership levels, most studies treat strategy as an organizational intervention without recognizing leaders’ proactive role in SST processes. In this research, we adopt a behavioral perspective on the SST process and suggest that leaders proactively engage in SST behaviors.

Design/Methodology/Approach/Intervention

We adopt a multiple source survey design with 169 leaders, to test a model that links leaders’ characteristics (IPT, leader identity, optimism, openness, resilience, confidence) to the extent to which they engage in SST behaviors, as well as the impact of these behaviors on leader performance.

Results

Our (initial) results show that leaders’ personal characteristics influence their SST behaviors, which in turn shape upper management’s perceptions of the leader’s performance.

Limitations

Leaders’ SST behaviors have not yet been assessed in prior research, so we adapted scales from the proactivity literature to measure SST behaviors. Future research should further validate these scales.

Research/Practical Implications

By examining leaders’ SST behaviors, and by exploring the antecedents and outcomes of these behaviors, we highlight the leader’s proactive role in the organizations’ strategic efforts.

Originality/Value

By incorporating a proactive perspective in dynamic capabilities research, we move beyond the intervention focus that has dominated the strategy literature.
INTERRUPT YOURSELF! WHEN IT COMES TO CREATIVE AND PLANNING PERFORMANCE SWITCHING TASKS AT YOUR OWN PACE BEATS CONCENTRATED AND EXTERNALLY INTERRUPTED WORK

Ann-Kathrin Seipp (1) - Clara Heissler (1) - Sandra Ohly (1)
University of Kassel, Business Psychology, Kassel, Germany (1)

Purpose:
Employees experience interruptions every 12 minutes during work. Those can be externally caused (e.g. e-mails) or self-determined when the timing of interruption is chosen by the individual (e.g. thoughts about another task). Both types are assumed to affect employee well-being and performance differently. Thus, the purpose of this study is to distinguish between the effects of different interruptions on typical knowledge worker tasks. Based on the assumption, that the ability to self-interrupt acts as a proxy for high autonomy we expect internal interruptions to affect performance positively but expect a negative effect for external interruptions.

Design/Methodology:
We conducted two laboratory experiments with a 1x3 design, to test how both types of interruptions affect creative (N=137) as well as cognitive-planning performance (N=223).

Results:
Contrast analysis revealed significant differences between the groups in both experiments. Participants within the internal interruption condition showed better creative performance (N=36, M=9.53, SD=4.02) than participants in the control group (N=52, M=7.71, SD=3.24), whereas external interruption condition showed no significant difference to the other two conditions (N=49, M=8.86, SD=3.34). For the planning task the internal-interruption group performed best (N=88, M=20.85, SD=7.07) and external interruption group performed worst (N=84, M=17.02, SD=7.85).

Limitations:
Because of the student samples and laboratory designs external validity is limited.

Research/Practical Implications:
Results indicate that internal interruptions can lead to increased performance and autonomy. More research on the boundary conditions and behavioural strategies for employees is needed.

Originality/Value:
This is one of very few studies focusing on internal interruptions.
LEADING THE WAY TO WELLNESS: POSITIVE LEADERSHIP PROMOTES WELLBEING THROUGH SOCIAL IDENTIFICATION

Christie Marsh (1) - Ana Leite (1) - Georgina Randsley de Moura (1)
University of Kent, School of Psychology, Canterbury, United Kingdom (1)

Purpose/Originality/Value

Workplace stress continues to rise and has numerous negative implications. Consequently, it is essential to investigate ways of improving employee wellbeing. The current research examined the influence of Positive Leadership on employee wellbeing and examined potential mediators that have not previously been investigated. Expanding on previous research, the current studies measured five facets of employee wellbeing.

Design/Methodology/Approach/Intervention

A cross-sectional design was used in our first study to investigate the relationship between Positive Leadership, employee wellbeing, organisational identification, identification with the leader, social support and turnover intentions. We recruited 195 participants using Prolific Academic to complete a survey assessing whether they considered their leader to be a Positive Leader. Additionally, 205 participants were recruited using Amazon Mturk for a second replication study using the same measures.

Results

Positive Leadership was positively related to identification with the leader, organisational identification, social support and employee wellbeing, and was negatively related to turnover intentions. A sequential mediation model using SEM (in MPlus) demonstrated that Positive Leadership was associated with increased employee wellbeing through identification with the leader and then organisational identification or social support in sequence.

Limitations

The studies used self-report measures that can lead to common-method bias. However, future studies will include a field study to address this.

Research/Practical Implications

The results provided further support of the importance of using a Positive Leadership style as a way of enhancing employee wellbeing and highlighted identification variables and social support as important underlying mechanisms.
Purpose

Workplace Social Capital is an important concept when addressing organisational and social factors of work environment. The purpose was to establish and evaluate the construct validity of a measure for workplace social capital based on the operationalisation suggested by the third version of the Copenhagen Psychosocial Questionnaire (COPSOQ III).

Methods

The present study is based on data collected as part of a validation and development project for the use of COPSOQ at workplaces and includes responses from 422 human service workers answering a workplace survey. Six items from the scales for organizational justice, vertical trust and horizontal trust in COPSOQ III middle-long version were included in the analyses. Rasch analysis was used for evaluating construct validity.

Results

The psychometric properties of the suggested scale for workplace social capital were satisfactory after accommodation for local dependency. The scale was found to be valid for use at group level. Each individual item works as intended, the scale is unidimensional and functions invariantly for women and men, and for younger and older employees.

Limitations

The proposed logit (and metric) scores are valid only for similar populations of human service workers or similar occupations having daily contact with patients, clients etc. We suggest replication of the study in a broader, international sample for assessing higher generalisability.

Implications

The scale for workplace social capital measured by COPSOQ III holds good construct validity for use at group level. The scale can be useful for practical applications at workplaces as well as for research purposes.
Igor Portoghese (1) - Maura Galletta (1) - Marcello Campagna (1)

University of Cagliari, Department of Medical Sciences and Public Health, Monserrato, Italy (1)

Abstract

Purpose. The JDCS model suggests that combination of job demands, job control and support forms eight job types: active (high demands, high control), passive (low demands, low control), high-strain (high demands, low control), and low-strain (low demands, high control), participatory leader (high control, high support), obedient comrade (low control, high support), cowboy hero (high control, low support) and isolated prisoner (low control low support). The main purpose of this study was to exploring subgroups of workers on their job demand, control and job support scores, as postulated in the JDCS model.

Methodology. We applied latent profile analysis (LPA) to identify profiles in a large sample of Italian healthcare workers (N=2464).

Results. LPA showed a six-latent-profiles solution: high-strain (high job demands, low control, moderate support; n=954), collective-low-strain (low job demands, high control, moderate support; n=690), cowboy-hero (moderately low job demands, high control, moderately low support; n=298), isolated-prisoner (high job demands, very low control, very low support; n=201), supported-active (moderately high job demands, moderately high control, very high support; n=172), and participatory-leader (low job demands, high control, high support, n=149). Results partially agree with JDCS theorization as it replicated four of the eight-profile solution identified.

Limitations. This study relied on a cross-sectional design, which precludes conclusions regarding profiles.

Research/Practical Implications. Profiles may aid future research investigating differential effects of interventions that may not be relevant for all employees.

Originality/Value. Person-centered studies utilizing the JDCS model are limited and it is unclear how the facets of social support are likely to combine with workload and control.
Purpose: Individuals’ ability to learn rules, acquire specific role behaviors, and ultimately to socialize into the new organizational environment has important consequences. However, few studies addressed the impact that socialization may exert on one’s individual differences. Consistent with the principles of sociometer theory (which emphasizes the interpersonal roots of people’s self-worth), in this contribution we investigated whether organizational socialization (OS) mediates the relationship between satisfaction with colleagues (SWC) and workers’ levels of global self-esteem (GSE).

Methodology: A complete cohort of Military cadets (Mage=23.02, SDage=2.23) attending a prestigious Italian academy filled a battery of self-report questionnaires once a year for three consecutive years (NT1 = 320, nT2 = 287, nT3 = 236). A series of cross-lagged panel models with latent variables were ran, in order to test the hypothesized mediation through a full-longitudinal design. Socio-demographic covariates were included, to further confirm the strength of our hypothesis. Results: In the best fitting model, SWC at T1 significantly affected OS at T2, and the latter significantly affected GSE at T3. The significant size of the mediation effect was confirmed by the Monte Carlo procedure. Limitations: The lack of objective data and the use of only one setting (military) are limits that should be addressed in future studies. Practical implications: This contribution would encourage practitioners to pay more attention to workers’ perceived organizational interpersonal environment, given that it may exert a significant impact on personal self-worth, and thus it may be considered an important antecedent of one’s personal well being at work.
Purpose. The purpose of this study is to explore how Millennials’ core self-evaluations (CSEs) differ from non-Millennials and how Millennials’ CSEs relate to creativity. In addition, we examine how high-quality leader-member exchanges (LMX) mediate the CSE-creativity relationship.

Design/Methodology. We employ a time-lagged, survey-based design in which we solicit Amazon Mechanical Turk (MTurk) Master Workers to complete three waves of online surveys, resulting in a matched sample of 169 Millennials and 174 non-Millennials.

Results. Contrary to our hypothesis, our results show that Millennials have lower CSEs than non-Millennials. However, as predicted, we find that LMX partially mediates the CSE-creativity relationship among Millennials, but not among non-Millennials.

Limitations. One limitation is the use of self-report data for all variables in the study, which may introduce bias in responses. However, we took steps to mitigate potential biased results by using multiple waves of data collection and including several attention check items.

Research/Practical Implications. We find support for a positive relationship between Millennial CSEs and creativity and for the critical role that LMX plays in fostering creativity among Millennials. Therefore, we offer insights into a benefit that Millennials bring to the workplace as well as an important mechanism for promoting Millennials’ creativity. Hence, managers that wish to promote creativity among Millennials should focus on developing high-quality relationships with their subordinates.

Originality/Value. This study integrates generational differences into both the CSE and LMX literatures, and the findings offer unique insights into managing Millennials and encouraging creativity.
1153 - DIVERSITY IN EDUCATION AND ORGANISATION: FROM POLITICAL AIMS TO PRACTICE IN THE NORWEGIAN POLICE SERVICE

Brita Bjørkelo (1) - Hege Høivik Bye (2) - Marit Egge (1) - Jai Ganapathy (3) - Mariann Stærkebye Leirvik (4)

Norwegian Police University College, Research Department, Oslo, Norway (1) - University of Bergen, Faculty of Psychology, Department of Psychosocial Science, Bergen, Norway (2) - Norwegian Police University College, Department for further and continuing education, Oslo, Norway (3) - OsloMet, NIBR, Oslo, Norway (4)

Purpose

Political and educational aims for more diversity in the Norwegian Police Service (NPS) have been set since the early 2000s. Argumentative underpinnings are to meet the societal mandate, equal rights, competence, and trust within the society. This study investigates diversity in the NPS across three studies.

Design

The “Diversity in education and organization” project consists of three parts (study environment, on-the-job experiences, and a survey conducted among all NPS employees).

Results

Findings from part 1 showed that the educational aim of recruiting and admitting 5 percent ethnic minority students was fulfilled. Still, the group was more “uniformed” and brought less cultural competence than expected. Results from part 2 indicated varying interpretations of the meaning and importance of ethnic diversity. Officers experienced that there was uncertainty as to how to utilize their “ethnic competence”. Results from part 3 showed that about half of the NPS are female (46 %), 4.7 % were employees with an immigrant background, and about 71 % did not belong to any minority group. Perceived argumentations for diversity were from high to low; trust from the public, followed by equal rights, the societal mandate and competence development.

Limitations

Due to lack of official data we cannot establish the representativeness of the total sample of NPS with respect to the proportions of employees across minority groups.

Originality

The research project provides unique insight into an important topic, namely how and whether diversity management aims and efforts have been translated into practice within the NPS.
The purpose of our research was to empirically test the Practices for Achieving Total Health (PATH) model, which constitutes the foundation for the American Psychological Association’s (APA) “Creating a Psychologically Healthy Workplace” agenda. The PATH model consists of five categories: health and safety, work-life balance, employee involvement, employee growth and development, and employee recognition. Using data from the Occupational Information Network (O*NET), this project quantified the five PATH categories into a PATH index that can be used to predict health risks for any occupation listed on the O*NET. The O*NET is a large-scale database that includes job requirements and worker attributes as well as work context and content for over 900 occupations. Initial validation of the PATH index with psychological health markers and job attitudes provides support for construct validity of the overall index as well as some of the subcategories. The PATH index was developed based on data available in O*NET, and therefore, its application to other occupational databases might be limited. Nevertheless, this research has important theoretical and practical implications. To the best of our knowledge, our research is the first to empirically test the PATH model. Although research on the PATH index is still in its early stages, it could provide insight into potential health risks of occupations. Employees would be informed of potential health risks associated with their occupation, and employers could take preventative measures to reduce health risks. Thus, insights gained from the PATH index could benefit both employees and organizations.
Work addiction or workaholism is characterized by an irresistible inner drive to work very hard; it is a combination of working compulsively and excessively. The present study investigated in a representative sample of 1552 Belgian workers the prevalence of work addiction in the Belgian working population. We also checked the relationship with job characteristics, several important work outcomes, impact on work life balance, health, stress, absenteeism, and burn-out. Finally and very interestingly, we link workaholism to the four regulations (types of motivation) as mentioned in the self-determination theory (intrinsic, identified, introjected and extrinsic motivation). In this study, we measured work addiction by means of a short version of the DUWAS, consisting of two core-components: Working Excessively (WE - 3 items) and Working Compulsively (WC – 3 items). Main conclusions are that 17% of the Belgian workers score high on both WE and WC, and can thus be labelled as workaholics. 66% of the workaholics state that their work has a bad influence on their health. They experience stress more often (83%) as compared to the non-WC and non-WE workers (40%). 25% has an increased risk on burn-out. Workaholics report themselves as longer and more frequently absent from their work due to sickness. Moreover, they experience less fun in their job. Finally, interesting relationships were found with central concepts of the self-determination theory, namely the four regulations and the three basic needs.
Purpose: Ideological Psychological Contracts (iPC) represent the mutual agreements between an employee and their organization that focus on pro-social values and behaviours. While commitment to a pro-social cause can boost employee performance, it may also lead employees to push themselves in pursuit of the greater good, making them susceptible to strain and burnout. Despite this proposition, we lack an understanding of how employees perceive their commitment to the pro-social values and what happens when the values are not upheld. Therefore, the purpose of our study was to explore what it means for an employee to engage in an iPC.

Design: We used a mixed-methods design with 19 healthcare workers involved in direct-patient care. In addition to completing semi-structured interviews, participants responded to survey items related to iPC endorsement, stress, and burnout.

Results: We identified themes that represent employees’ commitment to pro-social values, the behaviours they engage in to support the values, and what happens when the organization does not provide support to the extent that is expected. Additionally, we found commitment had a negative impact on well-being, demonstrating that strain and burnout are a concern for employees that engage in an iPC.

Limitations: Although healthcare provides an insight into occupations that explicitly support pro-social values, our findings may not generalize to other industries.

Implications: These findings further develop our understanding of iPC theory and organizations may understand the impact supporting the greater good has on their employees.

Originality: The present study provides empirical insight into the experience of an iPC.
1163 - THE EFFECTIVENESS OF SALES PROMOTION TECHNIQUES ON THE MILLENNIAL CONSUMERS’ BUYING BEHAVIOR

Luis Martinez (1) - Inês Antunes (1)
Nova School of Business and Economics, Universidade Nova de Lisboa, Carcavelos, Portugal (1)

Purpose
This paper attempts to find out the major dimensions of consumers’ perception about the benefits derived from sales promotion and the influence of word-of-mouth (WOM) on purchase intention.

Design/methodology
A convenience sample of 564 Millennials from 24 different nationalities completed a survey on sales promotion and buying behavior. Structural Equation Modeling approach was used to test the proposed model.

Results
The findings of the study revealed the perception of monetary savings, opportunities for value-expression and WOM as key-drivers of buying intention behavior.

Limitations
The study used self-assessments in a cross-sectional design, which does not allow for causal analyses.

Research/Practical implications
The perception of upgrading to high-quality products and brands seems not to induce Millennials to buy the product on offer. The findings will help companies to select the appropriate types of premium offers that greatly influence the buying behavior of Generation Y. Companies should manage monetary savings benefits complemented by the management of value-expression dimension.

Originality/value
New light is cast on the relationship between Generation Y consumers and the effectiveness of sales promotion regarding hedonic and utilitarian benefits.
Samantha Jones (1) - Yannick Griep (1) - Neil Conway (2) - Safâa Achnak (3)

University of Calgary, Psychology, Calgary, Canada (1) - Royal Holloway University of London, Egham, United Kingdom (2) - Vrije Universiteit Brussel, Brussels, Belgium (3)

Purpose: Perceived organizational support (POS) is commonly treated as an attitudinal consequence of violation feelings, which stem from perceived psychological contract breach (PCB). However, because both PC and POS assume an underlying mutual exchange relationship in which each party reciprocates the other party’s contributions, we argue that the relationship between PCB and POS is recursive and that low levels of POS may increase the likelihood to perceive future PCB through reduced trust in management. Therefore, the purpose of the study was to examine the reciprocal relationship between POS and PCB over time.

Design: We analyzed a 2-level time-lagged mediation model on data from 338 US employees (1215 observations). Respondents completed weekly surveys for six weeks that assessed PCB, violation feelings, POS, and trust in management.

Results: The findings support the reciprocal relationship between PCB and POS, showing that POS and PCB form a vicious cycle.

Limitations: Although we examined time-lagged variables, all responses were self-report and variables were collected at the same point in time, raising concerns of common method variance.

Implications: The findings of our study suggest that how organizations react after the event of a PCB is vital to how employee’s will perceive PCBs in the future. Organizations should work to reduce perceptions of PCB and increase perceptions of POS through open and honest communication with employees and providing remedies to PCB.

Originality: Our study demonstrates that the relationship between POS and PCB is reciprocal, resulting in a negative cycle of workplace experiences for employees.
1168 - MOTIVATION TO LEARN FROM MULTIPLE PROJECTS: A MYTH OF MODERN WORK DESIGN?

Alina Flestea (1) - Mara Bria (1) - Petru Curseu (1) - Oana Fodor (1)

Babes-Bolyai University, Psychology, Cluj Napoca, Romania (1)

Purpose: The complexity of the jobs has increased in recent years so that employees are not only expected to perform in a single group but also to fragment their work time in multiple, diverse, and often virtual project-teams. We build on Work Design Growth Model and explore (1) to what extent working in multiple project-teams increases the motivation to learn and (2) to what extent identification with the project and virtual leadership shape this motivation.

Design/Methodology: A total of 424 participants (mean age of 26.62 years old) members of 50 teams working in various organizational environments filled out an online survey including items on the variables included in the study.

Results: Our results showed a positive and significant main effects of time fragmentation and project identification as well as a negative effect of virtual leadership on motivation to learn. We also found significant interaction effects. The positive association between time fragmentation and motivation to learn becomes stronger when the average identification with the projects is high rather than low and weaker when the leadership is virtual rather than face-to-face.

Limitations: Our study has limitations related to the cross-sectional design and self-report measurements.

Research/Practical Implications: This study provides valuable results for future research and practical interventions in modern organizations by exploring both the positive and negative effects of multiple team membership.

Originality/Value: The study explores the positive effects of multiple team membership capturing the reality of contemporary work design.
Supporting Dyslexia in the Workplace: Linking Research to Practice

James Smith-Spark (1) - Rebecca Gordon (2)

London South Bank University, Division of Psychology, School of Applied Sciences, London, United Kingdom (1) - UCL Institute of Education, Psychology & Human Development, London, United Kingdom (2)

Purpose: The effects of developmental dyslexia extend beyond reading and spelling to other areas of cognition. These broader cognitive deficits persist into adulthood and have effects across different settings. While the impact of dyslexia on university study has been explored, there is less empirical evidence relating its effects on workplace performance. Such research is needed to inform the more targeted provision of workplace support and reasonable adjustments to accommodate employees with dyslexia. The current paper focuses on areas of impaired cognition most likely to affect job success. A review of previous literature identified particular difficulties with executive functioning and prospective memory. There is a need for a suitable ecologically-valid laboratory measure to test these cognitive abilities required for optimal performance in a workplace setting.

Design/Methodology/Approach/Intervention: Adults with and without dyslexia were presented with the Jansari assessment of Executive Function (JEF; Jansari et al., 2014). Results: Impairments identified by previous research are highlighted and, in the next phase of the research programme, will be explored experimentally using the Jansari assessment of Executive Function (JEF; Jansari et al., 2014).

Limitations: The work to date has identified cognitive abilities to test on an ecologically-valid measure but the empirical phase of the investigation is yet to begin. Research/Practical Implications: The paper highlights specific areas in which the executive functioning and prospective memory of adults with dyslexia should be supported in the workplace. Originality/Value: The work takes advantage of recent developments in dyslexia research to explore the impact of the condition on the workplace setting directly.
Purpose. Human Resources managers face a double challenge: find the right people for the job, and attract/identify talents. This requires the ability to communicate a good company brand image, and to understand candidates’ characteristics and potential. While recruitment specialists have specific strategies for the latter, the first goal is often ignored.

Methodology. A neuroscientific approach measured the candidates’ experience during a job interview. Thirty participants took part individually to a real job interview lasted forty minutes and emotional activation was measured in real time through skin conductance sensors (SC) (emotional arousal index), and an ElectroEncephaloGram (EEG) headset (engagement index) (Bolls et al. 2001; Cacioppo et al., 2000).

Results. Data showed: a) the most stressful parts of the interview such as agency mandate (SC mean=35.87; sd=37.54) and explanation of the work (SC mean=33.95; sd=35.57); b) the parts of the interview characterized by engagement such as career aspects (EEG mean=0.499; sd=0.65) and company presentation (EEG mean=0.485; sd=0.49).

Limitations. The use of a unique work context, but this study is a valid start point to detect also wellbeing and performance during assessment sessions.

Implications and value. This research could help Human Resources to define “best practices” in terms of verbal and non-verbal language to put candidates at their ease, increasing their motivation to join the company. Moreover, this study is functional to suggest the interview strategies reducing the candidates’ stress level and improving engagement. Future studies should provide the application of this scientific approach to advance employee training and to support career development.
1173 - CUSTOMIZED AVAILABILITY – USER REQUIREMENTS TO A SMART ASSISTANT FOR WORK-RELATED AVAILABILITY MANAGEMENT

Katharina Staab (1) - Zofia Saternus (2) - Ruth Maria Stock (1)

Technische Universität Darmstadt, Chair of Marketing and Human Resources Management, Darmstadt, Germany (1) - Goethe University Frankfurt, Chair of Information Systems and Information Management, Frankfurt, Germany (2)

Purpose

Information and communication technologies (ICTs) use replace increasingly the traditional boundaries between work and private life by a stadium of being connected to work anywhere and at any time (Boswell & Olson-Buchanan 2007). This permanent availability bears both chances (Hill et al. 2001) and risks (Ayyagari et al. 2011). Following the self-determination theory (Ryan & Deci 2000) and the boundary theory (Kossek & Lautsch 2012), a smart system for solving this “availability dilemma” by preventing the risks and retaining the chances has to consider individual preferences and needs of potential users. Our research is aimed to identify the key requirements on a smart availability assistant that is able to reflect the complexity and variety of employees’ availability needs.

Design/Methodology

Following an explorative approach, we first identified requirements for the smart availability assistant with qualitative interviews (18 participants). The relevance of these requirements was subsequently checked with a quantitative study (821 participants).

Results

Our data indicate the importance of an individual adjustable smart assistant that enables availability depending on the situation and urgency of contacting.

Limitations

The study is limited since analyses are based on self-reported data only.

Research/Practical Implications

Our results suggest that a smart availability assistant should be adjusted taking the user’s preferences into account. It should also be able to differentiate between situations and contents.

Originality/Value

To our knowledge, our research is the first systematically analyzing user requirements in a mixed-method study for a smart availability assistant.

Research into psychological identity has recognized that people foster multiple identities that emerge from and are groomed by contextual and environmental influences. However, conceptualizations of multiple identities have been limited to the understanding of specific identity dyads. To expand on the concept, scholars have conceptualized the intrapersonal identity network (Ramajaran, 2014).

This study elaborates on this conceptualization, as we propose an identity system theory that clarifies the generative principles underlying the emergence and transformation of identity systems. Building upon networks and systems theory, we propose identity systems as emergent and interconnected entities in a neural network structure.

In this study we define the attributes and elements by which identity systems can be expressed and we posit mechanisms for both active and passive approaches by which identity systems are managed to account for the creation, development, and diminishing of identity systems. In addition, we propose determinants of system stability and expected changes to identity systems following different types of disruption.

Identity system theory advances identity literature by providing for an integrative account of the interrelationships among multiple identities, elaborating on the temporal dynamics that underlie the emergence, development and diminishing of identities, and predicting outcomes of internal interactions within the identity system.

Note to the reader: This abstract refers to a conceptual paper which provides the framework for my PhD project. As I am in my first year of my PhD, I would like to share my ideas on this topic. In following years, I will be able to, in addition, share empirical insights.
1177 - Game-Based Assessment vs Situational Judgment Test: Applicant outcomes through a moderated mediation model

Panagiotis Gkorezis*, Konstantina Georgiou**, Ioannis Nikolaou**, & Sophia Perperidou*

* Aristotle University of Thessaloniki
** Athens University of Economics and Business

Purpose

Recently, the use of gamification in employee recruitment has attracted increasing interest among both researchers and practitioners. However, little is known about its effect on applicant outcomes. In addressing this gap, we examine the effect of the use of a game-based assessment (GBA) on applicants’ recommendation intentions through their perceptions of organizational attractiveness, in comparison to a situational judgment test (SJT). Moreover, we suggest that this effect is moderated by applicants’ attitudes towards game-based recruitment.

Design

We examined our hypotheses using a quasi-experimental design by assigning individuals to treatment and control group. In the control group, participants (n= 30) were asked to complete a SJT in order to be recruited for a company, whereas, in the treatment group, participants (n= 34) had to complete a GBA.

Results

Results demonstrated that participants who completed the GBA as a part of the selection process reported a stronger effect on organizational attractiveness and, ultimately, recommendation intentions compared to those who completed the SJT. Moreover, these effects were contingent on participants’ attitudes towards game-based recruitment.

Limitations

The limitations of the study relate to the lack of realism that scenarios present and the small size of the sample.

Implications

The present preliminary findings suggest that the use of GBAs in the recruitment process could be useful for recruiters in order to enhance applicants’ positive outcomes.
Originality

To the best of our knowledge, this is the first empirical study that investigates the effect of the use of gamification in the selection process on applicant reactions.
1180 - TECHNOLOGY ACCEPTANCE AND ABSENTEEISM: A PALMTOP FOR THE SAILORS OF A SHIPPING COMPANY

Chiara Panari (1) - Giorgio Lorenzi (2) - Marco Giovanni Mariani (3)

University of Parma, Economics, Parma, Italy (1) - Avm/Actv, Venezia, Venezia, Italy (2) - University of Bologna, Bologna, Italy (3)

Purpose. The present work tried to apply the model of Unified Theory of Acceptance and Use of Technology (UTAUT) to the study of the acceptance of a device used by sailors in tourist transports for navigation. Particularly, the first aim was to test if the acceptance of new technology is predicted by the effort expectancy and perceived utility of the device, the organizational facilitating conditions and the social influence. Furthermore, the second aim was to examine the relationships between the acceptance of new technology and workers’ satisfaction and absenteeism.

Design. A longitudinal study has been carried out. Self-report data was collected through a questionnaire that was administered to 243 sailors at time 1 (T1). Objective data of absenteeism was collected at time 2 (T2). The structural equation model was used to test the hypothesis.

Results. The results showed that at T1 the effort expectancy and perceived utility of device and organizational facilitating conditions have an impact on the intention of using device, that influence positively the work satisfaction. The work satisfaction (at T1) reduce the absenteeism (at T2).

Limitations. It could be useful to introduce variables related to the company organizational management of the new technology, that could moderate the intention to use the device.

Practical implication. The results can help the top management to identify the factors that can facilitate the introduction of new technology and organize appropriate training.

Originality. The work tried to integrate the approach of the acceptance of new technology and the perspective of workers ‘wellbeing.
Despite a rise in economy and labour market, unemployment remains an important issue in the Netherlands. A large group of job seekers is excluded from the job market, because of their diploma’s, age, background or past experience.

Greyston Bakery in the US developed the Open Hiring® concept to overcome such exclusion and to create job opportunities for anyone who is willing to try. Key to this concept is that anyone can apply, without any questions about background or experience. People from the list of applications are called in chronological order when there’s a job opening and they can start working the next day. They receive training and support while earning a minimum wage. After this training period their wage increases, they get additional benefits and this is the starting point for their individual career path - within or outside the organization. This process is embedded in a strong community program and support-system.

In this study, we investigated what Open Hiring® encompasses, and how the concept could be transferred to the Netherlands. Information is collected through document studies, a site visit and interviews with workers and partners from Greyston. In this presentation we’ll show the key elements of Open Hiring® and discuss what implementation of the concept in the Netherlands means for organizational strategy, the HR process (recruitment, selection, contracting, rewarding system, training etc.) and for guidance, support and supervision. As a follow up on this project, pilots started in 2018 in which Open Hiring® is applied.
Purpose: Mentoring formats are changing as the number of e-mentoring programs increases. But does digitalization also change formal face-to-face (ftf) mentoring programs?

Design: N = 89 mentees participating in a formal, academic peer mentoring program completed two online surveys measuring mentee’s extraversion (t1) and degree of instant messaging (IM) in private or group chats, meeting frequency and satisfaction with mentor (t2) with a seven-month time-lag. We conducted a moderated mediation model to test the moderating effect of IM on the relation between extraversion and interaction frequency and the mediation effect of interaction frequency between extraversion and satisfaction with mentor.

Results: The results show a positive relationship between extraversion and meeting frequency. This relationship is negatively moderated by private IM. For extraverted mentees the relationship between extraversion and meetings frequency is reversed for those with high amount of IM. There was no significant effect of group IM. Meeting frequency mediated the relationship between extraversion and satisfaction with mentor.

Limitations: Limitations are restricted external validity due to the special context of the program. Also, the impact on further outcomes like mentoring received as well as long-term effects should be investigated.

Implications: The results suggest that the amount of IM affects mentoring behavior, which should be considered when initiating ftf mentoring programs.

Value: This study sheds light on how digitalization is changing the mentoring-landscape, by taking individual differences into account and contributing to the discussion who is influenced how by changing means of communication.
INVESTIGATING THE ASSOCIATION BETWEEN STRESS AND PSYCHOLOGICAL RESILIENCE IN THE WORKPLACE: A LONGITUDINAL STUDY

Lucie Ollis (1) - Mark Cropley (1) - David Plans (2)

University of Surrey, School of Psychology, Guildford, United Kingdom (1) - University of Exeter, Centre of Digital Economy, London, United Kingdom (2)

Purpose: To examine the co-variation of stress and resilience over time and to test whether resilience is a stable construct, independent of stress or whether it develops or decreases with stress exposure.

Method: Employees who work 30 hours or more per week in the UK completed questionnaires at baseline (T1), after three months (T2) and six months (T3). This research will focus on the data collected for T1 (N=380) and T2 (N=118). Measures: stress, resilience, general health, mood, work-related rumination (WRR), job demands and social support.

Results: Resilience at T1 was highly correlated with resilience at T2 (r=.726, N=118, p=.001). Furthermore, resilience at T1 and T2 was highly negatively correlated with perceived stress when measured at the same time point (T1; r=-.581, p=.001, T2; r=-.616, p=.001). At T1, individuals with low resilience had significantly higher (p=.001) perceived stress (M=20.65, SD=5.81) than those with high resilience (M=13.24, SD=5.91). Similarly, individuals with low resilience at T2 had significantly higher (p=.001) perceived stress (M=19.25, SD=6.41) than those with high resilience (M=11.95, SD=5.17). Linear regression showed that resilience, general health, negative affect and affective WRR were significant predictors of perceived stress at each time point.

Limitations: Confounding variables such as life events could have had an impact on individuals stress and resilience. Although individuals who report more resilience report less stress, it could be that they are still experiencing stress but perceive the stressor to be less stressful and more of a challenge than those who are less resilient.

Originality/value: There are limited longitudinal studies with at least three-waves of data, directly assessing resilience and health outcomes.
PURPOSE - While previous studies showed that individuals benefit from their own proactive work behaviors, limited empirical work considers how these behaviors are perceived by others. This study provides an empirical example of the way fellow team members and customers perceive and respond to proactive work behaviors.

DESIGN - Between February and June 2017, three agile teams were observed during meetings and while working at the office for 120 hours each, resulting in 360 hours of fieldwork. Furthermore, semi-structured informal interviews were conducted with team members.

RESULTS - Agile team members initiate different forms of proactive work behaviors, for example taking charge to improve customer relations, with the goal to improve their work processes. In turn, fellow team members or customers perceived these proactive work behaviors either favorably, thereby motivating others to also behave proactively, or disturbing, in such a way that fellow team members refused to work for the customer. The type of reaction influenced the team’s output for the customer when having to deal with product requirements changes.

LIMITATIONS - The findings may be restricted in terms of generalizability as they are based on a single organization.

RESEARCH IMPLICATIONS - Considering interdependency of behavior and work complexity in teams, managers need to acknowledge team members’ perceptions and reactions towards proactivity as they have shown to influence the team’s output for the customer.

ORIGINALITY - This qualitative study highlights the importance of understanding how proactive work behaviors are perceived and acted upon by fellow agile team members and customers.
Purpose: Emotions are gaining ground in organizational research. A promising approach comes from affective neuroscience (Panksepp, 1998) that investigates basic affective dispositional systems (SEEK, CARE, PLAY, SADNESS, ANGER, FEAR, LUST). These are yet unexplored within organizational psychology but play an essential role in adaptive behavior and personality development. Thus, we aimed to test the utility of a neuro-affective measure in the organizational context.

Design/Methodology/Approach/Intervention: With a sample of 341 professionals, we tested factorial, convergent, concurrent, and incremental validities of the Portuguese Affective Neuroscience Personality Scales-short version (ANPS-s).

Results: The original factorial structure failed to meet the indicators of a good model fit, in a similar way to previous studies. From using Lagrange multipliers, we found a valid 15-item solution. Findings suggest that ANPS-s is related to personality traits (convergent validity). However, only SEEK explicates (concurrent validity) and explains specific variance (incremental validity) of organizational citizenship behavior.

Limitations: Although a cross-sectional design with self-reported measures was used, no indication of common method variance was found.

Research/Practical Implications: Findings uncovered some scale’s psychometric quality problems, probably related to some items poor facial validity. Thus, a new version of this scale, adapted explicitly for organizational context, is under development.

Given the dispositional nature and the specificity of each system, we expect that an improved and organizational-based scale will help to add knowledge on individual emotional functioning differences and how this may help to explain individual's organizational behaviors.

Originality/Value: This study integrates constructs from neuro-based emotional functioning and personality to contribute to a more in-depth knowledge of individual workplace behaviors.
Purpose
Cumulative research has established how human resource (HR) practice bundles boost organizational performance by stimulating employee abilities, attitudes, and behaviors. Adapting this paradigm, mediating and moderating roles of employee involvement between perceived HR practices and work ability are examined. Hypotheses include trade-offs between health-promotive properties and negative side-effects of intrinsically motivational (subjectified) work intensification.

Design/Methodology/Approach/Intervention
Data stem from a large-scale survey among German public employees (N = 11871) in administrative, vocational, and human service functions. Decent working conditions and empowering management style were established as distinct and integrated HR practice bundles. These and employee involvement were each measured with six items from a commercial survey. Occupational health was assessed with the work ability index.

Results
In linear regressions employee involvement partially mediated a positive relationship between empowering management style and work ability. Additionally, involvement negatively moderated (reduced/buffered) health-promoting effects of decent working conditions, such that highly involved workers benefitted less. Evidence for such “diminishing returns” manifested in significant 2-way and 3-way interactions.

Research/Practical Implications
Results strengthen the proposition that employee-oriented HR practices facilitate designing both health-promoting and motivational high-performance work systems, but also confirm undesirable trade-offs between employee involvement and occupational health.

Limitations
Results are subject to the limitations of cross-sectional survey studies, alternative explanations, and need for further validation.

Originality/Value
Robust results demonstrate the importance of HR practices for occupational health. Performance-oriented practices instrumentalizing employee involvement may incur human costs. Potential downsides of “motivational” productivity gains require close monitoring and compensatory health-promotive interventions targeting specifically self-endangering work behavior.
1196 - DYNAMIC AFFECTIVE SHIFT IN COPING WITH SELF-CONTROL DEMANDS AT WORK: HOW DAILY CHANGES IN AFFECT STABILIZES PSYCHOLOGICAL WELL-BEING

Elvira Radaca (1) - Stefan Diestel (1)
Bergische Universität Wuppertal, AOW, Wuppertal, Germany (1)

Purpose:
Because of the growing service sector more and more employees are faced with demands on self-control for achieving job-related goals. According to well-established models, self-control demands deplete limited regulatory resources and lead to impaired psychological well-being. Inspired by personality systems interaction theory, we examine how dynamic positive and negative affective processes moderate the negative relation between self-control demands and indicators of well-being.

Design:
We applied a daily diary design over the course of ten working days among a sample of 55 service sector employees.

Results:
Results from multilevel modeling showed a three-way interaction of distinct patterns of change in positive and negative affect and self-control demands in predicting well-being. In particular, employees who perceived an increase (upshift) in positive and negative affect during the working day showed high levels of work engagement even when self-control is high. In all other conditions when either one or both affects decreased self-control demands were negatively related with work engagement.

Limitations:
Correlational designs do not allow for strong causal conclusions.

Research/Practical Implications:
For organizations, our results imply that focusing on assessment and development of affect regulation skills holds promise for human resource management strategies. Moreover, a better understanding and dealing with affects through training programs can benefit effective affect management for a stable psychological well-being.

Value:
The present findings provide important insights into how affective shift foster coping with self-control demands at work.
Purpose: The importance of technology at our workplaces has gained and will increasingly gain in importance. Technological progress allows more and more functions once performed by humans to be automated. Nowadays, technological agents (i.e., computers, robots, chat bots, digital assistants, etc.) not only perform tasks on the command of human workers but have also begun to take over leadership functions over human subordinates (i.e., automated leadership). We argue that conceptual coverage both in leadership as well as in human-computer interaction (HCI) research is in danger of falling short of this development.

Approach: Literature search revealed that leadership research has so far almost exclusively dealt with leadership of human leaders over human subordinates, while models in HCI are based on the axiom that humans should always be in command of technological agents and do not provide for the possibility of technological agents leading humans.

Results: We demonstrate the utility of a synergistic approach of leadership and HCI research to examine automated leadership. We propose a definition of automated leadership and a process model explaining human subordinates’ acceptance and followership of technological agents as leaders based on the HCI model of Technology Acceptance and leadership research on leader legitimacy. Moreover, we discuss criteria for evaluating automated leadership systems and questions of function allocation.

Implications and Value: We discuss the implications of automated leadership for existing leadership and HCI models and call for awareness of ethical issues regarding this topic of high relevance for the future of human work.
Purpose: It is well known that the workplace is a potential significant source of stress. Indeed, mental health and stress are the biggest cause of long-term sickness absence in UK workers, with the healthcare and social care sectors being the two most affected occupational types. The aim of this project is to outline the organisational influences on social work and healthcare (NHS) staff in the UK, leading to the development of a health and social care specific app and series of workplace stress interventions.

Methods: The first phase was a survey of working conditions, stress, and wellbeing. Furthermore an action research approach incorporating individual interviews and focus groups was used to design a wellbeing toolkit and accompanying smartphone application.

Results: Survey responses from close to 5000 respondents demonstrated numerous influences on employee stress and wellbeing measures. 38 interviews, three virtual focus groups, and meetings with a steering group helped to design and implement the toolkit, app, and organisational improvements.

Limitations: One distinct limitation is the lack of any evaluation of the interventions thus far. However, evaluation will include repeated measures surveys, collection of organisational data, and individual interviews six months after implementation of the various interventions.

Practical Implications: This presentation will demonstrate the utility of co-constructing a series of mental health and stress interventions for public sector workers.

Originality: This the biggest ever study of health and social care workers, and among the first to co-develop and implement wellbeing interventions into this population.
Purpose. This study aims to investigate the role of proactive personality in enhancing transfer of training. Using the Baldwin and Ford model of transfer process and subsequent developments, the study considers the entire transfer of training process, which comprises trainee characteristics (e.g. proactive personality, motivation to learn and motivation to transfer) and work environment characteristics (e.g. environment facilitation).

Design/Methodology. The sample was composed of 566 persons who completed three questionnaires: at the beginning of the training intervention (T1), at the end of the training (T2) and after having completed the tasks related to the training programme (T3). In order to investigate our proposed model, a moderated serial mediation analysis was performed.

Results. Results showed that proactive personality was related to motivation to learn (T1) which increased motivation to transfer (T2) which, in turn, in combination with environment facilitation (T3), influenced transfer of training (T3). Furthermore, we found no direct effect between proactive personality and transfer of training.

Limitations. Only self-report measured have been used.

Research/Practical Implications. These findings are useful to better understand the role of individual factors in the transfer of training process.

Originality/Value. To the best of our knowledge, this is the first study that has considered proactive personality as a trigger of the process of training transfer.
THE MEDIATIONAL ROLE OF EMPLOYABILITY IN THE JOB DEMANDS-RESOURCES MODEL: A CROSS-CULTURAL STUDY IN FRANCE AND ITALY

Valentina Dolce (1) - Monica Molino (2) - Sophie Wodociag (3)

University of Turin, Psychology of work, Turin, Italy (1) - University of Turin, Psychology of work, Turin, France (2) - Université de Haute-Alsace, CREGO (Centre de Recherche en Gestion des Organisations), Mulhouse, France (3)

Purpose: The labour market is more complex and unpredictable nowadays, because of internationalization, the advent of new technologies, the boundaryless careers. In this scenario, employability is becoming increasingly important (Fugate et al., 2004). According to the JD-R Theory, this study aimed to explore the role of employability as mediator between cognitive demands, role clarity, supervisory coaching, and resistance to new technologies adaptation on the one hand, and job satisfaction on the other.

Method: A sample of 451 workers (221 Italians and 230 French) has completed a self-report questionnaire. Data were analysed with SPSS25 and Mplus7 to test a multi-group structural equation model (M-SEM).

Results: The estimated M-SEM [$\chi^2(351)=481.227; p<.001; CFI=.96; TLI=.96; RMSEA=.04 (.03,.05); SRMR=.06$] showed that for both sub-samples employability totally mediated the relationship between resistance to new technologies and job satisfaction and partially mediated the relationship between cognitive demands and job satisfaction. For both sub-samples, role clarity and supervisory coaching had a positive relation with job satisfaction not mediated by employability. Supervisory coaching was positively related to employability only for French.

Limitations: Cross-sectional design, self-report data, sub-samples not representatives.

Practical implications: Specific training could be provided to enhance supervisory coaching and role clarity. Cognitive demands in presence of others resources could play a challenging positive role. Results suggested also to act on personal level, promoting training to decrease resistance to new technologies both in France and in Italy.

Originality: This research, using a cross-cultural perspective, could enrich the literature on employability exploring its mediational function poorly studied today.
1207 - THE IMPACT OF LEADER READINESS ON LEADERSHIP DEVELOPMENT INTENTIONS AND PARTICIPATION

Shing Kwan (Avis) Tam (1) - Tamara L. Friedrich (1) - Dawn L. Eubanks (2)
Warwick Business School, Entrepreneurship and Innovation, Coventry, United Kingdom (1) - Warwick Business School, Behavioural Science and Entrepreneurship & Innovation, Coventry, United Kingdom (2)

Purpose
This research aims to examine how leader readiness factors (e.g. leader self-efficacy, identity fit, motivation) impact the intention of engaging in leadership development activities. We draw on Avolio and Hannah (2008)'s leader developmental readiness and Ryan and Deci (2000)'s Self Determination Theory for the proposed model of development readiness and engagement. We propose that leaders' developmental readiness can be defined from motivational and cognitive perspectives, and a higher developmental readiness will lead to higher motivation to engage in leadership development activities.

Design/Methodology/Approach/Intervention
This six months longitudinal study uses questionnaires for data collection through the Prolific Academic. The first study was conducted to examine the impact of readiness factors on the intention of individuals' participation in leadership development. The second study will evaluate the readiness changes in leaders and their leadership development participation.

Results
One hundred and thirty-three responses were collected and the results indicate that not all readiness factors behave the same way regarding the choice of leadership development activities. Moreover, individuals' supervisory experience and level of position do not seem to have a significant impact on development choices.

Research/Practical Implications
This research provides insights into the impact of leader developmental readiness on leaders' self-determined actions (choices) of leadership development and the respective effectiveness.

Originality/Value
It extends the understanding about the influence of individual differences (leader readiness) on leadership development intentions and participation. Moreover, the length of current readiness measure is impractical for applied research and the development of a leaner measure will add value to the leader readiness research.

1210 - DOES PHUBBING REALLY MATTER IN THE WORKPLACE?

Ömer Erdem Koçak (1) - Arnold B. Bakker (2)

Istanbul Medipol University, Business and Management, Istanbul, Turkey (1) - Erasmus University Rotterdam, Psychology, Rotterdam, Netherlands (2)

Purpose: Using self-determination theory (SDT), we conceptualize and validate the concept of phubbing – ignoring and neglecting accompanying people by shifting the focus from them to the smartphone.

Design/Method: Based on the extant literature we generated seven items and we collected data from 301 employees. We split the sample in two random groups to conduct exploratory and confirmatory factor analysis (EFA and CFA). In addition, we conducted a quantitative daily diary study among a sample of 101 employees.

Results: The EFA resulted in a one-factor solution explaining 60.5% of the variance. We could reduce the number of items to four, and the CFA showed good fit to the data. The diary study showed that being exposed to phubbing reduces daily work engagement (vigor, dedication, absorption), but this effect was only found in workplaces with a strong civility climate.

Limitations: We did not specify the perpetrator (supervisor, colleague), which may provide clearer results.

Implications: Being phubbed matters under certain conditions. Phubbing is a micro-stressor that may lead to frustration of the basic need to belong. Therefore, and in line with SDT, phubbing decreases employee work engagement.

Originality: We develop a new scale for phubbing in the work context and tested its effect in a diary study.
The objective of this paper is to apply the construct of organizational culture of Edgar Schein (1986) in a specific organizational culture, starting from the words of its own actors as a tool for knowledge, guidance and as to create a "Theory of this social cooperative". The fact-finding that drives this research is exploratory. The focus of this analysis are the culture and the organizational structure of the cooperative and one of its services, so all the employees and the managers has been interviewed. The method used in this research is qualitative, and for analyzing the culture were used Grounded Theory and the two cultural dimensions by Schein: "external adaptation" and "internal integration". From the analysis of the interviews and the derived categories, a theory of this specific organization studied has been created: the main culture and the sub cultures, and the solutions that the organization finds for manage its own internal and external complexity has been individualized.
NO JOB DEMAND IS AN ISLAND – INTERACTION EFFECTS AMONG EMOTIONAL DEMANDS AND OTHER TYPES OF JOB DEMANDS

Martin Geisler (1) - Hanne Berthelsen (1) - Jari Hakanen (2)

Malmö University, Centre for Work Life and Evaluation Studies, Malmö, Sweden (1) - University of Helsinki, Helsinki Collegium for Advanced Studies, Helsinki, Finland (2)

Purpose. Emotional demands are inevitable in human services, but may be positively valued since it often is a basic motive for engaging in this line of work. However, emotional demands do not act in isolation but in parallel with other demands. Interaction effects have been reported between emotional demands and other demands on negative outcomes (e.g., stress-related concerns). We investigated interaction effects between emotional demands and other demands (quantitative demands, work pace, and role conflict) on positive outcomes: meaning of work and quality of work.

Design. Data was collected in a Swedish social service organization. In all, 831 social workers participated (80 % participation rate).

Results. Overall, emotional demands related to higher reports of meaning of work but was unrelated to quality of work. A significant interaction effect and results of simple slope analysis showed that emotional demands had a positive effect on meaning of work, at low levels of work pace. Significant interaction effects were found between emotional demands and each of the respective demands on quality of work. Simple slope analyses revealed that emotional demands was positively related to quality of work, at low levels of quantitative demands and role conflicts, respectively.

Implications. The results inform research and practitioners by showing that emotional demands can be positive for quality of work and meaning of work, when the level of other demands is low.

Originality and Limitations. The effect of emotional demands on positive outcomes can be contingent on the parallel level of other types of demands. Data is cross-sectional and based on self-reports.
Purpose:
Communication and teamwork in high risk teams are recognized as crucial factors in improving patient safety. Due to their subordinate status, nursing students might hesitate to voice concerns. We proposed an intervention to study and promote voice behaviors among nursing students. We sought to explore their voice behaviors during care, including perceived barriers and enablers, and strategies used to speak up.

Design/Methodology:
A simulation-based study was conducted, in which 18 groups of students had opportunities to speak up facing a supervisor during suboptimal care. Patient behaviors were manipulated (docile vs active). Simulations and debriefings were video-recorded, and questionnaires were used to assess nurses’ attitudes (N = 98).

Results:
Four out of 17 groups voiced concerns facing errors during the simulation, irrespective of patient behavior. Student status, presence of the patient, and fear of evaluation were the most common barriers perceived. Naive questions were reported as the main strategy. Students’ attitudes were impacted by the simulation: teamwork climate was rated lower after the simulation than before, t(72) = 2.463, p = .016, d = 0.29.

Limitations:
One limitation of this study is the sample size. Changes in the scenario are also suggested to foster voice behaviors.

Research/Practical Implications:
This research had practical implications in nursing education: barriers to speaking up should be addressed, and efficient strategies promoted in the curriculum.

Originality/Value:
Most simulation-based studies investigate voice behaviors among surgical or anesthetist residents. The present study examined voice behaviors among nursing students, in a clinical situation with a conscious patient.
Despite the importance of newcomers’ socialization, the typical socialization trajectory seems bumpy, ambiguous, and filled with frustration. The honeymoon-hangover effect is the most dominant temporal trajectory in the newcomer socialization literature and it is characterised by a brief rise (i.e., the honeymoon period) in newcomers’ job attitudes, followed by a sharp decline (i.e., the hangover period), after which it stabilizes (Boswell, Boudreau, & Tichy, 2005). In this study we perform a meta-analysis of mean-level change (e.g., Roberts, Walton & Viechtbauer, 2006) in job attitudes over time to assess the prevalence of the honeymoon-hangover effect. Our results provide partial support for the prevalence of the honeymoon-hangover effect, as we find the ‘natural course’ of newcomer job attitudes to display high dynamism in the newcomers’ first three months on the job, followed by a moderate decline in mean-level job attitudes in the period of three to 12 months, after which it seems to stabilize. In our additional analyses we examine various moderators that could explain the mean-level change in job attitudes. The implication for theory and practice are discussed. Our main contribution besides showing the trajectory of newcomers’ job attitudes, is that we resolve the long-lived ambiguity about the number and density of (i.e. distance between) measurement waves in longitudinal studies on newcomer socialization.

APPLICATION OF A MINDFULNESS PROGRAM AMONG HEALTHCARE PROFESSIONALS IN AN INTENSIVE CARE UNIT: EFFECT ON BURNOUT, EMPATHY AND SELF-COMPASSION

ALBERTO AMUTIO (1) - GRACIA ROSA MARÍA (2) - Joan M. Ferrer - Alfonso Ayora - Manuel Alonso - Ricard Ferrer

UNIVERSITY OF THE BASQUE COUNTRY (UPV/EHU), SOCIAL PSYCHOLOGY AND METHODOLOGY, BILBAO, Spain (1) - HOSPITAL UNIVERSITARI VAL D´HEBRON, BARCELONA, Spain (2)

Purpose: To evaluate the effect of a mindfulness-based program on the levels of burnout, mindfulness, empathy and self-compassion among healthcare professionals in an Intensive Care Unit of a tertiary hospital.

Methodology/Intervention: A longitudinal study with an intra-subject pre-post intervention design was carried out. A total of 32 subjects (physicians, nurses and nursing assistants) participated in the study. A clinical session/workshop plus an 8-week training program on mindfulness techniques with specifically designed short-guided practices supported by a virtual community based on a WhatsApp group was offered. A weekly proposal in audio with different exercises was sent to participants. Various psychometric measures were used: burnout (MBI), mindfulness (FFMQ), empathy (Jefferson) and self-compassion (SCS), before and after the training program. Demographic and workplace variables were also compiled.

Results: Among the factors affecting burnout, the level of emotional exhaustion decreased (p = .012), mindfulness levels were not globally modified, although “observation” and “non-reacting” factors increased. Empathy was not modified, and Self-Compassion levels increased (p = .001). Satisfaction and program adherence levels were very high.

Limitations: Lack of a control group and sample size.

Research/Practical Implications: In the population described, this program produced a decrease in emotional exhaustion and an increase in self-compassion. These factors are related to an improvement of well-being and patient quality of care.

Originality/Value: This is one of the few mindfulness-based interventions that is conducted through a technological device. The value of this intervention is underlined given the shortage of time that health professionals can have to attend to face-to-face courses.
There is an emerging debate within organizational psychology about the potential effects of neoliberal ideology on work policies and practices. It still remains unclear how neoliberalism is justified and translated into work legislation, and what the countervailing forces and arguments are. In response to this debate, and in order to open the ‘black box’ of the ideology, this paper focuses on the public debate in Sweden over new legislation of sick leave processes. The purpose of the article is to explain how the state and associated agencies justified a new policy – where the person on sick leave is activated and responsible for getting back to work – and the possibility to critique the new policy by testing the format against i) the outlined aims and justifications, and ii) the experiences of the individuals on sick leave. Based on an analysis of opinion pieces in the major Swedish newspapers, the article shows the political assumptions underlying neoliberal policies and the possibility to critique their effect on contemporary workplaces. The paper discusses alternative conventions for workplace policies and the positions of the researchers in this debate. It concludes by arguing for taking individual’s critical capacity seriously in critiquing and developing workplace policies and practices.

Keywords: neoliberalism, ideology, sick leave policies, contemporary workplaces
Purpose: Brexit has raised political, economic, and social uncertainty in the UK; this uncertainty is likely to have consequences for organizations and employees. Yet, little is known about whether and how organizations’ strategies might buffer negative effects of Brexit on employee well-being. This paper explores whether employee perceptions that their organization is communicating effectively about Brexit influences employee well-being and decreases withdrawal cognitions (from the UK and the organization) through decreased job insecurity. Brexit-related communications should be particularly important to reduce job insecurity amongst non-UK citizens (who are more vulnerable to immigration laws). Furthermore, these communications should be more beneficial for those who experience lower procedural justice.

Design/Methodology: We conducted a cross-sectional study online via Prolific (a crowdsourcing platform), our sample consisted of 699 UK full-time employees (356 indicated that they had UK citizenship, 41 reported dual-citizenship and 302 had no UK citizenship).

Results: Results supported our conceptual model by showing that Brexit communications potentially decrease job insecurity amongst non-UK citizens who perceived lower procedural justice. In turn, job insecurity was negatively associated with well-being and with intentions to leave the organization and the UK. Interestingly, communications were positively associated with job insecurity amongst UK citizens who experienced lower levels of procedural justice.

Limitations: Cross-sectional study utilising a crowdsourcing sample.

Research/Practical implications: This study demonstrates the potential for organizational communications in buffering against the negative effects of Brexit on employee well-being amongst non-UK citizens.

Originality/Value: This research established a relationship between organizational strategy and employees’ reactions in the Brexit context.
Purpose: This research intended to examine work challenges women in Cyprus are faced with when climbing up their career ladder.

Design/Methods: The final sample of this present study consisted of 264 employees, (246 working women responded to a questionnaire, and 18 were interviewed). Convenience sampling was chosen for the participative organizations. The participative organizations represent a wide variety of job types. Descriptive statistics and ANOVAs were used.

Results: The outcomes indicated that unfair treatment between female and male employees exists and that career advancement barriers are present that impede upon women’s promotion, compensation and access to training and development programs. Other barriers are highlighted which appear to obstruct women’s advancement in their careers, such as: low levels of self-confidence, non-supporting spouse, company’s lack of ability to implement and enforce anti-discriminatory and equality legislation; male domination in senior positions; company’s lack of commitment to gender advancement; working hours that do not facilitate parenting; absence of equal career development opportunities for women and insufficient women role models in higher organizational levels.

Limitations: Reliance on self-reported questionnaire data.

Research/Practical Implications:

The frequency of reported barriers in women’s career advancement as mentioned in previous studies and the fact that the participants in this research reported experiencing such barriers while climbing the corporative ladder thus preventing and delaying their career advancement is worth investigating further.

Originality/Value: This study is one of the few conducted on Cypriot women and demonstrates the urgent need for greater investigation and increase awareness not only of the glass ceiling effects but also of the existence of barriers that impact on the career advancement of women.
The present study aims to investigate the work, and workplace experiences of employees with bipolar disorder and human resources management professionals’ (HRMP) attitudes toward them. In the modern world, people diagnosed with psychological problems may hide their psychological disorders from third people, groups, or institutions because of the potential for social exclusion; and, the work settings would take the first place in the list. Therefore, today fighting against the stigma attached to psychological disorders is a major issue. Even if functionally performing after attacks might be possible, the work settings are reluctant to let them work (Goldberg and Harrow, 1999). How the working conditions, work settings, and professional interrelationships affect bipolar people is the main question. The current study will be the first initiative in Turkey which will include the experiences of employees with bipolar disorder and HRMP. The eight white-collars with bipolar disorder (type 1&2) (CAPA Medical School in Istanbul) participated in semi-structured in-depth interviews. We analyzed transcribed interviews via MAXQDA software with the qualitative principles of Interpretative Phenomenological Analysis (IPA). According to the findings from the first phase, the main themes are “sharing of the illness with colleagues”, “importance of prophylactic treatment”, “effects of manic and depressive phases on work”, and “triggers of attacks in working environment”. The second phase of this study will include HRMPs from global and local companies settled in Istanbul via convenience sampling. Up to 6-8 participants will be interviewed and analyzed to understand how their perspective differentiates from/overlaps with the employees’ themselves.
LONGITUDINAL ANALYSIS OF THE RELATIONS BETWEEN IDENTIFICATION, COLLEAGUES SUPPORT AND PSYCHOLOGICAL DISTRESS

Lorenzo Avanzi (1) - Marco Bressan (1) - Cristian Balducci (2) - Luigi Lombardi (3) - Franco Fraccaroli (1)
University of Trento, Department of Psychology and Cognitive Science, Rovereto, Italy (1) - University of Bologna, Department of Psychology, Bologna, Italy (2) - University of Trento, Department of Psychology and Cognitive Science, Rovereto, Italy (3)

Purpose. Many studies have reported a positive relation between organizational identification and employee well-being. According to the Social Identity Approach, strongly identified employees should receive more easily support from colleagues, and this should reflect a strong coping strategy to face with job stressors. Empirical evidence seems to confirm this trend, but a longitudinal picture of the phenomenon is still missing in the literature. In the present study, we tested a mediational model in which identification is supposed to predict colleagues support that, in turn, should be negatively related to employee psychological distress over time. Methodology. The study was conducted using a three-waves longitudinal design on administrative and technical employees from a middle size University in Italy. About one hundred employees participated across all the waves, and we collected data on identification, colleagues support and psychological distress at each time. Results. Structural equation modelling partially confirmed our hypothesis. Limitations. More research is needed to generalize results to other countries and occupations. Practical Implications. Our results have strong practical implications for organizational well-being. Employers and managers should keep into consideration the workers’ attachment, in order to decrease employees’ psychological distress. Indeed, strongly identified employees tend to receive more support from colleagues, being more prone to help to each other, developing stronger cooperation and collaboration. Value. Despite our findings are in line with previous theoretical propositions and empirical cross-sectional evidence, the current research, to our knowledge, represents the first study which longitudinally tests (across three waves) the hypothesized mediational model.
CONGRUENCE AND DISCREPANCY BETWEEN NEWCOMERS’ ANTICIPATED AND EXPERIENCED WORK INTERFERENCE WITH FAMILY PREDICTING EARLY SOCIALIZATION OUTCOMES

Seterra Burleson (1) - Debra Major (1) - Xiaoxiao Hu (1)
Old Dominion University, Psychology, Norfolk, VA, United States (1)

Purpose

While relationships between work interference with family (WIF) and work-related outcomes are well established, the role of expectations regarding WIF in these relationships remains unexplored. Applying met expectations and newcomer socialization theory, we examined how congruence and discrepancy between anticipated work-interference with family (AWIF) and experienced WIF related to job satisfaction, affective commitment, and turnover intentions. It was hypothesized that when AWIF and WIF are in agreement outcomes are more favorable. Further, it was hypothesized that when the discrepancy is such that WIF is higher than AWIF outcomes are less favorable than vice versa.

Design/Methodology

Data were collected from 205 adults, first as graduating seniors in college and again three months into participants’ post-graduation jobs.

Results

Polynomial regression revealed that congruence between AWIF and WIF was related to higher job satisfaction and affective commitment but not lower turnover. Analyses supported the hypothesis that when WIF is higher than AWIF, job satisfaction and affective commitment are lower than vice versa, but there was no effect on turnover intentions.

Limitations

As data were gathered using self-report measures, common method bias cannot be ruled out.

Research/Practical Implications

Future research should examine interventions to provide realistic previews regarding expected levels of WIF for individuals prior to entering the organization to determine if job satisfaction and affective commitment can be improved indirectly through the formation of realistic expectations regarding WIF.

Originality/Value

Findings expand understanding of the nature of relationships between WIF and work-related outcomes by applying the concept of met expectations.
Barbara Steinmann (1) - Sophie Schoppe (2) - Günter W. Maier (1)

Bielefeld University, Work and Organizational Psychology, Bielefeld, Germany (1) - Bielefeld University, Bielefeld, Germany (2)

Purpose

Rule and Ambady (2008) analyzed whether naïve ratings of CEOs’ power and warmth derived from facial expressions relate to organizational success. They found associations between power-related traits and company profits. We aimed at replicating these findings, but also extended the work to implicit motives. Based on evidence in entrepreneurship (Collins, et al., 2004) and behaviors associated with this motive (McClelland, 1985), we assumed a significant link between organizational success and ascribed need for achievement (nAch).

Design/Methodology/Approach/Intervention

We used official photos of the CEOs of the 25 highest/lowest ranked companies in the HDAX. 177 students rated either the CEOs’ warmth, power, age, attractiveness, and affect, their implicit motives, or responsibility. Success indicators were derived from financial statements.

Results

Unexpectedly, indicators positively related to power ratings and the CEOs’ warmth. As assumed, nAch was positively associated with revenues, profits and stock prices. Ratings of the CEOs’ socialized power motive had a slightly negative relation with revenues and profits. Those of the affiliation motive did not relate to any indicator.

Limitations

Although implicit motives are reflected in facial expressions (Rösch, 2012), we do not know whether CEOs are motivated by the motives ascribed. Neither did we account for participants’ motives, which might have affected their judgements.

Research/Practical Implications

Photos in applications have been discussed for bearing the risk of biasing decisions. Our work, however, suggests that CEOs’ facial expressions are valuable in gauging their success.

Originality/Value

The study supplements evidence on naïve judgements of traits and their relation to objective success with those on implicit motives.
Negative social contact between care workers and care home residents is related to care workers’ ageist attitudes towards care home residents and older adults more broadly. In this research we examine whether contact experienced by care workers is also associated with organisational outcomes and explore psychological processes that explain those relationships. Based on intergroup contact theory (Allport, 1954; Pettigrew & Tropp, 2006) we conducted two studies. In Study 1 (N = 56) negative but not positive contact independently predicted care workers’ job satisfactions and turnover intentions. Mediation analysis further revealed that negative contact indirectly predicted turnover intentions via reduced job satisfaction. Having identified care workers’ job satisfaction as a key variable driving turnover intentions, Study 2 (N = 113) sought to examine the psychological processes explaining the link between care workers’ negative contact and job satisfaction. Results showed that care workers’ anxiety about their own ageing created an independent indirect pathway between negative contact and job satisfaction. Implications for care organisations and working practices are discussed.
Purpose: The present research aims to answer what people think they should do when asked to be a leader and how this “leader” label fits their behaviour.

Methodology: Across four studies, the verbal behaviour of 1262 leaders of 330 student engineering teams was coded. Each team worked on a five-day project with a different assigned leader each day. Fifteen behaviour categories and the total speaking time were coded during daily meetings for each member of the team. Leader effectiveness was also measured.

Results: Non-parametric analyses on all studies consistently showed that on the day the student was team leader, he/she significantly used more behaviours aimed at organising the team, spent more time talking, used more behaviours, and used fewer behaviours aimed at decreasing the speaking time of other member(s) than on days he/she was not a leader. Leaders that shared and asked personal information were perceived as more effective, while leaders that proposed too many ideas were perceived as ineffective.

Limitations: The generalisability of the results is limited due to the student sample.

Practical implications: This research provides information as to the kind of behaviours that students use when asked to be leaders. This information could help institutions to evaluate whether these behaviours are helpful or whether prior training is needed to show people what they are expected to do as team leaders.

Originality: The research shows several specific behaviours that are associated with leadership.
The objective of this study was to investigate informal waste pickers perceptions on stigma, wellbeing and coping strategies in the work. Waste picking has become economically beneficial in low income communities where employment opportunities are few and waste management systems are not well organised (Simatele and Etambakonga, 2015). There is need for researchers, practitioners and policy makers to understand lived experiences of this sector.

A cross-sectional qualitative ethnographic design which adopted an emic approach to understand waste-pickers understanding of their work was used. Purposive convenience sampling was used and yielded 16 participants who were interviewed using an open ended structured interview schedule. Findings reported rude treatment; public stereotypes about dirty work; verbal abuse, disrespect and lack of support were experienced by participants in this study. Pickers reported public views about their work as: dirty, homeless, mentally ill, criminals, and harassment from authorities. Participants reported positive emotions of pride due to income generation for their families and well-being were reported. The limitation noted is that a cross sectional design does not capture the lived experiences over time, a longitudinal design is best suited to gain in-depth understanding of pickers lived experiences. Positive emotions and economic income contribution to society are potential intervention points. At societal and policy level, organisations can develop training to increase pickers knowledge to increase pickers well-being.

The value of this study is in the reported positive job outcomes of pride in this sector of work. The investigation of coping mechanisms in the context is not widely reported.

*Corresponding author
Both large and small-and-medium (SME’s) are impacted by employees who are absent due to illness or non-work-related accidents. The current study explores differences in organizations of varying sizes in an attempt to create a clearer picture and to form a basis for new government and organizational absenteeism policy.

We used rough absenteeism data registered in 2017 by 27,184 employers for 234,358 employees, and calculated indicators for the duration and frequency of absences. Our sample proved to be representative of worker status (blue-collar vs white-collar), sex, age, and organizational size up to 1000 employees in the Belgian private sector. A weighting factor was used for regions.

Results demonstrate an increase in absenteeism dependent on organizational size. The bigger the organization, the higher the absenteeism. In addition, results indicate some other interesting differences. Micro-organizations (with less than 10 employees) seem to have the longest average absences (even in comparison to the largest organizations). However, the bigger the SME (up to 250 employees), the less long employees are absent but the more frequently employees take sick leave (even in comparison to the largest organizations). The largest organizations (between 500 and 1000 employees) have the highest total absenteeism, largely due to the high levels of both long average absences as well as high frequencies of absences.

Until now, it remained unclear as to how absenteeism differs in organizations of varying sizes. Thanks to this study and explanations for the results, we are able to design absenteeism policies tailored to the size of the company.
This study investigates the evolution of burnout from 2014 to 2017 and indicates groups with a higher risk. Data was gathered by Securex using online questionnaires. The Utrecht’s Burnout Scale (UBOS) was used to measure three symptoms of burnout: exhaustion, mental distance and decreased self-esteem. This study registers an "increased risk" of burn-out based on the norms for workers for the UBOS-A. Our sample in 2017 contained 1,552 employees, 914 being white collar employees. The sample was representative for sex, age, worker status (blue-collar vs white-collar), and region on the Belgian labor market. Our sample in 2014 contained 526 Belgian white collar employees and was representative for sex and age. The fact that the sample was not representative for region does not affect these results, because the regions do not differ significantly in terms of symptoms of burnout.

Results demonstrate that in three years, the risk for burnout has increased by about 70% among Belgian white collar employees. In 2017, this risk was especially high for employees between the age of 35 and 39. In addition, full-time employees had a higher risk for burnout than part-time employees. White collar and blue collar workers had an equal risk for burnout.

This is the first study on the evolution of burnout in a representative sample of Belgian employees based on the UBOS. Possible explanations are given, as well as some advice on organizational absenteeism policy.

WHEN NEWCOMER VOICE IS – OR IS NOT – HEARD: THE ROLE OF ORGANIZATIONAL SOCIALIZATION

Tim Reissner (1) - Hannes Guenter (1) - Simon de Jong (1)
Maastricht University, Organization & Strategy, Maastricht, Netherlands (1)

Purpose: When organizational newcomers speak up with ideas and concerns, managers sometimes reject this input, depriving their organization of potentially novel and useful insights. Drawing from organizational socialization theory we investigate why managers react negatively to such employee voice—the expression of challenging but constructive work-related ideas or concerns. We argue that managers will endorse promotive (solution-oriented) and prohibitive (problem-focused) voice if it comes from well socialised, rather than poorly socialised newcomers.

Design/Methodology: We collected data from 107 unique supervisor-newcomer dyads working in a range of organizations and used Hayes’ PROCESS procedures to test our model.

Results: Our findings show that managers—while rejecting prohibitive voice from poorly socialized newcomers—actually endorse problems and concerns if raised by socialized newcomers. We find no such moderation effect for promotive voice but an overall positive effect on voice endorsement.

Limitations: Future research may benefit from adding measures of silence and/or collecting data over multiple time points.

Research/Practical Implications: Prior research has found prohibitive voice to have largely negative consequences. Our research indicates a boundary condition to this effect highlighting the important role of newcomer socialization. In terms of practical implications, we caution managers not to expect newcomers to fit in silently as they thereby may bereft themselves of novel and useful input.

Originality/Value: At present, the research literatures on organizational socialisation and voice behaviour have evolved along parallel lines. We take steps to address this issue, especially by highlighting socialization’s value for voice endorsement.
EUDAIMONIC AND HEDONIC ORIENTATIONS AS SELF-MOTIVES FOR ENGAGEMENT: A FUTURE TIME PERSPECTIVE

Aly Kelleher (1) - George Michaelides (2)

Birkbeck, University of London, Organizational Psychology, London, United Kingdom (1) - University of East Anglia, Norwich Business School, Norwich, United Kingdom (2)

Purpose

This study focuses on how employees’ eudaimonic and hedonic orientations underpin the initiation of their daily actions and engagement, at work. Based on these orientations, employees are thought to pursue two different temporal processes, i.e. psychological meaningfulness and utility value, and influence their day-specific perceptions of their levels of autonomous motivation. To better understand the role of time in employee motivation, this study utilises the Future Time Perspective (FTP) theory, i.e. how employees’ perceptions of the future influences their present-day actions (i.e. employees’ FTP). This study also adopts the needs-satisfaction approach to engagement (i.e. Kahn, 1990), which underpins the persistence of employees’ daily actions.

Methodology & results

The hypothesised relationships included the assertion that employees’ FTP would moderate the effects of employees’ orientations on their day-specific perceptions of the two processes, and their levels of autonomous motivation. A daily diary study was conducted across UK organisations (N=70), and the data was analysed using Multi-Level Modelling. There is initial support for both between and within-person differences in these relationships.

Research & Practical implications

The examination of employees’ FTP and orientations will extend our theoretical understanding of employees’ motivation, underpinning their daily actions, i.e. how they make decisions to engage, in the present. This can assist organisations understanding on how tasks can either promote or inhibit motivation to engage. The focus on within-person differences, i.e. employees, in their orientations and FTP, in this study enables managers to gain a deeper understanding of the motives which underpin engagement levels in their workforce.
Our study investigates the relationships between weekly strengths use, weekly deficit correction, weekly basic psychological need satisfaction and weekly work engagement. Additionally, we argue that perceived organizational support for strengths use and for deficit correction are positively related to weekly strengths use and deficit correction behavior, as between-person variables. The 84 participants part of the technical, economic and socio-administrative departments of a large manufacturing organization have completed a set of questionnaires over a five consecutive weeks period. Using multilevel analysis our hypotheses were confirmed, as perceived organizational support for strengths use was positively related to weekly strengths use behavior, which in turn was positively related to weekly work engagement directly, but also through basic psychological need for competence satisfaction. Furthermore, perceived organizational support for deficit correction was positively related to weekly deficit correction behavior, the latest being positively related to weekly work engagement. Based on these findings, we suggest organizations can design human resources practices that focus on a balanced approach regarding employees' strengths and weaknesses, providing support for strengths capitalization and improvement of weaknesses in order to foster employee work engagement on a weekly basis.

Keywords: multilevel analysis, perceived organizational support for strengths use, perceived organizational support for deficit correction, strengths use, deficit correction, basic psychological needs satisfaction, work engagement.
LINKS, IN DIFFERENT COMPETITIVE ENVIRONMENTS, BETWEEN HUMAN RESOURCE MANAGEMENT (HRM) PRACTICES, COMPETITIVE ADVANTAGE, AND FINANCIAL PERFORMANCE OF SMALL AND MEDIUM SIZE ENTERPRISES (SMES)

Roland Foucher (1) - Jamal Ben Mansour (2) - Renée Michaud (1) - Denis Morin (3)

Université du Québec en Outaouais, Département de relations industrielles, Gatineau, Canada (1) - Université du Québec à Trois-Rivières, Département de gestion des ressources humaines, Trois-Rivières, Canada (2) - Université du Québec à Montréal, École des sciences de la gestion - département d’organisation et ressources humaines, Montréal, Canada (3)

Literature on the links between HRM practices and SMEs financial performance (Ben Mansour, Fabi, Lacoursière & Raymond, 2016) does not consider the following causal path inspired by the Resource based view (Barney, 1981): intensity of competition influences the links between HRM practices aiming at stimulating HR involvement and performance (independent variable), the competitive advantage developed (intermediate variable) and the financial performance achieved (dependent variable).

To help filling this gap, a research was conducted on a stratified sample of SMEs located in Canada; 298 CEOs answered a questionnaire. Intensity of competition and financial performance were measured by a single item; HR practices and competitive advantage, by a scale. Various question formats were used to limit common variance error (Conway & Lance, 2010).

Structural equation modeling (multi group analyses) was performed (M Plus). In the low competition group, HR practices explain 21% of the competitive advantage, which is not linked to the financial performance. In the high competition group, HR practices explain 33% of the competitive advantage, which in turn explains 13% of the financial performance. Thus, considering the intensity of competition to measure the influence of two types of HR practices on organizational performance was relevant. Since these variables were measured through perceptions and a synchronic research design, further studies using hard data to complete perceptions and a diachronic design to assess causality more accurately would be pertinent.
As people nowadays are relying more and more on technology or social media to achieve various purposes or to fulfil diverse needs in their lives, such as entertainments, building social connections, and self-development and so forth, the use of technology, or more specifically, the use of social media has inevitably become an indispensable part of people’s professional and personal lives. However, non-work related social media use at work is still largely regarded as counter-productive. This research intends to answer the following question: Is there a silver lining of using social media at work? Using a sample of 97 employees who participated the daily survey for 2 consecutive weeks, we examined the relationships among social media use at work, employee’s wellbeing, and work related outcome using multilevel analysis. Our findings revealed that daily social media use was positively associated, within individuals, with employees’ relatedness and life satisfaction in the current day, which in turn further positively related to next-day work engagement. Our results also showed that the impacts of daily social media use at work on relatedness were stronger for employees with higher general workload and higher autonomy in social media use. Our research, goes beyond the single-sided counter-productive view of social media use at work and proposes and examines the potentially bright side of it, which essentially constitutes as a crucial step towards a more complete and balanced understanding of this already prevalent phenomenon in the current digital era.
Scholars have argued that perceptions of the learning climate should facilitate innovative work behaviors. However, arguments have been often non-empirical (Eldor, 2016). The aim of this study is to address this issue by investigating whether work-based learning, task-based and interactional (Nikolova et al., 2013), can mediate the impact of learning climate, facilitation learning and error avoidance (Nikolova et al., 2014), on innovative work behavior (Janssen, 2000).

Design/Methodology

Structural equation modeling (SEM) analysis were conducted to empirically test the hypotheses. Using an online questionnaire, data were collected from a sample of 374 employees from a company in central Italy.

Results

The results show that both dimensions of learning climate can influence work-based learning and that task-based learning mediate the relation of climate and innovative behavior. Furthermore, the climate dimension of learning facilitation has a direct effect on innovative behavior. The proposed model was empirically supported ($\chi^2(220) = 672.475, \text{CFI} = .91, \text{TLI} = .90, \text{RMSEA} = .07, \text{SRMR} = .06$).

Limitations

The cross-sectional, self-report nature of the study prevents causal inferences and increases the likelihood of common method bias.

Research/Practical Implications

Advancing from existing studies, this research introduces a mechanism through which learning climate influences innovative work behaviors through learning opportunities on the job. The results suggest that perceptions of learning climate are fundamental to facilitate innovation, thus highlighting the importance of learning practices and error handling in determining innovative behavior.

Originality/Value

The research on perceptions of learning climate lacks evidence on its implications for innovative work behavior. The main contribution of these findings is to provide empirical support for the value of learning climate development in enhancing the innovation process through work-based learning.
Purpose: This study was designed to test validity and uniqueness of transformational leadership (TFL) and two forms of positive leadership - namely servant (SL) and authentic leadership (AL). We wanted to find out the relation between the mentioned leadership styles, selected managerial skills and perceived effectivity of leaders. The study was built on previous findings of Grisaffe, VanMeter & Chonco (2016) and Hoch, Bommer & Dulebohn (2016).

Design/ Methodology: The study combined three measurements: Authentic leadership Questionnaire (Avolio, Gardner & Walubwa, 2007), Global Servant Leadership Scale (Liden, Wayne, Meuser, Hu, Wu & Liao, 2015) and Czech Leadership Questionnaire - CLQ (Procházka, Vaculík & Smutný, 2016). The final sample of answers was N = 100 for both SL and CLQ and N = 124 for ALQ (including 20 self-evaluations from managers).

Results: The Cronbach Alpha was > 0.70 for all observed variables. There was very high correlation (0.87) between TFL and managerial skills. This model explains 78% of managerial skills variability. There also can be predicted a positive linear relation between TFL, AL and SL in relationship to leaders’ perceived effectivity.

Limitations: The study is done in one company operating within one national culture. We recommend replications in different cultures and within different organisations.

Research/ Practical implications: By comparing the three concepts, we provide findings of their interdependency as well as distinctiveness.

Originality/ Value: Our study is comparing three concepts (TFL, SL and AL) which are currently leading trends in leadership concepts building on findings of Hoch et al. (2016).
Purpose

The aim of this research is to examine the relationship between proactive work behaviors (PWB) and constructive deviant work behaviors (CDWB), supposed to be two different higher order factors related to common antecedents. We suggest that personal orientations related to deviance and normativity produce/reduce the generation of PWB and CDWB. We also suggest that perceived organizational obstruction (Gibney, Zagnonezyk, & Masters, 2009) enhance CDWB and inhibits PWB, whereas top management openness (Detert & Burris, 2007) produce opposite results.

Design/Methodology

A survey, measuring PWB (taking charge, idea generation, voice), CDWB (constructive deviance and prosocial rule breaking), personal orientation toward normativity (conformity and rule respect) and deviance (initiative and performance), perceived organizational obstruction, and top management openness, was distributed to French workers from public and private organizations (N=402).

Results

Structural equation modeling analyses by bootstrap were used to test the hypotheses. The theoretical research model present good MFI ($\chi^2$ (1559) = 2869.350, $p < .001$; RMSEA = .04; CFI = .91; TLI = .90; SRMR = .05) and supported hypotheses.

Limitations

The collection of data does not allow to postulate an overtime effect.

Research/Practical Implications

These results help to clarify the nomological network of proactive and constructive deviant constructs. They also introduce PWB and CDWB antecedents.

Originality/Value

This study is one of the first to show a difference between PWB and CDWB dimensions. It seems that individuals are more likely to generate CDWB when they perceive organizational obstruction; while top management openness favor the emergence of PWB.
YESTERDAYS WORK–PRIVACY CONFLICT, RUMINATION AND INCREASED SLEEP ONSET LATENCY PREDICT TODAY’S COGNITIVE FAILURE IN TEACHERS

Achim Elfering (1) - Diana Augusto Coelho (1) - Damian Schmutz (1) - Maria Undine Kottwitz (2)

University of Bern, Institute of Psychology, Bern, Switzerland (1) - University of Mannheim, Psychology, Mannheim, Germany (2)

PURPOSE Cognitive failures are errors in routine action regulation. The aim of this study in teachers was to test work-privacy conflict (WPC), rumination in the evening before sleep, and following sleep-onset latency as antecedents of current cognitive failure.

METHODOLOGY Fifty-three teachers filled out a general questionnaire and daily questions in the morning, after work, and evening of five consecutive work days and on Saturday morning. Sleep latency was assessed with sensewear ambulatory actimeters. Individual level of cognitive failure as assessed in the general questionnaire and yesterday’s cognitive failure (autoregression) were controlled in analyses of 172 reports of daily cognitive failure.

RESULTS All predictors variables including sex and age as control variables contributed significantly in explanation of daily cognitive failure. Higher WPC reported in the evening before sleep (B = 0.15, SE = 0.05, p = .003), more intense rumination before sleep as reported in the next morning (B = 0.10, SE = 0.02, p < .001, and longer sleep onset latency (B = 0.0060, SE = 0.0029, p = .019) predicted more cognitive failure during the next working day. There was no indication of a mediating process involved.

LIMITATIONS The relatively small sample may have led to an underestimation of the findings reported.

PRACTICAL IMPLICATIONS Work redesign should reduce WPC. Individual training should reduce rumination and sleep latency.

VALUE The study showed restricted recovery may have detrimental effects on teacher attention, memory and action regulation that may threaten educational performance and safety.
1268 - UNNECESSARY TASKS MAY LIE HEAVY ON THE BACK: A DIARY STUDY

Yannik Faes (1) - Achim Elfering (1)
University of Bern, Institute of Psychology, Bern, Switzerland (1)

PURPOSE Musculoskeletal pain (MSP) including neck pain, back pain, and pain in muscles and joints is common in office workers. Administrative work often includes tasks that are unnecessary in the view of employees but still have to be done. According to the „Stress as Offence to Self“ – model unnecessary tasks violate occupational role identity and threaten occupational self-esteem (Semmer et al., 2007). Resulting stress reactions include an increase in muscle tension and prolonged muscle tension may cause muscle pain. This diary study tests unnecessary tasks as risk factor for MSP.

METHODOLOGY Fifty-two employees of a public administration in Switzerland filled out a questionnaire on unnecessary tasks and other risk factors and then started a daily report of MSD across four weeks resulting in 775 reports of MSP intensity.

RESULTS Multilevel regression analysis showed unnecessary tasks to predict daily MSP (B = 4.44, SE = 1.88, p = 009, one-tailed) even beyond other significant risk factors (prolonged sitting: B = 2.22, SE = 1.29, p = 043; body mass index: B = 0.82, SE = 0.48, p = 043; maladaptive back beliefs: B = 3.05, SE = 1.53, p = 023, all p one-tailed).

LIMITATIONS The results reported were acquired from a relatively small sample that, may have led to an underestimation of the results reported.

PRACTICAL IMPLICATIONS Work redesign that reduces unnecessary tasks can help to prevent MSP in office work.

VALUE The study is the first one to test unnecessary tasks as risk factors for MSP.
The Triangle Model of Responsibility (Schlenker, 1997) proposes that perception of responsibility is a result of self-relevance (identity), task prescription, and control (event). Previous research has showed it predicts academic performance and job engagement. Responsibility is associated with accountability, predicting job performance in past research. The purpose of this study was to test the hypothesis that the Triangle Model of Responsibility, more specifically (1) person characteristics associated with self-relevance of job, (2) job description, and (3) situational characteristics associated with control, can explain job performance.

Survey data was collected from 703 employees in different positions in 12 different companies from a wide range of industries, measuring several aspects of job design, job satisfaction, job performance, and person characteristics.

Results of a multiple regression analysis indicated that five factors contributed uniquely to predict job performance. These five factors represent the three pillars of responsibility in the Triangle Model of Responsibility: Person characteristics associated with self-relevance of job (i.e., competence and health), job description (i.e., task clarity), and situational characteristics associated with control (i.e., work load and task predictability). These factors remained significant predictors also when controlling for organizational membership. Job satisfaction did not contribute to explaining job performance beyond what could be attributed to the factors representing the Triangle Model of Responsibility.

The results supported the hypothesized contribution of the Triangle Model of Responsibility in predicting job performance. Employers will benefit from improved job performance by basing decisions on job design, recruiting and development on the Triangle Model of Responsibility.
Purpose. Relationships represent a fundamental need both in personal and work life (Blustein, 2006, 2011). Positive relationships are an important factor for wellbeing and health of people in organizational contexts for the promotion of healthy organizations and healthy business (Di Fabio, 2017, 2018). In a primary prevention perspective, the present study aims: to examine the relationships between PRM and well-being (both hedonic and eudaimonic), controlling for personality traits; to analyze the mediation role of PRM in the relationship between personality traits and well-being.

Design/Methodology. Two hundred eighty three Italian workers were administered the Big Five Questionnaire (BFQ, Caprara, Barbaranelli, & Borgogni, 1993), the Positive Relational Management Scale (PRMS, Di Fabio, 2016), the Positive and Negative Affect Schedule (PANAS; Italian version Terracciano, McCrae, & Costa, 2003), the Satisfaction With Life Scale (SWLS; Italian version Di Fabio & Gori, 2015), the Meaningful Life Measure (MLM; Italian version Di Fabio, 2016), the Flourishing Scale (FS; Italian version Di Fabio, 2014). Hierarchical regressions and mediation analyses were carried out.

Results. The results showed that PRM added significant incremental variance beyond that accounted for by personality traits in relation to both hedonic and eudaimonic well-being. The mediation role of PRM emerged in the relationship between personality traits and both hedonic and eudaimonic well-being.

Keywords: Positive relational management; personality traits; hedonic well-being; eudaimonic well-being; workers.
Purpose. The 21st century is characterized by instability and economic turmoil (Blustein, Kenny, Di Fabio, & Guichard, 2018; Peiró, 2017). In a primary prevention perspective (Di Fabio & Kenny, 2016), it is important to improve resources of individuals to cope with the complexity of the post-modern era enhancing resiliency. Intrapreneurial Self-Capital (ISC, Di Fabio, 2014b) emerged in the literature as a core of individual intrapreneurial resources enhanceable by specific training (Di Fabio & Van Esbroeck, 2016). ISC assists people to cope with frequent changes and transitions by helping them to come up with innovative solutions to problems. The present study aims: to examine the relationships between ISC and resiliency, controlling for the effects of personality traits; analyze the mediation role of ISC in the relationship between personality traits and resiliency.

Design/Methodology. One hundred seventy nine Italian workers were administered the Big Five Questionnaire (BFQ, Caprara, Barbaranelli, & Borgogni, 1993), the Intrapreneurial Self-Capital Scale (ISC, Di Fabio, 2014), the Resiliency Scale for Young Adults (RSYA, Wilson et al., 2017). Hierarchical regressions and mediation analyses were carried out. Results. The results showed that ISC added significant incremental variance beyond that accounted for by personality traits in relation to resiliency. The mediation role of ISC emerged in the relationship between personality traits and resiliency.

Limitations. Self-report measures, cross-sectional design. Research/Practical Implications. ISC could represent a promising resource for resiliency of workers, opening new research and intervention opportunities. Originality/Value. New research and interventions in a primary positive prevention perspective to support resiliency in workers.

Keywords: Intrapreneurial Self-Capital; personality traits; resiliency; workers.
THE PERCEIVED CONSEQUENCES OF IDIOSYNCRATIC DEALS (I-DEALS) FOR GROUPS AND INDIVIDUALS: A QUALITATIVE CASE STUDY INVESTIGATION

Chris Woodrow (1) - Sara Chaudhry (2) - Maryam Aldossari (2)

Henley Business School, University of Reading, Reading, United Kingdom (1) - University of Edinburgh Business School, Edinburgh, United Kingdom (2)

Purpose

Idiosyncratic deals have been defined as “voluntary, personalized agreements of a nonstandard nature negotiated between individual employees and their employers regarding terms that benefit each party” (Rousseau, Ho & Greenberg, 2006, p. 978). However, there is some disagreement in the literature around the extent to which I-Deals benefit both employees and employers. The purpose of this study is therefore to explore the perceived consequences of I-Deals from the perspective of both employees and negotiating managers.

Design/Methodology/Approach/Intervention

Intensive semi-structured exploratory interviews were undertaken with academics in two UK organizations. The sample consists of 30 employees and 12 negotiating managers.

Results

Whilst satisfaction often increased for individuals who negotiated I-Deals, there was evidence that commitment did not. I-Deals were not always viewed as beneficial by managers, and negative effects (e.g. demotivation) emerged for others in the group. Some negotiations failed, leading to costs for all parties.

Limitations

This study was undertaken in a specific context with limited potential to negotiate some aspects of the employment relationship. Research may explore these issues in alternative contexts.

Research/Practical Implications

The research shows that conceptualizations of I-deals that stress benefits to all parties may not always be reflected in reality, and suggests that those negotiating on behalf of organisations should take account of other group members.

Originality/Value

This study demonstrates that I-Deals may not benefit all parties to the employment relationship, and may under certain circumstances be harmful.
Purpose. The 21st century is characterized by globalization, instability, and continuous change (Blustein, Kenny, Di Fabio, & Guichard, 2018; Peiró, 2017). Developing a positive relational environment for workers is fundamental in the organizations. In a primary positive prevention perspective, the construct of Workplace Relational Civility and its self-reported mirror measure (Di Fabio & Gori, 2016) introduces the preventive dimensions of Relational Decency, Relational Culture, and Relational Readiness. Human Capital Sustainability Leadership (HCSL) is a a new XXI century leadership style developed to effectively respond to the challenges of human resources management (Di Fabio & Peiró, 2018). The present study aims: to examine the relationships between WRC and HCSL, controlling for the effects of personality traits; to analyze the mediation role of WRC in the relationship between personality traits and HCSL. Design/Methodology. Two hundred thirty seven Italian workers were administered the Big Five Questionnaire (BFQ, Caprara, Barbaranelli, & Borgogni, 1993), the Workplace Relational Civility Scale (WRCS, Di Fabio & Gori, 2016), the Human Capital Sustainability Scale (HCSLS, Di Fabio & Peiró, 2018). Hierarchical regressions and mediation analyses were carried out. Results. The results showed that WRC added significant incremental variance beyond that accounted for by personality traits in relation HCSL. The mediation role of WRC emerged in the relationship between personality traits and HCSL. Limitations. Self-report measures, cross-sectional design. Research/Practical Implications. WRC could represent a promising resource for HCSL, opening new research and intervention perspectives. Originality/Value. New research and interventions for enhancing HCSL.

Keywords: Workplace relational civility; Human Capital Sustainability Leadership; positive primary prevention perspective; human resources management.
WHEN AND HOW LEADERSHIP TRAINING FOR MANAGERS MAKES SUBORDINATES HAPPY?:
A THREE-WAVE MULTILEVEL ANALYSIS

Takt Shishido (1) - Kyosuke Maeyama (2) - Saho Ueno (2)

Musashino University, Department of Business Administration, Tokyo, Japan (1) - Consulente HYAKUNEN, Osaka, Japan (2)

Purpose: This study investigated when and how leadership training for managers has a beneficial impact from viewpoints of subordinates, not of managers as training participants.

Method: We used matched manager-subordinate data, which were consisted of 32 managers (training participants) and 217 subordinates at a Japanese company. The survey was conducted in three waves. In the first- and third-wave surveys (before and after the training period), we asked subordinates about managers’ empowering leadership behaviors to measure subordinates’ sense of managers’ behavioral change, and about task conflict experiences with managers. In the second-wave survey (just after the training), we asked training participants about reactions toward the training. Results The results of multilevel analysis showed a significant interaction effect between participants’ feeling of stress toward the training and subordinates’ task conflict experiences with managers before the training period on change in managers’ leadership behaviors. Training participation led to managers’ behavioral change favorably for subordinates, when managers had few task conflicts with subordinates and felt stress in the training. Task conflicts with subordinates are not comfortable and often avoided by managers, even if required for mutual understanding and innovative ideas. Training participants try to change own behaviors at workplaces after the training where they feel stress and pressure to change them because they realize that task conflict-free relationships are actually unhealthy and problematic. Discussion Although our study advances training transfer research and has strong practical implications for HR managers, it should be cautious to generalize the findings because data were collected from one-company sample.
Purpose. Cooperation is a key process in order to perform effectively group’s tasks. Building on the conceptualization of groups as information processors, we suppose that team members’ capacity to exchange and integrate information perspectives into a group shared representation mediates the relationship between team gender diversity and team cooperation. According with Categorization Elaboration Model, we argue specific teamwork conditions may activate teammates’ social categorization process and an ingroup-outgroup bias which may decrease team information elaboration capacity and, in turn, team cooperation. Thus, we hypothesize that the relationship between team demographic diversity and team information elaboration is moderated by team size and satisfaction for workgroup relations.

Design. A time-lagged design was used to test a mediated moderated model on a sample of 28 work groups composed by 122 post-graduate students (61% are female) engaged in team work assignments.

Results. In numerous and less satisfied work groups, higher level of gender diversity hinders the elaboration of team relevant information, decreasing in turns the level of work group cooperation.

Limitations. The sample is composed by university students. Testing on a representative sample of workers is needed.

Research/Practical Implications. The study contributes to the comprehension of the team work conditions that activate the effects of team diversity on team cooperation.

Originality/Value. The study adopts objective team data with subjective team processes data being measured at different times of the workgroup life.
1282 - ABSENTEEISM AND WELL-BEING AT WORK: APPLYING THE SUSTAINABLE WELL BEING AT WORK MODEL

Amalia Raquel Pérez-Nebra (1) - Marina Greghi Sticca (2) - Fabiana Queiroga (1) - Núria Tordera (3) - José Maria Peiró (4) - Isabel Rodríguez (3) - Amparo Caballer (3)

Centro Universitário de Brasília, Psychology, Brasília, Brazil (1) - Universidade de São Paulo, Psychology, Ribeirão Preto, Brazil (2) - IDOCAL, Universitat de València, Social Psychology, Valencia, Spain (3) - IDOCAL, Universitat de València, & IVIE, Valencia, Social Psychology, Valencia, Spain (4)

Purpose: Sustainable Well-Being at Work Model (SWBW) suggests that the relation between well-being and performance is organized in synergic and antagonist patterns, indicating that this relation is more complex than the happy productive worker lineairism suggested before. Founded on the SWBW model we tested four patterns of the relation between well-being at work and individual absence, an indicator that may be considered a reverse measure of performance.

Design: Data were obtained from 2.177 teachers in public schools in Brazil, FD. We tested two types of absence: sickness and no-sickness absence ($r = 0.25$); and a general measure of well-being, composed by hedonic (high positive and low negative emotions) and eudaimonic dimensions (fulfillment).

Results: we found similar profiles using both types of absence indicators: high well-being low absence, low well-being high absence, high well-being high absence, and low well-being low absence. Multinomial analysis showed differences in job design characteristics between the four profiles.

Limitation: The self-report of absence.

Practical implication: The diagnostic value of the profiles in order to identify how organizational factors can contribute to synergetic or antagonist performance-well-being patterns.

Originality: The mayor contribution of this work is the support obtained for the SWBW model using different types of variables to identify the synergistic and antagonist profiles.
Purpose
This study contributes to the open innovation literature by investigating the relationships between stages in the innovation process, as perceived by employees. Specifically, we analyzed the direct relationship between idea generation and idea realization, while possibly mediated by idea promotion. Moreover, we looked into the moderating role of four shared-leadership dimensions in this process: transformational, transactional, aversive and directive.

Methodology
Hypotheses were tested using moderated mediation PLS-SEM models on a bootstrapped sample (n=173) of employees participating in open innovation, comparing contexts of high versus low on the four perceived shared-leadership dimensions.

Results
We found a direct and indirect positive effect between idea generation and realization, partly mediated via promotion. Moreover, higher levels of transactional and transformational shared-leadership strengthened the direct effect of idea generation and realization. Additionally, aversive shared leadership had a detrimental effect on the relationships between idea generation and realization, and between promotion and realization, while positively moderating the relationship between generation and promotion. Furthermore, higher levels of directive leadership strengthened the relationship between promotion and realization. Only directive leadership positively influenced the indirect relationship between idea generation and realization via promotion.

Limitations
Our cross-sectional design did not allow cause-and-effect relationships to be tested.

Implications
This study provides insight into the effects of different shared leadership behaviors within open innovation teams.

Originality
By addressing employees’ perceptions of the innovation process, we revealed internal mechanisms that drive and hinder open innovation and the shared management thereof, herewith contributing to the ill-understood “human side” of open innovation.
Purpose: One of the main goals in work and organizational psychology is the promotion of performance and well-being at work. The happy-productive thesis has proposed a synergetic relationship between both factors but results are still inconclusive. The relationship between both constructs across time and across countries needs further research. The purpose of this work is to test the synchronic and cross-lagged relationships between performance and well-being in a longitudinal and cross-cultural study.

Design: Data were obtained in a two wave study of workers from Brazil (N=183), Equator (N=122), and Italy (N=277). Performance and well-being were operationalized as In-role performance (IRP) and general Work satisfaction (GWS) respectively.

Results: Using change-score models we found that the effect size of change in the independent variable (IRP or GWS) on the changes in the dependent variable (GWS or IRP) was higher than the effect size of the cross-lagged relationships. Moreover, some patterns and differences were found between countries. The lowest prediction of IRP by GWS was in the Brazil sample, which showed the highest intercept, and the lowest prediction of GWS by IRP was in the Italian sample, which showed the lowest intercept. In Italy we found higher coefficients for the prediction of satisfaction on performance, meanwhile the reverse was found in Ecuador and Brazil.

Limitation: Variables were self-reported.

Practical implication: Cross-cultural differences have to be taken into account when planning performance and well-being interventions.

Originality: Changes in performance or well-being have relatively short time effects on each other.
Purpose

This study investigates the effect of transformational leadership on innovation, as well as the joint effect of transformational leadership and involvement in organizational culture on innovation.

Design/Methodology/Approach/Intervention

One hundred and two companies of different organizational contexts in Portugal were surveyed. Two different questionnaires were administrated. Top managers of each organization (N = 102) answered a questionnaire concerning the innovation activity in their organization, whereas workers of each organization (N = 905) answered a questionnaire about leadership (Transformational Leadership Scale) and involvement in the culture (Involvement dimension of the Organizational Culture Questionnaire Denison). Hypotheses were tested through hierarchical regression analysis.

Results

The results revealed an interaction effect between transformational leadership and involvement in organizational culture. In particular, a low level of employee involvement in the organization, and a more transformational leadership style has led to more organizational innovation. In contrast, a high degree of employee involvement and less level of transformational leadership led to higher indexes of innovation.

Limitations

The use of a cross-sectional, nonexperimental design limits causal inferences.

Research/Practical Implications

The effects of transformational leadership are not context-free. A practical implication of our results imply that organizational interventions focused on involving the members of the organization in the management process and developing transformational leaders will significantly enhance innovation on the organization.

Originality/Value

This research shows that leadership can influence innovation directly or indirectly through a propitious organizational culture. It can provide valuable metrics for managers to develop an organizational culture to promote their company’s innovative activity.
We examined relationships among organizational culture, leadership and innovation, in a diverse sample of 854 employees and 102 top managers representing 102 organizations with different sizes. Two different questionnaires were administered. In each organization, top managers were asked about the innovation activity and employees were asked about the leadership and organizational culture of their organization. Results from a structural model, tested by multi-group analysis, considering micro and small enterprises in one model (n = 464) and the medium and large enterprises in another model (n =385), shows very significant differences in the two models, which lead us to conclude the moderation effect of the company size variable on the relationships between leadership, culture and innovation. This variable produces differential effects not only on the leadership role in the relationship between culture and innovation, but also on the contribution of each indicator to innovation. The use of a cross-sectional, nonexperimental design limits causal inferences. The research findings improve understanding of the roles of leadership and organizational culture in innovation; it also compares innovation indicators showing also their influence and the contribution of the several variables in the model.
Purpose

This study examined whether the relationships between transformational leadership and innovation depended on the level of cultural consistency in the organization.

Design/Methodology/Approach/Intervention

Using a diverse sample of 905 employees and 102 top managers representing 102 organizations, employees answered a questionnaire about leadership (Transformational Leadership Scale) and cultural consistency (consistency dimension of the Organizational Culture Questionnaire Denison) and top managers of each organization answered a questionnaire concerning the innovation activity in their organization. Hypothesis was tested through hierarchical regression analysis.

Results

We found that transformational leadership interact with cultural consistency such that transformational leadership was more positively related to innovation when there are lower levels of cultural consistency and was less positively related to innovation at higher levels of cultural consistency.

Limitations

The use of a cross-sectional, nonexperimental design limits causal inferences.

Research/Practical Implications

A practical implication of our results is that transformational leadership is important to increment the innovation in the organization when combined with low levels of cohesion, integration or agreement around values and norms of the organization. In turn, when organizations have a highly consistent culture less intervention of the leadership is needed to increment innovation.

Originality/Value

The main value of this study is its analysis and testing of the relation of transformational leadership, cultural consistency and innovation. Innovation can flow in the organizations by a consistent organizational culture or by the impact of the leader in the case of weakness in the consistency. Results support the utility of adopting a contingency-based approach to the direct effects of leadership.
1300 - RETALIATION IN ULTIMATUM GAME

Ugo Merlone (1) - Arianna Dal Forno (2)

University of Torino, Psychology, Torino, Italy (1) - University of Molise, Economics, Campobasso, Italy (2)

Purpose

Ultimatum game is often considered an example of bargaining. However the kind of interaction implied in this game is a sort of one shot take-it-or-leave-it negotiation, in which consequence of unfair offers is limited to the veto power of the responder. We propose a variant of the ultimatum game in which the role of the responder is more articulated and study the reaction to the fairness of the proposer’s offer.

Design/Methodology

We conducted an experiment with N = 54 participants (55.6% female; average age 24.50 years) in which the responder were allowed to reallocate the proposed sum. The experimenters acted as fictitious proponents and provided the same five offers to each participant.

Results

Even when considering fair offers only, the difference between the proposed offer and the reallocation was significantly larger for the group where the possibility of a reallocation was known before accepting.

Limitations

All data were collected in a lab with the usual external validity concerns (Dipboye and Flanagan, 1979). Furthermore, further research should be conducted to see whether the timing of retaliation modifies the reallocation behaviors.

Implications

Being aware of the possibility of retaliation can make accepting less generous offers and may increase the magnitude of a punishment in a negotiation process.

Originality/Value

As far as we know, the possibility of retaliation in the ultimatum game has not already been explicitly explored.
The Relationship Between Work Autonomy and Daily Contextual Performance: The Moderating Role of Person-Organization Fit

Henrik Sørlie (1) - Jørn Hetland (1) - Arnold Bakker (2) - Roar Espevik (1) - Olav K. Olsen (1)

University of Bergen, Department of Psychosocial Science, Bergen, Norway (1) - Erasmus University Rotterdam, Rotterdam, Netherlands (2)

Purpose: This study examines 1) the relationship between Work Autonomy and daily peer rated Contextual Performance in an operational environment, and 2) the moderating role of indirectly measured objective Person-Organization Fit (P-O Fit) on this relationship.

Methodology: Data was collected through a quantitative diary study (30 days) among 57 naval cadets (1533 measurement points in total) participating in a sail ship training mission across the Atlantic ocean. Person-Organization Fit measures were obtained prior to the mission, and measures of Work Autonomy and peer rated Contextual Performance were collected through questionnaires on a daily basis. Multilevel analyses were carried out using MLwiN 2.20.

Results: Preliminary multilevel analysis showed a significant positive relationship between P-O Fit and daily contextual performance, while the relationship between autonomy and daily contextual performance was not significant. However, autonomy interacted significantly with person-level P-O Fit. Hence, as hypothesized, a significant relationship with autonomy was found for cadets with high P-O Fit, while a corresponding relationship for cadets with low P-O Fit was not.

Limitations: Though second-source, Contextual Performance is subjectively rated in this study.

Research/practical implications: This study strengthens the idea that both situational and individual factors interact to contribute to daily levels of contextual performance. The use of indirectly measured objective P-O Fit has implications for P-O Fit as a selection tool.

Originality: To our knowledge, this is the first study to show the moderating role of P-O Fit on Contextual Performance.
Managers of small and medium firms may well not be concerned with literature on Human Resource Management (HRM). Yet neglect of issues central to HRM, such as mentoring, organisational and career support, as well as providing engaging work may result in high rates of turnover and SMEs thereby losing the tacit knowledge and operational learning that leavers take with them and that are vital for sustained competitiveness. This presentation reports on employees’ attribution to HR practices in order to explain how neglect of issues central to HRM practices by managers of SMEs can result in losing their sustained competitiveness.

The research was conducted with one thousand two hundred and sixty five (n=1265) employer-supervisor dyads from thirty one (n=31) small and medium firms operating in a southern European member state of the EU, nine of which were social economy, five in robotics, four in the food industry, three in electronics, two in environmental management and the others in pharmaceuticals distribution, bicycle parts, freight transport, automobile components, education, telecommunications engineering, industrial ovens and fruit and vegetables. Data was collected in late 2016 and early 2017.

The findings suggest that the turnover less reflected a self-directed concern with boundaryless careers than a failure of the managers of SMEs to assure organization-fit rather than only demand job-fit. Although the study was in only one country and cross sectional rather than longitudinal it nonetheless suggest that SME employers' associations should be concerned to enhance understanding of organisation-misfit and careers in SMEs.
ARE TRAJECTORIES OF PREFERRED- AND EXPECTED RETIREMENT AGES ASSOCIATED WITH HEALTH AND EFFORT-IMBALANCE AT WORK?

FINDINGS FROM A SIX-YEAR SWEDISH LONGITUDINAL STUDY

Marta Sousa-Rbeiro (1) - Johanna Stengård (1) - Constanze Leineweber (2) - Claudia Bernhard-Oettel (1)

Stockholm University, Department of Psychology, Stockholm, Sweden (1) - Stockholm University, Stress Research Institute, Stockholm, Sweden (2)

Purpose

One key dimension in the study of retirement decision making is the preferred retirement age (PR-A). Another relevant although less investigated indicator is the age at which one realistically expects to retire (ER-A). This study aimed at identifying trajectories of preferred- and expected retirement age and exploring their associations with changes in self-rated health, depressive symptoms and effort-reward imbalance (ERI).

Design/Methodology/Approach/Intervention

The study used data from four waves (2010, 2012, 2014, 2016) of the Swedish Longitudinal Occupational Survey of Health. Sample consisted of 1440 workers aged 50–59 in 2010 who participated in all waves. Latent class growth modeling was used to estimate trajectories of PR-A and ER-A and their associations with self-rated health, depressive symptoms and ERI were investigated. Participants were divided in two groups according to age at T0 (50-54; 55-59) and analyses were age-stratified.

Results

Preliminary results suggest both between-person and within-person variability in retirement age preferences and expectations over six years in the two groups. Trajectories characterised by lower PR-A were associated with poorer health and higher levels of ERI. ER-A trajectories in turn seem to be less associated with health and ERI.

Limitations

This study relies exclusively on self-report measures.

Research/Practical Implications

The findings reinforce the importance of healthy work environments that facilitate a balance between efforts and rewards for promoting longer working lives.

Originality/Value

Retirement longitudinal studies are scarce and this study is one of the first to investigate longitudinal relationships between PR-A and ER-A trajectories, and health and effort-reward imbalance at work.
THE ROLE OF CONTEXT FACTORS FOR CREATING, MAINTAINING, AND PREVENTING INCIVILITY

Tine Koehler (1) - Victor E. Sojo (1) - M. Gloria Gonzalez-Morales (2) - José M. Cortina (3) - Jesse E. Olsen (1)

The University of Melbourne, Management and Marketing, Parkville, Australia (1) - University of Guelph, Psychology, Guelph, Canada (2) - Virginia Commonwealth University, School of Business - Management and Entrepreneurship, Richmond, United States (3)

Purpose

We explore the effect of organizational contextual factors on workplace incivility and its outcomes. Employing social exchange theory, we examine the effect of pay dispersion on incivility perceptions and its subsequent effect on absenteeism and stay intentions. Pay dispersion is a characteristic of distributive justice that challenges perceptions of equity. As per prior research, perceived inequity leads to perceived incivility through withholding effort, support, extra-role behaviors, and general job dissatisfaction. We explore the buffering effect of a climate of support as created by leader-member-exchange (LMX) to lessen the negative effect of pay dispersion on incivility. We thus examine the role of LMX for the prevention of incivility perceptions and their negative outcomes.

Design/Method

We used surveys to collect nested data from team members and their managers across 3 non-profit organizations. We measured pay (to compute within-team pay dispersion, IV), individual incivility perceptions (Mediator), LMX (aggregated to the team level, Moderator), and absenteeism and stay intentions (DVs). We test a cross-level, first-stage moderation model with LMX weakening the pay dispersion-incivility relationship.

Results

Data analysis is currently underway. Results will be presented at EAWOP.

Limitations

Future research needs to examine if findings generalize beyond non-profit organizations.

Research/Practical Implications/ Originality

Existing research focuses on target and perpetrator characteristics leading to incivility. Context factors, especially at the team-level, fostering, maintaining, or preventing incivility triggers from resulting in incivility, remain largely understudied. Identifying the unit- and organization-level factors that lessen incivility would help organizations promoting civility and its benefits.
COMPARISONS OF PERMITTED TOUCH PATTERN IN DIFFERENT RELATIONSHIPS

Yingyi Chang (1) - Steve Duck (2) - Zitong Sheng (3)

Virginia Commonwealth University, Management, Richmond, United States (1) - University of Iowa, Communication Studies, Iowa City, United States (2) - Virginia Commonwealth University, Richmond, United States (3)

Body Accessibility, which measures bodily areas that are permissible to be touched by others, were first defined and studied by Jourard (1966) using a bodily contact map that divides a human body image into 24 sub-regions. The current study aimed to replicate Jourard’s study that had not been updated for a long time and only focused on intimate relationships, and extended to discover the pattern of permitted touch by acquaintances and people at work. An online-version of a bodily contact map was used to study college students and employees. Notable differences were observed between the current study and Jourard’s study in certain bodily parts, such that the belly and legs become more acceptable to be touched, which may be due to changes in clothing style. In addition, the current study discovered very distinctive patterns of being touched by acquaintances and people from work, compared to parents and closest friends. For example, a larger gender difference was found in being touched by opposite-sex co-workers, compared to opposite-sex supervisors, friends and acquaintances. Moreover, several body areas should be paid attention in the workplace context, where female employees especially concerned with their back and back of head to be touched by their opposite-sex supervisors. Findings of this study updated existing knowledge of the permitted touch pattern of young adults. We hope that this study could serve as a guideline for public awareness of touch norm to reduce sexual harassment. Future research could analyze actual touch experiences and compare results with the current study.
1312 - WHO NEEDS PAY-FOR-PERFORMANCE?

ATTRIBUTIONS FROM PRIMARY HEALTH CARE STAFF

Maria do Carmo Neves da Silva (1) - Teresa Carla Oliveira (1) - Pedro Lopes Ferreira (2)

Universidade Coimbra, CEISUC, CeBER, Faculty of Economics, Coimbra, Portugal (1) - Universidade Coimbra, CEISUC, Faculty of Economics, Coimbra, Portugal (2)

No literature survey as yet has gained definitive outcomes for the effectiveness of pay-for-performance (P4P) in the context of HRM systems (Guest & Edwards 2017). Recently, in exploring people’s attributions of HR practices (Hewett, Shantz, Mundy, & Alfes, 2017), there also has been a shift to considering whether, and the degree to which, wellbeing may be central (e.g. Guest, 2017).

This comprehensive study was within primary care system where different models of management have been introduced. It involved fifty semi-structured fully transcribed interviews with 17 doctors, 14 nurses and 19 health administrators in 14 different family health units. It was also collected 72 patient satisfaction questionnaires in three different family health units: 12 were in a unit with no incentives at all; 12 in units with institutional financial incentives for the unit as a whole rather than for clinical and administrative staff; 12 for the unit as a whole as well as individual financial incentives for all staff; and the rest in transition between the two models with financial incentives.

Health professionals perceived that the organisational changes were intended to control their service. Those who interested in individual financial incentives tended to be younger nurses and administrators rather than senior doctors. Nor did the interviewees consider performance for pay in isolation rather than in relation to wellbeing and other factors such as the quality of service that they could offer to users and working relations with others.

The study requires follow up interviews and a longitudinal questionnaire surveys.
Purpose: The aim of this study was to examine the role of developmental networks in the relationship between structural empowerment (SE) and psychological empowerment (PE). SE leads to PE that culminates in positive workplace outcomes.

Design/Methodology: A sample of 335 employees from three different companies in Estonia participated in this study. PE was measured with Menon’s scale (2001; Menon and Hartmann 2002). SE measure was based on Kanter’s (1993) description of structural determinants. Structural equation modelling was used to analyze the structural relationship between measured variables and latent constructs.

Results: Results confirmed and supported Kanter’s SE theory. Results from structural equation modeling indicated that SE dimensions affected each PE component in the different way.

Results revealed that developmental networks are moderating the relationship between SE and PE and affect strength of the relationship between them.

Research/Practical Implications: Current study showed that developmental networks are crucial in the emergence of perceived PE in the workplace, but the networks didn’t act equally. Strong support was received from family and friends and from immediate managers. The latter stresses the importance of leadership quality in empowering employees.

Originality/Value: The results reviled that different kind of developmental networks activities had different impact on PE components and SE dimensions affect each psychological empowerment component in the different way.

Keywords: Structural empowerment, psychological empowerment, developmental networks, support network activities
1315 - WELLBEING WORKS: BUILDING A BUSINESS CASE FOR EMPLOYEE HEALTH AND WELLBEING

Katharina Naswall (1) - Jennifer Wong (2) - Sanna Malinen (2) - Joana Kuntz (2)
University of Canterbury, Psychology, Christchurch, New Zealand (1) - University of Canterbury, Christchurch, New Zealand (2)

Purpose:
The purpose of the present study was to examine the predictive role of wellbeing indicators for pro-organisational behaviors, such as organisational advocacy, engagement, turnover intention, and turnover.

Methodology:
The sample (N=289) consisted of professionals working in a financial organization in New Zealand. The study utilized a longitudinal design, with data collected with a one year interval, as part of the organization’s annual engagement survey. Furthermore, the team structure of the organisation was taken into account in order to account for between-team variation.

Results:
The results of multiple and logistic regressions indicate that of the wellbeing indicators, energy levels and expectations of how work will affect health were the most important for engagement, advocacy, turnover intentions, and turnover. Those with higher energy levels, and those who expected that work would not affect their health negatively, reported higher levels of engagement and advocacy, and lower levels of turnover intentions, as well as lower likelihood to have left the organisation at Time 2.

Limitations:
The study utilised self-report data for most of the study variables, and did not include financial productivity variables. Future research should attempt to incorporate financial measures to build a stronger business case for wellbeing at work.

Implications:
Results indicate that positive experiences among employees have the potential to lead to positive outcomes for organizations.

Originality:
The study is one of the first to explore wellbeing factors as predictors of pro-organizational outcomes, providing evidence that can be used to build a business case for wellbeing at work.
Purpose. The aim of the study is to examine how authorities motivate academics to enhance scientific effectiveness. The framework of this study is rooted in the Self-Determination theory and the AOM model. It means that individual behaviour is a configuration of ability, opportunity to contribute and motivation. However, using the self-determination continuum, different types of motivation can be stimulated.

Methodology. Semi-structured interviews were conducted with five academic authorities (top and midlevel managers) of the public technical university in Poland. Main topics were scientific effectiveness and strategy of motivation. Thematic analysis was implemented to identify patterns within qualitative data.

Results. The authorities recognized rewards as much more effective motivational tools. Thematic analysis indicated that the current system of incentives is mainly based on the financial gratification (external regulation). The next group of incentives was related to social rewards, e.g. public appreciation (external and introjected regulation). The third group of incentives was associated with reducing teaching and administrative duties (identified regulation). The last one can indirectly facilitate intrinsic regulation.

Limitations. A limited number of scientific fields regarding technology and engineering were represented (civil engineering, marine engineering, electronic and information engineering, computer science).

Practical Implication. The authorities are strongly focused on achieving organizational goals and give importance to promote controlled motivation their subordinates. However, they can pay more attention to create conditions for autonomous and intrinsic motivation. Managerial practices can have a positive impact on employee well-being and thriving.

Originality. The Self-Determination theory was integrated with human resources management in higher education.

Funded by the National Science Centre, Poland, grant no. UMO-2017/27/B/HS4/01033
1326 - MEDITATING AWAY A GUILTY CONSCIENCE: THE IMPACT OF MINDFULNESS ON GUILT AND REPARATIONS

Andrew Hafenbrack (1) - Isabelle Solal (2) - Matthew LaPalme (3)

UCP - Católica Lisbon School of Business & Economics, Organizational Behavior, Lisboa, Portugal (1) - INSEAD, Organisational Behaviour, Fontainebleau, France (2) - The Wharton School, Management, Philadelphia, United States (3)

Purpose

This research tested whether a state of mindfulness via meditation reduces state guilt and the impulse to repay people one has harmed.

Design

Our studies consisted mostly of state mindfulness induction experiments in which participants were randomly assigned to listen to an 8-15 minute guided mindfulness meditation recording or a control task then they reported their guilt or reparative intentions. One of our studies found converging effects with trait mindfulness, that it was negatively correlated with state guilt.

Results

State mindfulness reduced state guilt and weakened the normally-strong relationship between having harmed other people and wanting to repay them.

Limitations

Our studies were not conducted in organizations, partly because we felt uncomfortable approaching organizations to ask to do an intervention that we expected would have a negative impact on valued outcomes. We also do not yet have a significant mediation study so the effect on reparations could be due to another process.

Implications

Our research suggests that meditation can be used to cleanse one’s conscience prematurely. When people can reduce their guilt intrapsychically in this way, they feel less motivated to fix a problem they caused or repay another person who they harmed. This suggests that there is a risk that people could use mindfulness as a means or justification to avoid problems rather than engaging with or fixing them.

Originality

Virtually all of the research on mindfulness assumes or demonstrates that it has positive consequences. Our research indicates a case when mindfulness can be counterproductive to interpersonal interactions.

ABSTRACT

The majority of research on mindfulness has been devoted to uncovering its potential benefits, including by decreasing the incidence of antisocial behavior. However, mindfulness may also have unintended negative consequences if it is cultivated when individuals are experiencing a functional...
form of negative affect. We argue here that a state of mindfulness can interfere with the affective processes necessary to motivate reparation in guilt-eliciting situations. In five studies – one cross-sectional survey and four experiments – we find that mindfulness is negatively correlated with and reduces state guilt, and that mindfulness weakens the normally strong association between guilt-eliciting situations and prosocial reparative behaviors. Implications for theory and management practice are discussed.

Keywords: guilt, mindfulness, meditation, reparation, affect
1331 - CONSIDERATIONS AND INTENTIONS IN THE INTRODUCTION OF DIGITAL TECHNOLOGY AND THE RELATIONSHIP WITH LONG-TERM EMPLOYMENT

Ineke Van Kruining (1) - Charissa Freese (2) - Ton Wilthagen (3) - Tonnie Van der Zouwen (4)

Avans University of Applied Sciences, AAFM, Breda, Netherlands (1) - Tilburg University, HR studies, Tilburg, Netherlands (2) - Tilburg University, Tilburg Law School, Tilburg, Netherlands (3) - Avans University of Applied Sciences, ESB, Breda, Netherlands (4)

Key words: Digital Technology, organisational choice, long-term employment, inclusive HRM.

Purpose

Digital Technology has changed work. Several authors (including Acemoglu 2002, Autor, Levy & Murnane, 2003 and Goos, Manning & Salomons, 2014) identified skill effects of DT, job polarization and digital divide which may have consequences for segregation in society. The aim of this study is to map considerations and intentions of decision makers with regard to the introduction of Digital Technology and possible consequences for long-term employment of current employees in administrative professions.

Design/Methodology

Data gathering is ongoing. 27 interviews on the subject are planned with experts, scientists, policy developers and decision. Q Methodology (Brown 1980, Watts & Stenner 2012) is used to identify groups of participants who share the same opinion or alternative opinions, while identifying the differences and similarities between the groups.

Results

Based on preliminary results three types of considerations feature prominently 1) DT will result in job losses and new jobs at the same time, 2) a well-implemented policy of inclusive HRM or sustainable employment is essential and 3) cooperation of HR and IT during the DT process is vital.

Originality/Value

Up to now, research has mainly been carried out at the macro level, this study adds to the literature by looking into processes within organisations. By using Q methodology this study provides systematic and structured results, “yet rich and holistic”.

Research/Practical Implications

This study contributes to our understanding of the attitudes of professionals towards Digital Technology, employment and their choice behavior. This can ultimately help to avoid undesirable employment effects when introducing Digital Technology.
THE JOB DEMANDS – RESOURCES MODEL AND PRESENTEEISM: A FOLLOW-UP STUDY ON A LARGE REPRESENTATIVE SAMPLE OF AUSTRALIAN WORKERS

Alisha McGregor (1) - Peter Caputi (1)
University of Wollongong, School of Psychology, Wollongong, Australia (1)

Purpose: The job demands – resources (JD-R) model has been used to explain employee absence, turnover and performance. However, few studies have used it to understand the pathways that underpin presenteeism. The purpose of this study was to further validate the effectiveness of the JD-R model in the context of presenteeism.

Methodology: The Household, Income, and Labour Dynamics in Australia Survey was used to measure the relationships between job demands (e.g., job stress and job complexity), resources (e.g., job security and job support), employee health, job satisfaction and presenteeism among 9485 working adults. We tested the proposed hypotheses using path analysis whilst controlling for participant demographics (e.g., gender, age, occupation, education and duration of employment).

Findings: Higher job demands (job stress) and lower job resources (job security) were found to be indirectly related to presenteeism via reduced employee health. While more job resources (job security and job support) and lower job demands (job stress) were indirectly related to presenteeism via improved job satisfaction. We also found that job complexity was related to lower presenteeism via both improved health and job satisfaction.

Research implications: A key finding was the difference between challenge (e.g., job complexity) and hindrance demands (e.g., job stress). For example, challenge demands, such as complex tasks, may actually stimulate and energise employees, promoting job satisfaction and better health, which in turn, could reduce presenteeism.

Originality: This study is the first to validate the utility of the JD-R model in the context of presenteeism among a large nationally representative sample of Australian workers.
1333 - A TALENT DEVELOPMENT CENTRE AS A HYBRID SUCCESSION PLANNING AND LEADERSHIP DEVELOPMENT METHODOLOGY

Ederick Stander (1)
Psychai Talent Group, Johannesburg, South Africa (1)

Purpose
The purpose of this presentation is to put forward the conceptualization of contemporary Talent Development Centres (TDC’s), to outline the theoretical underpinnings and principles of the methodology and to share core elements of the approach as an engaging, analytics-driven and positive developmental intervention utilized within large corporate organizations globally.

Approach
Three core elements are addressed. The presentation will focus on A) the definition of Talent Development Centres within the theoretical framework(s) of competency based development and Positive Organizational Development; B) the principles for application of a validated and reliable TDC approach within the contextual drivers of the new world of work and C) empirical examples of data-driven approaches within a TDC.

Results
The presentation will explore core outcomes sought in organizational settings through application of TDC. This is done within the practical frameworks of Succession Planning and Leadership Development as Business Continuity functions. The TDC as an integrated process leveraged through technology is explained in detail. Practical learnings obtained through conducting of TDC’s in large global organizations are provided.

Limitations
Limitations and practical challenges of conducting a successful TDC are explored in the presentation.

Practical Implications
A TDC, when conducted on focused scientific principles and positioned for efficiency within the dynamic contextual drivers of the changing work environment, yields significant value for business continuity and sustainable organizational development.

Originality/Value:
The methodology is unpacked here as a science-practitioner approach; based on the practical and scientific experience of the presenter.
Purpose: The beneficial impact of social support on employee well-being and performance is well-described in the job demands-resources (JD-R) model (Demerouti et al., 2001), however, research on why social support is beneficial is lacking an understanding of more specific processes through which it operates (Daniel et al., 2009).

Originality: Using a self-determination approach, we focused on two qualities of relatedness need satisfaction, i.e., connectedness and social isolation (Sheldon & Gunz, 2009), as potential underlying mechanisms that link social support to employee performance and well-being outcomes. Furthermore, in differentiating between problem- and emotion-focused social support received (Lin et al., 2015), we expect two distinct intermediating pathways.

Methodology: The study has a longitudinal design with three measurement points. Preliminary analyses were carried out on T1 (May 2018) sample of 171 employees (53% women) within an international organization at three European subsidiaries, using an online questionnaire. T2 and T3 follow with a 4 months interval.

Results: Initial analyses revealed that problem-focused support is indirectly related to wellbeing outcomes through isolation, whereas emotion-focused support can explain both wellbeing and performance outcomes via connectedness.

Limitations: A major strength of this study is its longitudinal design which examines the effects of received social support across time. The critical differentiation of relatedness need satisfaction into two concepts has theoretical and practical implications. The small sample size requires careful interpretation.

Practical Implications: Organizations may benefit from work environments that enable feelings of connectedness. The results highlight the importance of social support in enhancing connectedness and reducing isolation feelings to encourage employee well-being and performance outcomes.
Purpose: The growing dynamism and complexity of the business environment has raised the importance of employees’ innovativeness as a way for businesses to remain efficient and competitive. However, there is limited consistency as to innovation’s effect on employee wellbeing (Engelbrecht, 2014). Stress-oriented theorists suggest that this association is negative (Demerouti & Euwema, 2005), whereas motivational researchers present a positive relationship (Harter, 1979). This study advances Servant Leadership (SL) as a moderator of this relationship, thereby resolving this theoretical tension.

Methodology: A theory-driven model of the relationship between wellbeing, innovation, self-efficacy, and autonomy and SL was tested using Structural Equation Modelling on two data collection waves from more than 500 teachers in England (Mean age = 41 years (SD = 6 years); 29% male).

Results: The relationship between innovation and wellbeing is conditioned by SL. This conditional effect is partially mediated by perceived personal autonomy and self-efficacy.

Limitations: We measured variables at different time points, but causality was not tested, as it is possible that wellbeing could contribute to idea implementation.

Research/Practical Implications: Situating SL as a condition for idea implementation to positively influence wellbeing, we contribute to the resolution of the theoretical tension between stress and motivational theories in the association. Importantly we argue for managers to put their followers’ needs first in ensuring that innovation enhances wellbeing.

Originality/Value: This study explains how and why SL shapes the effect that idea implementation has on employee wellbeing.
Purpose: This study focuses on workplace political behaviour in local authorities during a national-election period. Specifically, we examine the ways a perceived political climate influences engagement in political behaviour within a national-election period. We distinguish between the organizational politics and governmental politics.

Methodology: A qualitative research methodology was used. Sixteen interviews with managers were conducted in various local authorities during the 2015 election campaign for Israel’s parliament.

Results: Generally, the findings reinforce earlier arguments that in public sector two level of politics (organizational and governmental) take place and internal politics not played only a secondary role in public organizations. It also supports the idea that the more closely two experiences (politics in government institutions and organizational politics) approximate each other the more likely one experience flows into and influences another. More specifically, the findings show that participants perceived an intensification of political climate during the pre-election period which they attributed to a significant connection between electoral and intraorganizational politics. Additionally, a perceived organizational political climate intensifies engagement in a range of political behaviours throughout an organization and is connected with an administrative role.

Limitation: The research focuses only on local authorities.

Practical Implications: Leaders may gain a better understanding of the organizational politics in the broader political context of local authorities.

Originality: Our study stress that employee political behaviour in local authorities must be understood not just in terms of organizational factors but also in the context of electoralpolitical settings, specifically and governmental politics, in general.
1338 - INNOVATION PROCESS’ EXPLANATION OF THE ASSOCIATION OF SERVANT LEADERSHIP AND EMPLOYEE WELLBEING: AN APPLICATION OF DYNAMIC STRUCTURE EQUATION MODELLING (DSEM)

Sylvester Juwe (1) - Roberta Fida (1) - Ieva Martinaityte (1) - Kevin Daniels (2)

University of East Anglia, Norwich Business School, Norwich, United Kingdom (1) - University of East Anglia, University of East Anglia, Norwich, United Kingdom (2)

Purpose: It is expected that leaders will improve employees’ wellbeing and their innovativeness. Because of the contrasting requirements of idea generation and implementation, the two elements of innovativeness (Anderson et al., 2014), individuals’ success at being innovative depends on resource availability (Amabile, 1996). Servant leadership (SL) behaviour could contribute to innovative behaviour in such a way that it also enables wellbeing. Yet the theoretical understanding of the association of innovation, wellbeing and leadership is limited.

Methodology: This presentation adopts an 11-week intensive longitudinal design (77 days), with at least one weekly data entry from more than 300 teachers (Mean age = 39 years (SD = 6 years); 31% male). Using DSEM and latent change score model, we tested innovativeness as an explanation of how SL predicts changes in wellbeing over time.

Results: The relationship between idea generation and implementation is cyclical and negative within-individuals, yet positive between-individuals. Also, the extent to which individuals implemented their ideas fully mediated the relationship between SL and improved wellbeing.

Limitations: We have offered an alternative explanation for the effect of SL on improved wellbeing. We are, however, unclear on the sustainability of innovativeness.

Research/Practical Implications: Drawing on the paradox and resource conservation theories, we position employee innovativeness as an explanation of the SL–improved wellbeing relationship.

Originality/Value: Positioning innovation as an explanation of how SL predicts wellbeing changes by leveraging the uniqueness in assessing within-person dynamic processes as they unfold over time.
Mental Well-Being as a Moderator of the Relationship Between Emotional Intelligence and Reappraisal Amongst Leaders

Annie Haver (1) - Kristin Akerjordet (2) - Laura Robinson (3) - Peter Caputi (3)

University of Stavanger, School of Hotel Management, Stavanger, Norway (1) - University of Stavanger, Faculty of Health Sciences, Centre for Resilience in Healthcare, University of Stavanger, Stavanger, Norway (2) - University of Wollongong, Faculty of Social Sciences, School of Psychology, Wollongong, Australia (3)

Purpose: Emotional Intelligent (EI) leaders typically choose emotion regulation strategies that are less draining on personal resources. They also use reappraisal to enhance their positivity and mental well-being. This study investigates mental well-being as a moderator of the relationship between EI and Reappraisal. It also examined whether the moderated effect of mental wellbeing on the relationship between EI and use of reappraisal differ by gender.

Design/Methodology: Online self-report questionnaire was used to collect data from 246 Swedish leaders (70 % response rate). Data were analyzed using regression analyses, moderation and moderated moderation analyses.

Results: Mental well-being only moderated the relationship between Self Emotion Appraisal (SEA) and reappraisal. The (moderated) moderation effect of well-being on the relationship between EI and reappraisal differed significantly by gender, in particular in the relationship between “regulation of emotion” (ROE) and reappraisal, and between “others emotion appraisal” (OEA) and reappraisal.

Limitations: A limitation is use of cross-sectional self-report data.

Research/Practical Implications: Self Emotion Appraisal (SEA) concerns introspective self-awareness and is of importance in the health and service industry because it enables leaders to have the ability of organizing their emotions efficiently and to express these emotions naturally. Mental wellbeing is predominantly important for males to strengthen the relationship between EI and reappraisal, and less important for females, indicating that further research is required. Findings are important for developing management training.

Originality/Value: Advances our knowledge of the importance of EI in leadership and mental well-being.

Contributes to the limited literature on leaders’ emotion regulation and mental well-being.
Towards a Dynamic Perspective of Workplace Flexibility: A Latent Growth Curve Modelling Approach to Understand the Long-Term Effects on Performance and Work-Engagement

Christina Wessels (1) - Michaéla Schippers (1)
Rotterdam School of Management, Erasmus University, Rotterdam, Netherlands (1)

Purpose
Prior cross-sectional research has revealed that perceived workplace flexibility can lead to positive, negative, and zero effects for performance and well-being but has substantially left unexplored how to disentangle these mixed findings. Our goal in this study is to shed light on these inconsistent findings by incorporating the role of time. We expect that flexibility does not represent a static concept but that flexibility increases over time and is thereby beneficial for performance and work engagement.

Methodology
We tested our hypotheses using a three-wave longitudinal study (N=273) over 37 months in a governmental institution in the Netherlands.

Results
Results from latent growth curve modelling show that perceptions of flexibility increased over time. We found that the greater the rate of increase in digital mobility, the greater the rate of increase in perceived flexibility. Furthermore, our results indicate that changes in flexibility over time are positively related to changes in our outcome measures.

Limitations
Due to organizational constraints, we were only able to use self-reported data; thus common method bias cannot be excluded.

Implications
Our results extend theory on perceived flexibility by pinpointing the process of flexibility development. Furthermore, they emphasize the importance of digital mobility for increasing perceptions of flexibility and demonstrate the likelihood of performance gains for organizations.

Originality
This is the first study to show how flexibility unfolds over time to predict changes in performance.
1345 - DO MALE CEO APOLOGIES HAVE DIFFERENT OUTCOMES THAN FEMALE CEO APOLOGIES AND WHY?

Aylin Koçak (1)
Ghent University, Department of Personnel Management, Work and Organizational Psychology, Ghent, Belgium (1)

Purpose. Studies show that in case of a transgression, offering an apology leads to better outcomes than not offering one. This also applies to cases where a CEO publicly apologizes after a public scandal or mistake. However, few studies have investigated gender differences in this context. Scientists have consistently found that female CEO’s receive more negative reactions than male CEO’s. Underlying theories on stereotypes and role incongruity predict that these negative reactions will mitigate if the number of female CEO’s increases. The purpose of this study is to test these claims and combine both areas of research by comparing male and female CEO apologies in two types of industries, each with a different amount of female CEO’s.

Method. A 2 (apology versus no apology) x 2 (male versus female CEO) x 2 (male versus female industry) within-subjects design was used to measure 244 participants’ ‘attitude toward the company after a transgression’ or ‘post-transgression attitudes’.

Results. A repeated measures ANOVA revealed that offering an apology leads to better post-transgression attitudes than not offering one. Surprisingly, post-transgression attitudes are not significantly more negative when the CEO is female than when the CEO is male. However, post-transgression attitudes are significantly more positive in a female dominated industry versus a male dominated one.

Limitations. Limitations are the rather small sample and potential differential pre-transgression attitudes toward companies that participants might hold.
Purpose. Worldwide the creative industries are recognized as a key driver of contemporary economic growth. These industries are fragmented and count a large number of small enterprises and a small number of large enterprises, with a big amount of creative independent professionals that constitute these industries. Empirical research is however lacking on the pathways to a successful creative independent career. Thus, this study adopts a configurational approach to examine the combinatorial effects of self-determination theory needs on engagement and career success for fulltime and part-time creative independent professionals.

Methodology. A set-theoretic method, fuzzy-set qualitative comparative analysis (fsQCA), will be employed to identify configurations of conditions that explain why some creative professional achieve more career success and engagement, based on a sample of 105 independent creative professionals in Belgium, France, Germany, The Netherlands and the United Kingdom.

Results. Initial results show the importance of high levels of autonomy, competencies and working fulltime for having a successful career and high levels of engagement. The position of ‘belongingness’ needs is somewhat arbitrarily and can also be low to achieve career success and engagement.

Limitations. This study has a cross-sectional research design. This means that causality cannot be explored.

Research Implications. This study enhances configurational understanding of creative independent professionals and their career and show that they require individual support and advice.

Originality/Value. This study addresses the lack of career research in creative industries and applies a relatively new method in this field, the configurational approach, which is a meaningful addition to the well-known approaches of qualitative and quantitative studies.
Purpose: Time is a fixed resource with no variability. Yet across faculty there is variation in time allocated to different tasks. Research indicates that women tend to focus more time on teaching, mentoring, and service relative to men while men focus more on research (Misra et al., 2012). Time spent on paid work must also be balanced with time spent caring for family members and housework. The objective of the current study is to examine time allocation across work and family roles among tenure-track and tenured faculty.

Method: Data come from 837 faculty members. Time allocation was assessed with the categories used by Misra et al. (2012). Participants reported average number of hours spent in work activities (research, teaching, mentoring, service to university, service to professional discipline) and in nonwork activities (housework, childcare, eldercare).

Results: Men reported more time on research than did women. Women reported more teaching, more childcare and more eldercare than did men. Results show faculty spend significant time (13.67 hours) working on weekends.

Limitations: Data are based on a self-report, cross-sectional survey.

Implications: Long hours associated with faculty work have been the subject of recent discussions (e.g., McKenna, 2018). Results indicate faculty work 70-80 hours during the week and weekends. Much of faculty work can be enacted in a variety of settings, making it particularly vulnerable to boundary blurring.

Value: Extensive time spent on work on weekends suggests faculty may have little time during which they disengage from work, a key element of recovery (Sonnentag, 2012).

References

Purpose:
Defensive decision-making occurs when individuals choose a second-best option to protect themselves against negative consequences. We developed a scale to measure defensive decision-making and we provide evidence for the convergent and discriminant validity of the scale as well as construct validity.

Design/Methodology/Approach/Intervention: We conducted three studies. In Study 1, the scale was developed and evaluated (N= 145). In Study 2 (N= 175), we confirmed the factor structure in confirmatory analyses. We explored the relationship of defensive decision-making with innovative work behavior, psychological safety and the BIG 5 personality traits in a third study (N= 345).

Results: The results suggest that the scale to operationalize defensive decision-making is reliable and valid. We found that defensive decision-making has two correlated, but distinct, dimensions: decision-making avoidance and decision-making approach. Our findings indicates that psychological safety and a culture which promotes employee voice are positively related with decision-making approach. Considering individual differences, we found that emotionally stable, extroverted and open employees score low in decision-making avoidance.

Limitations: First, all studies were cross-sectional. Second, data were derived from self-report questionnaire data within each study.

Research/Practical Implications: The scale is helpful to operationalize this construct and thus assists organizations in uncovering defensive decision-making.

Originality/Value: This is the first time that defensive decision-making in organizations can be measured.
Purpose. In this study, we hypothesized that job autonomy, job variety would foster innovative work behavior and job performance of hospital middle-managers through the sequential mediation of psychological empowerment and proactive work behavior.

Methodology. A cross-sectional study was conducted among 321 French hospital middle-managers (73.8% women, mean age 47.08 years, SD = 8.47). We used an online survey to measure job autonomy (α=.78), job variety (α=.91), psychological empowerment (α =.86), proactivity work behavior such as voice (α =.93), taking charge (α=.85) problem prevention (α=.76) as well as innovative work behavior (α=.92) and job performance (α=.70).

Results. The proposed model was examined by using structural equation modeling. The final model shows good fit to the data (χ²= 50.66, df =34; CFI = .98; TLI = .97; RMSEA = .03; SRMR = .03). Analysis of indirect effects revealed that psychological empowerment and proactive work behaviors sequentially mediate the relation between job autonomy, job variety and innovative work behaviors of hospital middle-managers as well as job performance.

Limitations. The study was cross sectional, data were collected in a hospital via self-report questionnaire. Thus, results does not infer causation.

Practical Implications. Hospital governance and top hospital managers should more consider psychological empowerment and proactive work behavior like resources able to enhance hospital managers innovative behavior and performance.

Originality/Value. To our knowledge, this study is the first to examine antecedents, cognitive motivational state, proactive work behavior of hospital managers and consequences in a single study.
Purpose: Even though research has examined flexibility in the workplace for a considerable amount of time, we still find ambiguities on various levels within the published literature (Putnam et al., 2014). For example, it is still unclear, if flextime benefits employees and which work conditions contribute to the employees’ well-being (Spieler et al., 2017). Based on action regulation theory (Hacker, 2003), this study explores the moderating effect of work interruptions on flextime and well-being.

Design: 274 employees from the UK responded to a cross-sectional questionnaire on flexible work and well-being. According to recent research, flextime was separated into flextime use and flextime availability. This study tests how work interruptions moderate the relationship between flextime and emotional exhaustion.

Results: The results of a moderation analysis reveal that a high amount of interruptions may decrease the positive effect of flextime availability on emotional exhaustion, $\Delta R^2 = .04$, $F(1, 270) = 13.85$, $p < .001$. Flextime use shows very similar effects.

Limitations: The cross-sectional design limits statements about causation.

Research/Practical Implications: Designing flexible arrangements in a way that helps to prevent excessive interruptions can foster positive outcomes of flexible work.

Originality/Value: The negative effects of work interruptions on employees’ well-being has not been explored in the context of flexible work. Flextime availability and use can only have positive effects if the amount of interruptions can be limited.
CONSTRUCT PROLIFERATION AMONG NEGATIVE LEADERSHIP CONSTRUCTS: ASSESSING THE DISCRIMINANT VALIDITY OF CONCEPTUALLY RELATED CONSTRUCTS

Christoph Nohe (1) - Laura Vieten (1) - Guido Hertel (1)
University of Münster, Münster, Germany (1)

Purpose

Some supervisors are supportive, motivating subordinates to perform beyond the call of duty, whereas other supervisors humiliate or otherwise treat subordinates derisively. To capture the latter behaviors, researchers have developed a considerable number of negative leadership constructs, such as abusive supervision, destructive leadership, and supervisor undermining to name but a few. If “research streams are built around ostensibly new constructs that are theoretically or empirically indistinguishable from existing constructs” (construct proliferation; Shaffer, DeGeest, & Li, 2016, p. 81), it violates the fundamental principle of parsimony and interferes with building parsimonious theories. Therefore, this study examines whether there is construct proliferation among six commonly used negative leadership constructs.

Design/Methodology/Approach/Intervention

We collected data of 340 employees at two points in time. Participants filled out surveys on six negative leadership constructs. We will examine the empirical distinctness of those constructs following Shaffer et al.’s (2016) approach.

Results

Results will be presented at the 2019 Eawop congress.

Limitations

Replication studies and studies on other negative leadership constructs are desirable.

Research/Practical Implications

Our findings can reveal whether ostensibly different constructs on negative leadership behavior are empirically distinct or identical. Thereby, our results may not only lead to more parsimony in the research field of negative leadership but also to a clearer communication between researchers and practitioners.

Originality/Value

Prior studies have not thoroughly examined the potential problem of construct proliferation among negative leadership constructs. Therefore, our study assesses the discriminant validity of six commonly used negative leadership constructs. Our results may challenge or support the distinctness of those constructs.
Purpose: This study aimed to evaluate the psychometric properties of several scales for the intensive longitudinal assessment of work stress (i.e., strain responses) and psychosocial risk factors (i.e., work stressors) over the workday. Design: The research protocol was based on the ecological momentary assessment methodology and involved 150 full-time office workers. Short questionnaires were sent to participants’ smartphones six times per day at quasi-random time points, over three non-consecutive workdays. The instrument included 3 scales measuring stressors appraisal (i.e., quantitative workload, decisional latitude, organizational constraints) and 3 scales for strain appraisal (i.e., Positive/Negative Valence, Energetic Arousal/Fatigue, Tense Arousal/Calmness), plus contextual factors (i.e., work activity, equipment, social interactions). Results: In most cases, the scales showed satisfactory factorial structure, reliability and sensitivity to change. When averaged within-participants, the scales were moderately correlated with validated measures. Strategies for improving compliance are discussed. Limitations: Several participants were excluded because of low response rate or fake answers. Due to restricted sample size, results should be interpreted with caution. Implications: The proposed scales might allow to overcome some limitations of traditional retrospective methods, such as recall and response-style biases. They could be employed by both scholars and practitioners within the assessment of psychosocial risks and job design characteristics. By focusing on deviance from personal means, this method allows to control for the effect of individual dispositions and extra-organizational sources of stress. Originality: To our knowledge, this is the first study that deeply evaluated the psychometric qualities of scales for the intensive longitudinal assessment of work stress.
Purpose: Finding solutions for refugees’ labor market integration has become an urgent and challenging task. However, refugees remain a disadvantaged group in regards to labor market participation, as they often lack financial resources, language skills and may suffer from traumatic experiences (e.g., Ward, Bochner, & Furnham, 2001). To increase our understanding of how organizations can address those challenges, we aim to explore how organizations can facilitate organizational socialization (e.g. Van Maanen & Schein 1979; Jones, 1986) of refugee newcomers. Furthermore, we seek to examine effects of refugee newcomers on organizational insiders.

Approach: Data from 44 semi-structured cross-sectional interviews with different organizational stakeholders (e.g., refugees, supervisors, coworkers, management) across Germany. Following grounded theory, data was coded and analyzed at several points during data collection (Corbin & Strauss, 2008). Qualitative content analysis (Mayring, 2015) was applied for data analysis.

Results: Organizations may facilitate refugees’ organizational socialization by applying different institutionalized and individualized tactics. Further, different organizational outcomes and effects of refugee newcomers on organizational insiders were identified.

Limitations: Interviews were cross-sectional in nature, limiting our ability to draw causal conclusions. Sample consisted only of organizations in Germany. Including other country settings may increase understanding of refugees’ organizational socialization.

Research/Practical Implications: Insights allow us to gain an understanding into future practices and tactics that hold the potential to foster organizational socialization of refugees and other vulnerable groups.

Originality/Value: This study extends the current scope of organizational socialization theory and onboarding literature by exploring refugee newcomers’ organizational adjustment process and effects on organizational insiders.
Purpose:
Emotional job demands are pervasive and can be exhausting. The present study uses job demands-resources theory to argue that prosocial motivation is an important daily resource that helps people deal with daily emotional job demands. Specifically, we hypothesize that daily emotional demands are related to daily self-undermining through (a) daily exhaustion and (b) daily work engagement and that these relationships are buffered by daily prosocial motivation.

Design/Methodology
A total of 134 employees from different occupational settings filled in daily online questionnaires over five consecutive working days (482-514 data points).

Results
Results of a multilevel path analysis support the notion that prosocial motivation is a volatile resource that can buffer the unfavourable relationships between emotional demands, exhaustion, and work engagement. In addition, results show a moderated mediation effect from emotional demands to self-undermining via exhaustion (but not via work engagement) when prosocial motivation is low.

Limitation
All outcomes are based on self-report measures.

Practical implication
The results of the current study suggest it might be useful to make employees aware of their daily prosocial motivation in order to enable them to deal with their daily emotional demands.

Originality/Value
Our findings indicate that daily emotional demands have an unfavourable relationship with self-undermining behaviour through an energy-depleting path (via exhaustion). In addition, it shows that prosocial motivation can be an important volatile resource that can buffer the link between daily emotional job demands, exhaustion, and work engagement.
TIMING EMOTIONS AND EMOTIONAL REGULATION IN THE WORKPLACE: THE ENTWINED NATURE OF CIRCADIAN RHYTHMS AND EMOTIONS IN THE WORKPLACE

Teresa C. D'Oliveira (1)
King's College London, London, United Kingdom (1)

State of the Art

The association between sleep and emotions is proposed in the literature.

The impact of sleep disturbances on human emotional reactivity is highlighted in fMRI studies where an increased amygdala reactivity and the loss of functional connectivity between the amygdala and the mPFC was identified in sleep deprived participants (Walker, 2009). In the workplace, the impact of circadian stress on emotions is illustrated by studies on shift work and the increased rates of depression and anxiety in shift workers (Agnostopoulos & D'Oliveira, 2017).

Research also emphasizes the repercussions of daily emotional experiences such as acute and chronic stress on sleep physiology (e.g., Vandekerckhove & Cluydts, 2010) and that nearly all mood disorders express co-occurring sleep disturbances.

While the association between sleep and emotions has been vastly explored, the mutual influence of sleep loss on emotions and emotional regulation at work has received limited research attention.

New Perspectives/Contributions

The paper proposes that the conceptual discussions on emotional traits and states needs to be expanded to include the human circadian emotional reactivity. This new perspective has direct implications for the variables considered and the methodological approaches to the study of emotions in the workplace.

Research/Practical Implications

The study of the mutual influences of sleep and human emotional reactivity in the workplace requires the adoption of prospective longitudinal designs and experience sampling methods.

Originality/Value

By considering human circadian rhythms and their potential disruptions, the paper proposes an enriched perspective to the study of emotions and emotional regulation at work.
Purpose: This study aims to analyze the effect of two leadership functions, leader sense-giving (LSG) and leader promotion of team sense-making (LPSM) on team effectiveness, measured through team performance. The study also analyses the mediation role in this relationship of both deliberate and contingency planning and team adaptation.

Results: Deliberate planning and team adaptation positively mediate the relationship between LSG (B = 0.22, CI = 0.09, 0.37) and LPSM (B = 0.24, CI = 0.10, 0.40) on team performance. Contingency planning and team adaptation positively mediate the relationship between LSG (B = 0.24, CI = 0.09, 0.40) and LPSM (B = 0.25, CI = 0.10, 0.43) on team performance.

Limitations: Given the self-reported nature of data and the use of a common scaling approach, limitations exist regarding the applicability and extendibility of results of this study.

Research/Practical Implications: Teams need to include deliberate and contingency planning in their routine, as it positively impacts their capacity to adapt and consequently their performance. Leaders need to be trained in engaging in and choosing between LSG and LPSM functions in order to guide their team towards effective planning and adaptation processes.

Originality/Value: This study introduces a new leadership function, leader promotion of team sense-making, and analyses its influence on team effectiveness.
Purpose

For the past decades, job insecurity has received growing attention from researchers due to its impact on individuals and organizations. The present research aims to study antecedents of job insecurity. Specifically, we examine three categories of antecedents: organizational antecedents (i.e., communication, and training); individual background (i.e., job position, type of contract, education, gender, and tenure); and individual differences (i.e., negative affectivity, conscientiousness, organizational based self-esteem, and reciprocation wariness).

Design/Methodology

The study was carried out by means of questionnaires within a one-year period. In time 1 (2015) we measured the antecedents and in time 2 (2016) we measured job insecurity. Final sample was 145 employees from the industry sector.

Results

Regression results indicated that organizational tenure, conscientiousness, organizational based self-esteem, and organizational communication were the best predictors of job insecurity.

Limitations

Generalization may be a problem because the data were collected in just one organization.

Practical implication/Value

Several suggestions for managers emerged from the results. With a deepest knowledge about the potential causes of job insecurity, managers can put in place strategies to prevent it.
| Organizational Communication Training |
| Individual Background |
| Job position | Contract type |
| Education |
| Individual Differences |
| Negative affectivity | Conscientiousness |
| Org based self-esteem |

**JOB INSECURITY**
Purpose

The value of psychometric assessment might be apparent to scholars in Psychology, but outsiders have traditionally been wary of its potential. To verify the value for those within and demonstrate its worth to those outside the field, we estimate the impact of increased usage of assessments in "objectivist" terms: The effect on national GDP.

Approach

We replicate the workforce, the world of work, and the dynamics of the labor market by leveraging numerous data sources and meta-analytic techniques and create simulations of the US labor market with varying degrees of adoption of psychometric assessment.

Results

A selection system that uses assessments on General Mental Ability and the Big Five personality factors for all occupations, added $831 billion (7.12%) to $1.41 trillion (12.08%) to GDP in comparison to the contemporary market. A system using an estimated ideal test battery added $1.10 (9.44%) to $1.86 trillion (15.96%).

Limitations

We modelled a range of key parameters and test a number of assumptions, but not all potentially relevant elements could be included.

Research/Practical Implications

Our estimates provide a correction and update of prior work based on subsets of the workforce and we demonstrate the considerable effects that adoption of even relatively basic psychometric assessment could have.

Originality

Our estimates provide the most well-substantiated indication of the impact and potential of large scale adoption of applicant selection to date.
Background. Need for developing professional competencies throughout working career is widely acknowledged but there is lack of methods realizing the idea of life-long learning at mid-career and beyond. At times of constant changes within organizations, workplaces can no longer provide employment security but it needs to be complemented with enhanced employability of individual employees.

The aim of this study was to develop and to study the efficacy of the Mid-Career Competence Clinic - intervention which involves career management training for supporting skills development and employability among employees in their mid-career (aged 40-65 years). The study was conducted in collaboration of the Finnish Institute of Occupational Health (FIOH) and the Haaga-Helia University of Applied Science (HH). The intervention program utilized active learning and social learning principles and was implemented by two trained trainers. The program contents included e.g. future career goals, job search skills, managing changes, and social networking. The program consisted of two half-day face-to-face training and web-based learning tasks.

Study design. The two populations of the RCT study were alumni of HH (business and service professions) and members of the Union of Professional Engineers living in the metropolitan area, both limited to those aged over 40 years making in total about 11 000 persons. They were contacted by mail and provided with the opportunity to participate in the study by filling up and returning a web-based baseline questionnaire survey. The 1122 (62% women) respondents were randomized into experimental and control group. The members of the experimental group were sent an invitation to a mid-career competence clinic. A follow-up questionnaire survey was sent to all participants of the study right after the intervention and the control group received individual feedback from their responses to the questionnaire survey. Both groups also received a follow-up questionnaire one year later. The effects of the intervention on preparedness for competence development, goals and motivation, and on learning and work status will be investigated.

Results. The group program increased preparedness for mid-career management, which consisted of self-efficacies related to career management and recognizing and presenting one’s own skills and competencies, as well as, inoculation against setbacks in employability (ANOVA, F-value 13.93, p<0.001). The results of the immediate effects of the intervention showed that the intervention successfully increased preparedness for mid-career management.

Conclusions. It seems that the group method developed in this study can provide employees at mid-career a tool for developing their career management competencies. It can be implemented in universities of applied sciences or in other educational institutions as a program for developing mid-career competencies, or at workplaces. The intervention program and the study design, as well as, the preliminary results of the longitudinal effects of the intervention will be presented at the Conference.
Leaders have a notable impact on organisational culture, and consequently on the wellbeing of employees. Although good leadership encompasses an ethical element, numerous cases of power abuse and unethical behaviours are recorded, however, they may not be fully understood. This novel study explores the complex relationship between the 12 most commonly practiced leadership behaviours, as depicted by Stogdill’s LBDQ-XII questionnaire, Social Dominance Orientation (SDO), Dark Triad individual differences (Machiavellianism, Narcissism, and sub-clinical Psychopathy), gender, and levels of leadership seniority (Senior, Middle, and Junior).

The results indicate that task-oriented leadership behaviours, such as Production Emphasis and Superior Orientation were predicted by Narcissism while they were positively correlated with SDO and Dark Triad. Contrariwise, leadership behaviours characterised by a relational approach such as Consideration and Tolerance and Freedom, were negatively correlated by the SDO and Dark Triad. Interestingly, none of the most commonly practiced leadership behaviours were predicted by gender, seniority levels, or ethnicity.

Although the findings of the study are noteworthy, they must be carefully considered due to the limited participants’ numbers (N=58). Practical implications include the opportunity to predict, identify and manage poor and toxic leadership behaviours by combining psychometric instruments like SDO, Dark Triad, Emotional Intelligence, and leadership behaviour questionnaires. Most importantly, findings have implications not only for leadership selection and development in contemporary organisations but also for promoting more inclusive and diverse organisation with equal opportunities for women and minority groups.
EXPLORING THE IMPACTS OF THE 24/7 SOCIETY: A SYSTEMATIC REVIEW OF THE ASSOCIATION BETWEEN SHIFT WORK AND AFFECTIVE DISORDERS

Teresa C. D'Oliveira (1) - Antonios Agnostopoulos (1)

King's College London, London, United Kingdom (1)

Purpose

The “24-hour society” depends on the diversification of working time patterns with shiftwork dominating most applied solutions. The purpose of the study was to conduct a systematic review of the literature exploring the associations between shiftwork and affective disorders.

Design/Methodology/Approach/Intervention

A literature review was conducted using the electronic databases Medline and PsycINFO. Inclusion criteria included shift work, full time work and the clinical diagnosis or symptoms of affective disorders as depression, anxiety and bipolar disorder.

Results

The PRISMA flow chart for activities was adopted with a total of 23 articles extracted for the review. Findings suggest that an association exists between shiftwork and affective disorders with most studies highlighting depression and anxiety. After reviewing the 23 articles, ten studies found an increase in depressive symptoms; four studies found an association between with anxiety; four studies found an increase in both depression and anxiety. Only four studies found no association between shiftwork and depression.

Limitations

The review identified a lack of consensus regarding shiftwork characteristics that are studied (i.e., type of shift, shift length, shift rotation, shift direction) and controversies on the affective disorder identified and their measurement.

Research/Practical implications

Future research should focus on a consensus regarding the relevant characteristics of shiftwork as well as the level of analysis regarding affective disorders, i.e., symptoms versus clinical diagnosis. A better understanding of the psychophysiological mechanisms linking shiftwork to affective disorders, such as sleep, is also necessary.

Originality/Value

The study considers the mental health consequences of non-standard work schedules.
Workplace bullying (WB) is a highly negative experience that has consequences and costs for the individual, the organisation and society. It is a severe and widespread problem as approximately 9% of the Swedish working population have experienced bullying. Previous research on WB has primarily focused on either the targets or the perpetrators. This implies that one important actor has been neglected, the bystander. We maintain that there is a need to shift focus from the individuals who are directly involved in a negative situation to the bystanders and the organisational setting. The aim of the study is to investigate the complex situation of WB with focus on the bystanders.

The results from a pilot-study-questionnaire, (3885 respondents, random sample of individuals between 25 and 65 years, response rate 42%) indicate that the situations for targets and witnesses are quite similar regarding the following organisational factors: support from supervisors and colleagues, social climate, well-being, work engagement, intention to quit and work ability.

In order to get a deeper understanding of the phenomena, our aim is to analyse the organisational context in relation to WB and bystanders’ behaviour using a mixed method approach. The JD-R theory, the theory of Psychosocial Safety Climate, and a gender perspective will form the theoretical framework.

This study contributes with new knowledge about WB, bystanders’ behaviour and their relation to the work environment. This knowledge can be applied by managers and organisations in their preventive work.
COGNITIVE DEMANDS OF FLEXIBLE WORK: A DIARY STUDY WITH NURSES IN ELDERCARE HOMES

Vera Baumgartner (1) - Bettina Kubicek (2) - Roman Prem (3) - Lars Uhlig (4) - Christian Korunka (3)

University of Vienna, Department of Applied Psychology: Work, Education, Economy, Vienna, Austria (1) - University of Graz, Graz, Austria (2) - University of Vienna, Vienna, Austria (3) - University of Vienna, Vienna, Austria (4)

Purpose: Companies increasingly introduce flexible work arrangements to allow employees to organize their work schedules according to their individual needs and help them balance their life domains. Flexible work arrangements are considered to have ambivalent effects on work-home outcomes, but the underlying psychological mechanisms are poorly understood. The aim of this study is to assess whether cognitive demands, such as structuring of work tasks, coordinating with others at work, and reconciling work with private obligations, can lead to both, negative and positive work-home outcomes.

Design/Methodology/Approach/Intervention: A diary study with two measurement occasions over five consecutive workdays is currently being finished. Preliminary multilevel mediation analyses are based on 304 day-level datasets from 62 nurses working in eldercare homes.

Results: Results show that structuring work tasks and coordinating with others at work are perceived as straineous and lead to work-to-home conflict. In contrast, reconciling work with private obligations is perceived as a source for opportunities to learn to better organize oneself that, in turn, promotes work-to-home enrichment.

Limitations: All variables are based on self-reported data.

Research/Practical Implications: Our results show that cognitive demands are not ambivalent per se but specific to the context. In our sample of nurses, cognitive demands exclusively related to work are perceived as straineous, whereas cognitive demands requiring employees to engage in reconciling work with private obligations have beneficial effects.

Originality/Value: Using a dairy study design, we were able to investigate the underlying mechanisms that link cognitive demands of flexible work to daily work-home outcomes.
EMOTIONAL EXHAUSTION AND PARENT'S RELATIVE PERCEIVED WORK FLEXIBILITY

Constanze Leineweber (1) - Helena Falkenberg (2) - Sophie Albrecht (1)

Stockholm University, Stress Research Institute, Stockholm, Sweden (1) - Stockholm University, Department of Psychology, Stockholm, Sweden (2)

Purpose: When children are living at home, parents are interdependent of each other to care for them. Higher work flexibility than partner might provide better opportunity for recovery, but might also mean more responsibility for work at home or at paid work. It is possible that mothers and fathers use their relative work flexibility differently. The aim with this study was to investigate 1) the association between parent’s relative work flexibility, compared with their partner, and emotional exhaustion 2) gender differences in emotional exhaustion 3) the interaction between relative work flexibility and gender in relation to emotional exhaustion and 4) differences between mothers and fathers in time use.

Methodology: Mothers and fathers in paid work in Sweden with children living at home was included (n=2,911). Cross-sectional data was collected in 2012.

Results: The results indicated that 1) having higher flexibility than partner was associated with lower levels of emotional exhaustion; 2) mothers reported higher levels of emotional exhaustion than fathers 3) relative flexibility seemed to influence fathers emotional exhaustion more than mothers 4) differences in time use between mothers and fathers was found.

Limitations: Ideally, data from the same family would have been gathered and relative flexibility would have been measured in a more nuanced way.

Research/Practical Implications: Highlighting the importance of consider work flexibility in its family context.

Originality/Value: The first study, as far as we know, that investigates the relative work flexibility and emotional exhaustion among mothers and fathers.
Contemporary working teams are fluid organisational constructions displaying versatile relational dynamics with impact on the well being of their members. Burnout is central to most modern organisations, yet studies about the role of team dynamics on burnout are rather scarce. This study tackles this gap and explores through a compositional perspective the impact of team dynamics on the team members’ affective experience.

We hypothesise that relational conflict asymmetry has (a) positive influence on burnout and negative affect, and (b) negative influence on positive affect. Instrumental support asymmetry has: (a) negative influence on burnout and negative affect and (b) positive influence on positive affect. Emotional support asymmetry has (a) negative influence on burnout and negative affect and (b) positive influence on positive affect. Instrumental support attenuates the positive association between (a) relational conflict asymmetry and burnout, (b) relational conflict asymmetry and negative affect, and (c) negative affect and burnout.

Data was collected through an online survey. The sample includes 433 employees from 50 callcenter teams.

Results of the hierarchical linear modeling partially confirmed our hypothesis and highlight that (a) burnout is shaped by conflict and emotional support asymmetry, (b) negative affect is associated with relational conflict asymmetry, and (c) instrumental support asymmetry attenuates the association between RCA and burnout.

This is one of the first empirical studies that explored the implications of team dynamics on burnout and affect in teams based on a compositional perspective and is a helpful resource for practitioners preoccupied with managing team processes.
Purpose

The aim of the current study was to investigate how bullying experiences at work can be predicted by individual differences and by work-related characteristics. The individual and organizational outcomes of exposure to bullying were also analyzed in this research.

Design/Methodology

A questionnaire-based study was conducted among Hungarian employees (N= 478) where demographic factors, personality traits (BFI-10, CD-RISC), work-related psychosocial factors, organizational attitudes (COPSOQ II) and exposure to bullying (LIPT) were measured.

Results

The experience of bullying was significantly predicted by personality traits (Agreeableness and Openness to Experiences), gender, and organizational psychosocial characteristics (Recognition, Social community at work, Work pace, Role conflicts). Organizational psychosocial factors were more strongly connected to the experience of bullying compared to the individual, dispositional factors. Exposure to bullying was in connection with counterproductive outcomes both on the individual-level (Self-evaluation, Self-rated health, Burnout, Stress, Sleeping troubles) and on the organizational level (Commitment to workplace, Job satisfaction, Trust regarding management, Mutual trust between employees). The resilience of the victim worked as a moderator factor.

Limitations

This study’s cross-sectional, self-report data collection precludes inferences of causality.

Research/Practical Implications

These results suggest that the “costs” of bullying victimization can be identified not just on individual-but also on organizational level and managerial practices are crucial in prevention.

Originality/Value

While the vast majority of workplace bullying research concentrates separately on the environmental or on the individual risk factors of bullying, and was conducted on West-European or North-American samples, this study is the first, complex Hungarian bullying research.
Purpose

Job insecurity has received growing attention from researchers due to its impact on individuals and organizations. However, empirical studies reported mixed findings regarding job insecurity-performance relationship, suggesting that job insecurity can be perceived as both a challenge and a threat. The present research aims to 1) develop a measure of job insecurity as a challenge and as a threat, and 2) test two different mechanisms (i.e., organizational identification and emotional exhaustion) through which job insecurity may impact work behaviors.

Methodology

The study was carried out by means of questionnaires to 377 employees and their supervisors. Employees reported perceptions of job insecurity (challenge and hindrance), organizational identity, and emotional exhaustion. Their supervisors assessed outcome measures.

Results

Results from path analysis indicates that when job insecurity is considered a challenge, it promotes organizational identification and has no impact on performance. However, when perceived as a threat, job insecurity impacts negatively employees’ well-being and their performance.

Limitations

When interpreting our results, there are some limitations one should keep in mind due to the cross-sectional nature of data, and we therefore advise caution with any inferences of causality.

Practical implication/Value

Our results suggest that job insecurity can be perceived as both challenge and hindrance, thus these types of stressors and appraisals are not mutually exclusive. However, managers should be aware that the negative effects of job insecurity are stronger than the positive ones.
Purpose: A true partnership between patients and medical professionals as team members is an important topic due to its positive relationship to quality and efficiency of care. This study provides insight from patients on factors that support their involvement in treatment decisions, which is the core of patients’ team membership.

Design: Following Q methodology in an interview setting, 136 patients from three patient groups (diabetes, respiratory disease, and cancer) across multiple Dutch hospitals were asked to rank-order 42 statements covering possible factors that influence patient involvement, and to explain their reasoning.

Results: By-person factor analysis using software package PQMethod revealed four groupings of views on what is important for patient involvement;

- Patient condition: the present and projected future physical and mental condition of the patient and his/her coping abilities.
- Patient motivation: patient’s desire to influence their treatment and to interact with medical staff.
- Patient cognitive ability: having, finding, understanding, and discussing information by the patient.
- Patient relationship with professionals: the quality of the interaction between patient and medical professionals, including perceived characteristics of these professionals.

Limitations: This study allows us to describe a population of viewpoints, exploring the parameters of a construct, rather than generalizing to a population of people.

Implications: These results offer insights on the relative importance of factors relating to patient involvement from the patient perspective. Implications can be drawn for patient self-management, healthcare teams, and medical professionals.

Value: Identifying these views may create a variation of strategies to include patients in teams that fit patients’ preferences more.
In this article, we highlight the opportunities learning agility can offer when identifying and selecting employees who are considered most instrumental to the competitive advantage of the organisation. So far, there is no empirical evidence that speed (i.e., an ability to develop skills quickly) of learning and flexibility (i.e., moving among different ideas and across situations) of learning can play a predictive role in high potential identification.

By means of a case-control study, it was possible to separate the high potentials from the non-high potentials, based on their ratings of learning agility. Empirically, we report evidence for this predictive role of learning agility. The odds ratio indicates that employees who were given a high score on learning agility by their supervisor, were over 30 times more likely to be identified as high potentials. We conclude by saying that we were unable to investigate to what extent organisational factors moderated the outcomes in our study. This will be part of our future research agenda as we need insight into how organisational climate can support informal, on-the-job learning. Our research answers a call by Collings & Mellahi (2009) to expand empirical research on the identification and development of high potentials. As change and dynamism have become the new normal, organisations can gain competitive advantage by identifying and employing highly agile learners, a process that is nowadays frequently based on job or task performance, which is only visible after some years of working experience in the organisation.
Purpose

Complex technologies are accelerating the growth of automatization in companies. These technological developments lead to radical transformations of the nature of work. From a 21st century skills framework perspective, this paper examined what competencies are required from (new) tech employees in these recent developments.

Methodology

We interviewed 54 HR managers from different tech companies in the Netherlands and examined which technology developments they are facing and what competencies those developments require. In study 2 we developed a questionnaire in three knowledge, six skills, and three attitude domains were specified and we tested its relevance in a new sample among 236 tech companies.

Results

Our research shows that employers experience fundamental changes in work: more complexity in production processes, a continuous change in collaboration through robotization and automation of production lines, and new ways of organizing. This requires technicians with excellent knowledge of his own discipline but also the ability to collaborate with technicians of other fields. Furthermore, technicians increasingly need a good understanding of the broader business processes, and the drive to develop themselves continuously to stay up to speed with new technologies. Finally, employers explicitly stated employers and educators are jointly responsible to make the technicians of today future proof.

Limitations

This research was descriptive in nature. Future studies should focus on effects found.

Implications/value

The results of this study are relevant for HR practitioners and managers who are responsible for recruiting new tech employees while at the same time facilitating the (re)design of work processes and jobs to fit the technological developments.
Purpose: Drawing on social cognitive theory, this field study explores Blau’s job search behavior phases over a prolonged job search. The aim of the study is to understand how and when job seekers in a challenging job market engage in productive versus unhelpful job search strategies.

Design: This longitudinal field study followed 143 job seekers over six months. Data on job search behaviours (preparatory versus active), job search intensity, and job offers were collected at two points in time.

Results: Job search intensity positively moderates the relationship between preparatory (time 1) and active (time 2) job search behaviors. Overall, the results shed light on when and why job seekers may linger in the preparatory job search, thus hindering their active job search behavior and subsequently reducing their potential for receiving job search offers.

Limitations: The model tested in this study could be expanded to understand the underlying mechanisms that support successful transition from preparatory to active job search behaviours (e.g., resilience, job search self-efficacy).

Implications: Findings from this research support the proposition that job seekers require support in maintaining a prolonged job search. While most job search interventions are focussed on skills, there is a need to address the job seekers’ self-regulation.

Originality: This research contributes to the job search literature in that it begins to explore the relationship between key behaviours in Blau’s job search model. It also has the potential to support practice by pointing toward the need for novel interventions.
THE DOUBLE ROLE OF SURFACE ACTING IN THE CONTEXT OF A PERCEIVED EMOTIONAL DEMANDS-ABILITIES FIT AND THE BURNOUT DIMENSION DIENCEMENT

Irmgard Mausz (1) - Angela Kuonath (1) - Silja Kennecke (1) - Dieter Frey (1)

LMU Munich, Psychology, Munich, Germany (1)

Purpose: In the service sector, the emotional labor strategy surface acting was found to be linked to various negative outcomes such as burnout. Also the perceived emotional demands–abilities (ED–A) fit seems to be associated with burnout. In this study, we examine the relation between the perceived emotional demands–abilities (ED-A) fit and the burnout dimension disengagement in the emotionally highly demanding profession of judges and the process in which surface acting is a potential harmful factor by mediating and moderating the forenamed relation.

Design: In a survey 713 judges in Germany participated in a two-part online study (time lag of 8 weeks). To test this study’s hypotheses, we used three sets of analyses including mediation and moderation analysis as well as structural equation modeling.

Results: As hypothesized, results imply that surface acting is both mediating and moderating the relation between the perceived ED-A fit and disengagement.

Limitations: This study only includes self-report information.

Practical Implications: Results help to gain a better understanding of the harmful role of surface acting as an emotional labor strategy. Also the findings indicate the relevance of a perceived ED-A fit in emotional labor jobs.

Originality: We are addressing a gap in the literature analyzing the process in which surface acting plays a double role within the relationship between the perceived ED-A fit and disengagement.
Purpose
This paper analyses the assumption that top management in knowledge organizations characterized by high workplace democracy needs to be value-based and relation-oriented to achieve necessary organizational change.

Methods
This was a qualitative case study from 2015 to 2018 including six Norwegian knowledge organizations, yielding more than 30 interviews with top managers as well as other managers in the top management teams, and extensive observational notes.

Results
The analyses show that value-based leadership characterized by knowledge-sharing, open dialogue on leadership development, self-confidence, and clear decision-making ensure motivation, establishment of collective practices and an understanding among managers and employees that value-creation lies in the intersection between work culture and strategy. A relation-orientation builds social capital supporting employees' experience of organizational fairness, trust and cooperation abilities.

Limitations
Generalizability of findings is challenged by the focus on knowledge organizations in Norway, with high expectations to autonomy and workplace democracy. There are likewise few studies with which to compare findings. Also; "value-based" and "relation-oriented" are terms in leadership theory that must be clearer defined and validated.

Research/practical implications and originality value
Most management studies do not specify management level, and research on healthy top management practices is scarce. The findings of this study shatter the metaphor of the top manager as inaccessible, invulnerable and solely rational, and show the importance of a processual focus on values, social capital and strategies combined.
Purpose: Previous research has shown that heart rate variability (HRV) varies in response to stress induced by various methods, reflecting changes in the sympathetic and parasympathetic nervous system. Parallely, social undermining behaviours (SUB) at work have been considered stressors. Based on this evidence, we predict an impact of leaders’ SUB on HRV.

Design/Methodology: We conducted an experiment with students (n=193) working in 56 teams composed by either 3 or 4 members. While participants resolved a group task (detection of mistakes on documents with alphanumeric information) we manipulated the work environment (leader’s positive behaviours vs social undermining) and the difficulty of the task (low vs high). The participants’ heart electrical activity was recorded during all session with a Biopac MP150 and the following HRV indexes were calculated: SDNN (standard deviation of the normal-to-normal intervals) and RMSSD (root mean square of the successive differences).

Results: HRV changes through pre experimental, experimental and post experimental stages, in accordance to research conditions.

Limitations: The experiment is a laboratory study. The sample is only composed by volunteer students. The data analysis is in progress.

Research/Practical implications: Our findings will contribute evidence to the discussion on the use of objective indicators of psychological stress.

Originality/Value: We have not come across other studies applying objective indicators of psychological stress to the study of the effects of social undermining on work teams. Our results will provide empirical evidence on the effects of SUBs on workers’ health through objective indicators like HRV indexes.
Purpose: Managers and organizations are becoming increasingly aware of the need for ongoing, consistent performance conversations. However, managers tend to avoid feedback conversations. There is a need to develop techniques to help managers in discussing ongoing developmental issues in ways that strengthen relationship quality and improve overall performance. Kluger and colleagues proposed a psychological intervention for managing employee performance, the Feedforward Interview (FFI). One of the hypothesized benefits of this technique is the positive effect on the supervisor-subordinate relationship. In a quasi-experimental field study, we followed 212 supervisor-subordinate dyads, half of whom were trained in FFI as part of a coaching program.

Design/Methodology: Managers were trained in either FFI (n=76), or goal setting (n=136). Supervisor-subordinate dyads were followed for 18 months. Measures of relationship quality and performance were collected at three points in time.

Results: FFI increases performance and improves relationship quality over and above conversations anchored solely in the practice of goal setting. Subordinates also reported greater ‘perceived utility’ of the FFI as compared to the control.

Limitations: Participation at time 3 decreased significantly, reducing the strength of the claims that can be made for 18 months post-training.

Research/Practical Implications: This research advances our knowledge of FFI and the findings are directly applicable to the design of coaching programs in organizations.

Originality/Value: Extending our understanding and knowledge of FFI, adds value to the broader conversation of the potential for the application of positive psychology interventions in organizations.
Purpose

This paper explores how human relations managers can, as part of top management teams, be important executive drivers in the development of healthy workplaces.

Methods

This was a qualitative case study from 2015 to 2018 including six Norwegian knowledge organizations, where the function and role of six HR managers were studied in relation to their place in the top management teams of the organizations. The data material consists of more than 30 interviews and extensive observational notes.

Results

The results indicate that placing human relations managers in top management teams is an efficient way to connect and coordinate organizational development on the strategic, professional and employee levels in knowledge organizations. This furthers the healthiness of change and development for the part of the employees, for example in terms of ownership, as human relations managers integrate the employee perspective on roles, resources and working conditions in these processes.

Limitations

This study of the role of human relations managers was part of a study on top management; there is a need for more targeted studies on the effects on employee health of the integration of human relations on the executive organizational level.

Research/practical implications and originality value

The results show that the presence of the employee perspective in top management teams contribute to healthy organizational change and development processes, as well as more comprehensive strategic reflections. This implies that the role of human relations managers is critical in strategic organizational development.
Purpose

Existing research has largely focused on justice perceptions at one point in time, without considering the role of past experience (Fortin, Cojuharenco, Patient, & German, 2014). In this study we apply theories on dual processing (Epstein, Lipson, Holstein, & Huh, 1992) to examine how third parties’ or observers’ responses to previous experiences of injustice influence their reactions to new occurrences of perceived unfairness. We argue that third parties learn and reflect on their previous justice experiences. These reflections then influence how they respond to perceived injustices.

Methodology

Applying critical incident technique, we conducted semi-structured in-depth interviews with 15 MBA students in Germany. All had some work experience.

Results

Results indicate that third parties’ reactions to perceived injustice are influenced by their past reactions to unfairness, the associated emotions and reasoning, as well as the consequences of their actions.

Limitations

Our research is based on a small sample of MBA students. It therefore is not representative. As a next step, we plan to increase our sample size considerably.

Research/Practical Implications

We take a step towards developing a process model of how third parties’ previous experiences influence their reactions to injustice. Our study also points to the importance of considering the role of time in organizational justice experiences.

Originality

By exploring the role of past experiences and the interplay between emotions and rationality, we extend our understanding of the process with which third parties make decisions about how to react to injustice. We also contribute to research on the role of time in organizational justice.

References

Purpose: Creativity is inherited in knowledge work and is becoming a part of the job description in many more contemporary occupations. But how do we keep up with creative ideas day after day in high-pressure environments? The aim of this literature review to develop a taxonomy of individual strategies and corresponding affective and cognitive experiences conducive to creativity relevant processes (creative thinking skills and working styles). We draw on dynamic componential model of creativity and conservation of resources theory to propose a theoretical framework of creative routines.

Design/Methodology: An extensive literature search in the PsycINFO and PsycARTICLES databases has been conducted and 42 articles have been identified that fit our purposes.

Results: Our framework suggest the taxonomy of relational, physical, cultural and mental activities than enhance creative outputs though recovery experiences, positive affect, cognitive flexibility (such as perspective taking) and reduces stress and anxiety.

Limitations: A number of the studies included in the literature review have been conducted in the laboratory settings.

Research/Practical Implications: A proposed framework dovetails workplace wellbeing and creativity theories and sets the scene for the future research. A set of creative strategies serve as a toolkit for employers and employees informing how workplace creativity can be nurtured everyday.

Originality/Value: This literature review is the first attempt to develop a taxonomy of strategies and resultant psychological experiences and propose a framework of routines to enhance workplace creativity.
The purpose of the study is to contribute to the change management literature by investigating the interactive effects of follower dispositional resistance to change (RTC), perceived leader (LCS) and team (TCS) support towards the change and the quality of exchanges with one’s leader (LMX) and team (TMX), respectively, on follower beliefs toward acquisition (FBTA). Data was collected from 168 employees, working for a Turkish Bank which undergoes an Acquisition. Hierarchical regression analyses were performed by SPSS. The limitation of the study includes the single source data collection method. Follower RTC had a negative impact on FBTA, and LCS and TCS were positively related with FBTA. The effect of LCS was moderated by LMX: those followers who indicated high quality LMX showed favorable beliefs when their leaders supported the acquisition relative to when their leaders had a less favorable stance. Followers with low quality LMX were not affected by their leaders’ position on the acquisition. LCS and high-quality LMX had a favorable impact on appropriateness subscale of FBTA only when followers indicated low RTC. No effect was found for TMX. The study confirms the importance of social influence in leadership and LMX in a change environment and draws attention to limitations to influence dispositionally resistant followers. The originality of the research includes testing environment where this study was conducted in Turkish business environment during ongoing change process and tested variables which are the effects of RTC, LMX, and TMX on individual change beliefs.
LEADERSHIP & WELLBEING IMPLICATIONS FROM EMPLOYEE-CLIENT PSYCHOLOGICAL CONTRACT DYNAMICS

Marija Dumovic (1) - Denise Jepsen (1)
Macquarie University, Sydney, Australia (1)

Purpose
The study explores the concept of client psychological contracts to better understand workplace relationships employees have with clients and leaders in the context of stakeholder and leader-member exchange theories. It adopts a multi-agent perspective to psychological contract theory, and proposes that clients are an important referent in employees’ psychological contracts and wellbeing outcomes.

Design
Data was collected in a professional services organization (n = 260). The primary hypothesis is that the nature of the employee-client psychological contract impacts employees’ perceptions of the quality of their relationships with leaders and their wellbeing.

Results
Employees hold either relationship or outcome focused psychological contracts with clients, which act as positive or negative buffers for their overarching relationship with their employer, the quality of relationships employees have with leaders and wellbeing outcomes such as burnout and psychological distress.

Limitations and Implications
The study limitations are that all variables are subjective and measured through a questionnaire, which is open to common method variance error. The study has implications for leaders in integrating employee-client psychological contracts in a way that fosters the employee-employer psychological contracts, enhances the quality of workplace relationships and supports employee wellbeing.

Originality
This study extends psychological contract research beyond a dyadic relationship. The value of the study is in discovering the concept of client psychological contracts and their impact on employees’ workplace relationships and wellbeing.
1445 - EFFECTIVE HR PRACTICES IN CIVIL SOCIETY ORGANISATIONS: THE IMPORTANCE OF HIGH-COMMITMENT HR PRACTICES AND INTRINSIC WORK GOALS

Lise Szekér (1) - Miet Lamberts (1)

KU Leuven, HIVA - Research institute for Work and Society, Leuven, Belgium (1)

Purpose. Employees in civil society organisations typically are very passionate about their job. Intrinsic goals such as personal growth, good relations with others and contributing to society are important drivers for them. Flemish civil society organisations today experience many pressures to change their way of working and become more effective and productive to be able to survive. Building on insights of the self-determination theory, we expect that an HRM strategy that supports and strengthens the intrinsic goals of the employees might be the crucial way to allow these organisations to survive. High commitment HR practices focusing on development, empowerment and commitment might be more effective than an HRM strategy focusing on productivity in ensuring positive outcomes for both employees and the organisation.

Methodology. We conducted a linked employer-employee survey in fifteen Flemish civil society organisations with at least twenty employees. Using Hayes’ procedure, mediation is tested.

Expected results. We expect to find a positive relationship between high-commitment HR practices and work engagement and innovative work behaviour, and a negative relation with burnout and turnover intentions.

Limitations. Our study is restricted to a limited sample of Flemish civil society organisations. The specific characteristics of civil society in Flanders do not allow us to generalise these findings.

Implications. Civil society organisations should focus their HR strategy on strengthening and supporting the intrinsic work goals of their employees.

Value. This study contributes to a better understanding of the relations between HRM and the self-determination theory.
Purpose: This study aimed to explore the voice of unethical behaviour among police officers. Employee voice is a phenomenon which has received considerable attention but there are few empirical studies specifically examining both voice and unethical behaviour together. The research team sought to draw out the nuances of the sensemaking process, and what influences a police officer to voice or remain silent when they become aware of unethical conduct.

Methodology: The study involved 10 semi-structured interviews with members of the Professional Standards Department of one UK police force. The interview data was analysed using template analysis.

Findings: An initial framework of the voice of unethical behaviour was created which is deemed to be a starting point for the conceptualisation of this construct. In particular, it was found that the voice of unethical behaviour can be considered as a personal judgement call, which may consist of three smaller judgements on breach magnitude, voice consequences and silence benefits.

Value: Studies have shown that where unethical behaviour is not reported, there can be a range of harmful consequences, both for organisations and vulnerable individuals. Thus, this study succeeds in providing guidance to organisations working to increase the voice of unethical behaviour and, as a result, prevent against such harmful consequences.

Limitations: While this study is a strong example of research in a policing context, it is uncertain how much confidence there is in the transferability of the findings into other contexts. Triangulation of the findings is considered to be an essential next step.
Work-life balance and gender equality is an important issue that can impact work related productivity, employees’ wellbeing, stress, burnout, anxiety and mental health. A variety of schemes and policies have been put in place in the United Kingdom by employees, charities and the government to explore, ensure and promote this healthy balance. Athena Swan Charter, set up by the UK by the Equality Challenge Unit (ECU), is a nation-wide initiative committed to gender equality and excellent working practices in Higher Education. It encourages excellence though inclusivity and opportunities for all.

This talk presents a case-study of the School of Social Science at Heriot-Watt University in Scotland, during the Athena Swan Charter application. Data collected via semi-structured focus groups provide an insight into the work-life balance and wellbeing related issues experienced by academic staff. Thematic analysis shows strong links between work-life balance, gender, wellbeing and equal opportunities. Given the methodology, limitations of the study are particularly concentrated around confidentiality, face-saving and feeling free to speak honestly about concerns related to workload and inequality at work in front of other colleagues.

Practical implications of the study include specific actions and policies, with aims to influence good practice checklist, inform organisational culture around equal opportunities and work-life balance and consequently impact employees’ wellbeing.
Purpose

The purpose of this paper is to study how color contrast (complementary vs. analogous colors) affect individuals’ emotions and attitudes towards advertisements and purchase intention in the context of online web banner advertisements.

Design/methodology

Two surveys (Ntotal = 356) were conducted via the Qualtrics platform. The majority of participants were from the US and Estonia. The variables assessed included complementary and analogous color sets, Pleasure-Arousal-Dominance (PAD) scale, attitudes toward advertisements/brands, and purchase intention.

Results

Study 1 showed that the complementary color set of green and red elicited statistically higher levels of pleasure than all other color sets (yellow-violet complementary; orange, orange-red, orange-yellow analogous; and blue, blue-green, blue-violet analogous). In study 2, the green and red complementary color set had more positive attitudes and higher purchase intentions when used as the background of a web banner advertisement than all over color sets.

Limitations

The study used self-reported measures in online surveys, which are subject to biases.

Research/Practical implications

One surprising aspect of our findings was that pleasure seemed to be the only emotion that was correlated to more positive attitudes and higher purchase intentions. This finding is particularly important for marketing advertising, as it shows that a pleasurable color set, when all other factors are held constant (product, text, image) could have a profound effect on consumer’s attitudes towards advertisement and their purchase intentions.

Originality/value

This is one of the first studies focusing on the specific distinction between complementary vs. analogous colors in consumer behavior.
Purpose

This research explores the relation between packaging color and contextual color. Specifically, we were interested in investigating the role of complementary colors (product × store environment) in consumer behavior. We investigated if the choices are product dependent.

Design/methodology

We conducted an online questionnaire (via Qualtrics and Prolific) where 436 participants from several countries compared two scenarios (orange store × blue store) and two products (chocolate × soap). The variables assessed included purchase intention, product attractiveness, and color preference.

Results

Findings suggest an interaction between store and product color significantly affecting both product attractiveness and purchase intention. Importantly, we found that the product category might modulate the complementary color-effect, in terms of attractiveness and purchase intention.

Limitations

The study used self-reported measures in online surveys, which are subject to biases. Additional color combinations and product categories should be tested to generalize our results.

Research/Practical implications

Color preferences are dependent upon the topic and personal characteristics. To test color preferences related to a specific product category, we could hereafter extend our present investigation, also testing other behavioral concepts as the Associative Learning theory (Amsteus et al. 2015).

Originality/value

We verified that the complementary color contrast between the local where products are exposed, and the products themselves, contributes to enhance attractiveness and purchase intention depending on product category. These results confirm and extend prior research that found spatial characteristics, color contrast and interaction to affect consumer behavior.
We consider gamification as a way of game practices systematization in order to increase the training effectiveness for flight crew.

Considering the specifics of flight training and understanding the impossibility of working out every situation that may occur during the flight, and even more so to prescribe and work with the aircraft crews, we suggest focusing on a system of game methods aimed at maintaining the readiness of the flight crew to successfully operate in the whole range of situations: from usual to emergency. At the organizational level, this ensures an acceptable safety level of the Airline's flights.

Since 2016, the International Academy of Human Problems in Aviation and Aeronautics has been implementing the project “Using game techniques in the training of aviation personnel”.

The project has showed that the use of generative games has a good learning effect:

The game “SAFA Inspection” was used during the joint training of pilots and flight attendants (to reduce the inspection requirements for European flights).

The “Limitations” card game was used during the training of pilots on the A-320 (at the theoretical knowledge assimilation stage before training on the simulator).

The game “Flight” was held as part of the Recurrent CRM Training.

Simulator training also includes generative scenarios. The instructor takes the situation to the plane of success by reinforcing the pilots “safe behavior” skill.

A version of parlour game is being currently developed - the “Commander of the Aviation Squadron”, which will serve as an introduction to the specifics of aviation career.
1458 - FACE SIMILARITY DISCOVERY TASK: A TOOL FOR IMPROVING LEADERS’ EXPECTATIONS AND COLLABORATORS’ PERFORMANCE

Davide Pietroni (1) - Sibylla Verdi Hughes (2)

University D'Annunzio of Chieti-Pescara, Dept. of Neuroscience, Imaging and Cognitive Science, Chieti, Italy (1) - University of Padova, Centro Linguistico di Ateneo, Padua, Italy (2)

PURPOSE

Leadership style is strategic for organizational success. Leaders’ expectations of their collaborators’ potential can subconsciously affect leaders’ behaviors and collaborators’ performance. Unfortunately, leadership training programs aimed to capitalize on the powerful Pygmalion Effect largely failed since unaware deception seems essential. We propose that transformational leaders’ expectations towards their collaborators could be unconsciously and effectively triggered by a Transference process based on a Face Similarity Discovery Task (FSDT).

METHODOLOGY

Forty-two consultants of an Italian Training Company were randomly matched with 42 participants and asked to perform a FSDT between “their” participant and their company’s charismatic Founder vs. a Neutral model. Then consultants were videotaped while observing their participant performing the “cookies task”. Finally, participants watched the videotaped facial expressions of the consultant observing their performance and then were asked to repeat the “cookies task” for as long as they wanted.

RESULTS

Consultants found the FSDT task easy. Participants evaluated the videotaped facial expressions of the consultants observing their performance in the Founder condition as significantly warmer, more interested and smiley than in the Neutral condition. Consequently, in the Founder condition participants showed higher motivation in carrying out the “cookies task” for a longer period.

LIMITATIONS

We did not control for a potential “affective prime” induced by the mere exposure to the Founders face during the FSDT.

IMPLICATIONS

Our FSDT seems effective in: unconsciously influencing leaders’ affect and expectations towards their collaborators, modulating the perceived encouragement of leaders’ expressions while observing their collaborators and, consequently, in improving collaborators’ motivation and commitment.
Purpose

Despite growing research on workplace bullying, few studies have examined interrelationships among policy awareness and training, mental health, and workplace mistreatment (bullying and negative acts). We surveyed 15,030 members of a Canadian organization representing provincial public school teachers in English and French. For this analysis we included all usable English surveys (N=3,030).

Design/Methodology

We administered the Negative Acts Questionnaire (Einarsen et al., 2009) followed by participant self-labelling as bullying targets and observers using definitions provided. We measured awareness of and training on provincially-mandated school division harassment and violence prevention policies. We measured mental health by assessing “flourishing” (Keyes, 2002), a composite measure of emotional well-being and social and psychological functioning.

Results

Mean comparison and cross tabulation analyses show that higher policy awareness and training were associated with lower levels of bullying and negative acts and with higher flourishing rates. There were compounding increments to flourishing for policy awareness and training levels even among bullying targets and observers and those experiencing negative acts.

Limitations

Cross-sectional, self-report data limit strengths of this large sample of traditionally hard-to-access employees.

Research/Practical Implications

Policy awareness and training may reduce bullying and negative act experiences and buffer against decrements to mental health. As legislative and regulatory requirements for psychological and physical workplace safety increase, policy and training are important levers for prevention and intervention to improve wellbeing and work experiences for educators.

Originality/Value

This study contributes knowledge of the buffering role on mental health that policy awareness and training play regardless of mistreatment experiences.
INCLUSION AND THE #METOO MOVEMENT: THE IMPACT OF SEXUAL HARASSMENT ON WOMEN AND MALE ALLIES IN THE WORKPLACE

Nicholas Smith (1) - Jennifer Dimoff (1) - Kelly Hamilton (1) - Patrick Lee (1) - Luke Mahoney (1) - Katy McMahon (1) - Whitney Vogel (1)
Portland State University, Psychology, Portland, United States (1)

Purpose
In the era of the #MeToo movement, organizational leaders are increasingly realizing the impact of sexual harassment and discrimination. We provide a multi-method longitudinal examination in which we link sexual harassment to negative outcomes.

Design/Methodology
This study was conducted with a financial firm in the US, and includes qualitative data from 12 employee focus groups (8–12 participants per group) and five semi-structured interviews with executives and quantitative data from a follow-up survey of 104 employees (83% response rate).

Results
Findings from the qualitative data indicated that although leaders of the firm espoused an interest in diversity (with an emphasis on increasing the representation of women throughout the firm), executives and employees disagreed on whether or not sexual harassment and discrimination was an issue inside the firm. Results from the quantitative survey demonstrated that women experienced or observed sexual harassment more than men, which led to worse job outcomes and lower wellbeing. Men who identified themselves as “allies” faced similar negative job and wellbeing outcomes due to increased perceptions or experiences of sexual harassment.

Limitations
The quantitative survey was cross-sectional self-report in nature, however we are currently preparing an additional quantitative survey.

Research/Practical Implications
In this case, we find that the very employees who would be most likely to create and sustain a diverse and welcoming culture, women and men who identify as allies, are the most harmed by inaction.

Originality/Value
This work examines an under-studied sample in the financial industry (a traditionally male-dominated industry) that has international applicability.
EXAMINING THE RELATIONSHIP BETWEEN WORK STRESS AND EMPLOYEE OUTCOMES: A LONGITUDINAL MODERATED-MEDIATION MODEL

David Mayers (1)
University of Calgary, Psychology, Calgary, Canada (1)

The author investigated a new model of stress that extends previous empirical work on the challenge stressor-hindrance stressor framework. Previous research highlights the importance of distinguishing between stress that occurs in relation to hindering aspects of a job (hindrance), and stress that emanates from challenging aspects of a job (challenge). However, little is known about the psychological mechanisms responsible for stress effects. To this end, a model was developed to investigate perceptions of Need-Supply (N-S) fit (the match between employee needs and organizational supplies) as an explanation (mediator) for the relationship between challenge stress and hindrance stress with job satisfaction, affective commitment, normative commitment, and voluntary turnover intentions. In addition, job self-efficacy was proposed to moderate the mediated effect of challenge stress, while self-esteem was proposed to moderate the mediated effect of hindrance stress. A full three-wave panel study was carried out using sample of full time employees from a variety of organizations across a wide range of industries. Generally, the results of this study provide mixed support for perceptions N-S Fit as a mediating mechanism linking stress to employee outcomes. The data failed to support lagged effects of stress on perceptions of N-S fit. The data provided some support for a model where the influence of stress on perceptions of N-S fit happens in the same temporal space. The moderating effects of job self-efficacy and self-esteem failed to find support. Overall, the results suggest that perceptions of N-S fit and job attitudes are relatively stable and resistant to lagged effects of stress over a six month time span. Theoretical implications, limitations, suggestions for future research, and managerial implications are discussed.

Keywords: Job, Stress, Challenge Stress, Hindrance Stress, Perceived Need-Supply Fit, Job Satisfaction, Organizational Commitment, Turnover Intentions
Change fatigue is a detrimental response when individuals perceive organizational changes as being unrelenting and excessive, and impacts workers globally. Public school educators in the United States are experiencing a multitude of reform initiatives, and this seminal study of their change fatigue and related symptoms explores how organizational culture influences the experience of change fatigue.

Results from an online survey of 752 Tennessee teachers and administrators revealed high levels of change fatigue for 86.4%. Turnover intentions were also high, with 40% reporting vulnerability to both job and career turnover. Change fatigue was positively related to turnover intentions and to emotional exhaustion, and negatively related to organizational commitment.

The impact of culture was assessed using Quinn and Rohrbaugh’s Competing Values Framework. As hypothesized, the group culture-type was negatively related to change fatigue as was the developmental culture-type. Unexpectedly, the hierarchical culture-type also correlated negatively with change fatigue. The rational culture-type showed no relationship. These results indicate that strength and supportiveness of school culture, rather than culture-type, may act as a buffer against change fatigue. Additionally, Person-Organization (P-O) fit did not mediate the relationship between the group culture-type and change fatigue, but P-O fit partially mediated relationships between developmental and hierarchical culture-types and change fatigue. The partial mediations suggest that employees whose values match the values of their organization experience less change fatigue. Lack of mediation for the group-culture type suggests that the benefits of the group culture-type persist across differing personal values. Further implications of the study’s findings are discussed.
DESIGN AND VALIDATION OF A SHORT FREE TEST OF GENERAL INTELLIGENCE

Georgi Yankov (1) - Michael Zickar (1)

Bowling Green State University, Psychology, Bowling Green, United States (1)

Purpose. Commercial batteries of intelligence scales take roughly 60 minutes to complete, require proctors, and are paid even for research use. This research describes the development and validation of a short, 10-item measure of general intelligence (g) to serve as a free domain instrument like the Mini-IPIP scale serves for the Big Five.

Design/Methodology/Approach/Intervention. The test structure rests on Cattell-Horn-Carroll’s model of intelligence. It measures the following broad cognitive domains: fluid intelligence, crystallized intelligence, visual-spatial intelligence, working memory, and processing speed. Item calibration involved both classical and IRT methods, and was based on multiple samples collected from 646 college students and 435 Amazon MTurk workers.

Results. Items and the total score are free from differential item functioning gender and race-wise. The total score correlates with the second edition of the Wechsler Abbreviated Scales of Intelligence at .48, with ACT/SAT scores at 29, and with GPA at .24.

Limitations. The validity of the test is still limited. We are currently collecting criterion-related data on job performance to further validate the test, and intend to present this data at EAWOP 2019.

Research/Practical Implications. The test is a brief and economic alternative to proprietary intelligence tests, especially when screening for intelligence in data collections involving many instruments.

Originality/Value/Contribution. This research contributes to the evolving need for open-sourced and valid instruments for use in intelligence-related research.
Purpose: This presentation discusses the impact of a natural disaster on human resource practices post-disaster, the needs of employees, and the steps taken by organizations to address the impact of the natural disaster.

Methodology: A qualitative study was conducted to examine the practices of preparation, immediate response, and post-disaster practices and their impact on employees and on business operations. The research team conducted a 16-item structured interview with experts from human resource (HR) departments or top management members from 20 organizations in Puerto Rico affected by Hurricane Maria.

Results: The results showed similarities and differences in post-disaster HR management approaches among organizations and type of industry. Organizations adapted their HR practices to the post-disaster conditions of destroyed or damaged infrastructure and an impacted workforce.

Limitations: The limitations of the study include those typical of qualitative studies. However, this methodology allowed for a deeper study of organizational processes post-disaster.

Implications for Research and Practice: The results showed that alternative HR practices had to be adapted immediately following disaster. HR initiatives had to be taken to facilitate employee reintegration to work and business operation.

Originality/Value: This research contributes to the limited existing literature on the impact of natural disasters on HR practices, on the employees, on the organizations. The results and lessons learned from the study also shed light on practices that had to be undertaken to face the extreme circumstances of a devastating hurricane that impacted Puerto Rico and its implications for other organizations and countries affected by natural disasters.
TOWARDS A RESILIENT SAFETY CULTURE - TRANSFORMING PEOPLE, SYSTEMS AND PROCESSES

Yuzanne Maré (1)
Institute for Transdisciplinary Development, Change Management, Pretoria, South Africa (1)

An international mining organisation based in Africa initiated a holistic safety performance improvement programme through people, processes and systems. An initial safety maturity review was conducted to, (1) determine the current maturity state within the organisation using an integrated review of the workplace and formal systems as well as employee behaviour, and (2) gain insight into the current maturity state with the intent to design a tailored change process to enable a sustainable safety maturity shift.

All employees were interviewed regarding the safety system and behaviours influencing the maturity index. The survey and qualitative data indicated a compliant culture.

A Generative Participatory Action change approach was used to accelerate the power of the enabling factors identified in the culture. Intervention design was a trans-disciplinary. The organisation’s core values were re-positioned using themes identified through leadership, team development, conversations, storytelling, and continuous evaluation to drive the maturity improvement from a compliant to resilience status. Behaviour change was anchored with systems simplification and organisational process integration.

Improvement was facilitated internationally, with limited client-facing time. The project’s impact reflected influence to family and community beyond original intent. A key outcome is a shift from a rule-following mindset to an altered belief in the importance of safety as a value. The project delivered high momentum change that aimed to make safety personal, concrete and present for all employees.
MORE COOKIES FOR ALL OF US: THE INFLUENCE OF LEADERSHIP ON PROSOCIAL BEHAVIOR WHEN COMPETITION GETS TOUGH

Florian Scholz (1) - Eric Kearney (1)

University of Potsdam, Business Administration / Leadership, Organizational Behavior and Human Resource Management, Potsdam, Germany (1)

Purpose: Sharing knowledge about what sells and what doesn’t sell is probably one of the most important prerequisites for organizational success. Yet whether employees share such knowledge is often a prosocial act: Do I want others to benefit from what I know? As such, prosocial behavior is particularly at risk in highly competitive environments.

Method: In a 2 by 3 factor experiment with 295 participants we tested the influence of servant vs. empowering vs. directive leadership on prosocial behavior under the conditions of high vs. low competition. We randomly assigned participants to one of the six groups where they worked for a fictitious chocolate company and could share or withhold important information that significantly benefitted their co-workers or their own income.

Results: As expected, competition significantly reduced prosocial behavior across all three kinds of leadership. However, followers of servant leaders showed the most and significantly more prosocial behavior when competition was high. It made no difference whether followers had an empowering or directive leader: in both cases they demonstrated less prosocial behavior.

Limitations: When competition was low, we found that only followers of empowering leaders demonstrated significantly less prosocial behavior compared to followers of servant leaders.

Implications: Leadership that strongly role models prosocial behavior (like servant leadership) appears to foster more voluntary prosocial follower behavior in competitive situations than leadership that focuses on personal growth and autonomy or emphasizes clear directions.

Add-on Value: We demonstrate that servant leadership makes unique contributions to follower prosocial behavior.
1491 - LINGUISTIC MARKERS OF HIGH-LEVEL EMPLOYEE TURNOVER

Péter Restás (1) - Zsolt Péter Szabó (2) - Andrea Czibor (1)

University of Pécs, Social- and Organizational Psychology, Pécs, Hungary (1) - ELTE University, Social Psychology, Budapest, Hungary (2)

Purpose:
The aim of this study was to investigate employee turnover intention with narrative and linguistic methods. Our understanding of turnover is based on the psychological relationship between the employee and the workplace. Using narrative methods can provide a richer understanding of this relationship.

Desing/Methodology:
Our research used mixed methods on an employee sample (full time, Hungarian, N=274). It contains demographic factors, work and organizational questionnaires (Employee turnover intention; Identification; OCB; Organizational trust; Organizational Commitment and Organizational Culture). Also, we used a semi-structured interview with questions about workplace stories (Success; Failure; Characteristic story about the workplace in general). Interviews were analyzed with a linguistic and narrative method.

Results:
Our results show that employees with high-level turnover intention mention specific topics significantly more when they describe their workplace (Uncertainty; Feedback; Task description and History of the workplace). Furthermore, they use specific turns of language with a higher frequency in their workplace stories (Negative emotions; Negative evaluation; Us personal pronouns; Them personal pronouns, and Constraint).

Limitations:
Linguistic analysis of workplace interviews is a method in its infancy. There are methodological hardships which need to be overcome. Data was collected on a Hungarian sample, so the results of language-use cannot be fully translated into general conclusions.

Research/Practical Implications:
By using a narrative based method, an organizational research tool can be created for understanding the hidden psychological processes of the workplace.

Originality/Value:
Identifying linguistic patterns in employee narratives can shed light on understanding and predicting workplace behavior, thereby facilitating employee retention.
As workforce aging becomes a global phenomenon, the relationship between HRM and the well-being of older workers is gaining considerable attention. Applying the “why-of-HR-practices” view to the aging context, we examined mechanisms by which two types of HR attributions (older workers’ well-being and cost attributions) influence older workers’ subjective work-related well-being via the mediating effect of occupational future time perspective (O-FTP).

Methodology:
We used three waves of time-lagged data regarding 3,105 full-time employees aged 45-64, working for privately-owned Japanese firms.

Results:
Structural equation modeling revealed that O-FTP at Time 2 acted as a partial mediator between HR well-being attribution at Time 1 and Time 3 employee outcomes, including enhanced subjective work success, increased motivation to continue working, and reduced job apathy. The relationships between O-FTP and these outcomes were strengthened with HR well-being attribution, whereas the relationships between O-FTP and reduced job apathy were weakened with HR cost attribution.

Limitations:
The geographical area of the sample was limited to Japan, which has the highest proportion of older adults in the world.

Research/Practical Implications:
To increase older workers’ O-FTP and well-being, HR practices need to be implemented to enable workers to see enacted practices as the employer caring about them, not as the employer’s intention to cut costs.

Originality/Value:
This study adds value to the existing research on the HRM—well-being link in the aging context by clarifying the role of differential employee attachments in enacted HR practices that vary in terms of their effects on O-FTP and work-related well-being.
Whilst effective leadership is central to organisational success and the wellbeing of employees, it is arguable that our understanding on how leaders perceive their identity is limited, as is the impact of gender, seniority level and cultural differences on the perceptual aspect of role identity.

Much depends on how such investigations are conducted, and on the way in which the issues to examine are determined. Our interviews were structured using the Repertory Grid approach, a technique that allows the participants to identify and verbalise their own construction of themselves as leaders – a very appropriate way to set the terms of an investigation into leadership identity.

Repertory Grid interviews were used to identify the personal constructs of their own leadership identity in a purposive sample of 80 leaders and managers in different seniority levels and cultural backgrounds.

Among the more frequent constructs identified were some that are not currently included in conventional psychometric measures, and some examples are provided from the initial stages of our study to illustrate this point.

Leadership identity is increasingly recognised as a key factor influencing effective leadership performance. Our study has the potential to increase our understanding of theoretical models of leadership, and may contribute to effective practice in leadership selection and development.
Eva Gemzøe Mikkelsen (1) - Annie Hogh (2)

University of Southern Denmark, Department of Psychology, Odense, Denmark (1) - University of Copenhagen, Department of Psychology, Copenhagen, Denmark (2)

Purpose

To evaluate a dialogue-based intervention designed to increase constructive bystander behaviour in negative social situations at work and to prevent risk situations for bullying.

Methodology

Five post intervention group interviews were conducted at a nursing home, an orphanage and a hospital department. Approx. 12 months later, four follow-up group interviews were conducted at the nursing home and the hospital. Interviews were recorded, transcribed and analysed using the method of interpretative phenomenological analysis.

Results

Post-intervention interviews indicated increased awareness of the negative consequences of passive or colluding bystander behaviour and of risk situations for bullying. Follow-up interviews at the hospital department showed that despite a lack of follow-up initiatives, the interviewees reported an increased awareness of constructive bystander behaviour. At the nursing home, the intervention’s positive effect seemed to have lasted. This was partly due to follow-up initiatives that facilitated increased cooperation and trust and employee skills in constructive communication and feedback.

Limitations

The study only included three workplaces and there were no control workplaces. As regards to documenting the effect of the interventions, base-line and follow-up quantitative data would have added to the validity of results.

Practical implications

The intervention may be used by workplaces which aim to prevent bullying.

Value

Given the paucity of research-based knowledge on prevention of bullying including bystander interventions, the study yields valuable knowledge to the field of research.
1499 - THE DARK SIDE OF JOB CRAFTING: IS TASK CRAFTING ALWAYS HEALTHY?

Elisa Lopper (1) - Annekatrin Hoppe (1) - Jan Dettmers (2)

Humboldt-Universität zu Berlin, Department of Psychology, Berlin, Germany (1) - Medical School Hamburg, Hamburg, Germany (2)

Purpose: Job crafting - a form of proactive behavior - describes a process of shaping one’s job so that task and social relationships at work suit individuals’ abilities, preferences and needs (Wzresniewski & Dutton, 2001). One of three job crafting activities involves changing the form, scope or number of one’s tasks at work – namely task crafting.

Previous research has established positive effects of job crafting on wellbeing. These studies haven’t focused on specific job crafting activities and only looked into linear relationships. It is also conceivable that, at a certain degree of permanently crafting one’s tasks, employees fail to do their actual tasks, feel overwhelmed or need to invest more time in finishing their work, which could in turn lead to lower levels of wellbeing.

Approach: In this study, we therefore proposed a curvilinear relationship between task crafting and work-related wellbeing. Furthermore, we explored, whether autonomy, self-efficacy and time pressure moderate these relationships.

Results: In a three-wave longitudinal panel with 171 employees in Germany hierarchical polynomial regression confirmed non-linear relationships between task crafting (T1) and the wellbeing variables emotional exhaustion (T3), cognitive irritation (T3), and work engagement (T3). Contrary to our assumptions, moderate levels of task crafting were associated with a) higher emotional exhaustion, b) higher cognitive irritation and c) lower work engagement, compared to low and high levels of task crafting. Only autonomy moderates the curvilinear relationships of task crafting with emotional exhaustion and cognitive irritation such that more autonomy strengthened the relationships.

Implications: These unexpected results are being discussed.

Quelle:

PERCEIVED CAREER SUPPORT: THE INTERACTION OF SUBORDINATE AND SUPERVISOR GENDER IN THE NORWEGIAN POLICE SERVICE

Hege H. Bye (1) - Brita Bjørkelo (2)

University of Bergen, Department of Psychosocial Science, Bergen, Norway (1) - Norwegian Police University College, Oslo, Norway (2)

Purpose

Many organizations are aiming at becoming more diverse, especially at higher levels of the organizational hierarchy. Understanding factors that influence the career trajectories of employees from underrepresented groups is therefore important. One such factor is receiving career support from supervisors. The purpose of this study was to investigate the relationship between subordinate and supervisor gender and subordinates’ perceptions of career support at different levels of the organizational hierarchy.

Design/Methodology /Approach

We conducted a survey in the Norwegian Police (N = 2956, response rate = 31 %). The questionnaire contained questions about respondent gender, gender of the immediate supervisor, leadership level, and perceived career support.

Results

Preliminary analyses indicate that the relationship between subordinate-supervisor gender similarity and perceived career support did not vary significantly across organizational levels. Men and women perceived equal levels of career support overall, but women were less supported by male supervisors than men were. There was no evidence of a “Queen bee” – effect; rather there was a tendency for women to receive more, not less, career support from female supervisors.

Limitations

We excluded top-level managers due to sample size limitations at the highest hierarchical level.

Research/Practical Implications

The difference in perceived support from male supervisors among male and female subordinates is small, but may still have practical implications for women’s career trajectories.

Originality/Value

The large sample makes it possible to investigate whether the nature of the relationship between subordinate and supervisor gender and perceived career support varies across levels of the organizational hierarchy.
**ENGAGEMENT IN HEALTHY FOOD: A STUDY ON THE PSYCHOLOGICAL DETERMINANTS OF FREE-FROM PRODUCTS CONSUMPTION**

MARIAROSARIA SAVARESE*, GUENDALINA GRAFFIGNA*

*Faculty of Psychology, ° Faculty of Agriculture, Food and Environmental Sciences
**Department of Psychology
**EngageMinds HUB – Consumer & Health Research Centre
Università Cattolica del Sacro Cuore

Purpose
Among Functional Foods, “free-from” products are gaining attention (Sirò et al., 2008); in Italy it seems to potentially become a new healthy food trend. Despite they have been broadly studied from the economic and agricultural perspective, it lacks a consumer understanding. This research investigates representations, attitudes, motivations behind the consumption process from a consumer psychology perspective.

Methodology
A systematic literature review mapped the psychosocial determinants of the functional foods consumption; a quantitative phase explored the relation between attitudes, knowledge and consumption (sample: 120 Italian consumers), a qualitative study built the psychosocial process of “free-from” products consumption, as prototypical category (20 Grounded Theory interviews).

Results
The psychosocial determinants of functional foods consumption have been studied so far with a cognitive-behavioral focus, but it lacks a dynamic and multidimensional look; in the Italian context there seems to be a gap between the consumption (66% of the sample) and the awareness (only 27%) of functional foods, but they are related to health prevention; the interviews highlighted how this gap can be explained by a complex and multifaceted process of identity reconfiguration consumers make when they decide to change their food style by integrating these products as part of a healthier diet.

Limitations
More research should be done to explore the other functional foods categories; a verification of the qualitative model should be implemented.

Practical Implications
This results can open the door to consumer education interventions towards healthier food models.

REFERENCES
Employees often need to adapt to situational demands as well as shift their mindset, preferably supported by a broad and adaptable work-related behavioral repertoire. Early in their careers psychologists and social workers are still developing said repertoire, which tests their work related psychological flexibility. Considered a personal resource, psychological flexibility moderates work-related stress. However, prolonged lack of personal and organizational resources would impair the development of adequate behavioral repertoires, possibly to the extent of hampering work related psychological flexibility.

Purpose

We hypothesize that improved work-environment supports the development of relevant professional behavioral repertoires and strengthens work related psychological flexibility.

Approach

In 2018 (P2) we sent a survey to 5176 newly graduated psychologists and social workers in Sweden, of whom approximately 3800 previously received our 2017 (P1) survey. We will use the P1 and P2 ratings of psychosocial work environment to sort participants into No-, Positive- and Negative-change categories respectively. Thereafter we will measure intra-individual changes in work-related psychological flexibility per category, as well as inter-group differences in P1 to P2 change.

Preliminary results

In a cluster analysis on P1 data, results indicated that individuals in well-balanced work-environments rated their psychological flexibility higher than those in high-demands-low-resources contexts. Suspecting a direct or indirect influence of demands-resources (im)balance, we expect psychological flexibility at Point 2 to reflect changes in work-environment from Point 1 to Point 2.

Limitations

All results are based on self-reported survey data.

Practical implications and originality

Significant results would indicate that early career work-environment influences work-related psychological flexibility.
THE ERROR AVERSION CULTURE: CONTRIBUTE TO WORK ERRORS AND MEDIATING ROLE OF NEGATIVE EMOTIONS

Maria Luisa Farnese (1) - Roberta Fida (2)

Sapienza University of Rome, Department of Psychology, Rome, Italy (1) - University of East Anglia, Norwich Business School, Norwich, United Kingdom (2)

Purpose. Literature has recently suggested that organizational cultural orientation toward errors (namely, EC: error culture) is a key factor for reducing the negative consequences of adverse events and their further occurrence. However, studies have mostly focused on “positive” approaches (i.e., EC-management) while disregarding the “negative” ones (i.e., EC-aversion). Specifically, to the best of our knowledge, no studies examined the relationship of EC-aversion (composed by the two strain and covering up facets) with work errors.

We aimed to examine this relationship, and also the mediating role played by negative emotions (i.e., social emotions: guilt, embarrassment, shame; and anxious emotions: worry, anxiety).

Design/Methodology/Approach/Intervention. We tested a structural equation model on a sample of 353 employees (64.9% females, mean age 38.9 years, SD = 10.02) working in 81 teams of different organisations. Analyses took into account that employees were nested in teams.

Results. Results confirmed the association between EC-aversion and work errors (i.e., mistakes and slips). Further, the relationship between the strain facet and mistakes/slips was fully mediated by negative emotions, whereas the covering up facet was associated with mistakes/slips also directly.

Limitations. Main limits are subjective measurements to investigate employees’ perceptions about effective errors and cross-sectional nature of our data (need for longitudinal studies).

Originality/Value. Overall, this study highlights the importance of cultural dimensions in the error handling process, showing the pivotal role of negative emotions in increasing the likelihood of making secondary errors.

Key words: Error culture, error aversion, negative emotions, work errors
Purpose. Knowledge represents a crucial drive for competitive advantage, being the base for the organization's intellectual capital. The SECI model (Nonaka, 1994) is the most well-known conceptual framework for knowledge generation in organizations. To date, however, few questionnaires tried to measure it and few empirical studies supported its theorization. The present twofold study aims to contribute to the validity of the SECI model by testing a multidimensional questionnaire (KMP-Q), designed to capture the knowledge conversion modes theorized by Nonaka.

Design/Methodology/Approach/Intervention. Study 1 studied the KMP-Q 8-dimensions structure (i.e. mentoring practices, knowledge sharing, team reflexivity, organizational memory, organizational communication, use of technology, HR training, personal development) through a confirmatory factorial analysis on 372 Italian employees working in different sectors. Study 2 replicated the factor structure on 466 health-workers, and further investigated the unique impact of each dimension on some organizational outcomes (i.e. performance, innovativeness, collective effectiveness).

Results. Results pointed out the good psychometric properties of the questionnaire in terms of both dimensionality and construct validity (the different knowledge generation dimensions were specifically linked to organizational outcomes).

Limitations. Self-report data and cross-sectional designs are the main limitations of the study.

Research/Practical implication. KMP-Q is a psychometrically robust questionnaire that may contribute to actualize and verify the SECI model. Moreover, by proposing a multidimensional systemic view of generation processes, the KMP-Q allows to detect strengths/weaknesses of KM policies and related programs.

Originality/Value. To the best of our knowledge, this is one of the first attempts to propose a comprehensive measure of knowledge generation in work contexts.

Key words: Knowledge management; Nonaka; SECI model
Purpose: While research has started to explore the role of work intensification for employee health and well-being, the role of leadership in this context of acceleration have yet been unexplored. The current study is based on the assumption that leaders can be a causal agent of acceleration and introduces the concept of accelerating leadership. We examine the relationship between accelerating leadership and outcomes such as commitment, cynicism, or alienation in interaction with the employees’ stress-mindset. We propose an indirect effect of accelerating leadership on organizational attitudes and behaviors, which is mediated via identification with the leader. Furthermore, we propose the employees’ negative stress-mindset to intensify this indirect effect.

Design/Methodology/Approach/Intervention: In order to test this model, we conducted a two-wave-survey study (N = 144) with a time lag of one week.

Results: The data support our hypothesized model. We found a negative relationship between accelerating leadership and organizational commitment and identification with the leader and a positive relationship between accelerating leadership and cynicism towards the leader, alienation from work, and time-related counterproductive work behavior. Furthermore, identification with the leader mediated the relationships between accelerating leadership and all outcomes. Moreover, employees’ stress mindset moderated the respective indirect effects.

Limitations: Our data cover rather short-termed effects of accelerating leadership, whereas more long-term effects remain to be shown.

Research/Practical Implications: The results underline that accelerating leadership is a meaningful construct and shed some light on the role of leaders in an accelerated organizational and societal context. Future research

Originality/Value: Our study is among the first to introduce and empirically test the concept of accelerating leadership.
1510 - APPROACHING RETIREMENT IN THE ELDERLY CARE SECTOR: A QUALITATIVE STUDY OF OLDER WORKERS’ PERCEPTIONS OF WORK AND LATE CAREER PLANNING

Marta Sousa-Ribeiro (1) - Linda Persson (1) - Magnus Sverke (1) - Petra Lindfors (1)

Stockholm University, Department of Psychology, Stockholm, Sweden (1)

Purpose

This study aimed at investigating how older nursing assistants working in elderly care experienced aging at work and perceived their psychosocial work environment, as well as exploring the role of work- and organizational factors in their retirement preferences.

Design/Methodology/Approach/Intervention

Semi-structured interviews were conducted with eight nursing assistants (age 55–61 years), and working in residential care. Data were analyzed using the Interpretative Phenomenological Analysis approach.

Results

The analysis identified four super-ordinate themes: 1) meaning of work; 2) psychosocial work environment; 3) experience of aging; 4) retirement decision-making. Work was experienced as demanding, characterized by high workload, time pressure, and low control. Furthermore, participants perceived few possibilities for job crafting and were concerned about being unable to manage their workload once they got older. A main driver for working after retirement was the possibility to work on one’s own terms and to reduce current job demands.

Limitations

While the small and homogeneous sample limits generalization, it allows for a detailed investigation of the subjective experiences of this group of older workers. Yet, studies in different occupational groups and organizations are needed.

Research/Practical Implications

Findings highlight the importance of healthy psychosocial work environments and organizational practices that promote sustainable work and successful aging in the workplace.

Originality/Value

Due to an accelerated demographic aging, it is important to increase the knowledge of how nursing assistants approaching retirement in the elderly care perceive opportunities and constraints to them prolonging their working life. Furthermore, qualitative studies, particularly among blue-collar occupations, remain few.
1511 - SELF-OTHER AGREEMENT AND GENDER DIFFERENCES IN PERCEPTIONS OF LEADERSHIP STYLES: A MULTI-RATER STUDY USING THE LEADERSHIP CIRCUMPLEX SCAN

Emily Knowles (1) - Jeromy Anglim (1)
Deakin University, School of Psychology, Melbourne, Australia (1)

Purpose: The Circumplex Leadership Scan (CLS; Redeker, de Vries, Roukhout, Vermeren, de Fruyt, 2014, EJWOP, 23, 435-455) is a psychometrically sound multi-rater leadership assessment tool that measures eight leadership styles which are arranged in a circumplex defined by the axes of agency and communion. The current study examined how self-other agreement varied across dimensions of the CLS and assessed the degree to which male and female leaders’ ratings vary across leadership styles. Method: The sample consisted of 458 Australian leaders (40% female). In addition to self-ratings, 6008 other-raters (i.e., direct reports, peers and managers) rated the focal leaders on the CLS. Results: Results indicated that self-other agreement was higher for the authoritarian and directive leadership styles (r = .49 and r = .48) than for charismatic dimensions (r = .25 and r = .24). Female leaders placed greater importance on the participative leadership style (d = 0.20). Female leaders were rated higher on inspirational (d = 0.44), coaching (d = 0.52) and participative (d = 0.24) leadership styles. Limitations: Despite the benefits of other-ratings, both self and other ratings may both be influenced by biases, and caution is required when generalizing findings regarding gender differences to other countries and contexts. Practical Implications: This research has implications for understanding how the objectivity of leadership assessment, and perceptions of gender differences, vary across leadership styles. Originality: This study provides the most comprehensive female sample of leaders – allowing for contrast of gender differences in leadership styles – using the CLS to date.
FILLING THE PUZZLE: USING THE E-WORK WELL-BEING SCALE (EWW) TO DETERMINE LINKS BETWEEN REMOTE E-WORKING AND COGNITIVE WEARINESS AND PSYCHOSOMATIC CONDITIONS

MARIA CHARALAMPOUS (1) - CHRISTINE GRANT (2) - CARLO TRAMONTANO (2)

Coventry University, COVENTRY, United Kingdom (1) - COVENTRY UNIVERSITY, COVENTRY, United Kingdom (2)

Purpose

Working anywhere, at any time, is a growing trend in today’s organisations (Ter Hoeven & Van Zoonen, 2015). Remote e-working was found to be associated with different spheres of individuals’ working lives (Allen, Golden, & Shockley, 2015). However, a recent review suggests that the elements of cognitive and psychosomatic well-being are vastly unexplored (Charalampous, Grant, Tramontano, & Michailidis, 2018). Hence, the current study uses the newly developed E-Work Well-being (EWW) scale to shed light upon how remote e-working links to individuals’ cognitive and psychosomatic well-being.

Design/Methodology

An online survey was administered to 202 participants. Exploratory Factor Analysis suggested that the cognitive and psychosomatic well-being dimensions of the EWW scale tapped the theoretical constructs. Correlations also indicated links between these dimensions and existing well-being measures.

Results

Preliminary findings show that remote e-workers’ cognitive weariness positively linked to their psychological distress and sleeping problems, negatively linked to their general well-being, detachment from work, and self-efficacy. Also good psychosomatic conditions were associated with positive emotions, job satisfaction, organisational commitment, and were negatively associated with emotional exhaustion. Ergonomics were also found to relate to remote e-workers’ psychosomatic well-being.

Limitations

A snowballing method was used to collect data, which eliminated researchers’ control over the recruited sample.

Research Practical Implications

The EWW scale will enable individuals and their organisations to better understand the impact of remote e-working, and technology use, on well-being at work.

Originality/Value

The current study not only provides an innovative tool to monitor and assess remote e-workers’ well-being at work; but also investigates understudied links between remote e-working, and cognitive, and psychosomatic well-being.

References:

Robotics offer the opportunity to counteract the foreseeable elderly care crisis. Previous work, summarized for instance in Frennert and Östlund (2014), focuses on aspects of general interest (acceptance, ethical concerns etc.) for social robots with emphasis on their interaction with elderly people. Because existing reviews include studies from both domestic and professional care, a lack of overview can be observed with regard to the usage of robotics in nursing homes from a work organization perspective. The present review aims at filling that gap.

From September to November 2018 a systematic review in following Grant and Booth (2009) is conducted. Due to predefined keywords and databases there can be no claim to an exhaustive overview of the literature.

The review is based on the hypothesis that the majority of published studies focus on a more domestic usage of robots as well as their main interaction with elderly, care-dependent people. In contrast, the influence of robotics on professional caregivers and the embedding in their work process is expected to be less examined. Furthermore, a lack of large samples and long-term studies or quantitative research can be assumed.

Conclusions are drawn concerning future research of robot application in nursing homes. It is discussed, how far different study designs can help to deepen our knowledge of the employees' needs in and attitudes toward the usage of robotics in the nursing home context.

By exemplifying the need for research, attention is drawn to further technical and work design potentials that can be exploited.
Purpose. The Syrian civil war contributed to the refugee and migration crisis in the world, resulting in more than 600,000 people fleeing to Germany applying for asylum. Subsequently, European countries like Germany are forced to think of integration strategies to incorporate newcomers in their society. Still little is known about integration and distress of Syrian refugees in Germany. The objective of the present research is, using the Multi-dimensional Individual Difference Acculturation (MIDA) model and building on findings with immigrant groups, to analyze the role resources have for refugees’ integration and distress.

Methodology. A sample of 260 Syrian refugees, recruited in language training centers in Germany, answered based on the MIDA model questionnaires on psychosocial resources, acculturation and psychophysical distress in Arabic language. Correlations, hierarchical and multivariate regressions were carried out to analyze the role resource have for the refugees’ integration and distress.

Results. As hypothesized, psychosocial resources, including psychological well-being, cultural competence and out-group social support, were positively related to integration and negatively to psychophysical distress. Psychosocial resources were found to be a statistically significant predictor for the integration of refugees.

Limitations. Although literature states that acculturation is not a static concept but changing over time and depending on specific situations, the current study is cross-sectional. Future research should use a longitudinal design.

Value & practical implications. This study is extending acculturation research on refugees, including further psychosocial personal, contextual and cultural resources. Findings can be used in national policy making for successful integration of refugees within European societies.
ACHIEVEMENT MOTIVATION IN THE SYSTEM OF PROFESSIONALLY-IMPORTANT QUALITIES OF INTERNATIONAL TRADE ORGANIZATION MANAGERS

Inna Ptukha (1)
Kyiv National University of Trade and Economics, Chair of Psychology, Kyiv, Ukraine (1)

Purpose. To analyze the indicators of motivation in the structure of international trade organization managers' professionally important qualities. The research was based on the concepts of motivation of H. Hekhauzen and Yu. Orlov and the concept of entrepreneurial activity polymotivation (L. Karamushka, O. Kredentser, M. Korolchuk, Yu. Pachkovsky).

Design. The research was conducted in international trade organizations on a sample made up of 50 efficient managers (experts) and 120 candidates for manager positions using D. Leontiev Life Orientations, Yu. Orlov Assessment of Achievement Motivation and Schwarzlander Assessment of Aspiration Level. The obtained scores were divided as follows: 1-3 points - low, 4-7 points - average and 8-10 points - high levels of professionally-important qualities.

Results. 1. In international trade organizations, both experts and manager candidates had high achievement motivation (9.5±0.5 and 8.4±1.6 points respectively), which implied the respondents' determination, diligence, purposefulness, readiness to assume responsibility, ambiguity tolerance, readiness to take risks and competitiveness (the characteristics that determine individuals' success in life). 2. Levels of achievement motivation statistically differed in different age groups of manager candidates in international trade organizations (p<0.01). 3. The respondents did not statistically significantly differ in other professionally-important qualities.

Limitations. The research was conducted in a small number of Kyiv-based companies.

Practical Implications. Achievement motivation is of prime importance in the system of individuals' professionally-important qualities, hence the Assessment of Achievement Motivation questionnaire may be recommended for selecting international trade organization managers.

Originality. This was the first research in Ukraine into international company managers' professionally important qualities.
1525 - LEVERAGING WORK DESIGN TO PREVENT CARELESS RESPONDING DURING ONLINE SURVEYS

MK Ward (1) - Jia-xin Tay (1) - Sharon Parker (1)
Curtin University, Future of Work Institute, Perth, Australia (1)

Purpose
Online surveys enjoy widespread use because of their speed, access and convenience. A disadvantage is the threat of careless responding (CR) defined as responses from people who have not given adequate attention to an item. CR can create psychometric problems and preventing CR has been ineffective. Online surveys can be conceptualized as work, especially on platforms such as Mechanical Turk (MTurk), and work design literature exhibits robust relationships between enhanced work characteristics and performance. The current study tests a new prevention strategy based on principles of good work design.

Design/Methodology
We conducted an online survey study with Mechanical Turk workers using an experimental design with random assignment to one of two conditions: control vs. enhanced work design (EWD; in which autonomy, feedback, and task significance were boosted). Outcome variables were multiple indicators of CR and attrition.

Results
Initial results show those in the EWD condition took more time on the survey and answered more consistently across similar items, and were more willing to take additional measures.

Limitations
By enhancing several aspects of work design simultaneously limits our ability to isolate effects of individual facets of work design. However, multiple work design variables co-exist in reality.

Research/Practical Implications
The results suggest that work design principles could help reduce CR in online surveys and improve the quality of data.

Originality/Value
This study was the first to apply work design principles to address CR. The results showed promise and also improved our understanding as to why CR occurs.
Purpose

Research suggests that actual change might undermine engagement and lead to burnout, but little is known about the effects of anticipated change (employee perceptions regarding an imminent change) on these variables and what moderates this relationship. We invoke the Conservation of Resources theory (Hobfoll, 1989, 2001) and respond to calls in the literature (Arnold, 2017) to examine how dimensions of transformational leadership (TL) act as ‘social’ resources that buffer the negative (positive) impact anticipated change has on employee engagement (burnout).

Design/Methodology

We adopted a time-lagged design and collected data at two time points (6 months interval) from 647 employees nested in 139 teams in a hospital in Malta. We developed a scale to measure anticipated change and used multilevel structural equation modelling (Preacher et al., 2010) to test the hypotheses.

Results

At the individual level, different dimensions of TL interact with anticipated change to drive work engagement and reduce burnout via enhancing the personal accomplishment dimension.

Limitations

Concerns may arise because of the low internal validity (non-experimental design) and external validity (hospital setting in Malta). Future research is invited to replicate our results using experiments and in different contexts.

Research/Practical implications

We address calls in the literature (Arnold, 2017) to examine the relationship between TL and employee well-being by investigating dimensions and contextual factors.

Originality/Value

Our study considers the impact of employee perceptions of an imminent change on well-being and highlights the importance of managing employee well-being when change is about to happen. One effective way to do this is by exercising TL.
Although Prosocial Organizational Behavior has been researched for decades, it probably reached its peak of popularity when Grant (2013) introduced the concept of givers, takers and matchers, bringing to attention the differentiation of successful versus self-sacrificing giving and its implications for success and well-being. Mäthner and Lanwehr (2017) linked this popular concept to existing theory and research, proposing a three-dimensional framework of self-sacrificing, integrative and self-serving cooperation motivation and developing a psychometric questionnaire for self-assessment. Cooperative behavior is by most organizations being promoted because of its assumed positive outcomes, however, the authors propose, that self-sacrificing motivation is associated with potential negative side effects for the individual.

In a first study, the questionnaire was validated with N= 976 employed workers from a variety of industrial sectors. The three-dimensional factor structure has been confirmed. Self-sacrificing can indeed be differentiated from integrative cooperation motivation. In a subsequent study with N=593 employed workers, the interrelations to occupational related health-promoting and -endangering behavior and experience patterns (Schaarschmidt & Fischer, 2008) are being examined. The results indicate that self-sacrificing giving correlates to relevant indicators which are associated with a higher risk for burn-out.

Although the study is conducted cross-sectionally and based exclusively on self-reports, relevant conclusions about the risks and implications of self-sacrificing giving motivation can be drawn. The developed questionnaire provides an efficient diagnostic measure and offers a subliminal starting point for individual burn-out prevention. Implications for further research are being discussed.

Sources

INSIDE-OUT: THE CONTRIBUTION OF TRUSTWORTHINESS AND ACADEMIC SOCIALIZATION TO FUTURE EMPLOYABILITY

Maria Luisa Farnese (1) - Stefano Livi (2) - Paola Spagnoli (3)

Sapienza University of Rome, Department of Psychology, Roma, Italia (1) - Sapienza University of Rome, Department of Social and Developmental Psychology, Roma, Italia (2) - University of Campania "Luigi Vanvitelli", Department of Psychology, Caserta, Italia (3)

Purpose. University students’ expectations of future employability is related, among others, to external employability cues useful to reduce uncertainty. Anyhow, little is known about this process. This study aimed to verify the link between trustworthiness in professors’ ability (i.e. a cognition-based mechanism to reduce uncertainty) and self-perceived employability. Moreover, drawing from Social Identity Theory and Organizational Socialization frameworks, it aimed to delve deeper into this process, hypothesizing that professors’ trustworthiness may contribute to the students’ socialization by enhancing their inclusion and understanding of the university context; and this, in turn, may lead to students’ future employability both directly, supporting their learning processes, and indirectly through identification with future professionalism.

Design/Methodology/Approach/Intervention. We conducted a cross-sectional survey study on a sample of 548 Italian university students.

Results. Results of a regression model showed that the direct effect of trustworthiness in professors’ ability on future employability is reduced when compared with the socialization-identification mediated model. Trustworthiness is also directly related to identification with the future professionalism.

Limitations. Self-report data and cross-sectional design were the main limitations.

Research/Practical implication. Findings offer some insights on the awareness that professors should have about their contribute both on students’ socialization and on their future professional career. Findings also highlight the relevance of the inclusion process that, from socialization into the university context, extends to the identification with the future professionalism.

Originality/Value. This study contributes to the existing literature by providing initial evidence of the role of trustworthiness as a cue for uncertainty reduction also for self-perceived employability, through the socialization-identification pattern.

Key-words: ability trustworthiness, academic socialization, employability.
Purpose: Crossover as a transmission of positive and negative moods, emotions, and dispositions between closely connected people has been shown to be an important source of individuals’ psychological states and experiences. Whereas crossover research has mainly focused on partners in intimate relationships, this study extends recent research on crossover processes in the leadership context. By taking a longitudinal perspective, it focuses on the direct leader-follower crossover of positive affect and the role of follower emotion regulation within this crossover process.

Design: We applied a longitudinal study with two measurement occasions (time lag: 2-3 weeks) among 53 leaders and their 205 followers.

Results: Applying multilevel hierarchical linear modeling revealed that leaders’ positive affect experienced at T1 predicted changes in followers’ positive affect at T2. Furthermore, this relation was fostered by followers applying the beneficial emotion regulation strategy of reappraisal. Both the direct and moderated crossover effect were in turn indirectly related to followers’ work engagement at T2.

Limitations: This study relies on self-report data.

Implications: The present study contributes to crossover research in the leadership context highlighting that leader affectivity even predicts changes in follower positive affect and in turn work-related behavior.

Originality: First study to support the transmission of positive affect between leader and follower in a field context. The longitudinal perspective even allows to depict changes in follower affectivity. By including follower emotion regulation as boundary condition, it further supports a follower perspective in leadership research.
Purpose. Although the diversity and inclusion topics are attracting growing interest in recent years, the existing scales mainly measure the perception of discrimination or specific attitudes towards individual diversity categories (such as gender or age or race etc.). This study presents a new instrument, Organizational Diversity & Inclusion Scales (ODIS, Menatta, Caligiuri, Bianchi, Borgogni, 2018), that measures concurrently the perceived discrimination, the attitudes towards main types of diversities (gender, disabilities, aging, ethnicity, LGBT) and the perceptions of inclusive organizational policies.

Methodology. The analyses were carried out on a sample (n=1784) from both public and private Italian organizations. Face and content validity were examined through a jury of experts who evaluated clarity and appropriateness of each item. In order to verify the internal validity, EFA and CFA were carried out by randomly split-half the collected sample. The validity of construct and criterion were examined through correlation analyses with other scales already validated in the Italian context.

Results. The results show good psychometric properties of the instrument confirming factorial structure.

Limitations. A cross-sectional study design was used.

Research/Practical Implications. The present study proposes a new instrument to measure the degree of inclusion and diversity within the organizational context and also the perception of organizational policies allowing to plan targeted actions.

Originality/Value. ODIS represents the first instrument that measures organizational diversity and inclusion on three levels simultaneously: self-reported individual level (perceived discrimination), hetero-referenced individual level (attitudes towards specific diversities) and organizational level (perceptions of diversity management).
The number of informal self-employed workers in Chile has been increasing, which has generated concern in the political environment, for reasons such as the precarious working conditions in which they work and the lack of social protection, generating a "belief" that these workers they have a "bad life".

The purpose of this research is to study the life satisfaction of informal self-employed workers in the Ñuble Region (Chile) and to be a promoter of future research in the country.

For this case, 280 informal self-employed workers were applied the "Scale of Satisfaction with Life" created by Diener et al. (1985). This measurement obtained a coefficient of Cronbach's alpha of 0.870. In addition, the same scale was applied to 280 salaried workers, as a control group, which obtained a coefficient of Cronbach's Alpha of 0.718.

The first results show that 92.9% of informal self-employed workers say they are satisfied with life and only 7.1% feel dissatisfied. Similar results were obtained in salaried workers, even the latter being lower in satisfaction with respect to affirmations referring to achieving important things in their lives and re-live life in the same way with which, for this case the political belief is invalidated and it reaffirms what is indicated by Veenhoven (1991) and Dienner (2000) that the well-being of people is subjective, so it is necessary to include it as an indicator in the generation of public policies in the country, as they point out Odermatt and Stutzer (2017).

Keywords: Self-employment, Satisfaction with life, Subjective well-being, Ñuble Region.
Purpose: Work demands may threaten sleep quality in railway employees. The current actigraphy study tests whether daily work stressors (time pressure, shift work, social stressors), work resources (control and social support), and mental detachment from work predict sleep quality even when demands and control after work are controlled in analyses. Design/Methodology: Fifty-two railway employees participated in data collection during five consecutive work days. Multilevel regression models were applied.

Results: Analyses confirmed social stressors from supervisors to predict more frequent sleep fragmentation, and lower sleep efficiency (% sleeping). Higher levels of daily time control predicted shorter sleep-onset latency and better self-reported sleep quality. Detachment after work was negatively related to social stressors and time pressure at work but unrelated to indicators of sleep quality and did neither mediate nor moderate the social stressors from supervisors-sleep quality relationship.

Limitations: The current study did not control for sleep threatening environmental factors like noise. The small sample size is a limitation of the current study. Meanwhile as long as cross-level interaction is not in focus like in the current investigation power seems to be acceptable (Maas and Hox, 2005).

Practical Implications: Work redesign that increases time control and decreases social stressors is recommended to preserve daily recovery in railway employees.

Originality/Value: Inclusion of task-related and social stressors at work as well as private stressors and control over leisure time is an advantage.
ASSESSING CUSTOMER SERVICE ACROSS CULTURES

Alanna Harrington (1) - Jonathan Gove (1) - Paul Yarker (1)
Cubiks, Guildford, United Kingdom (1)

Purpose:
The study examines the generalisability across cultures of a situational judgement test designed for use in a customer service/retail context.

Design/Methodology:
276 individuals piloted the measure in Germany, Poland, Spain and France and their responses were analysed. Based on the candidate’s responses, out of 36 items sixteen items were rekeyed and three items were removed as there were significant differences between different countries. The SJT was implemented across the organisation in nine different countries and the responses of 7000 individuals were examined after one year.

Approach/Intervention: An analysis of item option endorsement was undertaken to examine congruence between the scoring key and the response tendencies of participants from different countries. Differential item functioning was examined to determine whether items perform consistently across cultural groups.

Results: Results are pending completion of the final stage of analysis in November 2018. It is expected that some differences will be observed due to differing cultural expectations of service quality (Furrer et al., 2000).

Limitations: Results are based on one organisation and so may not be generalisable, and may be influenced by different practices in operating regions.

Originality/Value: The study extends the research by Lievens et al., (2015) by examining the transportability of an SJT across multiple different cultures and languages. From a practitioner perspective, it adds valuable evidence to inform decisions as to whether the same SJT can be applied to selection and development processes across different countries fairly and consistently, which is crucial as more organisations move to adopt global HR practices.
1544 - RESILIENCE, STRESS APPRAISALS AND THE INFLUENCE OF PAST SPORTING EXPERIENCES ON FUTURE WORKPLACES SUCCESS

Christopher Bryan (1) - Deirdre O'Shea (2) - Tadhg MacIntyre (3)

University of Limerick, Kemmy Business School, Limerick, Ireland (1) - University of Limerick, Personnel and Employment Relations, Limerick, Ireland (2) - University of Limerick, Health Research Institute, Limerick, Ireland (3)

Purpose

Development is a lifelong process and scientists have been interested in the personal assets and coping strategies that can be developed through sport but benefit adolescents in all walks of life and future work (Coakley, 2011). Resilience is often seen to be fostered through adverse environments together with high emotional support (Masten, 2001). Sport is increasingly seen as a vehicle for positive youth development, this research bridges the gap of office workers resilience behaviours and effects of past sporting experiences.

Design/Methodology

This investigation was carried out on office workers across eight Irish companies (n=101) by conducting a four-part longitudinal survey over an eight-week period. R Studio (Version 0.96.122) was used for Exploratory Structural Equation modelling.

Results

The analysis suggested that employee resilience was influenced by past sporting events and consistent with research carried out in other contexts, challenge appraisals was the best predictor and significantly higher in those employees who had persisted longer in competitive sports.

Limitations

Testing across four time point’s lead to a high dropout rate, while the lack of a specific resilience scale minimised the fluctuations in resilience captured.

Research/Practical Implications

Results offer empirical evidence of how past sports participation rather than just sporting success may develop resilience in future careers. Management implications are outlined, and new perspectives offered regarding HR recruitment procedures.

Originality/Value

To our knowledge, this study is the only research specifically focused on past sport behaviours and implications for human capital and recruitment.
Purpose. Within the last decades, empirical evidences showed that workers experiencing thriving at work tend to develop innovative work behaviors, tend to reduce turnover and perform better (Carmeli & Spreitzer, 2009; Wallace et al., 2013). The study aimed to analyze the mediating effect of thriving at work in the relationship between organizational trust, innovative work behavior and extra-role performance. Methodology. A group of 230 employees participated to the study. Data were collected using a questionnaire encompassing the following measures: Organizational Trust scale (Ferres & Travaglione, 2003), Thriving at work scale (Porath et al., 2002), Innovative work behavior scale (Scott & Bruce, 1994) and Extra role performance scale (Podsakoff et al., 1990). Results. The bootstrap analyses showed a positive indirect effect of thriving at work on innovative work behaviour and on extra-role performance. Organizational trust showed a positive and significant direct effect on innovative work behaviour and a positive but not significant direct effect on extra-role performance. Limitations. Cross-sectional study and convenience sample through self-reports answers. Practical implications. Results confirmed the role played by a people-based approach to HRM underlining its implications for organizational behaviour and individual adjustment. Value. A strength of the study was its contribution to the investigation of the effects of thriving at work on the relationship between trust and organizational behavior in the Italian context.
The Regulation of Resilience at Work: Growth Curve Models of Resilience During Major and On-going Life Events

Christopher Bryan (1) - Deirdre O'Shea (2) - Tadhg MacIntyre (3)

University of Limerick, Kemmy Business School, Limerick, Ireland (1) - University of Limerick, Personnel and Employment Relations, Limerick, Ireland (2) - University of Limerick, Health Research Institute, Limerick, Ireland (3)

Purpose

This study investigates the stability of resilience and its self-regulatory influencers in order to sustain in goal directed behaviours at work. Resilience processes have been categorised by Bonanno and Dininich (2013) in relation to an adaptability to react to either chronic or acute stressors. Organisational environments involve achievement motivated environments with both major and everyday stress where individuals are required to regulate their emotions (Tugade & Fredrickson, 2007). This investigation focuses on short-term processes within common office workers which act as a rich and dynamic natural laboratory of resilience fluctuations in mentally healthy individuals’ undergoing goal-oriented behaviour (Uphill, Lane, & Jones, 2012).

Design/Methodology

This investigation was carried out on office workers across eight Irish companies (n=101) by conducting a four-part longitudinal survey over an eight-week period. R Studio (Version 0.96.122) was used for all data cleaning and testing of growth curve models in conjunction with time-varying covariates.

Results

Results showed that within-person changes in social uplifts, and emotion regulation strategies to persist in goal directed behaviour were positively and reciprocally related to within-person changes in resilience; social uplifts were also a positive predictor of within-person changes in emotion regulation strategies to persist in goal directed behaviour, but not vice versa. Major life events were uncommon and accounted for small yet significant amount of change in all other variables.

Limitations

Testing across four time point’s lead to a high dropout rate, while the lack of a specific resilience scale minimised the fluctuations in resilience captured.

Research/Practical Implications

These results offer empirical evidence of how organisational HR departments can optimally managed employee resilience to sustain goal-directed behaviour during on-going and major life challenges.

Originality/Value

To our knowledge, the study is the only research specifically focused on resilience processes in mentally healthy individuals during short term chronic stressors.
Purpose: Why are some employees engaged, whilst others are not? Do individuals react differently to same demands. The overall purpose of the study was to examine whether there are individual differences, relating to personality, in the extent to which peoples work demands impact their work engagement (WE).

Methodology: A sample of 122 UK workers were surveyed about their perceived challenge and hindrance demands in their daily work, their levels of WE, and their personality characteristics. Specifically, conscientiousness, extraversion and neuroticism were predicted to have different moderating effects.

Results: Multiple moderated regression analysis was conducted. Findings showed that challenge demands were positively related to overall WE; however, the negative relationship between hindrance demands and WE were not significant. Moreover, the interaction of demands and personality traits did not impact overall WE level, on any of the predicted characteristics.

Limitations: The study was cross-sectional and was conducted using a heterogeneous sample of employees working in different organisations. Future studies should consider homogeneous occupational settings to understand the relevance of demands to particular settings.

Research Implications: The study aimed to address the variances observed within the literature on Job Demands-Resource model, that job demands can be classified as challenges and hindrances. Employees life stage and job status may influence stable personality traits and therefore narrower facets of personality may reveal different relations with WE.

Originality: Past research has not explored personality as a moderator in the relationship between challenge and hindrance demands and WE.
Purpose: Our study aims to investigate the trait-state dynamics of dark personality traits (e.g., amoral manipulation, distrust) and bright personality traits (e.g., empathy, trust) under different work situations (positive or negative). We expect that employees’ dark personality traits are more likely to be translated into dark states when encountering negative work situations (e.g., unfairness), leading to negative work outcomes. Employees’ bright personality traits are more likely to be translated into bright states when encountering positive work situations (e.g., empowering leadership), leading to positive work outcomes.

Design: This study applies a weekly survey design over five consecutive working weeks. One pre-measurement (baseline survey) assesses all stable employee traits. Five identical weekly surveys measure all concepts that fluctuate weekly: state-level of personality, work situations and work outcomes.

Results: Data collection is ongoing among Dutch employees. We strive for 450 data points from a sample of 150 respondents in the end (presently 300 data points from 115 employees are available). Preliminary analyses showed that ICCs for the state level of personality variables ranged between .55 to .77, which indicates that 45% to 23% of the personality variance may result from with-person fluctuations.

Limitations: Only self-report measures are employed in the current study.

Research/Practical implications: Taking into account both the state and the trait level of personality advances our understanding of how personality interacts with situations to predict human behavior at work.

Originality/Value: Our study applies a diary approach to personality research and integrates both dark and bright personality into the same design.
Purpose: The goal of this study was to obtain an accurate understanding of how work engagement fluctuates from moment to moment throughout the day and across the span of a week.

Design/Methodology/Approach/Intervention: Drawing upon the revised version of Job Demands-Resources (JD-R) model, I examined momentary work engagement in relation to its moment-level and person-level antecedents. In investigating the relevant hypotheses, I employed the experience sampling method (ESM), where the participants used their smartphones as signaling and data-entering devices.

Results: The participants included 65 workers who were asked to fill out a survey, and then report their momentary experiences five times a day for five days. Results of multilevel modeling based on 1,124 observations revealed that momentary work engagement contained 77% of within-person and 23% of between-person components. The results further indicated that challenge demands—doing hectic and complex tasks—positively predicted the outcome, whereas hindrance demands—doing unclear and emotionally charging tasks—did not. In addition, the availability of momentary resources—doing meaningful tasks with high autonomy, along with a sense of confidence and optimism—positively predicted momentary work engagement.

Limitations: Some limitations include an exclusive reliance on self-report assessments and a limited between-level sample size.

Research/Practical Implications: Gained insights on the momentary predictors can expand the literature on the JD-R model and help facilitate the optimization of day-to-day experiences at work.

Originality/Value: The smartphone-enabled momentary assessment seems to be a promising tool for researchers and managers to obtain fine-grained, realistic picture of engagement at work.
THE ROLE OF TENURE AND JOB SATISFACTION IN THE PROSPECTIVE RELATIONSHIP BETWEEN WORKPLACE BULLYING AND INTENTION TO LEAVE: A MODERATED MEDIATION MODEL

Mats Glambek (1) - Johannes Gjerstad (2) - Ståle Einarsen (1) - Morten Birkeland Nielsen (2)

University of Bergen, Department of Psychosocial Science, Bergen, Norway (1) - National Institute of Occupational Health, Oslo, Norway (2)

Abstract

Purpose. While the relationship between workplace bullying and intention to leave is well established, there is still a lack of research on the mechanisms of the association. In the present study, we investigate whether bullying targets’ inclination to quit is mediated by job satisfaction and if it is stronger among relatively new employees.

Design/methodology. We employ a representative sample of employees from the Norwegian workforce (N=975), with data collected at two time-points with a six-month lag. Using the Process macro supplement to the statistical package SPSS, hypotheses were tested in a moderated mediation model.

Results. As hypothesized, exposure to bullying behaviors predicted increased stability adjusted intention to leave over time. The reverse causation model was non-significant. Moreover, the association was fully mediated by job satisfaction, and tenure moderated the relationship between bullying and job satisfaction, with long tenure acting as a buffer in the relationship.

Limitations. Single source biases may represent one limitation of the present study. However, with the use of a stability adjusted mediator and outcome, possible inaccuracies associated with such biases are minimized.

Research/practical implications. In revealing that negative consequences of bullying depends on the target’s tenure, the present study should have implications for scholars and practitioners with respect to understanding and tackling workplace bullying, especially with respect to turnover intentions among those newly employed.

Originality/value. This is one of few studies to investigate the mechanisms of the bullying-turnover relationship, and possibly the first to address tenure as a moderator.
1564 - PAY, PAY INEQUALITY AND DEPRESSED WELL-BEING

Neil Conway (1) - Marion Fortin (2) - Gregor Bouville (3) - Eric Campoy (3)

Royal Holloway, University of London, Management, Surrey, United Kingdom (1) - University of Toulouse, Toulouse School of Management, Toulouse, France (2) - Université Paris Dauphine, Management & Organisation, Paris, France (3)

Purpose: To examine the combined effects of pay and pay inequality on psychological wellbeing using a needs satisfaction framework underpinned by self-determination theory.

Design/Methodology: Drawing on a large scale UK nationally-representative dataset of 14,804 employees nested within 1,752 workplaces, we test hypotheses that lower pay levels will associate with workplaces that fail to support self-determined environments (i.e., fail to support employee autonomy and competence), where lower levels of pay, autonomy support, and competence support associate with lower overall need satisfaction, which in turn relates to negative affective well-being. We further hypothesize that pay level will have stronger effects on overall needs satisfaction in workplaces characterized by high pay inequality (the Gini index), and the direct effects of pay inequality on overall need satisfaction will be moderated by the extent workplaces operate individualized performance-related pay, with pay inequality positively affecting need satisfaction in workplaces practicing individualized performance-related pay, but a negative effect elsewhere.

Results: Findings support hypotheses.

Limitations: Cross-sectional data.

Research/Practical Implications: A need satisfaction analysis explains how lower pay results in negative affective well-being. The findings raise concerns that pay’s associations with lowered autonomy and competence support further impoverish the psychological experience of low paid work, and that workplace pay inequality significantly shapes the context surrounding need satisfaction.

Originality/Value: Pay inequality is globally accepted as a major current societal concern and is growing particularly since the 2008 global financial crisis. While economists, sociologists and some psychologists have researched pay inequality, it has been neglected in organizational psychology.
1555 - NARRATIVE IDENTITY OF GERMAN STARTUP FOUNDERS

Matthias F. C. Hudecek (1) - Anja Krzystek (1) - Sophia Schlederer (1) - Dennis T. John (1)
FOM Hochschule, München, Germany (1)

Purpose
Psychology of life stories suggests that individuals construe their own life as authors (McAdams, 2006). The purpose of this qualitative study was to explore how personal and professional life experiences are incorporated into the narrative identity of startup founders.

Design/Methodology /Approach/Intervention
Conducting 15 narrative interviews with German startup founders using a modified version of the Life Story Interview (McAdams, 2008), participants were asked to think about his or her life as if it were a book. Key scenes (high, low and turning point) and life themes were described in detail. All interviews (duration from 90 minutes to 2.5 hours) were audio-recorded and transcribed. Each transcript was analyzed for five main themes derived from empirical literature on narrative identity: Agency, Communion, Redemption, Contamination and Meaning Making.

Results
Results showed similar patterns of the main themes across participants. All founders had high values of Agency and Redemption. Meaning Making and Communion were present in all interviews on a medium level, whereas Contamination was found only scarcely.

Limitations
More interviews are needed to validate these results.

Research/Practical Implications
Results are of particular interest to better understand personality and contributors of entrepreneurship and could be used to develop specific coaching programs to support startup founders. Future research could – based on more interviews – examine how these specific patterns of narrative identity have evolved. In addition, it could be explored whether and how the narrative of founders influences their organizations and its cultures.

Originality/Value
This study is the first in Germany that investigated narrative identity of startup founders using the presented methodology.
Purpose
The banking sector in South Africa is currently being challenged to persistently assess and improve its processes in order to keep up with the rapidly changing financial landscape. Change is never easy, but during times of change workplace trust is challenged optimally. The purpose of this research was to investigate the role of workplace trust (i.e. trust in the organisation and trust in the immediate supervisor) in the job satisfaction and work engagement of employees in this sector.

Design/Methodology/Approach/Intervention
A quantitative research approach was adopted, using a cross-sectional design to collect data; participants were selected through convenience sampling (n = 214). For analysis, Mplus was used for structural equation modelling.

Results
Trust (trust – in organisation and supervisor) influenced job satisfaction significantly. Employees’ physical engagement was significantly influenced by work trust in the organisation, while their emotional engagement was significantly influenced by work trust in the supervisor. Lastly, job satisfaction caused an indirect effect on the relationship from work trust (organisation and supervisor) to work engagement.

Limitations
The study was cross-sectional in nature. The sample size was relatively small; yet representative of the entire population.

Research/Practical Implications
Management can create awareness and roll out training initiatives that highlight the significance of trust, work engagement, and job satisfaction, through tailor made training that targets line managers.

Originality/Value
Banks can actually improve their credibility and restore their reputations if the impact of trust on the work engagement and job satisfaction of employees can be understood.
TIMES OF UNCERTAINTY: HOW ARE LEADERSHIP AND TEMPORAL FOCUS RELATED TO STRESS?

Wendelien van Eerde (1) - Annemieke Bulters (1)
University of Amsterdam, Amsterdam, Netherlands (1)

Purpose. The purpose of this study was twofold: 1) to test how visionary leadership is related to employees’ insecurity about the future, and this in turn to their levels of stress, and 2) to examine how temporal focus on the past, present, or future is related to uncertainty and stress.

Approach. Due to the energy transition, employees in the utility sector are likely to feel uncertain about the future, as there are many changes possible, but no clear answers yet. 478 participants (47 supervisors) in a Dutch utility company responded to a questionnaire. Visionary leadership, temporal focus, quantitative job insecurity, qualitative job insecurity, and strategic uncertainty were assessed, as well as stress.

Results. We show, using a PROCESS procedure, that the relation between visionary leadership and stress is mediated by quantitative and qualitative job uncertainty. In addition, we found that the supervisors’ future temporal focus is negatively related to followers’ strategic uncertainty regarding the organization. Employees’ future focus was unrelated to their perceptions of uncertainty and stress, whereas the stronger employees focus on the past, the more stress they report. Present focus was negatively related to stress.

Limitations. Only one measurement, in one organization, was obtained.

Implications. Visionary leadership may help to alleviate the effects of uncertainty in changing contexts. Knowledge on temporal focus may help organizations understand and deal with the uncertainties associated with change.

Originality. This study contributes to the research on leadership and stress, where temporal focus has not been researched before.
1573 - OCCUPATIONAL MOBILITY AND SUSTAINABLE CAREERS: DOES OCCUPATIONAL MOBILITY RELATE TO HAPPINESS, HEALTH, AND PRODUCTIVITY OVER TIME?

Ivana Igic (1) - Andreas Hirschi (1) - Katja Dlouhy (2) - Guri Medici (3) - Gudela Grote (3)

University Of Bern, Department of Work and Organisational Psychology, Bern, Switzerland (1) - University of Mannheim, Department of Management, Mannheim, Germany (2) - ETH Zürich, Department of Management, Technology and Economics, Zürich, Switzerland (3)

11.1 Career (planning and management; patterns and mobility; Occupational choice and careers guidance)

Occupational mobility and sustainable careers: Does occupational mobility relate to happiness, health, and productivity over time?

Ivana Igic (1) - Andreas Hirschi (1) - Katja Dlouhy (2) - Guri Medici (3) - Gudela Grote (3)

University Of Bern, Department of Work and Organisational Psychology, Bern, Switzerland (1) - University of Mannheim, Department of Management, Mannheim, Germany (2) - ETH Zürich, Department of Management, Technology and Economics, Zürich, Switzerland (3)

Purpose

The sustainability of careers (i.e., staying happy, healthy, and productive over time) is increasingly important due to demographic change, longer working life and the dynamics caused by digitization. However, the relation between mobility, a key topic in current careers, and sustainability of careers remains uninvestigated. Based on theories of human capital, conservation of resources, and embeddedness we propose that occupational mobility may be harmful to sustainable development, as it may lead to a loss in human capital, depletion of resources, and inhibition in developing strong occupational social ties.

Design/Methodology/Approach/Intervention

The study is based on a ten-year longitudinal data set with 6 waves among young workers (N =1123). Occupational mobility scores over 10 years were calculated and related to trajectories of (non-) sustainable career paths defined by indicators of health, happiness, and productivity based on growth mixture modeling.
Results

We identified three meaningful patterns that describe (non-)sustainable careers over a 10 year time span: “Sustainable - growth”, “Sustainable - maintenance”, and “Non-Sustainable- decline” which significantly differed in levels of occupational mobility in the expected direction.

Limitations

We focused on a young sample below age 30, which limits variance in occupational mobility and time.

Research/Practical Implications

We show that occupational mobility can have negative effects on developing a sustainable career.

Originality/Value

We link occupational mobility to sustainable careers within a large sample and over 10 years. We take a long-term dynamic perspective and explore sustainable career development in relation with “accumulated” mobility, considering not just intra-, but also inter-individual changes.
A MULTIGROUP SEM ANALYSIS OF THE MODERATING INFLUENCE OF CULTURE ON WORKPLACE DEVIANCE BEHAVIOUR IN INDIA AND USA

Kanimozhi Narayanan (1)
Aston university, work and organisational psychology, Birmingham, United Kingdom (1)

Purpose
Previous research on deviance behaviour has concentrated predominantly in the USA despite proof that Indian organizations are indeed affected by workplace deviance (Pradhan & Pradhan, 2014): both destructive and constructive deviance. In addition, from the deviance perspective, surprisingly no study so far has examined the presence and effects of individualism and collectivism within the same culture at the individual level. Thus the present study will determine the moderating influence of culture on workplace deviance with climate and witness behaviour towards deviance using a social cognitive perspective.

Design/Methodology /Approach/Intervention
Multigroup invariance analysis were used on all the constructs and the developed model was tested in India (n=404) and the USA (n=583) via Amos 22.0 using Multigroup structural equation modelling (SEM) analysis.

Results
The results revealed that irrespective of nationality individual’s cultural orientation did have a moderating effect on the relationship of the determinants with workplace deviance.

Limitation
The common method bias of the Self-reported data was acknowledged in the research by taking into account both procedure (Podsakoff et al. 2003) and empirical assessments (Malhotra, Kim, & Patil 2006).

Research/Practical Implications
The presence of individualist and collectivist within the same culture provides proof of individual difference, thus suggesting that while hiring, assessment of this aspect would provide more information about an individual’s expected behavioural outcome.

Originality/Value
The study is the first to analyse the effect of culture using social cognitive theory as a lens with Multigroup SEM in deviance literature thus contributing to both theory and methodology.
Tomokazu Takeuchi (1) - Norihiko Takeuchi (2)
Gakushuin University, Department of Management, Tokyo, Japan (1) - Waseda University, Graduate School of Business and Finance, Tokyo, Japan (2)

Purpose:
Applying a person-environment fit perspective to the contexts of newcomers’ career development and adjustment, the present study examines a sequential mediation model wherein newcomers’ career exploration behavior during their job search leads to post-entry work adjustments via the person-vocation (P-V) fit and its resulting expected level of present job utility in regard to attaining career growth opportunities.

Methodology:
To test this hypothesized model, we used time-lagged data of 111 newcomers, who worked for privately-owned firms in Japan, collected via four waves of surveys over nine months.

Results:
Structural equation analyses demonstrated significant paths from career exploration behavior at Time 1, through P-V fit at Time 2, and expected present job utility in regard to attaining future career growth opportunities at Time 3, to three adjustment outcomes at Time 4 (affective commitment, job satisfaction, and reduced turnover intentions). Indirect effect tests confirmed that P-V fit at Time 2 and expected present job utility at Time 3 acted as sequential mediators.

Limitations:
The geographical area of the sample is limited to Japan; therefore, caution is needed when interpreting the results.

Research/Practical Implications:
Findings strongly support the notion of continuity in career development from pre-entry career exploration experiences to post-entry work adjustments.

Originality/Value:
This study adds value to the existing research on newcomer adjustments, which has focused primarily on newcomers’ post-entry experiences in regard to facilitating adjustments. Using multi-wave, time-lagged data, our findings establish the connection between individuals’ pre-entry career exploration behavior and their post-entry work adjustments.
Purpose – Sustainable careers are careers that enable workers to be employable currently and in the future, while remaining healthy, happy, and productive. Although personal agency has been studied as a critical antecedent of sustainable careers, there has been an ongoing call for research that investigates the contribution of contextual, and specifically organizational, factors. The current study answers this call and examines the interaction between specific health and developmental practices implemented by organizations and individual career adaptability in relation to employees' sustainable careers operationalized through perceived employability and well-being.

Design – Survey data are collected among 458 employees nested within 136 organizations in the Netherlands. We included employees from small (23.8%), medium (37.2%) and large (39%) organizations from various industries. We analyzed the data using multilevel regression in MPlus.

Results – Results indicate that employability perceptions and well-being vary both between individuals and between organizations. Individuals’ employability perceptions and well-being relate positively to career adaptability. In addition, the differences in employability and well-being of workers across organizations are, after controlling for the organizational size, significantly attributable to the differences in the implementation of organizational practices oriented towards employee development and health.

Limitations – Future research should use multi-source data for measuring organizational level variables. Additionally, longitudinal research is needed to assess the long-term outcomes.

Implications – Implementation of specific health and developmental practices might contribute to employees’ sustainable careers.

Originality – This study adds to the scholarly literature on employability and sustainable careers by looking into organizational-level factors complementing individual level-level research that dominates the field.
Purpose

Drawing on the work environment hypothesis and conflict escalation theory, the aim of this study is two-fold; first to investigate the potential detrimental effects of work group-level conflicts on workplace bullying, and second to investigate whether laissez-faire leadership moderates this relationship.

Design/methodology

We conducted a survey among the employees of a university in the Netherlands (N=871), where the participants were nested in 55 working groups, each group with one leader. We chose multilevel analysis based on the hierarchical data structure. Task conflicts were measured and analysed at the group-level (level 2), while laissez-faire leadership by the immediate superior, as well as workplace bullying were measured and analysed at the individual level (level 1).

Results

The analyses showed a significant main effect of group-level task conflicts on workplace bullying (B=.365, p<.001). Furthermore, the relationship between group-level conflicts and workplace bullying were stronger for individuals experiencing higher levels of laissez-faire leadership (B=.200, p<.001). Hence, the findings supported both hypotheses.

Limitations

Self-report single-source measures were applied. Due to the specific sample, the generalizability of our findings are limited.

Research/Practical implications

The present study highlights the importance of leaders recognizing and dealing with group conflicts, even when the conflicts are task-related; as leaders’ inactivity and avoidance of leadership will probably foster such conflicts to develop into bullying.

Originality/Value

To our knowledge, this is the first study to employ a multi-level design to investigate and show a strengthened relationship between group-level task conflicts and workplace bullying through higher levels of laissez-faire leadership.
Purpose

Fairness in allocating monetary rewards greatly contributes to a positive employment relationship which is conducive towards promoting positive individual and organisational outcomes. Money should not be used as a Band-Aid; not everything can be remedied with money. Although money is important, it is, however, not the most important factor in retaining talent. This study investigated the importance of monetary rewards in retaining talent in the utility industry in South Africa.

Design/Methodology/Approach/Intervention

In this qualitative research approach, a purposive sample (N = 15) was taken from managers (n = 6) and permanently employed lower-level staff (n = 9) from an organisation in the utility industry, tapping into their experiences of possible reasons for the high turnover propensity and severe exodus of skilled employees. Data were transcribed, where after the content was coded into themes.

Results

Monetary rewards and the fairness with which they were allocated were indeed important in retaining talent, but sound leadership qualities in managing employees effectively also influenced talent retention. Lastly, turnover propensity was imminent where employees did not experience job satisfaction.

Limitations

Qualitative research might be influenced by the researcher’s own prejudices and idiosyncrasies. The researcher endeavoured to exclude any prejudice by constantly reflecting on the research process.

Research/Practical Implications

Skills loss implies an exit of valuable intellectual capital and competitive advantage; therefore, organisations can no longer ignore factors that hamper their retention strategies.

Originality/Value

Organisational efforts to improve situational circumstances for employees will promote positive individual and organisational outcomes. The fair allocation of money through strong leadership can prevent organisational disruptions such as strikes and other incidents of labour unrest.
Carrying for the Carers: The Role of Emotions in Compassion Among Doctors and Nurses

Ian Fletcher (1) - Sabir Giga (1) - Gordon Jackson-Koku (1)
Lancaster University, Lancaster, United Kingdom (1)

Purpose: The emotional demands of healthcare work are well documented, however, the role of different emotional processes in managing the affective impact on compassion remain under-researched. The study investigated the influence of emotion regulation, emotional competence, cognitive fusion, and emotional contagion on compassion in hospital-based doctors and nurses.

Methodology: Participants were randomly sampled and recruited from a large teaching hospital in the UK. They were requested to complete an online survey with measures that assessed the relationships between; compassion (satisfaction and fatigue), emotional regulation strategies (cognitive reappraisal or emotional suppression), cognitive fusion, and emotional competence (intrapersonal and interpersonal).

Results: A total of 513 participants were recruited into the study. Approximately 41% of the variance in compassion fatigue and 27% of the variance in compassion satisfaction scores were explained by emotional regulation strategies (cognitive reappraisal) and levels of intrapersonal emotional competence. Moderation analyses identified that intrapersonal emotional competence was a significant moderator of cognitive reappraisal for both compassion satisfaction and compassion fatigue.

Limitations: The cross-sectional design limits interpretations of causality and recruiting from a single hospital restricts generalisability of findings.

Practical implications: Focusing on the value of both cognitive appraisal and ways to enhance intrapersonal emotional competence skills during professional training and post-qualification will enhance abilities to manage stress in emotionally charged settings (hospitals). Targeting these emotion processes will also help to maintain and enhance compassion satisfaction and reduce compassion fatigue.

Originality: This is the first study to investigate the influence of different emotion processes on compassion in doctors and nurses.
The purpose of this paper is to examine the relationships between the emergent concept of fear of expatriation with further workplace fears (economic crisis and dangerous working conditions) and with mental health problems.

Design - The study uses a quantitative design. Self-reported data were collected from 265 Italian expatriate workers assigned to both Italian and worldwide projects.

Results - Structural equation model analyses showed that fear of expatriation mediates the relationship of mental health with fear of economic crisis and with perceived dangerous working conditions. Results revealed that Model 3 had an AIC of 7301.58 compared to an AIC of 7290.35 for Model 1, suggesting that the hypothesized full mediation model represents a superior fit to the data than the non-mediation model (ΔAIC = 11.23). As expected, in addition to fear, worries of expatriation are also related to further fears.

Limitations - Although, the study is based on self-reports and the cross-sectional study design limits the possibility of making causal inferences, the new constructs introduced add to previous research.

Research/Practical Implications

Our results confirmed our innovative hypothesis and we suggest that companies’ key people take into account the construct of fear of expatriation for business health purposes. With this in mind, companies need proper advice from qualified consultants such as occupational physicians and industrial psychologists.
1589 - A DEEPER LOOK AT CONSTRUCT VALIDITY OF ASSESSMENT CENTERS - WHICH BEHAVIORS DO ACTUALLY MATTER?

Simon Breil (1) - Mitja Back (1)
University of Münster, Psychological Assessment and Personality Psychology, Münster, Germany (1)

Purpose
What is and what can be measured within Assessment Centers (ACs)? This question has engaged selection researchers for the last decades, but left them with confusion and disagreement. To move beyond the general exercise vs. dimension discussion we took a deeper look into (interpersonal) behavior shown in ACs. Specifically, we aimed at 1) identifying specific behavioral cues relevant for performance differences and 2) analyzing their structure and optimal combination in predicting performance.

Design/Methodology
Data of an actual (speed) AC for the selection of medical students (N = 203 applicants, 60 judges) was used, which focused on short interpersonal role-plays. The whole AC was videotaped and trained experts rated over 50 specific behavioral cues (e.g., upright posture, statements of support, hectic facial movements, fluent speaking) within three stations.

Results
SEMs showed that behavioral differences can be reduced to the broader constructs of Agency, Communion, Nervousness and Intellectual competence which all influence subsequent performance judgments. Furthermore, using a machine learning approach, we identified specific behavioral combinations that had a strong impact on subsequent judgments.

Limitations
While results are somehow consistent across stations they need to be replicated within other ACs (longer/different stations) and other samples (professionals).

Research/Practical Implications
Our results offer first hints of what can and cannot be distinctively measured within ACs and how one can design stations to evoke individual differences in desired behaviors/skills.

Originality/Value
As a first approach to micro-analytically investigate behavioral differences within an actual AC, this study provides a new understanding of what ACs can measure.
Mindfulness and Creativity: The Mediating Role of Exploration Behaviors

Corinne Beauchemin (1) - Frédéric Mallette (1) - François Courcy (1) - Francesco Montani (2)

Sherbrooke University, Psychology, Sherbrooke, Canada (1) - University of Monaco, Organizational Behavior and HRM, Fontvieille, Monaco (2)

In Canada, competitiveness performance continues to lag peer countries due to weak innovation capacity (1), which is often associated with creativity. To support innovation, researchers must find individual levers to promote creativity. Chaskalson (2011) suggested that mindfulness impact positively some workplace outcomes, including creativity (2). Past research showed that the relationship between mindfulness and creativity depends on one of the fourth mindfulness components (3), but fewer examined this relationship through the theory of ambidexterity. This theory suggests that the interaction of exploration and exploitation behaviors could promote the creativity performance of employees (4-5). In this study, the authors have selected the descriptive component (the ability to describe verbally the phenomena observed) (3) and the exploration (the ability to explore new avenues) (6). Thus, describing each detail and exploring all facets of the idea should increase creativity. This study examines the mediating effect of the exploration behaviors between description and creativity, which, to the authors’ knowledge, has not been examined yet. In this crosssectional study, 237 workers were recruited from various Canadian companies. They completed mindfulness skills (KIMS-Short) (7), exploration behaviors (8) and creativity (9) questionnaires. The basic assumptions being respected, the indirect effect analysis conducted with PROCESS (10) found a positive link between description and creativity (r²=44.55%). These results provide empirical support for the theory of ambidexterity to foster creativity among employees. But, the self-reported questionnaire used to measure creativity could be influenced by common measurement biases. Future research should attempt to find more empirical data to support this lever.

References:

Why do we keep interrupting ourselves? Investigating affective and situational conditions that support self-interruptions.

Purpose:
Today employees struggle to focus on their work. First, there are external triggers calling for attention. Second, internal interruptions occur frequently distracting employees. The question why people interrupt themselves and under which circumstances self-started interruptions occur remains unanswered. The purpose of this study is to gain knowledge about the causes of self-interruptions and the situations in which they take place.

Design/Methodology:
We used a critical incident technique in an online questionnaire. Participants (N=101) reported either a situation in which they worked focused or a situation in which they interrupted themselves (e.g. by starting a second task). The questionnaire further contained the Activation-Deactivation-scale and the DIAMONDS scale to gather information about the participants affect and the situations characteristics in which the interruption took place.

Results:
Analysis of variance revealed significant differences within situations for intellect (MFocused=5.77 vs. MInterrupted=4.71; F(1,99)=12.82 p=.001), duty (MFocused=6.37 vs. MInterrupted=5.99; F(1,99)=3.34 p<.05), sociality (MFocused=3.95 vs. MInterrupted=4.77 ; F(1,99)=3.60 p<.05) and for positive activation (MFocused=5.22 vs. MInterrupted=3.87; F(1,99)=41.06 p<.001). Other situational characteristics of the DIAMONDS showed no significant difference between the groups.

Limitations:
The design of the study does not allow causal interpretation and further results are only based on cross-sectional analysis which slightly restricts informative value.

Research/Practical Implications:
Further research is necessary to clearly identify under which circumstances internal interruptions occur. Moreover, a daily perspective on the reasons for internal interruptions will help to identify patterns of interruptions during work.

Originality/Value:
No research on situational and affective conditions of internal interruptions has been published yet.
Purpose: To describe the first evidences of a community-based participatory research project (namely, Place4Carers) aimed to co-design an innovative organizational model of social services for family caregivers of elderly citizens living in the remote area of Vallecamonica. This innovative service model should be a way to guarantee ageing-in-place processes as well as higher families’ inclusion and engagement in a more effective partnership with the welfare system and the local health organizations.

Methodology: Place4Carers features 7 work packages. Currently the first two faces were conducted. WP1 consisted of an extensive survey on unmet needs and expectations for support of the population of family caregivers receiving services in Vallecamonica. WP2 consisted of a scoping literature review on existing interventions to engage family caregivers living in remote areas. Furthermore, additional focus groups were aimed to co-generate ideas for shaping caregiver oriented services and organizational models.

Results: For WP1, 95 patients and 35 caregivers have been identified. Patients suffered from high impacting disabilities and are needed for ongoing assistance. Caregivers were mainly females, mean 60 y.o and with a low level of education. Scoping review in WP2 resulted in only 14 interventions on elderly’s caregivers living in remote areas, which were mainly focused on psychological, educational and organizational support. Wp2’s 3 focus groups have discovered a lack of information about available services and of psychosocial and networking support.

Limitation: The impact of Place4Carers activities should be conceivable as local. However, since it includes actions and strategies in order to assess the generalizability of the insights produced to other extra-urban contexts in Lombardy we are going to have some insights about results’ exportability.

Originality and practical implications: Place4Carers moves from the depth understanding of local people needs in order to orient welfare services improvement and help in setting achievable goals of improvement for service organization. Place4Carers’ results are going to contribute to deliver more value to elderly citizens and health and social system, while making the welfare processes and organization more efficient and effective.
1599 - SICKNESS ABSENCE OF NURSES WORKING IN RESIDENTIAL ELDER CARE: BOTH JOB- AND HOME-RELATED?

Velibor Peters (1) - Angelique E. de rijk (2) - Josephine Engels (3) - Inge Houkes (2) - Ijmert Kant (4)

Maastricht University, Faculty of Health, Medicine and Life Sciences, Maastricht, Netherlands (1) - Maastricht University, Faculty of Health, Medicine and Life Sciences, Maastricht, Netherlands (2) - HAN University of Applied Sciences, Faculty of Health and Social Studies, Nijmegen, Netherlands (3) - Maastricht University, Faculty of Health, Medicine and Life Sciences, Maastricht, Netherlands (4)

Objectives Sickness absence is an important problem of nurses working in elder care. However, determinants in the home situation are often neglected. Further, the nurses’ work schedule fit with private life might be an important job resource that could prevent sickness absence. Also, the pathways to sickness absence are still poorly understood: is it via health or via motivation? Therefore, the present study investigates the role of home demands, home and job resources with respect to sickness absence among nurses working in residential elder care, and whether these relationships are mediated by health or motivation.

Methods Longitudinal (SEM) analyses with a one year follow-up among 365 nurses were performed. Analyses were based on survey data including home demands, home and job resources, health complaints, motivation and registered sickness absence data. Analyses were controlled for the type of work schedule, working hours, job demands, age, education and gender.

Results This study shows that more job resources like work schedule fit with private life can prevent sick leave among nurses working in residential elder care. Its protective effect is mediated through nurses’ health rather than nurses’ motivation. Home demands increase sickness absence through their health rather than their motivation.

Conclusions More attention is needed for nurses’ work schedule fit with private life and their home demands to potentially reduce health-related sickness absence among nurses working in residential elder care. Future research on sickness absence should not only include the traditional job demands but also job resources such as work schedule fit with private life. Adapting the work schedule to the employees’ private life seems a good measure to reduce health-related sickness absence within one year.
THE ASSOCIATION OF WORK CHARACTERISTICS, SLEEP, AND PHYSICAL ACTIVITY WITH BURNOUT

Janina Janurek (1) - Sascha Abdel Hadi (2) - Andreas Mojzisch (3) - Jan Alexander Häusser (2)
Justus-Liebig University Giessen, Social Psychology, Giessen, Germany (1) - Justus-Liebig University Giessen, Giessen, Germany (2) - University of Hildesheim, Hildesheim, Germany (3)

Purpose
Previous research identified time spent in physical activity and sleeping as predictors of burnout. Also, in multiple studies, job characteristics such as job demands and job control have been found to be influential on psychological well-being. In this particular study, we integrate these findings, assuming that each of these three highly prevalent activities – work, sleep, and physical activity – might act as predictor of burnout.

Design
We conducted a 14-days ambulatory assessment study with an objective measure of physical activity. 207 employees wore an accelerometer to assess time spent in physical activity and sleeping (8,059 observations), and reported job demands and job control in a daily survey. Levels of burnout were assessed before and after the two-week data assessment.

Results
Job demands were positively related to burnout. Against expectations, job control, time spent in physical activity, and sleeping showed no significant relationships with burnout.

Limitations
Since burnout had been assessed only two times, before and after ambulatory assessment, we could not analyze effects on a day-level.

Research/Practical Implications
These findings highlight the importance of job demands for psychological well-being and should encourage companies to develop work regulations that are suited for maintaining psychological well-being.

Originality
Our study integrates research investigating movement and sleep behavior into the field of research concerning effects of work characteristics on burnout.
Is the effect of workplace bullying exposure on subjective well-being mediated through the frustration of the need for relatedness? A longitudinal six-wave study.

Workplace bullying is a serious phenomenon that has serious detrimental effects on victim’s health, attitudes, and work-related behavior. Drawing on self-determination theory, we propose that bullying exposure thwarts employee’s need for relatedness with the result of decreased well-being. Studies examining these mechanisms used either a cross-sectional design (Trépanier et al., 2013) or a longitudinal design with (not theoretically justified) long time intervals (i.e., 12-month time lag; Trépanier et al., 2015). Therefore, the aim of our study was to test this mediation in a longitudinal design with much shorter time intervals (i.e. monthly), whether to see if the bullying exposure also shows short-term effects on well-being. A six-wave online survey design with monthly time lag was employed and data were collected among U.S. employees. The sample consists of 1,595 respondents (55.8% females, n=890, ageM = 36.9, ageSD =10.3). Workplace bullying exposure was assessed with the S-NAQ (Notelaers et al., 2018), frustration of the need for relatedness with the Psychological Needs Thwarting Scale (Bartholomew et al., 2011) and well-being with the WHO-5 well-being-index (Topp et al., 2015). Cross-lagged mediation analysis within a structural equation modeling framework confirmed the mediation model: Bullying exposure was significantly related to a change in frustration of relatedness and frustration of relatedness was significantly related to a change in well-being across all waves. The study findings advance the field through showing that bullying exposure has not only a long-term effect on well-being but also a short one, and that this effect is mediated through the frustration of relatedness.
Purpose: This longitudinal experimental study examined the impact of a gamification system (game design elements in non-game contexts) on the effectiveness of a two-week online intervention. We expected the intervention to increase mindfulness, recovery-related self-efficacy, and different well-being indicators. We expected gamification to amplify these effects through boosting motivation and engagement.

Design/Methodology: In a randomized control trial, we deployed two treatment groups (intervention with gamification vs. without) and a wait-list control group. Participants (N = 95) accessed an online platform with daily mindfulness-related exercises. We deployed questionnaires one day before and during the intervention, as well as one day afterwards and two weeks afterwards.

Results: Results indicate towards a successful intervention with positive changes in mindfulness and recovery-related self-efficacy as well as a decrease in exhaustion and perceived stress; whereas no changes in the control group were observed. Participants in the gamified intervention engaged in significantly more exercises online; however, no differences were observed regarding the total active exercising time, motivation and satisfaction compared to the non-gamified intervention.

Limitations: Controlling for situational factors in an online intervention is limited. Also, relying upon self-reports for assessing intervention success is limited as they are prone to certain response biases.

Research/Practical Implications: Enhancing an online intervention with a gamification system evokes certain behavioral change. However, it may not affect the effectiveness of the intervention. Further research is needed on specific aspects of gamification design.

Originality/Value: Experimentally testing the effectiveness of gamification in an online intervention is—to our knowledge—unique in gamification research.
Multiple Social Groups Support Adjustment to Retirement Across Cultures

Ben Chun Pan Lam (1)
University of Queensland, Psychology, BRISBANE, Australia (1)

Purpose: Research has demonstrated the positive effects that social identification with multiple groups has on people’s health and well-being, not least during the transition from work to retirement. However, these effects have not been examined outside Western retirement contexts. This paper addresses this gap by investigating the contribution that group membership and identification with multiple social groups makes to supporting retirees’ physical health and well-being across cultures.

Methodology: Responses from a representative sample of 10,513 retired individuals from 51 countries drawn from the World Values Survey were used in analysis. This focused on the number of group memberships, identification with multiple groups, subjective health, and well-being that respondents reported.

Results: Analysis showed that belonging to multiple groups positively predicted retirees’ health and well-being in both Western and non-Western cultural contexts. In line with cross-cultural research, there was evidence that country-level collectivism moderated the strength of this association, with the effect being weaker in collectivistic (vs. individualistic) countries.

Limitations: The analysis was based on cross-sectional data which cannot address questions about causal relationships between multiple group membership and retirement adjustment.

Theoretical Implications: The current study adds to a growing body of research which argues for the importance of social identity processes when seeking to understand and successfully manage the retirement transition.

Value: This work therefore confirms the complex interplay between social group processes, culture, and life changing contexts (e.g., the transition to retirement) when it comes to understanding health and well-being.
LEADERSHIP CHALLENGES IN AUTONOMOUS TEAMWORK – BALANCING "STAYING CLOSE" AND "LETTING GO"

Marte Pettersen Buvik (1) - Eva Amdahl Seim (1) - Tone Merethe Aasen (1)
SINTEF Digital, Department of Technology Management, Trondheim, Norway (1)

Purpose
Autonomous teams are proposed to be more effective, innovative and competitive in a complex knowledge work setting. While many companies experience a pressure to grant autonomy, there are still pressures to retain and exert control throughout the organization. This is a complexity and a tension that managers at different levels of the organization must deal with. Furthermore, enhanced autonomy creates new challenges for alignment and sets new requirements for the different management roles.

Design/Methodology
Case-study approach with interviews in a large finance institution in Norway. 14 interviews with a total of 17 managers (from top managers to team leaders) were conducted.

Results
Preliminary analysis show that the different management roles become more complex as the organization strive for enhanced autonomy. There are concurrent demands for staying close to the team and to letting go and there exist countervailing pressures within the organization to grant autonomy while aligning and retaining control at the same time The results indicate that one of the most important leadership tasks is to create a structure for autonomy where the scope of action for the team is encapsulated and the team direction is aligned with the overall goal of the organization.

Limitations
Results from case studies are context dependent and cannot be globally generalized.

Research/Practical Implications
Our results underline the importance of paying attention to the development of management roles of different levels when striving for enhanced autonomy in organizations.

Originality/Value
This study offers new insight into the challenging and complex role of management of autonomy.
1609 - THE ROLE OF PERCEIVED CAREER OPPORTUNITIES FOR OVERQUALIFIED EMPLOYEES

Barbara Körner (1) - Maike E. Debus (1) - Martin Kleinmann (1)
University of Zurich, Department of Psychology, Zurich, Switzerland (1)

Purpose: This study examines perceived career opportunities (i.e., employees’ perceptions of the degree to which job opportunities are available for them within their current organization) as a boundary condition for effects of overqualification. In particular, we propose that overqualification is indirectly related to task performance and OCB via anger towards employment situation, and that these negative indirect effects are buffered by perceived career opportunities. Moreover, we assume that perceived career opportunities mediate the moderating effect of leader-member exchange.

Design: Data were collected from 272 employees (56 % women, age mean = 39 years) at three measurement points with a time lag of two weeks each.

Results: In sum, the results support the assumption that perceived career opportunities moderate the relationship between overqualification and its outcomes (mediated by anger towards employment situation) and that perceived career opportunities is triggered by leader-member exchange (mediated moderation). Particularly results showed a negative indirect moderation effect of leader-member exchange on the relationship between overqualification and anger towards employment situation through perceived career opportunities. Additionally leader-member exchange significantly predicted perceived career opportunities.

Limitations: The proposed model does not include actual career advancements.

Practical implications: When selecting overqualified applicants, organizations are advised to provide them with career advancement opportunities in order to reduce potentially negative outcomes.

Originality: By identifying the role of perceived career opportunities, we add to the growing literature on boundary conditions of the overqualification-outcome link.
Purpose.

A recent study (Leslie, Manchester & Dahm, 2017) found that gender pay gaps (GPGs) reverse in the upper echelons of organisations. The authors hypothesise that women rewarded in line with their strategic potential to demonstrate organisational diversity. However their study relies on self-report salary data using a private sector US sample with high potential for market-based compensation, limiting generalisability.

This paper examines the “strategic diversity value” effect of women by exploring GPGs, and the factors that comprise GPGs using academic staff payroll data within two Russell Group universities (n=4,000). Both apply Athena Swan Charter principles placing strategic importance on the progression of women in under-represented disciplines at the heart of HR practice. Pay levels are tightly regulated within a national framework and there is little room for variability.

Design/Methodology /Approach/Intervention

Using Oaxaca-Blinder decomposition techniques we compare GPGs and factors that comprise pay gaps in departments with a high density of women (eg Arts and Humanities) with those with low density (typically Engineering and Physical Sciences).

Results

We find little difference in raw GPGs, favouring men in high and low-density departments, however gaps narrow and a greater proportion of the GPG is explained in low women-dense departments. By decomposing the factors that underlie these patterns we show that salaries in low-women-dense departments are better predicted by “fair” elements such as seniority and length of service than those in high-women-dense departments.

Limitations

Generalisability to other contexts

Research/Practical Implications

Implications for strategic reward practice to close GPGs.

Originality/Value.

This study extends the earlier work into the UK higher education sector.
Purpose
This paper aims to delineate how an indigenous Chinese concept guanxi HRM would undermine employee well-being. Drawing on basic psychological needs theory (BPNT), it postulates that guanxi HRM creates a social environment that frustrates employees’ basic psychological needs, thus undermining employee well-being; the value of perseverance would moderate the process from need frustration to employee well-being.

Methodology
This paper performed regression analysis and path analysis based on a survey in China with 321 valid responses.

Results
The results are consistent with the hypotheses except for the moderating role of perseverance. Perseverance mitigates the undermining effect of need frustration on emotional exhaustion but it does not moderate the relationship between need frustration and overall employee well-being.

Limitations
It is a cross-sectional design. All the measures are subjective and rated by the same participant.

Research implications
This paper underlines the importance of context for HRM studies in China; the findings substantiate the BPNT’s proposition at the Chinese workplace; the study demonstrates the importance of acknowledging the multi-dimensional nature of employee well-being.

Originality
It fills the gap in Chinese HRM by linking guanxi HRM to employee well-being via the lens of basic psychological needs satisfaction theory; methodologically, it simultaneously operationalises employee well-being as positive and negative measures.
Irene Nikandrou (1) - Irene Tsachouridi (1)

Athens University of Economics and Business, Athens, Greece (1)

Purpose-The purpose of this paper is to integrate temporal comparisons into the study of organizational support. To do so, we propose a new construct, namely Temporal Perceived Organizational Support (TPOS). TPOS captures an employee’s belief that the organization supports him/her now more than it did in the past. Moreover, we aim to contribute to the understanding of the role of social comparisons (Relative Perceived Organizational SupportRPOS) and temporal comparisons (TPOS) in moderating the direct and indirect relationship between Perceived Organizational Support (POS) and its outcomes (willingness to support the organization and intent to quit).

Design/methodology/approach- Our paper incorporates two field studies. Our first study incorporates RPOS as moderator of the relationship between POS and its outcomes through felt obligation and expected reciprocity, while our second study incorporates TPOS as moderator.

Findings- RPOS was found to moderate (weaken) the POS-felt obligation relationship thus affecting the mediating role of felt obligation in the POS-outcome relationship (moderated mediation). Similarly, TPOS was found to weaken the POS-felt obligation link and as such the ability of felt obligation to mediate the POS-outcome relationship (moderated mediation).

Practical implications: Our findings indicate that perceptions of social and temporal treatment need more attention, as they can substitute the lack of POS regarding employees’ social exchange processes.

Originality/value: A new construct (TPOS) is proposed. Moreover, it is the first time that social and temporal comparisons constructs are examined as moderators of the relationship between POS and its outcomes.

Paper type- Research paper

Keywords: Temporal Comparison; Social Comparison; Perceived Organizational Support; Willingness to support; Intent to quit; Extra-role
1621 - WHEN PERSON-ORGANIZATION VALUES FIT MATTER: UNDERSTANDING THE FACTORS ENABLING PRACTICE CHANGE IN NURSING STAFF AFTER A SHIFT OF CARE PARADIGM

Annalisa Casini (1) - Noémie Haguinet (1) - Dan Lecocq (2) - Nathan Nguyen (1)
Université catholique de Louvain, IPSY, Louvain-la-Neuve, Belgium (1) - Université libre de Bruxelles (ULB), ESP, Bruxelles, Belgium (2)

Purpose: This study aims at understanding the factors enabling change in the practices of the nursing staff because of a top-down imposed shift of paradigm of care (from “curing the patient” to “co-constructing the care together with the patient”) in a university hospital in Belgium. The theoretical framework of the person-environment fit has been adopted for testing the hypothesis that only nursing staff whose personal values fit with those of the organization and of the new paradigm of care are willing to set up co-construction of care practices.

Methodology: 79 members of the nursing staff (79.7% women) answered a paper-and-pencil self-administered questionnaire. This comprises, among others, measures of subjective and objective fit between Person and 1) Organization values (POfit), and 2) Care Paradigm values (PCPfit). Willingness to co-construct the care with the patient (care co-construction) was measured as dependent variable.

Results: The main results show that the care co-construction is positively associated with PCPfit (p<.000). Moreover, the objective POfit of the co-construction values moderates the association between the subjective POfit and the care co-construction (p<.001). More precisely, the association of subjective POfit on care co-construction was positive (vs. negative) when nurses reported high (vs. low) levels of objective POfit.

Limitations: This is a cross-sectional study run on a small size sample.

Implications: The fit between the co-construction values of the staff and the organisation should be strengthened.

Value: Many hospitals worldwide that are setting up a similar transition in the care paradigm would benefit from the present results.
Purpose. While acknowledging the benefits of mobile technology, recent research warns us about the dark side of such phenomenon outside the organizational settings (e.g. Barley et al. 2011). Drawing upon the Conservation of Resources (COR) theory, we investigate how the afterhours mobile use for working purposes affects individuals’ mental fatigue the next day, and in turns affects individual likelihood to engage in social activities with the spouse.

Design/Methodology. Using the Experience Sampling Methodology (ESM), we involved 73 employed participants and their spouses over the course of 10 working days.

Results. To test our hypotheses we conducted HLM analyses. Our results suggest that mobile technology use in the evening increases mental fatigue the next day and diminishes the likelihood that employees spend time engaging in social activities with their spouses. Moreover, our study demonstrates that spouse recovery support (i.e., helping the employees to relax) plays a pivotal role in alleviating the negative effects of mental fatigue on the engagement in social activities.

Limitations. While a sample size of less than 80 focal participants has been used in previous research and has been considered acceptable, it is nevertheless small.

Research/Practical Implications. The study contributes to current research by increasing our understanding of the drawbacks of extensive mobile use at home for working purposes, and of the potential means to alleviate this effect.

Originality/Value. The paper considers in a simultaneous fashion the effects of afterhours mobile technology use on work and family environment by embracing both the employees and spouse perspective.
Since workforce is greying, an increasing pressure has been put on many sectors, including the public sector, to raise legal retirement age. Nevertheless, older workers, and specifically teachers, usually retire much earlier. In the organizational and educational literature, most studies regarding end-of-career teachers have been applying a deficit perspective: reporting on older teachers’ challenges and difficulties. Only a limited amount of studies takes into account senior teachers’ potentials, learning, and further career development. In this present article, we therefore approach end-of-career teachers from a non-deficit perspective. This paper aims to contribute to a better understanding of older teachers at work, by identifying different profiles and by analysing HR practices that target them. Combining identity, organizational and social network theory, we focus on end-of-career teachers’ knowledge and expertise exchange and their position within the school’s network. In particular, we conducted a comparative mixed-methods case study (interviews, social network analysis) in two secondary schools with a sample of ten senior teachers, four younger teachers, and two principals. The results illustrate that older teachers hold central positions in their workplace and have, in accordance with the socio-emotional selectivity theory, limited but strong bounds with colleagues. Moreover, school principals seem to benefit from older teachers’ organizational knowledge by involving them in decisional processes. Nevertheless, results show that principals mainly apply remedial measures to deal with changes due to aging. This paper ends with some implications for school principals: Applying a non-deficit developmental approach is key for sustainable HR management in schools across the lifespan.
Purpose: Although 21st century work largely occurs in teams, most teams research is laboratory-based. More field-based teams research is necessary; however, issues such as turnover, attrition, intervention dosing, and multi-team membership (MTM), whose magnitude is multiplicative compared to individual-level research, present significant challenges. We present two studies using different methodologies, and facing different challenges, as case examples for handling these practical obstacles.

Design/Methodology /Approach/Intervention

Case 1: We combined a web-based survey of 620 healthcare teams with archival performance data to examine the impact of coordination elements on performance. We used key survey questions, inclusion criteria, and a multi-modal recruitment strategy to handle recruitment, MTM, and coercion challenges.

Case 2: This field experiment tested the impact of a monthly performance-feedback report and debrief intervention on team coordination in a sample of 34 healthcare teams followed over seven months. We used inclusion criteria, intervention adaptations and attendance tracking to handle recruitment, attrition, dosing, and MTM challenges.

Results

Case 1: On average, 76% of teams invited were represented in our sample, albeit at different levels of within-team participation (25-100%). Teams that more effectively created common perspective among their members performed better in selected areas of care.

Case 2: Our intervention significantly impacted selected aspects of team coordination, among teams receiving more consistent intervention doses.

Limitations: Challenges listed and handled are not exhaustive.

Research/Practical Implications: Our research presents practical solutions for making field-based research more prevalent.

Originality/Value: No generally-accepted practices currently exist for handling these research challenges in team settings. Our work presents a starting point for developing consensus.
1627 - HOW DO PERCEIVED NEED SUPPORT AND COMMUNICATION AMONG COLLEAGUES PREDICT SATISFACTION AT WORK?

Simon Grenier (1) - Marylène Gagné (2)

Université de Montréal, Psychology, Montréal, Canada (1) - Curtin University, Curtin Business School, Perth, Australia (2)

Purpose: Work teams are now ubiquitous in the workplace and they represent a specific relational context in and of itself. Knowing both colleagues’ need support and perceived communication are likely to lead to several positive consequences such as satisfaction at work. Self-determination theory was used to examine how perceived need support from coworkers (support for autonomy, competence and affiliation) impacts both perceived communication among colleagues and individual need satisfaction. Method: 169 lifeguards working in 36 teams completed a paper and pencil survey including a coworker need support scale, a perceived communication among colleagues scale and a satisfaction at work scale. Results: Data were analyzed using the Bootstrapping Regression Process on SPSS. The results of the study show that colleagues’ need support is important to promote communication among colleagues. The mediation model indicates a partial mediation effect of perceived communication on participants’ satisfaction at work while the effect of perceived need support stays significant. Thus, both perceived need support and perceived communication among colleagues seems to be important to promote one’s satisfaction at work. The current results will be discussed further during the presentation Limitations The cross-sectional nature and the specificity of the population who completed the study limit the generalization of our results. Contribution: Our study underscores the importance of the quality of need support and communication among colleagues to promote satisfaction at work.
A RESOURCE-DEPLETION PERSPECTIVE OF LINK BETWEEN SLEEP DEPRIVATION AND WORK-FAMILY CONFLICT

Jian Shi (1)
Eindhoven University of Technology, Department of Industrial Engineering and Innovation Sciences, Eindhoven, Netherlands (1)

Purpose
With the salience of social dilemma arisen from sleep, a growing number of occupations have been forced to work much more under sleep loss, employees usually lose their sleeping time for the work and family demands (Barnes, 2012, 2013). And theory and research on sleep deprivation in work and organizational contexts have initiated to pay attention until recently (Barnes, 2016; Litwiller et al., 2017), this study draw on self-regulation and ego depletion theories to delineate the processes and boundary conditions with especially how employees’ sleep deprivation triggers their following work-family interference with emotional and cognitive depletion mechanisms, and moderated by their work-family centrality.

Design/Methodology
Through a diary study design, we collected data from 109 full-time employees with a total of 524 workday observations, and utilized hierarchical linear modeling to test the hypotheses.

Results
Empirical results suggested that employee’s daily sleep deprivation had positive relationships with their emotional exhaustion and cognitive fatigue during the following day, which in turn increased their following day’s work-family conflicts. Furthermore, employee’s work-family centrality was found to aggravate these relationships by exacerbate deprived employees emotional and cognitive depletions associated with their past sleep loss.

Limitations
The study relies on a sample of self-reported measures which could potentially limit by their responsive bias and narrow size of samples.

Research/Practical Implications
Starting the workday with inadequate sleep, a deprived employee with a little resource tank only decreases the likelihood that there are any emotional and other regulatory fuels left at the end of the day when it is time to interact with family, thus sleep-deprived employees will experience more work-family conflict than well-rested ones. And employee with high work-family centrality (i.e., high work
centrality) could easily suffer more emotional and cognitive depletions and aggravate their work-family conflicts.

Originality/Value

This study contribute the sleep deprivation research by providing empirical evidence for the adverse effects of sleep deprivation on employees’ work-family interface, and also contributes to resource depletion theory by identifying individuals’ emotional exhaustion and cognitive fatigue as significant emotional and cognitive resource depletion mechanisms and processes correspondingly that have direct implications for their depletion states.
Purpose: Focus on health-promoting leadership is of significance in healthcare settings to improve organizational health so that nurses are attracted and retained as a valuable resource to optimizing outcomes such as job satisfaction, quality of care and patient safety. The aim of this systematic review was to summarize and synthesize accumulated evidence on health-promoting leadership related to nursing considered of significance for future nursing leadership internationally.

Design/Methodology: Eight databases were searched. An integrative review, allowing for inclusion of both qualitative and quantitative peer-reviewed literature was undertaken. Of 339 papers, 13 were eligible for inclusion: eight qualitative and five quantitative. Studies were assessed for quality using standardized checklists (PRISMA, CASP). Additionally, an adaptive framework based synthesis was used, allowing themes identified a priori to be specified as coding categories and new themes to emerge de novo by inductive analysis.

Results: Health-promoting leadership appears to be value-based moving beyond good leadership behavior by raising leaders’ health awareness and awareness of influencing contextual factors viewed in a more holistic and long-term systemic approach. Health-promoting leadership seems thus to be a promising avenue and critical part of organizational capacity for health promotion bridging the domains of positive health and leadership requiring salutogenic presence, open communication and more relationship-oriented leadership styles.

Originality/Value: Advancing our knowledge of the importance of health-promoting leadership in people intensive environments.

Contributes: This has the potential to make a meaningful contribution to advancing nursing leadership, enhancing resilience in healthcare systems instead of reducing stress.
1635 - THE EMOTIONAL EFFECTS OF MAKING MISTAKES: A QUALITATIVE STUDY OF THE EMOTIONAL OUTCOMES OF PRESCRIBING ERRORS

Sabir Giga (1) - Ian Fletcher (1) - Liz Brewster (2) - Sandra Varey (1)
Lancaster University, Division of Health Research, Lancaster, United Kingdom (1) - Lancaster University, Lancaster Medical School, Lancaster, United Kingdom (2)

Purpose: In addition to the impact on patients (Nguyen et al., 2017), health care professionals also report distress, fatigue and burnout as a result of patient safety events such as medical errors (Tawfik et al., 2018).

Methodology: This qualitative study involved one-to-one interviews with 21 participants including consultants, nurses, matrons, foundation year doctors and pharmacists, based at a public hospital in the north west of England. The interviews focussed on experiences and subsequent emotional impact of making a prescribing error. All interviews were recorded and transcribed, and thematic analysis was used to interpret the data.

Results: Key themes emerging from the findings include feelings of embarrassment, distraught, anxiety, trauma and helplessness. The emotional impacts of making a prescribing error included lower self-confidence, personal sense of defeat, grief and fear.

Research limitations: The organisational context is likely to influence policy and procedures, as well as quality and safety. We therefore recommend that the study is replicated in a variety of other settings.

Implications for research and practice: The perceptions and experiences of staff regarding current reporting procedures and systems are likely to be crucial to efforts for reducing prescribing errors as well as improving their own health and wellbeing.

Originality/Value: To date, there is limited research on the views and experiences of healthcare staff towards prescribing errors and the emotional effects it has on them.

References

Purpose

Studies has pointed towards distributed leadership as beneficial for innovation and organizational change. However, we know little about what engage employees in leadership tasks. The present study inquires into leader and employee characteristics of importance for employees’ distributed leadership agency (DLA). Moreover, whether there is a relationship between DLA and innovative behavior. We also wished to know if national culture plays a role, in particular with reference to cultures’ power distance dimension.

Design

This cross-cultural study surveyed 255 nurses from an Italian hospital and 685 nurses from a Danish hospital.

Results

SEM analyses shows that in both countries, empowering leadership was positively related with DLA, and there was an interaction effect of self-efficacy and empowering leadership on DLA. In turn, DLA was positively related with innovative work behavior.

Limitations

The study is cross-sectional, and causality cannot be inferred. Generalization beyond health care professionals similar to nurses should be considered carefully.

Research/Practical Implications

In order to stimulate DLA and innovative behavior among nurses in hospitals, managers may benefit from training in empowering leadership. Moreover, the results may point towards HRM initiatives that strengthen nurses’ self-efficacy such as for example competence development.

Originality/Value

The study contributes to research in distributed leadership by emphasizing the roles of empowering leadership and employees’ self-efficacy. The cross-cultural approach contribute with knowledge about the cultural sensitivity vs. robustness of distributed leadership, and adds to the generalizability of research in distributed leadership.
In this paper, we expanded on psychological contract development theory by exploring the mental schemas of graduates’ anticipatory psychological contract. With this research, we aimed to explore and substantiate themes associated with the mental schemas of graduates, so that the psychological contract formation theory can be expanded by incorporating entitlement disconnect as part of the anticipatory psychological contract. Literature regarding the formulation of the psychological contract is still underdeveloped, especially regarding the anticipatory phase thereof. Entitlement disconnect has also not been focused on in past literature, especially as a component of the anticipatory psychological contract that can have an impact on graduates’ professional career plan and voluntary turnover intention. A qualitative approach to research was adopted consisting of interviews with 18 final-year graduate students in the final phase of their degrees to derive themes associated with the mental schemas of graduates’ anticipatory psychological contract. The findings suggest that graduates already have a developed mental schema that was based on their entitlement. It was also confirmed that graduates had a disposition towards voluntary turnover intuition before organisational entry, which was due to an entitlement disconnect perception. The final and most surprising finding was that some graduates displayed a pre-employment psychological contract breach, where graduates already anticipated contract breach before entering an employment relationship. This research suggests that graduates’ mental schemas in their anticipatory psychological contract play a much bigger role in the development of their psychological contract, after organisational entry, than what was initially thought.
Purpose
In emotion work research it is unclear whether the requirement to display certain emotions has positive or negative effects on psychological health. The challenge-hindrance stressor framework suggests that hindrance stressors are positively related to psychological strain and negatively related to well-being. Challenge stressors, in contrast, are positively related to psychological strain, but also positively related to well-being. Therefore, the research question is whether emotion work variables are challenge or hindrance stressors.

Design/Methodology
Using SEM we investigated causal relations between emotion work and burnout in a 3-wave longitudinal study of 205 service workers. Emotion work included the requirement to display positive emotions, negative emotions, sympathy emotions, sensing emotions and emotion-rule dissonance. The burnout components emotional exhaustion and personal accomplishment were used.

Results
ER-dissonance had a negative effect on emotional exhaustion. The requirement to display positive emotions and sympathy emotions were beneficial, both negatively related to emotional exhaustion; the requirements to display positive, sympathy and negative emotions as well as sensitivity requirements had a positive effect on personal accomplishment. Results show that emotion work variables have both positive and negative effects on well-being and can be seen as challenge stressors.

Limitations
The present study only used self-report data.

Research/Practical Implications
The results support the view of causal effects of emotion work on burnout. The assumptions of the challenge-hindrance stressor framework also apply to emotion work.

Originality/Value
To our knowledge, this is the first study matching emotion work to the concept of challenge and hindrance stressors and testing this in a longitudinal study.
This paper contributes to the discussion on employee stress and the burnout syndrome by focusing on the translation of government policies into multi-stakeholder collaboration. The new role as rehabilitation coordinator in Sweden aims to illuminate how permeable organizations enable space for inter-organizational stakeholder initiatives and collaboration. At the same time, such leaking boundaries challenge formal organizational entities and their demarcations.

Multi-stakeholder collaboration is often under debate in the Swedish public sector, when strong borders between authorities is often described as major obstacles for solving serious societal problems. In the field of escalating sick leave, various attempts to foster collaboration have been initiated over the years. The establishing of formal linkages between various agencies is one example along with “reconciliations meetings” to identify rehabilitation efforts involving the person on sick leave, selected public agencies and the employer.

The new position as rehabilitation coordinator follows this line of thinking on collaboration, with the explicit intention to facilitate the return to work for employees. The burnout syndrome is of special interest, as it an increasingly common diagnose implying long periods of sick leave. We understand the role as coordinator as a broker and translator of public health policy in a multi stake holder context. In this process, conflicting logics and rationalities explain why formal bureaucracy is needed to ensure a righteous treatment of the patient at the same time as overly formal procedures reinforce boundaries and hereby hampers requested multi-stakeholder collaboration facilitating a way back to work.
Purpose

Over the last decades, researchers have increasingly investigated gender roles in leadership through adapted models. This study aims to identify gender differences between managers in big organizations, applying an adaptation of La Bella Leadership Model (LBLM).

Design/Methodology/Approach/Intervention

Data were collected from 1312 managers (85% males and 15% females). A questionnaire presented output distributed in four areas identified in LBLM (structural area, visionary area, political area, and empowerment area). It was administered in public and private organizations.

Results

Findings support statistically significant gender differences, examined in the four areas, important for a manager to apply in its leadership. They highlight how women are different from men in the visionary area (women present the organization’s vision and their positioning, ask support, receive and listen feedback from collaborators) and in the political area (women find sometimes win-win solutions and get them accepted, and show a perception collaborators’ performance), instead in the empowerment and structural areas the sample’s examined behaviors didn’t present any difference by gender.

Limitations

The main limitations concern the adoption of a new leadership model. The sample is composed of a male majority. Future analysis with different samples may help the research.

Research/Practical Implications

This work can help the boss to understand which the managers’ real capacity is: they can better enhance or improve the managers’ capacity for the best organization growth.

Originality/Value

This research expands knowledge on leadership and gender by fostering a new perspective about how a manager exercises its leadership.
Aim: This study aims to investigate the moderating effect of resilience factors in the relationship between exposure to bullying behaviour and return to work self-efficacy (RTW-SE), assuming that high resilience, acts as a buffer in this relationship.

Design/Methodology: A sample of 159 patients with common mental disorders (CMD), on sick leave or at risk, exposed to bullying behaviour completed the Short-Negative Acts Questionnaire (S-NAQ), RTW-SE, and Resilience Scale for Adults. The PROCESS macro SPSS supplement was used to analyse whether resilience moderated the relationship between exposure to S-NAQ and RTW-SE.

Results: The S-NAQ–RTW-SE relationship was moderated by resilience (B=-.382, SE = .19, t = -2.04, p < .05). The model explained 23.5% of the variance for RTW-SE, (F (3, 123) 12.56, p < .0001). The relationship was significant for those with a lower (B=-.41, SE = .17, t = -2.42, p <.05), moderate (B=-.68, SE = .18, t = -3.81, p <.005), and higher resilience score (B=-1.04, SE = .30, t = -3.44, p <.001). These results suggest that resilience does not have a buffering effect for RTW-SE when exposed to high levels of bullying behaviour.

Limitations: Only survey data were applied.

Implications: The result indicate there might not be a beneficial gain in training patients to become more resilient to help improve RTW-SE when exposed to bullying behaviour.

Originality/Value: To our knowledge, this study is the first to examine the moderating effect of resilience on the relationship between bullying behaviour and RTW-SE.
Diego Ávila (1) - Jaime Bayona (1)
Pontificia Universidad Javeriana, Business Administration, Bogota, Colombia (1)

Purpose
To validate the Spanish language adaptation of the Internal Corporate Social Responsibility Questionnaire (ICSRQ) by Mory et al (2015) in a sample of Colombian workers, as well as to test the relation between the ISRQ dimensions and organizational commitment.

Design/Methodology/Approach/Intervention
We perform a translation-backtranslation method to obtain a linguistic adaptation of the items and a CFA to test the original factor structure of seven dimensions (i.e. employment stability, working environment, skills development, workforce diversity, work-life balance, tangible employment involvement and empowerment).

We ran the CFA using AMOS in a sample of 323 Colombian workers of different organizations and economic sectors. To check for additional external validity, we compare the results of the ICSRQ with the position of each organization in third-party employee branding rankings (e.g. great place to work).

Results
We obtained adequate fit indexes of the seven-factor structure; however, some items were dropped due to lack of convergent and discriminant validity. We also obtained significant relations between the levels of internal social responsibility, organizational commitment, and the relative position of organizations in CSR and best working-practices rankings.

Limitations
Our sample was mainly based in Bogotá, Colombia; some economic sectors were under-represented, a larger sample could be required.

Research/Practical Implications
The ISCQ represent a validate alternative to third-party consultant rankings to assess responsible work practices among employees.

Originality/Value
To our knowledge, there are no other CSR questionnaires that assess employee responsibility in Spanish language.

Reference
Research in organizational justice has conclusively shown that procedural justice is related to subordinate work attitudes and behaviors. Nevertheless, little is known about the antecedents of this type of justice, especially the role of subordinates in shaping how managers enact justice. Building on work in heuristic decision making, social cognition, and the literature on job demands, we suggest that managers use subordinate performance as a heuristic in deciding how to allocate procedural justice and that they do so in a way that favors subordinates whose performance stands out positively or negatively. We propose that this effect gets stronger as managerial workload increases. Data from a field survey with 111 manager-subordinate dyads suggest that high and low subordinate performance were indeed associated with significantly higher levels of procedural justice than average performance. To avoid concerns inherent in the interpretation of correlational, same source data and to further unpack the relationship between performance and procedural justice we conducted a laboratory experiment with 179 management students taking the role of leaders who observe their followers’ performance and allocate them earnings. Additionally, leaders had the option to treat their followers procedurally just by allowing them to make own suggestions on how much they should earn. Results indicate that leaders significantly favored the extreme performers – but only when they themselves were under high job demands. In terms of practical implications, making managers conscious of ‘middle’ performers and of their own tendency to overlook them could be an important first step in preventing such discrimination.
1654 - ARE YOU THREATENING ME? – THE CONCEPTUALIZATION OF A CONFLICT ESCALATION QUESTIONNAIRE

Miriam Scheppa-Lahyani (1) - Dieter Zapf (1)
Goethe-University, Frankfurt, Germany (1)

Purpose
Conflict consulting often refers to the conflict escalation model (CEM) of Glasl (1982). This model comprises nine stages of conflict escalation split up into three phases. Depending on the stage of conflict escalation, a different form of intervention will be effective. In addition to the CEM, the knowledge about power imbalance is of relevance for intervention. The present study develops an instrument for identifying the escalation stage of a conflict including power balance vs. imbalance.

Design/Methodology
In study 1, conflict escalation was measured by interviews (N=31). In study 2, the instrument was developed as self- and interviewer-ratings. To identify a possible power imbalance, which is necessary for conflict resolution, some items referred to both conflict parties. Ten students completed the self-assessment. Afterwards, two students interviewed them by using the observer-rating version. A third study is under way and will be reported.

Results
In study 1 conflict escalation correlated r=.42 with psychosomatic complaints. In study 2, the instrument identified the stages of conflict escalation reliably. However, the observer-ratings differed to some extent.

Limitations
The instrument is still time consuming and has to be shortened. Therefore we include adaptive testing to limit length and increase simplicity.

Research/Practical Implications
The instrument is helpful for conflict advisors to choose the best way of intervention. It is also useful for further conflict research.

Originality/Value
To the best of our knowledge, it is the first instrument which combined the CEM with power imbalance and which is based on adaptive testing.
FOLLOWING BAD LEADERS: THE ROLE OF LEADER LEGITIMACY IN TRANSGRESSIVE LEADERSHIP

Andre Marques (1) - Isabel Pinto (2) - Ana Leite (1) - Georgina Randsley de Moura (1) - Jan-Willem van Prooijen (3) - Jose Marques (4)

University of Kent, School of Psychology, Canterbury, United Kingdom (1) - University of Porto, Faculty of Psychology, Porto, United Kingdom (2) - VU Amsterdam, Social & Organizational Psychology, Amsterdam, Netherlands (3) - University of Porto, Faculty of Psychology, Porto, Portugal (4)

Purpose: Previous research has shown that people do not always remove harmful leaders in organisations, even when they clearly transgress important norms. Indeed, despite their wrongdoings, ingroup leaders are generally given considerable leeway in their behaviour, with little to no evident retaliation from the group. There is still limited understanding as to which processes drive these group-based reactions (acceptance versus punishment) to transgressive leaders. In this research, we propose that leader legitimacy has a key role in determining followers’ perceptions regarding the leader’s transgressions, and that this will impact whether transgressive leaders will be tolerated or deprecated by their groups.

Design/Methodology: We used an experimental vignette methodology to construct organisationally relevant scenarios across three studies.

Results: Participants only ascribed transgression credit to transgressive leaders perceived as legitimate. Conversely, transgressive illegitimate leaders were perceived as threatening, received less validation from the group, and triggered negative emotional reactions and collective agreement to remove such leaders from power. Furthermore, this effect occurred even when controlling for leader group prototypicality, and in the absence of formal social control measures towards such transgressions.

Limitations: Study 1 was collected through pen-and-paper questionnaires. Studies 2 and 3 used a crowd-sourcing sample.

Research/Practical implications: This research sheds light on why some leaders are pressured to resign from their position after their misconducts become public, while others are allowed to remain in office.

Originality/Value: Our studies suggest that being ethical or transgressive seems to depend more on how legitimate leaders are perceived to be than their actual behaviour.
Purpose: Managing one’s career has changed tremendously in recent decades due to global trends in the workforce, including a growing female labor market participation and shifting societal norms (Greenhaus & Kossek, 2014). This is especially true for the increasing number of dual earner couples, who tend to face many challenges in combining their work and home domains (Masterson & Hoobler, 2015). To cope with these demands, partners often develop couple-level strategies and align their career decisions accordingly (Becker & Moen, 1999). Yet, individuals may not experience every arrangement as equally successful. The aim of this paper is to examine how different couple-level career management strategies relate to individuals’ job, career and life satisfaction. Moreover, we explore whether these relationships depend on individual characteristics (e.g. gender, individual career aspirations), family characteristics (e.g. home demands) and organizational characteristics (e.g. family-friendly organizational policies).

Methodology: We collected data with 186 Flemish heterosexual dual-earner couples (i.e., 372 employees) at two occasions, one year apart. Every respondent’s observations have been paired to those of his or her partner, using the Actor-Partner Interdependence Model (APIM).

Results: Results will be analyzed by means of multilevel moderation modeling.

Limitations: We only collected data with heterosexual dual-earner couples and our findings are thus not informative for career management in other family types, such as single-parent families or homosexual couples.

Research/Practical implications: This study advances our knowledge of how dual earners address and experience the combination of career and home challenges, both on the individual and couple level.
WHEN GOSSIP IS SELFISH: COMPETITIVE TEAM GOALS AND FEELINGS OF ENTITLEMENT STIMULATE EMPLOYEES TO SELF-PROMOTE THROUGH GOSSIP

Elena Martinescu (1)
King's College London, King's Business School, London, United Kingdom (1)

Recent research depicts gossip as a way to discipline and control disobeying group members. However, people may gossip for self-serving reasons in work teams they perceive as having competitive goals, because individuals may believe that they need to emphasize they are better than their colleagues in order to succeed in such environments.

In Study 1, 123 Dutch employees recalled specific situations in which they engaged in workplace gossip. Results showed that perceiving competitive goals in one’s work team was positively related to gossip frequency, and this relation was mediated by self-promotion motives.

Furthermore, in Study 2 (N = 120), where people reported on their general gossip behavior, feeling entitled to a higher power position at work moderated the effect of competitive team goals on self-promotion motives and on gossip spreading. For employees who felt entitled to a higher position, perceiving one’s team to have competitive goals predicted self-promotion motives and subsequently increased gossip behavior, but when people had low feelings of entitlement, competitive team goals were unrelated to self-promotion and gossip.

Our research indicates that employees who perceive their teams as having competitive goals are likely to engage in gossip in order to promote themselves in their eyes of others, but only if they believe they deserve a higher power position in the organization. These findings complement previous studies that focus on gossip as a prosocially motivated behavior, that improves group cooperation (e.g. Feinberg et al, 2012; Wu et al, 2016), by revealing what factors motivate use of gossip to promote one’s own interests in organizations.
1666 - WHO IS STRESSED OUT BY EMOTION WORK?

THE CHANGING NATURE OF EMOTIONAL JOB DEMANDS IN DIFFERENT TYPES OF SERVICE JOBS

Marcel Kern (1) - Kai Trumpold (1) - Dieter Zapf (1)
Goethe-University, Frankfurt, Germany (1)

Purpose
Research on emotional job demands has revealed inconsistent findings on their effects on employee well-being. This raises the question, how different effects on work-related outcomes can be attributed to different job types. This study provides a framework for service jobs and shows that emotional job demands match the concept of challenge or hindrance stressors depending on a taxonomy of service jobs.

Design/Methodology
We analyzed data of 35 cross-sectional studies (6925 participants) working in several service jobs. We identified 61 job clusters that were rated by experts regarding five characteristic dimensions following Mills and Margulies (1980). Interaction effects of the service job taxonomy on the relationship of stressors on well-being were tested.

Results
As expected, results indicate that service job characteristics moderate the effects of emotional job demands on well-being. For instance, the need for the employee to identify with customers moderates the relationships of several emotional job demands, such as the requirement to show negative emotions, sensitivity requirements, and emotion-rule dissonance with well-being.

Limitations
The present study only used cross-sectional data. Moreover, service job ratings are based on answers of eight experts only.

Research/Practical Implications
Results offer a better comprehension of emotional job demands with implications for health care prevention. To make accurate assumptions about effects of stressors on well-being, we suggest considering the taxonomy of service jobs.

Originality/Value
To our knowledge, this is the first study matching emotional job demands to the concept of challenge and hindrance stressors and testing a taxonomy of service jobs as boundary condition.
Purpose: The purpose of our study is to explore career trajectories of women internet taxi drivers in Iran. Drawing from intelligent career framework (Arthur, Khapova, & Richardson, 2017) and institutional theory (Scott, 2015), we trace institutional influences on three ways of knowing (why, how, and with whom).

Design/Methodology/Approach/Intervention: We adopted an interpretivist qualitative approach and interviewed 30 women internet taxi drivers working in Tehran, the capital city of Iran. We used constant comparative method to analyze the data (Lincoln & Guba, 1985)

Results: Our findings outline our participants’ careers with regards to the three ways of knowing—why (e.g., financial problems, sanction effects), how (e.g., developing navigation and internet skills), and with whom (e.g., internet taxi ambassadors, passengers, family). We also demonstrate how six restraining institutional factors (e.g., women’s work rights, gender role expectations) as well as seven facilitating institutional forces (modernity, and high pay rates in Tehran) impact our participants’ careers.

Limitations: Our participants were able to enter and sustain a male-dominated job; therefore, our findings do not reflect the impact of institutional factors on those who could not enter the internet taxi-driving career or had to leave it within the same context.

Research/Practical Implications: Researchers and practitioners interested in understanding career trajectories of women who reside in a developing country and navigate their careers in a male-dominated occupation can be informed by our findings.

Originality/Value: We contribute to the boundaryless career literature by showing how institutional forces might act as boundaries for seemingly boundaryless jobs. We also apply the intelligent career framework to careers of an understudied group of workers in a low-skilled occupation as well as an understudied cultural context.

References

Purpose: Job crafting has attracted considerable research attention over the last years and has achieved a solid place within the field of Organizational Psychology. Since the interest on job crafting is spreading among different disciplines, we aim to explore how job crafting research is approached in different research fields (e.g., health science, organization, management, education, tourism) and depicting how job crafting literature and its foundations are evolving over time.

Methodology: We apply a social network analysis to bibliometric data concerning 250 articles on job crafting. Specifically, we use co-citation, cross-citation and co-occurrence analysis in order to explore the relations among topics, research field, authors, references, methodologies and main theories and how they evolve over time.

Results: This research-in-progress shows the main communities of scholars developing job crafting discourse and their methodological approaches; the growing trend of publications and citations; the main connection among the most cited references (co-citation analysis); and the most used keywords and the connections among them.

Limitations: Several limitations inherent the research design, the databases, and the applied bibliometric methods are discussed.

Research/Practical Implications: This study offers a conceptual basis for further developing job crafting research and may help researchers in this area to identify relevant journals to refer to as well as new topics or research methodologies that can guide them in their work on job crafting.

Originality/Value: Our study complements existing attempts to synthesize job crafting research (i.e., meta-synthesis; Rudolph, Katz, Lavigne, & Zacher (2017); Lichtenthaler & Fischbach (in press) by applying a cross-disciplinary bibliometric perspective.
THE EFFECT OF LEADERSHIP SENSE GIVING AND COGNITIVE FLEXIBILITY ON TEAM ADAPTIVE PERFORMANCE

Ana M. Passos (1) - Ana Guedes (1) - Catarina Santos (2) - Sjir Uitdewilligen (3) - M. Travis Maynard (4)

Instituto Universitário de Lisboa (ISCTE-IUL), Human Resources and Organizational Behavior, Lisbon, Portugal (1) - Maastricht University, Organisation and Strategy, Maastricht, Netherlands (2) - Maastricht University, Work and Social Psychology, Maastricht, Netherlands (3) - Colorado State University, Management, Fort Collins, United States (4)

Purpose: The number of publications that aimed to explain team adaptation has increased in the last years. Authors have argued that in order to adapt to unexpected situations, teams need to adjust their cognitive and behavioural processes, and emergent states. This study clearly goes beyond previous research by experimentally testing effect of leadership sense giving and team cognitive flexibility on team adaptive performance.

Design/ Methodology: We conducted a laboratory experiment using a 2 x 2 between subject design. Each three-person teams (total: N = 63 teams; 189 undergraduate students) worked on a computer-based real-time command-and-control fire fighting simulation (NFC) for approximately 1 hour and a half.

Results: Findings suggest that the cognitive flexibility manipulation has an effect on team adaptive performance. Results also suggested an interaction effect between cognitive flexibility and leadership sense giving.

Limitations: These were ad-hoc teams that just worked together in the lab on this particular task.

Research/ Practical Implications: This study offers meaningful contributions to team cognition literature by showing that the team’s capacity to be flexible and leadership sense giving are crucial to achieve high levels of performance in dynamic environments.

Originality/ Value: This study opens a new avenue on team cognition literature by showing that team adaptation is stronger for teams in the cognitive flexibility condition, than for teams in the control condition. The innovative power of this study lies in the manipulation of a cognitive variable and leadership functions that have been scarcely used in team literature.
1686 - SEQUENTIAL ANALYSIS OF VERBAL BEHAVIOURS IN TEAMS USING REAL-TIME CODED DATA

University of Sheffield*
University of Leeds**

Purpose: To assess differences in sequences of verbal behaviours in teams across three conditions in an intervention study.

Methodology: A 15-category behaviour analysis (BA) system was used to code the verbal interactions of 191 teams (1044 participants) in real-time during 6 meetings across 3 days. Trained observers were used to code the teams’ behaviours using a bespoke iPad app.

The intervention consisted of three conditions. Condition 1 was a control condition where teams were observed only. Condition 2 received guided reflection at the end of each meeting. Condition 3 were given feedback on their behaviour, followed by guided reflection. Conditions 2 and 3 also watched instructional videos on the verbal behaviours.

Two forms of outcome data were collected: objective outcome data of students’ marks on presentations and written assignments; and subjective perceptual measures, such as self-efficacy and psychological safety.

Results: Analyses will be run to assess differences in behavioural sequences between the three experimental conditions. Further, analyses will be run to see if different sequences of behaviour are predictive of differences in outcome measures.

Limitations: The results will not be generalizable, given the student sample used.

Practical Implications: Analyses of the sequential patterns of verbal behaviours will provide insight into the effect of instructional videos on verbal behaviours patterns, as well as communication patterns of effective teams (as defined by outcome measures).

Originality/Value: This is the first time sequential analysis has been carried out on a large-scale study of verbal behaviour in teams using real-time coding data.
1699 - CRAFTING TO FIT OR FITTING TO CRAFT? EXAMINING THE RELATIONSHIP BETWEEN PERSON-ENVIRONMENT FIT AND JOB CRAFTING

Nicolas Jourdan (1) - Janine Bosak (1) - Yseult Freeney (1)
Dublin City University, Business School, Dublin 9, Ireland (1)

Purpose
People are naturally inclined to engage in job crafting in order to achieve better fit with their work environment (Tims & Bakker, 2010; Wrzesniewski & Dutton, 2001). However, the relationship between person-environment (PE) fit, job crafting and subsequent PE fit needs further investigation for two reasons: (1) Although lack of PE fit is expected to trigger job crafting, this proposition has rarely been tested; and (2) Theories such as COR or broaden-and-build theory by their nature, may explain how fit, rather than lack of fit, relates to job crafting. To address these issues, the present research examines participants' person-job fit perceptions at two occasions, as well as the mediating role of job crafting in fitting in and the moderating role of value congruence.

Design/Methodology
A two-wave, 3-month lagged study was conducted using Mturk. The final sample consisted of 488 participants, whose responses were used to test a moderated mediation model using SEM.

Results
Both person-job fit (needs-supplies) and person-job misfit (demands-abilities) fostered job crafting which in return affected subsequent person-job fit. In addition, as expected, value congruence facilitated job crafting.

Limitations
Data are limited to self-report data from US participants only.

Research/Practical Implications
Our findings highlight the importance of value congruence in fitting in and crafting one’s job, and provide support for an inner drive to fit.

Originality/Value
This study provides preliminary evidence for viewing complementary PE fit as being regulated by job crafting. Value congruence facilitates changes in complementary fit through job crafting behaviours.
Purpose

Because change is omnipresent in organizations, it is vital to understand how team change readiness associates with positive team- and individual-level outcomes. In three studies, we test the roles of team leader change readiness (Study 1), individual member change readiness (Study 2) and power (Study 3) in the team change readiness-job/team performance relationship.

Design/Methodology/Approach/Intervention

In all studies we assessed cognitive, emotional, and intentional change readiness. In Study 1, we collected data from 384 members nested in 59 teams and their team leaders. In Study 2, we collected data from 360 members from 60 teams at T1 and acquired individual job performance ratings from the team leaders at T2. Finally, we used data from 281 members of 59 teams and leader-rated team performance to test our hypotheses in Study 3.

Results

Study 1 shows that higher levels of change readiness of the leader strengthens the association between team change readiness and team performance and viability. Study 2 shows that low discrepancies between individual and team change readiness at T1 positively affects team commitment and job performance at T2. Study 3 shows participation in decision making and power distance moderate the association between team change readiness and team performance.

Limitations

The results can only be generalized to the Netherlands, and two of the three studies use a cross-sectional design.

Research/Practical Implications

Our research shows that the alignment of change readiness across levels is important to team effectiveness.

Originality/Value

This study is the first to stress the importance of being on the same page regarding change readiness.
1703 - MEASURING DISENGAGEMENT IN A GAME-BASED ASSESSMENT

Emily Boardman, Cognitive Scientist (Arctic Shores)
Huw Williams, Cognitive Scientist (Arctic Shores)
Lara Montefiori, Chief Scientist (Arctic Shores)

State of the Art

Engagement in a game-based assessment (GBA) may vary as a function of interference from transitory or persistent sensory distractions, external time pressures, or the perceived personal significance of the assessment. Identifying behavioural indicators of engagement may mitigate potential confounds that it introduces in deriving reliable psychometric measurements.

New Perspectives/Contributions

Hypothesised indicators of inattention from GBA metrics were identified, including periods of inactivity and exaggerated fluctuations in performance between- and within-tasks demanding similar cognitive decision-making functions and these were computed in an algorithm to provide an indicative score of “Engagement”. After controlling for Engagement, the relationship between GBA-measured and self-reported conscientiousness was marginally increased (N=380), indicating that state may slightly mediate trait-level differences; conversely, the relationship between GBA-measured and self-reported neuroticism was slightly reduced when controlling for Engagement, suggesting it may be partially a latent manifestation of neuroticism.

Research Implications

Live candidates, hiring managers trialling the assessment, and students using the GBA for personal development will be compared, with the hypothesis that candidates will be higher in Engagement. Additionally, internal reliability in the component measures for a personality construct is expected to be lower in candidates relative to individuals in low-stakes conditions and in those lower in Engagement, as a function of consistency of focus.

Additionally, participants will be subject to laboratory-controlled manipulation of auditory and visual distraction during completion of the GBA to investigate how environmental distraction interacts with self-reported and GBA-measured Big Five and impulsiveness.

Originality/Value

The development of this tool has sought to provide a means of increasing confidence in the reliability and accuracy of a candidate’s scores obtained using GBA, via the identification of variation in focus and motivation.
State of the Art

Game-based assessments (GBAs) are a relatively novel measure of individual personality often used for selection & assessment. They generally benefit from more enjoyable experience and a more intrinsic assessment style, meaning applicant ‘faking’ is reduced. GBAs measure personality using an individual’s stimulus response and decision-making tendencies in tasks developed in the field of cognitive neuroscience. However, individual differences are often perceived as confounds or noise in cognitive tasks. As such, cognitive paradigms are designed to minimise between-individual variance in order to create highly replicable mechanisms or effects that can be consistently attributed to specific brain processes across all individuals. Conversely, identifying between-individual variance is fundamental to all forms of assessment tool, including both self-report and GBA techniques. This has implications on how we use such tasks in applied settings, where personality is often important in predicting workplace factors.

New Perspectives/Contributions

We explore methods for enhancing useful between-individual variance in cognitive tasks that underly GBAs. Techniques include alternative statistical analyses and changes to task designs.

Research/Practical Implications

Understanding individual differences is important throughout work and occupational contexts. This research encourages other researchers and practitioners using GBAs to avoid carbon-copies of lab-based paradigms for measuring individual differences.

Originality/Value

Advancements in the ability of GBAs to measure personality are important to applied sectors, particularly within recruitment contexts. To our knowledge, we are the first to look at how restrictive variance in cognitive tasks impact personality GBAs. Further, we provide methods in applied contexts for improving such assessments.
DOES WORK VALUE AFFECT EMPLOYEE WELL-BEING IN CHINA? A SELF-DETERMINATION THEORY APPROACH

Athena Li LIU (1)
The University of Toulouse 1, Human resource management, Toulouse, France (1)

Purpose
The self-determination theory (SDT) argues that extrinsic work value orientation, relative to intrinsic value orientation would frustrate basic psychological needs and undermine employee well-being. Numerous empirical studies based on Western samples have supported this proposition. This paper aims to test the cross-cultural validity of such propositions in China.

Methodology
Study 1 conducted a survey to duplicate the study on work value orientation, need satisfaction, and positive job outcomes (Vansteenkiste et al., 2007). The cross-sectional survey collected 321 valid responses. Study 2 is a quasi-longitudinal study using data from the China Labor Dynamic Survey in 2012 and 2014. This dataset has 1761 valid cases. Both studies controlled the objective income and perceived income satisfaction to ascertain the relationship.

Results
Overall, the studies support the proposition that needs satisfaction contributes to employee well-being. However, the regression analyses suggest work value orientation do not predict employee well-being and general well-being although a few correlations between work value orientation and well-being are significant.

Limitations
Study 1 uses a cross-sectional design. Study 2 does not use the exact measures in the Western literature. It selected items similar to the conceptualisation of the constructs.

Research implications
This paper suggests the importance of satisfying basic psychological needs to improve employee well-being. It also implies that the mechanism underlying the value orientation and employee well-being in China can differentiate from the West.

Originality
Theoretically, it challenges the cross-cultural validity of SDT propositions on value orientation and well-being. Methodologically, it uses quasi-longitudinal research design of large sample size.
Purpose:
This study sought to uncover how psychological contracts (PCs) are shaped by factors both within and outside the organization and the subsequent implications of perceived organizational obligations from the careers angle. In particular, this research responded to Conway & Briner’s (2005) call to investigate how the PC is influenced, as well as experienced, by a range of contract-makers.

Design/Methodology
80 in-depth interviews with managers/professionals in four multinational enterprises (MNEs) explored employees’ career expectations. Data was collected in the distinctive socio-institutional context of Pakistan, which has a relatively small, and subsequently tight, external labour market.

Results
Analysis highlighted how employment in foreign MNE’s in Pakistan confers social status on employees (irrespective of whether employees are identified as talented versus non-talented by the employer). Interestingly, the results highlighted that organizational policy of not explicitly communicating internal talent identification and talent development processes led all employees to self-confer talent status upon themselves, resulting in high expectations.

Research/Practical Implications
Extant talent management (TM) literature does not consider how employees’ perceptions of talent status can implicitly encourage/reinforce certain career expectations that the organization may not be able to satisfy because of internal and environmental constraints on TM programs.

Limitations
This project focused on a managerial/professional sample specifically and greater insight could be generated by comparing a range of employee groups.

Originality/Value
This is the first paper that offers useful directions in theorising the complexity of factors shaping PCs and the multiplicity of contract-makers especially in the TM context.
PURPOSE: 325,000 mobile apps to provide health-related information were registered in 2017 alone. For young people, apps provide the benefit of an anonymous, autonomous and sensitive way to access health information. However, it is not always clear whether these apps deliver high quality information or achieve the changes in behavior intended. In this study, we present the findings of an independent psychological evaluation of a clinically-approved app designed to improve young people’s health literacy. Using a hybrid approach to evaluation we combine two frameworks drawing from Eysenbach et al.’s (2002) to assess the quality of information including completeness, readability and design; and McMillan et al. (2016), based on NICE (2014) guidelines, to assess the impact on health behavior including areas of purpose, initial assessment and tailoring, and behavior change.

DESIGN: The research team agreed the evaluation framework and criteria, setting out a clear protocol prior to conducting the evaluations. 4 reviewers worked on the page evaluations of NHSGo app. Two reviewers were allocated to each of the 11 pages evaluated. Each reviewer recorded their score and provided illustrative comments where relevant and their ratings were combined.

RESULTS: The purpose and the completeness of the information, drawing from a clinically validated information source NHS Choices, were highly rated and was developed with extensive collaboration with young people. However, a number of features faired less favourably: i) limited attention has been paid to special design features (e.g. inappropriate for users with dyslexia), ii) users were not readily able to assess their condition or personalize the information accessed, iii) readability are often too high for the target group, alienating users who struggle with literacy and iv) elements known to encourage behavior change (e.g. interactivity, support groups) were not evident despite the provision of succinct actionable points enabling young people to take control of their health behavior.

LIMITATIONS: The evaluations were conducted by psychologists and further research would benefit from pre-post evaluations to assess behavior change in an objective manner.

IMPLICATIONS: With the increasing use of health-related apps across the globe, there is need to consider whether they achieve their intended aims. Our research presents a framework that can be readily applied to evaluate apps and draws attention to the ways in which apps can be designed to enhance impact.

ORIGINALITY/VALUE: This is the first independent psychological evaluation using a hybrid approach to evaluate the NHS Go app. The approach and learnings from the evaluation can be translated to the design and development of apps designed to stimulate behavior change.
Purpose

Due to the dearth of research in the area of game-based assessment (GBA), it is particularly important to investigate the potential adverse impact of GBAs against protected classes. The purpose of this study is to determine whether the use of the GBA “Skyrise City” adversely impacts genders or different ethnic groups.

Design/Methodology/Approach/Intervention

Data was collected from the selection processes of two corporations who used Skyrise City. This resulted in two samples (N = 690, and N = 916) obtained from high stakes assessment contexts.

Results

Preliminary analyses reveal several significant differences in GBA scores between genders and ethnic/racial subgroups, but the effect size for the majority of these group differences are trivial to small. Where significant differences with small to medium effect sizes were observed, they were replications of similar group differences found in self-report measures. The full findings will be presented at the conference.

Limitations

Hiring decisions for these samples were made using multiple assessments, and thus the associated hiring data could not be used to determine whether the significant differences led to discriminatory selection decisions for those clients.

Research/Practical Implications

This study provides evidence that GBAs replicate findings observed within the literature based on self-report data, and do not cause adverse impact to protected demographic groups than more conventional assessment formats, and that significant group differences are largely trivial.

Originality/Value

This study demonstrates that the use of GBA’s in high stakes contexts does not significantly disadvantage members of protected classes.
1711 - THE CRITERION-RELATED VALIDITY OF A GAME-BASED ASSESSMENT

Liam Close (1) - Lara Montefiori (2)

Arctic Shores/Birkbeck, University of London, Science, London, United Kingdom (1) - Arctic Shores, Science, London, United Kingdom (2)

With the advancement of technology and assessment methods, it is possible to measure cognitive and personality constructs through game-based assessment (GBA). However, there is a dearth of research in the area of GBA, specifically regarding the reliability and validity of this method of assessment. Through this paper, we will investigate the predictive validity of a GBA that measures both personality and cognitive constructs, with the intention of furthering the GBA knowledge base.

Methods:

458 employees at a large American retail company completed a GBA that measures both cognitive and personality measures across 7 levels. 111 manager ratings of the original employee were completed, measuring 7 job related competencies which then formed a composite measure of overall performance.

Results:

The results of the analysis showed that a large proportion of variance in specific competency scores (14% - 29.2%) was explained by a small subset of the constructs measured within the GBA. Furthermore, a small subset of cognitive and personality constructs explained a large amount of variance in relation to overall job performance (R² =.354 F(8,100)=6.845, p<.01), which suggests that GBAs are a good predictor of workplace performance.

Limitations:

The specific sample used within this study makes it difficult to generalise the findings to other types of roles. Further validation studies will be required to investigate the criterion-related validity of GBA in different types of roles.

Practical Implications:

This research provides evidence of the predictive power of GBA, and how variance explained by the GBA surpasses that of traditional personality and ability assessments observed within the literature.

Originality:

The evidence presented in this paper is the first of its kind, showing the extent to which GBA can predict work-related performance, and helps build on research gaps observed within the literature.
1714 - STEREOTYPE THREAT AND COGNITIVE PERFORMANCE: A COMPARISON BETWEEN GAME-BASED AND TRADITIONAL COGNITIVE ASSESSMENTS

Liam Close (1) - Lara Montefiori (1)
Arctic Shores, Science, London, United Kingdom (1)

Purpose:
Stereotype threat has been found to impact performance on different types of cognitive tests. This phenomenon tends to be observed more within protected groups, such as women and certain minorities, which is one of the reasons why we tend to find adverse impact within cognitive tests for these groups. Game-based assessment (GBA) offers an alternative method to assess cognitive functioning. This paper aims to investigate the extent to which stereotype threat negatively impacts performance in both a traditional cognitive assessment and GBA to understand if changing the format of the assessment reduces the relationship between assessment performance and stereotype threat.

Methods:
Data is currently being collected on this project. A sample of 200+ participants are expected to complete a numerical reasoning assessment, a GBA specifically measuring cognitive constructs, and a measure of stereotype threat.

Results:
Results are not yet available for this research paper, but data is currently being collected, and will be completed and analysed by February 2019, and will be ready to present long before the conference start-date.

Limitations: This sample will not be based on high-stakes data.

Practical Implications:
These findings will help highlight how the method of assessment impacts the relationship between stereotype threat and test performance, and will help add to our understanding of how we may be able to reduce adverse impact within selection by using GBA to assesses cognitive ability.

Originality:
No research to-date has assessed the impact of stereotype threat on GBA performance.
Xavier Caroff (1) - Justine Massu (1)

Laboratoire Adaptations Travail Individu - Université Paris Descartes, Paris, France (1)

According to Basadur (2004; Basadur & Basadur, 2011), managers tend to reproduce existing practices rather than creating new ones because they lack familiarity with the ideation-evaluation miniprocess of creative problem-solving. Moreover, besides from being unfamiliar with the creativity miniprocess, managers may act creatively only if they appraise the appropriateness and potential effectiveness of creative actions compared to routine behaviors. Such appraisal results from a sensemaking process of creative actions postulated by Ford (1996). Consequently, this research seeks to identify individual and organizational characteristics that influence managers’ sensemaking process toward creative problem solving. First, 234 managers from the same company completed an online questionnaire assessing their regulatory focus and organizational support toward creativity. Then, they experienced the effectiveness of the ideation-evaluation miniprocess during a management training from which we assessed their creative performance. Finally they completed a paper and pencil questionnaire assessing their sensemaking process (attitudes toward the miniprocess, subjective norms and perceived control) and decision to apply the miniprocess to solve daily problems in their activities. Structural equation modeling analyses confirmed the relevance of the sensemaking process in managers’ decision to apply creative problem solving in their activities, as well as the influence of individual motivation, performance and organizational support on managers’ sensemaking process. The present research affirms the necessity to study managerial creativity from an interactionist approach (Woodman, Sawyer and Griffin, 1993) taking into account specific contexts. Because this study took place in one international group, replications are needed in order to ensure the generalizability of the present results.
THE RELATIONSHIP BETWEEN ABUSIVE SUPERVISION AND PERFORMANCE: THE ROLE OF SUBORDINATES SELF-ESTEEM

Daniela Silva (1) - Maria João Velez (2)

Universidade Portucalense Infante Dom Henrique, Porto, Portugal (1) - Universidade de Lisboa, Instituto Superior de Ciências Sociais e Políticas, Lisboa, Portugal (2)

Recently, the interest in the study of abusive supervision (Tepper, 2000), has increased due to negative consequences either for the individual, or to the organization as a whole.

There is a need for additional studies that identify the individuals’ factors that can minimize the adverse effects of abusive supervision. Specifically, we propose self-esteem as a moderator in the relationship between abusive supervision and subordinates’ performance. Additionally, we suggest organizational trust as a possible mediator between abusive supervision and performance.

Participants were 201 supervisor-subordinate dyads from different organizational settings. The bootstrapping results indicate that organizational trust mediates the relationship between abusive supervision and performance. We also suggest that self-esteem acts as moderator in the relationship between abusive supervision and organizational trust, since it is associated with a positive self-assessment on competence and personal value, making employees with high self-esteem less vulnerable to feedback and negative behaviors from abusive supervisors.

Bootstrapping results indicate that organizational trust mediates the relationship between abusive supervision and performance and that abusive supervision is significantly related to organizational trust when self-esteem was low (t=3.15; p<.05), but not when it was high (t=-.52; p>.05), with consequences for performance.

This research provides a new perspective over abusive supervision by not focusing exclusively on the negative outcomes and not viewing subordinates merely as passive subjects.

Research results indicate that subordinates’ characteristics, such as self-esteem, may reduce the effects of abusive supervision on organizational trust, such that when self-esteem is high, abusive supervision has a weaker relationship with organizational trust, which in turn is reflected on work outcomes. This is in line with previous research on personality, by showing that individual characteristics affect the way individuals appraise and deal with situations.

One limitation is related to common method bias, since employees provided ratings of LMX, TMO and followership. Because our design is cross-sectional, we cannot infer causality.

This research makes several contributions for theory and practice. Firstly, it expands the content domain of abusive supervision research and highlights the effectiveness of subordinates’ individual characteristics for coping with abusive behaviors. Secondly, it is useful for managers to know that abusive supervision may affect employees differentially, and that some subordinates have tools at their disposal to deal effectively with abusive behaviors.

This research contributes to the better understanding of abusive supervision, mainly by shedding some light concerning individual factors that could buffer the negative effects of abusive supervision on organizational functioning.
This research addresses the effect of a person-environment misfit as a catalyst for leaders’ dissatisfaction with the status quo, and their decisions to question existing practices and adopt innovative behaviors. It examines how value misfit may lead to managers’ dissatisfaction with the prescribed practices, which activates their desire to create new practices. Managers (N = 207) from different companies completed an online questionnaire assessing individual and organizational values (adapted from Wils, Luncasu, and Waxin, 2007), satisfaction toward prescribed practices, readiness for change and innovative work behaviors. Hypotheses were tested through polynomial regression, response surface and path analyses. Results support the main hypothesis that incongruence between the values of individuals and those of their organizations indirectly and positively influences the emergence of innovative behaviors through dissatisfaction toward prescribed practices and readiness to step away from them. Response surface analyses (Edwards, 2007) revealed that, depending on the specific values of interest, the incongruence had different and significant effects on dissatisfaction. For example, a misfit for the value benevolence only predict dissatisfaction when individuals attribute more importance to it than their organization, whereas a misfit for the value authority predicts dissatisfaction whether the individual or the organization attribute more importance. Results reaffirm the need for organizations to emphasize diversity in managers’ profiles, values and practices as well as the need for research to better understand how dissatisfaction can lead to innovative behaviors.
Applicant faking is a pervasive issue within self-report personality questionnaires. Game-based assessment (GBA) may offer a solution to this issue due to its format. GBAs do not require participants to actively rate themselves, and thus should be more difficult to fake than self-reports. This study aims to assess the extent to which candidates can fake their scores in a self-report measure of personality and in a GBA.

Methods:

350 participants were recruited to complete a short-form measure of the big-5, and Skyrise City, a GBA that measures multiple cognitive and personality constructs. To incentivise faking, a cash reward was offered for the individuals whose personality best met the desired job description. Scores were compared to a sample (N = 291) who completed the same assessments, but were encouraged to answer as truthfully as possible.

Results:

For the GBA measure of personality, the Faking group scored significantly higher on 5/9 of the Traits, with effect sizes ranging from small to large. Three of the GBA measures showed no significant between-group differences and Fakers also scored significantly lower on the Politeness measure.

Limitations:

The samples used in this study did not complete the assessments for a recruitment process, thus the findings cannot be generalised to shed light on the prevalence and impact of faking within actual selection processes.

Practical Implications:

On the whole GBAs appear to be harder to fake than self-report measures.

Originality:

This paper presents one of the first studies directly comparing faking in self-report and GBA measures.
"I THAT IS WE, WE THAT IS I": THE MEDIATING ROLE OF WORK ENGAGEMENT BETWEEN KEY LEADERSHIP BEHAVIORS AND VOLUNTEER SATISFACTION

Purpose: Leadership styles may offer relevant clues to the challenging issue of managing volunteers. In particular, as part of an epistemological argument concerning the issue of communal identity and recognition, we assume that a leader encouraging a collective dimension among the followers may improve positive outcomes. Therefore, moving from the motivational process proposed by the Job Demands-Resources (JD-R) model, this study aims to analyze the relationship between the above-mentioned leader’s behaviors and volunteer satisfaction, hypothesizing a mediating role of work engagement.

Design/Methodology/Approach: 195 Italian volunteers completed a self-report questionnaire. The hypothesized relations were tested by using structural equation models. To verify the significance of the indirect effects, asymmetric confidence intervals were computed.

Results: The two key leadership behaviors studied were positively associated to work engagement that, in turn, was positively related to volunteer satisfaction. Since the paths connecting antecedents and outcome were not significant, we conclude that the mediation of work engagement was total.

Limitations: The cross-sectional design and the small sample size did not allow us to make inferences regarding the causality of the associations or generalizations of the results, respectively.

Research/Practical Implications: Based on these findings, leaders training programs can be implemented, in order to enhance satisfaction and prevent resource erosion. These activities will build essential competences aimed to recruit, coordinate and retain volunteers.

Originality/Value: This study contributes to the implementation of the JD-R model to a non-organizational context, such as the voluntary sector.

Keywords: Leadership, volunteer satisfaction, work engagement, identity and recognition.
Robots are increasingly used to support work. Indeed, the professional domain is the context in which robots are most deployed out of the laboratory. One of the core aspects to consider for the successful introduction of robots is user acceptance, which is typically conceived as the willingness to use the system again. With the aim of understanding to what extent user acceptance of robots deployed in the workplace is addressed, we conducted a systematic literature review. Three scientific databases were inquired (i.e., ACM Digital Library, Scopus Digital Library and IEEE Xplore Digital Library). 20 articles were specifically concerned with the investigation of robot acceptance in the workplace. By analyzing them we found that robot acceptance has been assessed so far in three working domains, i.e., industry (55%), healthcare (25%) and education (20%). It seems that robots are generally well-accepted in all of the above-mentioned domains, but specific factors affecting user acceptance emerged as well. In the industrial context the characteristics of the robot (e.g., appearance) were mainly identified as influencing acceptance. The personal characteristics (e.g., age) of teachers and educators together with the entertaining capability of the robot seemed to play a role. Healthcare professionals were inclined to accept robot especially for physically demanding and repetitive chores. Concerns for the possible job loss emerged, highlighting the need for more in depth investigation.
According to statistics, during 2016 there were almost a million of structure fires worldwide. As part of the effort in responding to these kinds of emergency situation, training programs for staff and personnel are usually organized. However, training programs might not always be received the level of motivation that makes the resource investment worthwhile and effective.

In recent years, Virtual Reality (VR) has been proposed to be an enticing, versatile and relatively affordable training tool. VR allows to re-create risky situations in a safe, controlled, realistic environment where the user can experience and practice proper behaviors. However, only a few studies have been published in which the effectiveness of VR training is assessed and compared with other training formats.

In this study, we compare different formats of a training program to teach how to extinguish different office-related fires. Formats vary in their levels of immersion (Imm) and/or interaction (Int): immersive VR (high Imm and Int), 360° video (high Imm, low Int), desktop simulation (Int, low Imm), desktop video (low Imm, no Int) and paper-based material (no Imm, no Int). Their performance in terms of knowledge acquisition and sustained motivation have been measured via both quantitative (answers accuracy, reaction time, questionnaires) and qualitative (interviews) methods. Furthermore, a fifteen-day follow-up has been run to verify the long-term efficacy of the training. Results show that immersion and interaction are important variables in training and learning, highlighting when and how it is recommended to invest in virtual systems for emergency training.
PURPOSE. Opportunity exploration is at the core of entrepreneurship definition (Short et al., 2009) and requires innovative work behaviours (IWB) (De Jong & Den Hartog, 2010). Therefore the psychological antecedents of IWB of entrepreneurs are of great interest for entrepreneurship as well as for I/O psychology research.

Methodology. IWB (Janssen, 2000) and its postulated predictors resilience (Campbell-Sills & Stein, 2010) and SWL (Diener et al., 1985) are assessed via an online survey with a sample of 325 French entrepreneurs, controlling for seniority, number of employees, education, salary, sex, and age.

Results. Though a substantial overlap of the two predictors, direct effects on IWB have been found for resilience as well as SWL. Furthermore, company size is significantly related to IWB ($\beta = .15$). All other controls are of no significance in the prediction of IWB of entrepreneurs. Differential findings for IWB’s three sub-dimensions (idea generation, idea promotion, idea realisation) are reported.

Limitations. Findings might be limited to French region. Further research should focus on longitudinal data, other-ratings and behavioural data.

Research/Practical Implications. Individual well-being is related to IWB of entrepreneurs. Combining quite stable concepts, such as SWL, with the trainable ability to cope immediately with (job) stressors (resilience) explains a crucial performance behaviour of entrepreneurs, that is IWB.

Originality/Value. Considering well-being supports current research interest in the well being of entrepreneurs. Moreover, these findings provide a starting point for entrepreneurship health education.
Customized digital systems have the potential to make the unfolding of working tasks easier and more efficient by shaping employees’ sequence of actions. However, often such systems are customized without carefully considering the very characteristics of the workplace, resulting in tasks of higher complexity for operators. Structured video-analysis allows to investigate working practices in place without interfering with the usual routines, and it enables the detailed description of the context where actions are performed. In this work we examined a validation laboratory of a large multinational company, where home appliances are tested before being launched on the market. Our aim was to inform the redesign of the customized system that is currently used to manage and track the validation process. To this end, we video-recorded an entire working day using multiple cameras. The videos were systematically analyzed using a computer-supported software to code the frequency and duration of specific actions. Furthermore, qualitative aspects were considered (e.g., the tools employed). Combining quantitative and qualitative data from the video-analysis, we identified the most critical operations (e.g., characterized by frequent interruptions or slow-downs). Our findings indicate that the actual version of the system forces employees to make redundant operations (e.g., taking personal notes regarding machine specific and then type them into the system) and does not efficiently notify them about the need to intervene on a machine (e.g., alarms notification). Based on these results, we propose new design recommendations.
1737 - IT'S ALL IN YOUR HAND(PHONE)S: THE EFFECTS OF INDIVIDUAL PERCEPTION OF JOB CONNECTEDNESS ON WELL-BEING

Rashimah Rajah (1)
Koblenz University of Applied Sciences RheinAhrCampus, Business and Social Sciences, Remagen, Germany (1)

Purpose
Modern advances in communication technologies allow endless possibilities for knowledge workers. However, scholarly works have had mixed results with regards to this phenomenon, which we term job connectedness. Grounded in the job demands-resources theory, we postulated that job connectedness is related to different levels of well-being and performance based on individual perceptions of whether ICT devices are a job resource or a job demand.

Design/Methodology
Experience sampling methodology was conducted with full-time employees (n=194) in Singapore, where participants responded to online surveys three times a day over the course of a week. Multilevel modeling was used to analyze data.

Results
Results showed that when individuals psychologically appreciated job connectedness as a job resource, they experienced higher job satisfaction (β=.177, p<.05), lower burnout (β=.224, p<.05), and higher job performance (β=.152, p<.05). Engagement in job connectedness itself did not have an impact on well-being and performance. However, interaction terms became significant when psychological appreciation of ICT devices as a job resource was added to the models.

Limitations
It is plausible that individuals who engaged in very high levels of job connectedness or who were generally disconnected tended not to provide responses.

Research/Practical Implications
The findings suggest that psychological factors remain important in understanding the mixed responses towards job connectedness. On days where job connectedness was perceived as a job resource, individuals tended to flourish.

Originality/Value
This research aims to complement previous studies by (a) identifying a boundary condition for the effects of connectedness on well-being and (b) taking a multi-level perspective and examining dynamic within-individual processes.
Purpose: Additional studies are needed to bridge the gap between the diversity of socioprofessional demands in the knowledge economy and the dominant explanatory models of occupational stress. This is particularly true regarding the demands influencing psychological distress among regulated professions (engineers, lawyers, etc.) since the tools available to measure such distress do not address the impact of the specific demands induced by professional structures. Current studies thus underestimate the level of psychological distress in these professions and capture very little of the phenomenon. This paper presents the validation of a 9-item self-report scale (Professional Stressors Index-PSI) for the study of psychological distress in regulated professions. Methodology: Items were constructed through qualitative exploratory interviews conducted with Quebec lawyers (N=24). The constructed scale was tested (N=44) and retested (N=2126) among Quebec lawyers. Results: The error term in this new formative measurement model shows a good coverage of the construct domain by the proposed indicators. Research/practical implications: These results point to specific stressors associated with the exercise of a regulated profession with a view to identifying organizational and professional mechanisms that could help professionals face the challenges associated with psychological distress. Limitations: The proposed scale needs to be validated for other professions and in other countries to confirm the relevance of these stressors in different contexts. Originality: Creating and validating this scale among a large sample of regulated professionals has helped bridge the knowledge gap regarding the specific demands to which lawyers are exposed and that lead to psychological distress at work.
Purpose

Previous proactive research has predominately measured proactivity construct as an outcome of motivations and positive affect. It is although argued that these relationships between motivation and positive affect with proactive behaviour can be reciprocal, still this discussion remains ambiguous, since no study as far as known has tested these in practice. Thus, in this study, several motivational factors including both intrinsic and extrinsic motivational resources and positive affect have been linked to a range of proactive behaviours at work. The proposed relationships were grounded on social exchange, self-determination, and affective events theories.

Design/Methodology

In order to test the proposed reciprocal relationships, a longitudinal study was conducted over 5 weeks (online-questionnaire), measuring the constructs every week from 76 professional workers working in IT (information technology) field. A total of 380 observations have been recorded and used for data analyses.

Results

Dynamic reciprocal relationships are observed between motivational resources with proactive behaviour based on multilevel structural model with time-lagged effects.

Limitations

A potential bias due to self-measured scale for proactive behaviour, although there was no statistical sign for common method variance.

Research/Practical Implications

Organisations may consider the importance of both intrinsic and extrinsic motivations on employees’ actions at work and may put an effort to enhance such resources for positive outcomes, specifically for proactive behaviour.

Originality/Value

Reciprocal relationship was needed to have better understanding of the cause and effect relationships between the motivations and proactive behaviour. To the best of knowledge, no study has investigated these reciprocal effects with a variety of motivational resources thus far.
TIME-WISE PROACTIVE BEHAVIOUR: COMPARISON OF COMPLEX VERSUS ROUTINE WORK CONTEXTS

Cumali Uri (1)
University of Sheffield, Sheffield, United Kingdom (1)

Purpose

Today organisations are likely to treat proactive behaviour as an essential role requirement, employees with a proactive orientation, and communicating to employees that proactive behaviour is valued and important. However, still many employees do not take charge of issues related to change processes in the workplace. It is argued that individuals are more likely to engage in such behaviours when they have a complex job rather than routine work, because complexity brings more information circling which enables them to see what is needed. However, this discussion still remains unclear, since no study as far as known has considered such discussions in practice. Thus, this study explores if proactive behaviour is varied by characteristics of the job (complex versus routine), and moreover, explores the time wise variation, since proactive behaviour is not a stable.

Design/Methodology

To test the proposed effects, a longitudinal weekly study was conducted over 12 weeks, measuring the proactivity constructs every week from 41 professional workers who works in complex jobs (project planning) and 44 blue collar workers who works in routine jobs (such as delivery and stationary duties). In the beginning of the study and at the week 6, job complexity was rated.

Results

According to the repeated measure analysis based on the mixed model, proactive behaviour varied over the time (within-subjects). Moreover, this variation was significantly differed by two groups: those who has complex jobs and those who has routine jobs (between-subjects).

Limitations

In this study, proactive behaviour was measured with self-rated questionnaire which may bring a potential inflation. However, such threat was not identified according to the statistical tests used.

Research/Practical Implications

Organisations may encourage employees to deal with relatively complex tasks and provide more opportunities to use their own initiative to deal with complex tasks at work, such as through job enrichment and empowerment.

Originality/Value

This study adds to our understanding of the complex nature of jobs are able to bring more opportunities for proactive behaviour compare to the less complex routine jobs.
Purpose: Research-based entrepreneurship is a crucial innovation driver. This contribution highlights how academic’s intentions to form spin-offs are encouraged by awareness-rising patterns and support within a university ecosystem.

The study draws on the ‘entrepreneurial university’ (EU), as well as on the ‘theory of action’, according to which academics go through a process of constructing an entrepreneurial intention. This includes a preactional and a volitional stage: the first stage represents general and hypothetical needs. Meanwhile, the second one encompasses stages of spin-off formation with more specific needs. We will analyze the relation between the university ecosystem and the Rubicon-Index, also integrating gender.

Methodology: We tailored a nationwide survey to determine what hinders or facilitates entrepreneurship in different stages of intention formation. Using the notion of the EU, a questionnaire is designed for (pre-) founders (N = 7300) at Swiss Universities (UAS) in 2018. Mean scores of gestation action will be reported to reconstruct a Rubicon-index using SEM in R.

Results: outline strengths and weaknesses of spin-off promotion in higher education as interplay between intentional processes and context factors. They will highlight patterns, characteristics and “best practices” of spin-off promotion.

Limitations: low response rate, lack of longitudinal data relate to spin-off promotion.

Practical Implications: Results enable targeted and personalized spin-off support in higher education.

Originality: For the first time, conditions of potentially positive effects of institutional mechanisms on different phases of formation of entrepreneurial intention will be systematically investigated.
1753 - YOU CAN'T WIN: POWER AND ACHIEVEMENT VALUES AND EMPLOYEE BURNOUT

Caroline Pulfrey (1) - Franciska Krings (1)
University of Lausanne, Lausanne, Switzerland (1)

Purpose:
Lack of value congruence between organization and employee is considered to be a central predictor of burnout. But does the relation between values and burnout depend not just on whether your values fit those of the organization you work for, but also which values are adhered to? Motivation research has shown that competitive achievement motivation predicts emotional exhaustion and power seeking is associated with depersonalization.
We hypothesized that the more employees see their supervisor, workgroup, organization and profession as characterized by self-enhancing values of power and achievement, the more they will experience burnout.

Design/Methodology
Four studies were carried out with employees from a range of nationalities and professions. Participants assessed perceived supervisor, workgroup, organizational and professional values as well as their own, then reported levels of burnout. Polynomial regression analyses and were used to analyze data.

Results
Results indicate that the more employees perceive that their organizations, their supervisors their workgroup and their profession to be characterized by values of power and achievement the more they report experiencing emotional exhaustion at work. In addition, lack of congruence between employee and their supervisor/group in these self-enhancing values also predicts emotional exhaustion.

Limitations
As in most congruence research, limitations include the use of correlational, self-report studies.

Originality/Value
These findings move forward congruence research, revealing that, in predicting emotional exhaustion, the type of value mismatch as well as with which aspect of the organization the mismatch is experienced, may matter as much as whether values are seen to be congruent or not.

Key words: Value congruence, power, achievement, burnout
Purpose: Individualized pay-setting, where pay raises are based on job performance, are used in many organizations. Research suggests that employees’ justice perceptions are important for pay to have beneficial outcomes. It can also be expected that the level of agreement between employee and supervisor regarding the fairness of the pay-setting process may have similar positive effects. The aim of this study was to investigate how congruence in pay justice perceptions between supervisor and employee relates to employees’ work-related attitudes and behaviour.

Methodology: An online questionnaire was administered to all white-collar employees (N=744) and their pay-setting supervisors (N=188) of an industrial enterprise in Sweden, which had recently implemented a more individualized pay-setting system. The matched data was analysed using polynomial regression analysis.

Results: Preliminary results of the polynomial regression analyses show that employee experiences of pay-related justice related to more positive work-related attitudes, a lower inclination to leave the organization, and better job performance. The preliminary findings also indicate a tendency for more favourable outcomes among employees who experienced higher fairness congruence with their supervisor.

Limitations: The cross-sectional design does not allow for causal inferences. The study needs replication among other occupational groups, in other sectors, and in different countries.

Implications: The results highlight the importance of a transparent pay-setting process, which is perceived as fair by both supervisors and employees.

Originality/Value: While supervisors’ enacted justice has been highlighted in research on organizational justice, there is a lack of research on the congruence between supervisors and employees regarding pay-related justice perceptions.
Personality and sickness absence: The moderating role of gender, age and supervisor support

Purpose: The present study examines whether personality is associated with physician-certified sickness absence, and if the relationship between sickness absence and personality is affected by gender, age and supervisor support.

Design: We used cross-sectional survey data assessing the Big Five personality traits from a large sample of currently healthy Norwegians in the labor force aged 18–62 years (N = 4,653). Survey data were linked to register data on sickness absence for four years after the survey year.

Results: Results show neuroticism and agreeableness to be positively associated with subsequent sickness absence. When controlling for a variety of covariates, only agreeableness remained significantly associated with sickness absence. Interaction analyses demonstrated that gender moderated the relationship between openness and sickness absence, and that the negative relationship between conscientiousness and sickness absence increases with increasing age.

Limitations: Register data did not provide detailed information on diagnoses or reasons for sickness absence.

Research Implications: The results indicate that it could be useful to tailor interventions that target individuals with high agreeableness scores to reduce long-term sickness absence.

Originality: Several studies suggest that personality traits are associated with absenteeism, but studies examining the prospective relationship between personality and register-based sickness absence in a large survey sample are scarce.
Purpose. Evidence of inequities in migrants’ health has demanded for the reorientation of health policies to provide diversity responsive and equitable health services. Diversity responsiveness, defined as a set of congruent behaviours, attitudes and policies to work effectively in cross-cultural situations, requires interventions at individual, organizational and system levels. However, organizational practices remain heterogeneously implemented in Italian health services. This study aims to explore how health policies address inequities in migrants’ utilization of health services and to compare different perspectives in local policies construction and their implementation, considering drivers, facilitators and barriers. Methodology. A qualitative methodology was used. A policy document analysis of the current regional health plans was conducted in three Italian Regions, selected for their high foreign population incidence rate. Interviews to 18 key stakeholders (in health systems and civil associations) were analysed through a thematic analysis. Results. Findings show different concepts of equity for migrants’ health, and the role of contextual factors in affecting the organizational implementation of diversity responsiveness practices. Relevant differences concern the focus paid to organizational commitment practices and the participatory ones. Limitation. The study allowed us to obtain preliminary results, that should be further examined with a wider sample. Practical implications. Results provide a clearer insight about the conditions that foster equitable health services, by showing areas of improvement in reducing the implementation gap faced by organizations confronted with highly differentiated population. Value. The study contributes to understand barriers and drivers in supporting diversity responsiveness and health equity for migrants, using a multilevel framework.
Purpose

Psychological capital (PsyCap) has been widely investigated in different contexts. However, most studies tend to be correlational in nature. This study aims to manipulate PsyCap in an experimental setting by using the best possible self (BPS) intervention. Furthermore, it aims to explore whether a higher degree of PsyCap enhances creative performance.

Design/Methodology/Approach/Intervention

Participants took part in an online pretest (N=171) which measured trait PsyCap as well as other variables (e.g. core self-evaluations). One week after completing the pretest, participants were invited to another measurement and randomly distributed to either BPS (n=78) or the control condition (n=93). Both groups had to do a 15-minute online writing assignment followed by the manipulation check. Finally, participants performed at a creative performance test.

Results

Analysis of covariates will be conducted in order to examine whether PsyCap is significantly higher in the BPS condition compared to the control group. Furthermore, we will test whether participants in the BPS condition show significantly better results in the creative performance task compared to the control group.

Limitations

A limitation of experimental studies is the potential restriction of external validity. Hence, generalizability may be a problem. Especially the creative task might be perceived as artificial.

Research/Practical Implications

A successful experimental manipulation would facilitate studies which are interested in causality. Moreover, it could be used practically in order to enhance PsyCap as a daily intervention.

Originality/Value

This study is the first to manipulate PsyCap not only in an experimental setting but also in a randomized controlled trial.
1769 - LEADER EMPOWERMENT BEHAVIOR AND JOB ATTITUDES: TESTING THE MEDIATING ROLE OF PSYCHOLOGICAL EMPOWERMENT

Parisa Hosseini Koukamari (1) - Morteza Charkhabi (2)

Shahid Beheshti University of Medical Science, Public health and safety, Tehran, Iran (Islamic Republic Of) - (1) University of Clermont Auvergne, Psychology, Clermont, France(2)

Background: The first aim of this study was to investigate the association between leader empowerment behavior and job attitudes. The second aim was to test the mediating role of psychological empowerment.

Methods: The sample consisted of 230 health care who were working in a large Iranian public hospital. Participants were recruited by random sampling method and completed scales on leader empowerment behavior, psychological empowerment, affective commitment, and job satisfaction. Structural equation model through AMOS-21 and SPSS-21 software along with Bootstrap method was used for data analysis.

Results: Findings indicated that there is a significant association between leader empowerment behavior and job attitudes. Further analyses also showed that the association between leader empowerment behavior and job attitudes can be mediated by psychological empowerment.

Conclusion: The result of this study provides insights for health managers to know how influence workers job attitudes which will ultimately lead to higher employee performance. So, for increasing job satisfaction and commitment among health workers, familiarizing managers with empowerment behaviour concepts would be useful.

Keywords: leader empowerment behaviour, psychological empowerment, job satisfaction, affective commitment
1770 - VISUALIZING ONE MILLION APPLIED PSYCHOLOGY FINDINGS

Frank Bosco (1) - James Field (2) - Fred Oswald (3) - Krista Uggerslev (4)

Virginia Commonwealth University, Management, Richmond, United States (1) - West Virginia University, Management, Morgantown, United States (2) - Rice University, Psychology, Houston, United States (3) - Northern Alberta Institute of Technology, Management, Edmonton, Canada (4)

The metaBUS project maintains the largest collection of hand-curated applied psychology research findings and contains over 1,100,000 correlations from over 14,000 published articles. The findings are extracted from articles using a semi-automated approach and then hand-classified by experts according to a variety of criteria (e.g., a branching taxonomy of constructs studied). This resource is freely available (see http://metabus.org) and is used by psychologists around the world. In our oral presentation, we propose to (1) provide a brief overview of the project and tutorial on how to use the metaBUS platform to facilitate research efforts, and (2) provide a variety of advanced visualizations that summarize contents of this massive database. As examples, we will provide advanced visualizations of database field distributions (e.g., sample size; response rate; coefficient alpha; country of origin) in the form frequency plots, density plots, heat maps, and others. Further, we will provide large-scale visualizations of the frequency and effect size magnitude of thousands of bivariate relationships simultaneously (e.g., arc diagrams depicting thousands of meta-analytic estimates). We aim to interest the audience using this massive collection of expert-coded research findings by shedding light on our research landscape using fun and interesting visualizations.
1772 - ADHD AND THE WORKPLACE; DOES THE RESEARCH AND ONLINE ADVICE ADD UP? A CRITICAL EXAMINATION OF SYSTEMATIC REVIEW FINDINGS AND DIGITAL DATA

Kirsty Lauder (1)
Birkbeck College, Organizational Psychology, London, United Kingdom (1)

Purpose
Attention Deficit Hyperactivity Disorder (ADHD) is a neurodevelopmental condition estimated to affect 3.5% of employees globally. Challenges at work include frequent lateness and missing deadlines, resulting in poor productivity. In addition, issues with stigma surround the diagnosis of ADHD resulting in many adults seeking workplace advice online. Despite the documented challenges, organisational research addressing support is limited. Therefore, the aim of the study was to critically examine research and online support for adults with ADHD at work with the intention to bridge the gap between research and practice.

Methodology
The present study consists of two parts, the first part is a systematic review of 150 interventions aimed at supporting adults with ADHD across a range of disciplines, including, educational, pharmaceutical and organisational. The second part uses thematic analysis to identify themes in 27 publicly available online articles used to support adults with ADHD at work. These findings are then compared.

Results
Findings suggest that research into adults with ADHD in the workplace needs to focus on psychosocial interventions to support online advice from practitioners and encourage evidence-based practice.

Limitations
Limitations include the lack of research in the field and the complexity of analysing digital data.

Research and practical implications
The study concludes by suggesting potential reasonable adjustments for adults with ADHD that incorporate research findings and online help-seeking ideas. Such adjustments include the individual, task and environment.

Originality and value
Thus far, no interventions documented in the literature that address ADHD involve the workplace despite the breadth of advice online.
EXAMINATION OF THE RELATIONSHIPS BETWEEN ORGANIZATIONAL CLIMATE, ORGANIZATIONAL COMMITMENT, AND CONSTRUCTIVE ORGANIZATIONAL DEVIANCE

Claire Allain (1) - Guillaume Deprez (1) - Adalgisa Battistelli (1)
Université de Bordeaux, Bordeaux, France (1)

Purpose
An important part of research about constructive deviant behavior is about the definition of the concept. This study focuses on its antecedents and identifies the role of perceived organizational climate (POC) as an antecedent of constructive deviant behavior (CDB).

We examine the relationship between organizational climate formalization oriented and organizational goals oriented (Patterson et al., 2005) and CDB (Galperin, 2012). We suggest that the organizational climate will have a negative relationship with CDB and that affective organizational commitment moderates this relationship.

Design/Methodology
The survey is based on self-reported data, using POC (perceived formalization and organizational goal oriented), CDB (organizational dimension)(Galperin, 2012), and organizational affective commitment (Lapointe & Vandenberghe, 2018) measures. The sample (N = 734) is from private aeronautic organization, with 81% male, an average age of 46.64 (SD = 10) and organizational tenure of 20.48 (SD = 11).

Results
Moderation analyses were used to test the hypotheses. The results support the role of climate as antecedents of CDWB. Organizational commitment inhibits this negative relationship.

Limitations
The cross-sectional, self-report nature of the study increases the likelihood of common method bias.

Research/Practical Implications
These results identify the role of organizational climate as antecedents of CDWB, implies new axe of research and for practice.

Originality/Value
This study is one of the first to identified POC as an antecedent of CDB. It seems that individuals are more likely to produce CDB when they perceived it as formal.
Purpose. The current labor market is characterized by the growing phenomena of NEET (“Not in Education, Employment or Training”) which in Italy involves more than 2 million young people. The "Youth Guarantee" Program is designed to bring closer to the labor market NEET between 15 and 29 years old and reduce unemployment. This study emphasizes the positive role played by perceived employability, the individual perception of his/her possibilities of obtaining a job (Vanhercke et al., 2014). Perceived employability is hypothesized to mediate the relationship between positivity (Caprara et al., 2010), as a personal resource, and employment status. The antecedents of the effectiveness of the Program were also analyzed.

Methodology. 317 people, who had participated in Youth Guarantee during the last year, were involved in the research. SEM were used to test the hypothesized relationships among the variables, controlling also the effect of demographic characteristics and previous work experiences.

Results. The mediating role of perceived employability between positivity and employment status was supported. Moreover, social support from the placement office and perceived employability were related to the effectiveness of the Program.

Limitations. The study is cross-sectional and the sample is not representative of the NEET population at the national level.

Originality/Value. This study underlines the contribution of positivity and perceived employability to employment status, as an objective occupational outcome. From a practical point of view, it highlights the importance of increasing perceived employability and to enhance the support from the placement office, in order to promote employment opportunities and program effectiveness.
1777 - EMOTIONAL DISSONANCE IN WORKPLACES: DIFFERENCES BETWEEN JOBS AND PERCEIVED WELL-BEING

Francesco Pace (1) - Giulia Sciotto (1) - Elena Foddai (1)
Università degli studi di Palermo, Scienze Psicologiche, Pedagogiche e della Formazione, Palermo, Italy (1)

Purpose. According with a recent EU-OSHA research, among the sources of major stress on workplaces there is some connected to emotional regulation, such as "having to deal with difficult customers, patients, pupils, etc. (58%). Hochschild (1983) called emotional labour the process by which employees manage their emotions to meet organizationally mandated emotional display rules or norms concerning. When an employee must express an emotion he or she does not feel, is lead to emotional dissonance, that affect well-being (Sheldon et al., 1997). The aim of this work is to explore how the emotional dissonance affect the personal well-being in a sample of italian workers differentiated by sector, and the mediating role of the perceived organizational resources.

Methodology. To assess work demands, resources, and outcomes we used the italian version of Questionnaire on Experience and Assessment of Work (QEEW, van Veldhoven & Broersen, 1999; Pace et al., 2010); to assess the emotional dissonance we used a scale originally developed by Brotheridge and Lee (2003); to assess psychological strain we used the General Health Questionnaire (GHQ-12, Goldberg and Williams, 1988). We collected 371 subjects from many different companies (public/state-owned companies and private companies, representing different economic sectors and productive). We conducted multiple regression and mediation analyses.

Results and conclusions. We found that scales connected with emotional labour and emotional dissonance were connected with psychological strain measures in different ways, depending on the level of contact with customers, patients, or pupils. The mediation of personal and organizational resources has a different role, depending on how workers have to deal with "difficult" people.

Limitations. The cross-sectional nature of this research.

Research/Practical Implications. Future research directions are discussed in order to advance our understanding about solutions that minimize the connection between emotional dissonance and strain.
PURPOSE: Young people are increasingly using apps to source information about health. The purpose of the study was to examine how the use of a new clinically approved NHS app by young people enabled them to access high quality health information and whether it had a positive impact on their health behavior.

DESIGN: Using the Integrated Behavioural Model and Theory of Planned Behaviour, along with using an online survey tool (Qualtrics) with adapted established scales, a survey was carried using a sample of 137 participants. Measuring ‘intention to act’ as an effect of using the app was used as a means of predicting future behaviour change with multiple regression analysis applied.

RESULTS: Based on survey results and using frequency analyses to address two research questions, the study established that the majority of participants had increased their knowledge base and had high levels of trust in the information they had received. The study found that, (i) higher levels of trust in the app, (ii) feeling informed by the app, and (iii) believing that it will be difficult to have control over their health behaviour, all predicted a stronger likelihood of enacting positive health behaviours (Intention to Act). We establish that having greater trust in the app is likely to facilitate a positive relationship between attitudes towards behaviour change and intention to act.

LIMITATIONS: Strict causality could be established given the use of a cross-sectional design and a restrictive sample size. Future longitudinal studies are recommended to establish better causation.

IMPLICATIONS: Based on an examination of what are strong predictors of intentions to act and subsequent future behaviour change, it is likely that such a health app can make a positive difference to people’s health behaviours. Particularly, in that young people will act on the information engaged with in a way likely to improve/support positive health behaviours.

ORIGINALITY/VALUE: This is a unique quantitative study to demonstrate how the use of a free public health app when actively adopted by young people can optimize health literacy behaviour.
Introduction: The use of function titles such as “Chief Happiness officer” makes people think that employers can affect the general happiness of their employees. But is that really so? If so, can employers influence the happiness of their employees with SDT?

Aim of the study: This study explores the relationship between Basic Psychological Needs at Work (BPNW) and general life satisfaction, via Job Satisfaction and takes the differences between types of work (self-employed, private sector, public sector) into account.

Methodology: A database of 3770 Belgians was applied. The BPNW were measured using a six-item BPNSNF (Basic Psychological Needs Satisfaction and Needs Frustration) inventory. General life satisfaction was measured using the Cantril Ladder. A one item question was applied for Job Satisfaction (scale from 0 to 10).

Three analyses were conducted among the different types of work. First, a linear regression between the BPNW and Job Satisfaction was conducted. In a second analysis, BPNW and Job Satisfaction were considered as independent variables in a linear regression analysis with the Cantril Ladder as dependent variable. Finally the sobel test assessed whether the relation between the BPNW and the Cantril Ladder is mediated by Job Satisfaction.

Results: Our analyses show that, regardless of the type of work, the BPNW are directly and positively related to Job Satisfaction (B between 1.19 and 1.50, p<0.001) and general life satisfaction (B between 0.13 and 0.41, p<0.05). The sobel tests indicate that the relationship between BPNW and general life satisfaction is mediated by Job Satisfaction. The latter two variables are also positively related with each other (B between 0.32 and 0.35, p<0.001). Preliminary results indicate that the general life satisfaction of self-employed workers seems to be more affected by their job satisfaction than other types of workers.
STRATEGIC ORIENTATIONS AND TEAM EFFECTIVENESS IN HIGH-TECH COMPANIES IN BULGARIA

Tsvetelina Panchelieva (1) - Snezhana Ilieva (2)

Bulgarian academy of sciences, Organizational psychology, Sofia, Bulgaria (1) - Sofia University, Psychology, Sofia, Bulgaria (2)

Abstract: The purpose of the article is to reveal what are the factors for team effectiveness and which are the leading strategic orientations in the high tech companies in Bulgaria. A new Scale for team effectiveness is developed and four factors are identified – team processes, team results, team commitment and shared mental models. By applying the Scale of Henri Hakala (2011) for strategic orientations, five types of strategic orientations (customer, technology, learning, entrepreneurship orientations and organizational performance) are studied. The sample consists of 494 people who work on different positions in software companies in Bulgaria. Results show that the most important factor for team effectiveness is team processes and interaction and the predominant strategic orientation is the learning orientation. It turns out that in order to improve team effectiveness in tech organizations the learning orientation (and its implications such as knowledge sharing and knowledge transfer) is the key element. The Team effectiveness model can be applied in different organizations especially from the high tech industry to measure the teamwork and effectiveness. The implications from the study are valuable for managers at all levels and team leaders when working with teams and when trying to improve their effectiveness. HR professionals and consultants also can use the scale and take into consideration the results from the study when planning training programs for employees at all levels.

Key words: team effectiveness, strategic orientations, management, high-tech, software
THE IMPORTANCE OF LMX LEADERSHIP IN PREDICTING POSITIVE AND NEGATIVE ORGANIZATIONAL OUTCOMES: THE MEDIATING EFFECT OF JOB-RELATED EMOTIONS

Stig Berge Matthiesen (1) - Andrea Bobbio (2)
BI - Norwegian Business School, Organization and leadership, Bergen, Norway (1) - University of Padova, Psychology, Padova, Italy (2)

Purpose

Leader-member exchange leadership (LMX) constitute an inspirational and dyadic form of leadership. In the present paper an overarching research model will be investigated, applying altruism as an organisational resource outcome measure, whereas counterproductive work behaviour acts as a demand outcome measure (cf. the well-known demand resource model). We will investigate if LMX also may have a link through job-related emotions in predicting altruism and counterproductive behaviour.

Method

A group of 351 Italian adult workers took part in the study. The sample was recruited from different companies (mean age 46.2 years, 50.4 % males). The outcome measures utilised were a 16 items scale on Counterproductive work behaviour from Barbaranelli et al. (2013), a six items scale on altruism, selected from Podsakoff (1990), whereas LMX was captured by a seven items scale (Graen & Uhl-Bien, 1995). Job-related affective well-being scale, with 15 positive and 15 negative emotional items, were taken from Katwyk et al. (2000).

Results

A model that fitted the data well is presented. LMX had a stronger association with counterproductive work behaviour, as compared with altruism. Some of the interconnections were mediated through positive and negative job-related emotions. These associations may reflect that the emotional aspect constitutes an essential part of LMX leadership as well.

Practical implications/ Value

The LMX perspective demonstrates the importance of having a dyadic perspective on leadership. Leadership issues taking place within the dyads involving leaders and their immediate subordinates may have positive as well as negative organisational impacts depending on the quality of the relationship.
Purpose: To study the mediating role of team work engagement between team psychological safety and team outcomes.

Design: The study employed cross sectional design. The data were collected through survey from 115 knowledge workers embedded into 23 teams. Rwg(j) and ICC(1) and ICC(2) were calculated to justify the aggregation of individual data to team level.

Results: The study found that team work engagement mediated the relationship between team psychological safety and perceived team performance and satisfaction with team membership.

Limitations: The cross sectional research design and the smaller sample size are the limitations of the study.

Research/Practical Implication: The study extends our knowledge about relatively new construct of team work engagement in predicting team outcomes. The managers can harness engagement at the team level by providing psychologically safe environment where team members can express their ideas and opinion without the fear of being judged or ridiculed. This in turn has the positive impact on team outcomes.

Originality: The positive impact of team psychological safety on team on engagement is sparsely studied in team effectiveness literature. Moreover, the relationship between team work engagement and team outcomes hasn’t been explored much. The study bridges this gap.
A COMPARISON OF THREE IMPORTANT JOB ATTITUDES ACROSS FOLLOWERSHIP STYLES

Mojtaba Amanolla Nejad (1) - Morteza Charkhabi (2)
Imam Reza International University, Psychology, Tehran, Iran (Islamic Republic Of) (1) - University of Clermont Auvergne, Psychology, Clermont, France (2)

Purpose: This study aims to compare three key job attitudes of job satisfaction, organizational commitment and job involvement across four different types of organizational followers (containing passive, conformist, pragmatist, and exemplary ones). Method: To collect data and test the hypotheses, 320 employees using stratified random sampling method from an Iranian Oil and Gas company were recruited. Participants filled scales on Kelley’s followership styles, job satisfaction, organizational commitment and job involvement. Results: The results of multivariate and ANOVA tests showed a significant difference between these three job attitudes across four different followership styles. In addition, Scheffe’s test revealed that exemplary followers reported the highest job satisfaction and affective commitment compared to other types of followers. Practical Implication: this study suggests organizations to pay a more specific attention to different followership styles if they intend to select and train employees who will be more committed to organizational goals. Limitations: The cross-sectional research design of this study may prevent us to generalize our findings. Originality: Organizations by selecting particular followers might be able to predict the job satisfaction and the organizational commitment of their future employees.

Keywords: followership styles, job satisfaction, affective commitment, job involvement
Melanie De Ruiter (1) - Rene Schalk (2) - Pascale Peters (3) - Robert Blomme (1)

Nyenrode Business Universiteit, Strategy, Organization and Leadership, Breukelen, Netherlands (1) - Tilburg University, Tilburg, Netherlands (2) - Nyenrode Business Universiteit, Breukelen, Netherlands (3)

Purpose:
There is a lack of knowledge on how ideological psychological contracts (iPCs) are formed. It is important to understand how iPCs are formed as this can help organizations create realistic beliefs about the inducements they offer. As important figureheads, it is proposed that top managers shape employee perceptions of iPCs.

Approach:
In this conceptual paper, a framework is presented which focuses on the factors that affect top manager behavior that is relevant to iPCs and how this behavior in turn shapes employee perceptions of organizational ideological obligations. Signaling and social identity theory are used to explain the mechanisms.

Results:
It is proposed that factors at the societal (external pressures), organizational (organization type), relational (PC between top manager and board) and individual level (top manager values) affect a top manager’s behavior, which in turn shapes employee perceptions of iPCs.

Limitations:
Although top managers are key in shaping iPCs, not all organizational representatives involved in shaping iPCs are considered.

Implications:
Recommendations for examining trickle-down effects to understand how top managers embed iPCs within the organization are presented.

Originality:
We take a unique approach by examining how the behavior of distal contract makers (i.e., top managers) shapes iPCs. We not only consider the behavior of these contract makers, but we take a step back to also consider how factors such as industry type and PC between top manager and board affect top manager behavior. Hence, we suggest iPCs are embedded in a broader organizational context and are interdependent on factors that affect top manager behavior.
Purpose:
This study aimed to explore how managers can help employees transform to an agile way of working in different phases of the change process.

Design:
A theoretical sample of employee-manager dyads (8 employees, 8 managers) involved in multiple phases of the transformation from an insider perspective was selected. The interviews focused on perceived manager behavior and employee needs and stages of individual change.

Results:
Employees’ needs changed during different phases of the transformation and during these stages different manager behavior was perceived helpful. In the beginning, steering behavior addressed the need for external and identified motivation. The tipping point occurred when employees fulfilled their need for competence and wanted to increase their need for autonomy. At this point, too much steering was perceived as hindering, while sounding behavior was considered helpful.

Limitations:
Retrospective accounts were used to explore behavior in the initial phase of transformation, yet steps were taken to improve the accuracy of these accounts.

Implications:
According to popular management press, agile management should employ a hands-off approach in which managers take a step back when agile is introduced. In contrast, to stimulate agile behavior at the onset, our results showed that steering behavior was perceived as helpful and effective.

Originality:
By focusing on manager behavior in different phases of an agile transformation, this study answers a call for more research on exploring differences in manager behavior in multiple phases of change. By focusing on individual, micro level change, this study gives a more fine-grained understanding of helpful manager behavior in an agile transformation.
1797 - A DAILY DIARY STUDY OF WITHIN- AND BETWEEN-PERSON EFFECTS OF TRAIT MINDFULNESS AS A PERSONAL RESOURCE AT WORK: REVEALING “HIDDEN” INTERACTIONS

Lucie Zernerova (1) - Paul Flaxman (1)

City, University of London, Department of Psychology, London, United Kingdom (1)

Purpose: This study investigated influence of trait mindfulness as a personal resource on dynamic patterns of job burnout and work engagement unfolding over five days. Many previous daily-diary studies have reported within-person results only; to extend this research, we adopted a dual process perspective of the expanded JD-R model (Bakker & Demerouti, 2014; 2017) and used multilevel modelling to disentangle episodic (within-) and chronic (between-person) effects.

Design: A 5-day diary study with 1083 measurement occasions nested in 144 employees of various UK-based organisations.

Results: Trait mindfulness (FFMQ total) did not moderate within-person reactivity to stressful work episodes: regardless of trait mindfulness, high demand-low control work episodes were associated with higher burnout and lower work engagement. However, trait mindfulness moderated the between-person effects. Specifically, mindfulness prevented burnout in employees exposed to high demand-low control working conditions. A more complex pattern of results emerged with respect to work engagement. Mindfulness boosted work engagement in low demand-high control working conditions but was negatively associated with work engagement in low demand-low control conditions.

Limitations: Mindfulness was measured as a trait; it was not manipulated or measured as a state.

Research/Practical Implications: Different patterns of results found for within- and between-person level of analysis. Cultivation of mindfulness may be useful for preventing employee burnout. However, it may be less useful for buffering the impact of job stressors on work engagement.

Originality/Value: This is the first study to report both within- and between-person results for trait mindfulness as a moderating personal resource within the JD-R model.
EMPLOYABILITY FOR TATTOOED JOB SEEKERS: THE DOUBLE POINT OF VIEW OF RECRUITERS AND CANDIDATES

Stefania Fantinelli (1) - Teresa Galanti (2) - Michela Cortini (1)
University G. d'Annunzio of Chieti - Pescara, Disputer, Chieti - Pescara, Italy (1) - University G. d'Annunzio of Chieti - Pescara, Disputer, Chieti - Pescara, Italy (2)

Purpose The present research aims at deepen the influence of body art in the selection process. In details, we considered tattoos as a specific kind of body art and their relation with prejudice. According to previous studies (Timming et al., 2015; Baumann et al., 2016) tattoos can significantly affect the interview process and future work life.

Methodology We implemented a triangulated methodology conducting a series of focus group interviews with a sample of tattooed job seekers; in addition, a sample of 200 students in economics and psychology, who could probably become recruiters in the next future, were invited to fill in a questionnaire where they were asked to evaluate a job candidate resume.

Results As we hypothesized, there is a significant difference in the self-perception of job candidates: those with big and visible tattoos have often a sort of dissonance in showing or covering their body art. On the side of future recruiters, the results suggest that visible body art can potentially be a real impediment to employment, even if this effect is reduced for job applicants seeking non-customer-facing roles.

Limitations Limitations of our study are related to the little sample that inhibits the generalization of our results and to the self-reported measures.

Practical implications Some relevant implications concern the tattoos’ social perception in the workplace.

Originality The originality of the present study resides in the still partly unexplored job candidates’ point of view concerning the selection process in relation to body art expression.

Keywords: tattoo, job interview, job candidate, selection, prejudice.
The aim of this study is to determine the extent to which cognitive appraisals of job insecurity may mediate the link between job insecurity and well-being among employees. According to cognitive appraisal theory, the two cognitive appraisals of job insecurity, hindrance vs. challenge appraisals, were integrated into a conceptual model and examined as the mediators of job insecurity-wellbeing association. Well-being related outcomes were job satisfaction and emotional exhaustion. Hypotheses were tested using a total sample of 306 hospital staff. Respondents from diverse departments of this hospital were recruited and completed scales on quantitative job insecurity, hindrance vs. challenge appraisals of job insecurity, job satisfaction, and emotional exhaustion. Results indicated that hindrance appraisals of job insecurity mediated the association between job insecurity and emotional exhaustion. Challenge appraisals did not mediate the job insecurity-well-being association. In all, only one out of four mediation paths was found significant. As a result, employees hindered by job insecurity are more likely to be emotionally exhausted by perceived job insecurity.

Keywords: job insecurity; well-being; hindrance appraisals; challenge appraisals; job satisfaction; emotional exhaustion
Purpose. According to a recent framework, we tried to establish the construct “motivation to work” (MTW), the motivation to enter into a work arrangement or to remain there in higher working age. This may be relevant in the retirement process and predictive for retirement timing. Past large-scale studies that aimed at measuring this motivation (or its proxies) had varying conceptual clarity and success. We developed a short measure indicating the strength of MTW.

Methodology. We used data from (1) an online survey (N = 107) and (2) the german lidA-cohort study (www.lida-studie.de) (N = 3,371) to examine reliability, factor structure and associations of the scale with selected variables among older workers.

Results. (1) Using exploratory factor analysis, we identified a 5-item scale with suitable psychometric properties. (2) Confirmatory factor analysis supported the previously obtained one-factor solution, with metric invariance holding across both sexes. Reliability was $\alpha = .73$. The scale showed a medium association with desired retirement age. Other criteria also correlated as expected.

Limitations. As a trade-off for broad item content the homogeneity of the scale (= .36) was on the lower bounds of the recommended range. The data is representative only for German age cohorts born 1959 or 1965. Results were obtained with a cross-sectional design.

Research/Practical Implications. It seems fruitful to distinguish MTW from general work motivation. The scale is especially applicable in large-scale retirement studies due to its high economy.

Originality/Value. We established a new construct and introduced a direct, content-free, economic measure to avoid indirect ad hoc operationalizations.

Disclosure of interest: None declared.

Keywords: motivation to work, work motivation, older worker, retirement
Anatoly ZANKOVSKY (1)
Russian Academy of Sciences, Institute of Psychology, Moscow, Russian Federation (1)

The research and management practice have shown that traditional leadership models do not satisfy the requirements of the constant changes in modern organizations. This situation urgently calls for new scientific approaches that meet modern challenges. Fast economic development of Asian countries has already brought to life intensive discussions about eastern type of leadership. For many centuries Europe has provided the World with excellent models of leadership. Now when there is an urgent need for promoting effective leadership in Europe, scientists and management experts should do their best to consolidate the long-term experience and achievements. A new leadership concept, opening wide research and applied opportunities is suggested. Empirically validated, new three dimensional leadership model facilitates to better organizational activities helping organizations to achieve synergy and gain the most ambitious goals. Traditionally two basic factors determining effective leader’s behavior have been outlined: task-orientation and concern for people (Blake & Mouton, 1963; 1985). The suggested leadership model includes additional value/cultural orientation factor, comprising basic values extracted from corporate codexes and corporate culture of leading companies. These values are trust, fairness, responsibility, openness and commitment. The value/cultural orientation factor indicates how leader’s values match values of ideal corporate culture. A new typology of leadership styles takes in consideration not only personality and behavioral characteristics of leadership, but the specific aspects of corporate culture and power distribution in organization as well. On the basis of the model a new three level (individual-group-organization) program of organizational development and training is elaborated and successfully used in organizations in Germany, Austria, Bulgaria, Poland and Russia.
There has been a growing debate among scholars and practitioners on the relationship between working conditions and the balance of work and family demands. Despite accumulated evidence of the positive effects for both organizations and individuals of building family supportive working environments, there is still an ongoing debate about the mechanisms by which organizations can influence that type of contexts.

This study seeks to deepen the understanding of human resource practices as facilitators or inhibitors of work family balance. In addition, the relationship between those practices and positive organizational values and managers’ family supporting attitudes are analyzed as antecedents of “family supportive organizations”. Furthermore, the study considers two types of organizational consequences, hard – fulfilment of family projects and soft – intention to quit and employee engagement.

The data for this study were collected from a sample of 1156 individuals working for six major companies in Portugal. Our sample is diverse in terms of gender, age, and family status. The research model and hypotheses were tested using Structured Equation Modelling (SEM).

The results indicate that HR practices have positive and significant effects on the formation of family supportive organizations. Furthermore, both positive organizational values and managers’ family supporting attitudes have incremental effects. Moreover, the degree on which organizations are perceived as family supportive demonstrated to be associated to both hard and soft outcomes.

This study advances our understanding of the antecedents of building family supportive organizations as well as individual and organizational outcomes. The paper discusses limitations and avenues for future research.

Keywords: family supportive organizations, HR practices, positive organizational values, psychological climate, work family balance
This study aims to deepen the extant theoretical and empirical knowledge on the mechanisms by which organizations succeed in promoting effective adaptation of their newcomers. The most common stream in the literature adopts a cognitive perspective which assumes adaptation occurs mainly through knowledge acquisition, namely, about the job, work group and organization. On the contrary, a largely overlooked perspective concerns the importance of newcomers’ affective reactions during this transition phase. So, our study integrates both variables in order to understand their mutual influence on a critical organizational outcome, i.e., person–environment (P-E) fit.

The data for this study were collected from a sample of 240 individuals who have recently begun a new job, i.e., starting date one to three months from data collection. To reduce risks of common method variance we did it in two moments. The research model and hypotheses were tested using Structured Equation Modelling (SEM).

The results indicate that onboarding practices have positive and significant direct and indirect effects on P-E fit, and also that there is a double partial mediation mechanism through newcomers’ knowledge and affective reactions. Moreover, affective reactions demonstrated to be associated to newcomers’ knowledge acquisition.

This study advances our understanding of the mechanisms through which onboarding practices can positively influence newcomers’ compatibility to the job, work group and organization. It is also relevant its contribution to understand the synergistic effect of knowledge and affect in the promotion of effective newcomers’ adjustment. The paper discusses limitations and avenues for future research.

Keywords: onboarding practices, employee adjustment, affective reactions; perceived P-E fit
The pro-environmental initiatives of companies in Turkey were investigated. Turkey is considered as highly vulnerable to climate change and Turkish organizations are the largest contributors to the emissions of the country. We sampled the top 75 companies in Turkey, recorded and categorized their green initiatives using a categorization developed by Ones et al. (2014). Results showed that Turkish companies had more saving focused initiatives than initiatives that are focused on transforming. Furthermore, positive association between the number of initiatives and financial performance of the companies (i.e., sales) was found ($r = .44, p < .01$). These findings are consistent with research showing that companies in Turkey are more focused on energy saving initiatives and less focused on creating long-term strategies for sustainability (CDP, 2016).

Previous research of individual innovative work behavior (IWB) is scarce with effects of supervisor’s IWB on employee IWB and task performance. We address this gap by proposing that leader identification, employee innovative behavior and employee engagement play an important role in the relationship between supervisor’s innovative behavior and employee task performance. The study develops and tests a model of the mechanisms linking supervisor’s innovative work behavior and employee task performance using a sample of 165 supervisor and employee dyads from an organization based in Croatia. Results of moderated-mediation analyses provided support for our hypotheses, demonstrating that supervisor’s innovative work behavior was positively related to employee task performance, mediated by employee innovative behavior. Furthermore, leader identification was found to moderate the relationship between supervisor’s innovative work behavior and employee innovative behavior. At the same time, the relationship between employee innovative behavior and task performance was moderated by their work engagement. The main limitations of our study are related to reduced generalizability due to small sample size, and the cross-sectional nature of the collected data, which requires caution when making causal inferences. However, findings of the study offer new insights for understanding the role of leaders in stimulating employee IWB and task performance.
Purpose:

It has been proposed that using one's strengths at work can lead to flow. However, this has not been empirically tested yet. The present study uses a diary approach to examine the momentary strength use-flow association. In addition, it is tested whether strength use and/or flow can positively affect objective cognitive performance and decision making (i.e., risk taking).

Design:

On five consecutive workdays and twice a day, participants had to fill in their strength use and flow during the previous hour. Subsequently they conducted two computer tasks measuring cognitive performance (i.e., the Stroop Task) and risk taking (i.e., balloon risk task).

Results:

We found that strength use positively related to flow. Higher experienced flow was associated with more risk taking and this effect was moderated by negative affect. Stronger flow states were associated with poorer performance in the Stroop task.

Limitations:

Most of the participants were young white collar workers (average age 28.0) in China, which may limit generalizations.

Implications:

People can be encouraged to use their strengths at work because this will foster their flow experience.

Values:

This is the very first study to test the momentary relationships between strength-use and flow while also using objective cognitive/decision making outcomes. Theoretically, the study contributes to insight in the cognitive and behavioral characteristics of strength use and flow.
"CAN WE PLEASE HAVE OUR SAY?": CONSIDERING THE EFFORT-REWARD IMBALANCE (ERI) AND THE JOB DEMANDS-RESOURCES (JD-R) MODELS THROUGH TWO NOVEL QUALITATIVE STUDIES

Cameron Williams (1) - Suzanne Dziurawiec (2) - Mark Larsen (1)

University of New South Wales, Black Dog Institute, Sydney, Australia (1) - Murdoch University, School of Psychology & Exercise Science, Perth, Australia (2)

Content: While the ERI and JD-R work-stress models have been applied in hundreds of quantitative studies (with employees and the future workforce [i.e., students]), qualitative studies, which may provide nuanced/individualised perspectives, are rare/non-existent.

Methodology: A thematic analysis (based on these two work-stress models) will be discussed, using 330 responses from an open-ended item (representing students from 15 disciplines/40 universities). Additionally, results from a naturalistic qualitative study, which analysed students’ ERI- and JD-R-related posts from ~200 Facebook groups (e.g., university-clubs), will be discussed.

Results: The qualitative data corroborate the existing quantitative research (e.g., links between the work-stress models and outcomes including burnout and withdrawal intentions). Additionally, the qualitative data supports/expands the two theories (e.g., by discussing the models’ different ‘reward’ and ‘demand’ components). Furthermore, the qualitative comments uniquely demonstrate how organisations may prevent/minimise employees’ and students’ work-stress based on these models (e.g., through gamification/badging).

Limitations: To supplement these text-based investigations, interview/focus-group research is required. Additionally, while these student-based results likely generalise to workplaces, studies with employees are needed for validation. Nonetheless, the qualitative comments will also be used to highlight the merits of organisational-psychology research focused on students (e.g., by demonstrating that students’ experiences with work-stress influence their future-oriented motivation and wellbeing when entering the workforce).

Originality/Implications: This study addresses the scarcity of qualitative research based on the ERI and JD-R models. Ultimately, this research has helped provide more nuanced understandings in this field, and may inform future qualitative/quantitative research (with substantive benefits for employees and the future workforce [i.e., students]).
1832 - CHARACTER STRENGTHS USE AND PERFORMANCE: A POSITIVE PSYCHOLOGY GOAL-SETTING EXPERIMENT

Jennifer H.K. Wong (1) - Fleur C. Pawsey (2) - Katharina Näswall (1)

University of Canterbury, Psychology, Christchurch, New Zealand (1) - University of Canterbury, Business, Christchurch, New Zealand (2)

Character strengths are universally valued human qualities that instill a sense of fulfilment in individuals when expressed (Peterson & Seligman, 2004). The opportunity to use and apply signature strengths at work, which are individuals top-rated character strengths, is linked to better work performance (Littman-Ovadia, Lavy, & Boiman-Meshita, 2016). However, Rust, Diessner, and Reade (2009) found that individuals who work on developing their under-utilized character strengths reported more positive emotions and less distress. From a human resource standpoint, developing weaknesses is valuable because while employees are hired based on their strengths, weaknesses in their work may hinder promotion or lead to termination (Kaiser, 2009). Therefore, other uses of character strengths aside from solely signature strengths should be considered in evaluating character strength-based interventions at work.

In the current study, we piloted a character strengths goal-setting experiment with undergraduate students recruited from a 100-level psychology course at a university in New Zealand. Participants completed a character strength assessment at the beginning of the semester and were randomly assigned to be either in the condition of (1) developing their three signature strengths, (2) developing one top and two under-utilized character strengths, or (3) randomly assigned character strengths (control group). The intervention carried over four weeks during lab times, during which participants were coached weekly by researchers to set three SMART goals around their character strength condition. At the end of the semester, participants’ final grades for the lab course will be collected, and an ANOVA will be conducted to test for group differences in final grades across the character strength conditions. This study is novel in that it uses a randomly assigned character strengths condition as a general goal-setting control group. Implication for academic practices and character strengths goal-setting interventions at work will be discussed.
Purpose: Siegrist’s (1996) work-stress theory (the effort-reward imbalance [ERI] model) consistently predicts work/health-related outcomes for staff/students in educational settings. However, the model’s third component (‘overcommitment’—an intrinsic inability to withdraw from work) has been largely neglected. While some studies have found that overcommitment independently predicts work/health outcomes, and exacerbates the ERI-outcome relationship, results remain equivocal. Additionally, a mediation-model (whereby overcommitment predicts ERI, which in turn predicts outcomes) warrants consideration for the first time.

Methodology: Survey responses from 2,451 students (representing 40 universities/15 disciplines) were analysed through Hayes’ PROCESS-macro. Many outcomes were measured to provide nuanced/novel results (e.g., life stress; exhaustion; cynicism; dropout intentions; depressive symptoms).

Results: Significant overcommitment main-effects were identified for all outcomes (except cynicism) and, counter to hypotheses, overcommitment acted as a ‘protective’ buffer/moderator in the relationships between ERI with dropout intentions and academic stress (all \( p < .001 \)). As hypothesised, mediatory relationships were also demonstrated with all outcomes (average 95% CI [.26,.33]), and additional data/analyses will be presented (qualitative comments relating to overcommitment; predictors of overcommitment; and an overcommitment cut-off score).

Limitations: Due to the cross-sectional data, causal-mediator pathways cannot be substantiated. Furthermore, while using a student-based sample is inherently valuable (as positive educational trajectories develop better-equipped employees for future workplaces), and while findings likely generalise to employees, workplace validation is required.

Originality/Implications: This research focuses on the often-neglected ERI component; expands on the limited student-based ERI-work; helps clarify existing/discrepant findings with employees; provides initial/novel support for mediation pathways; and offers substantive benefits for diverse student/staff groups.
THE APPLICABILITY OF WORK-STRESS MODELS FOR EDUCATION STAFF AND THE FUTURE WORKFORCE: A SYSTEMATIC AND META-ANALYTIC REVIEW

Cameron Williams (1) - Mark Larsen (1)
University of New South Wales, Black Dog Institute, Sydney, Australia (1)

Purpose: While the effort-reward-imbalance (ERI) and job-demands-resources (JD-R) theories appear to predict the wellbeing and performance/motivation of two ‘high-risk’ groups (education-staff and students), results remain discrepant. Therefore, a synthesis of existing research is required to better understand stress-related outcomes in these populations.

Methodology: This review systematically analysed peer-reviewed research linking the ERI- and JD-R-models to education-staff and students (following PRISMA-guidelines). Ultimately, articles were identified through PsycInfo/ProQuest/Scopus/ScienceDirect (with additional reference-list searches). Alongside meta-analytic/quantitative data (random-effects models with publication-bias tests), ‘qualitative’ appraisal/critique will be presented (e.g., research-gaps, practical-implications).

Results: Results support the moderate-strong predictive power of work-stress models with education-staff and students’ health- and work-related outcomes. This predictive power has generally been demonstrated with a few commonly-measured outcomes (e.g., burnout, depressive-symptoms), but also with some novel variables (e.g., drug/cigarette-use). Furthermore, significant meta-analytic moderators exist (e.g., outcome-type), and the models’ different facets (e.g., ‘efforts’, ‘rewards’) demonstrate unique main-effects. Lastly, multiple individual-differences (e.g., PsyCap) buffer/exacerbate, or mediate, the stress/strain-outcome relationships; however, results remain mixed (thus requiring additional nuanced research).

Limitations: This review predominantly relies on cross-sectional/self-report studies, written in English. Additionally, the ERI model has generally received less attention than the JD-R model (especially with students), and further research with students is needed (given that positive educational trajectories help develop better-equipped staff for the future workforce).

Originality/Implications: This first/novel review highlights the utility of work-stress models within educational settings, and identifies areas requiring further research. Additionally, by providing guidelines for ‘best-practice’ interventions and workplace-culture, substantive benefits (relating to wellbeing/performance) are offered for staff/student groups.
Purpose

The presentation describes the construction and validation of a self-report instrument to measure Career Management Skills (CMS) of unemployed clients. The underlying concept differentiates three dimensions: job market confidence, career readiness and vocational strains. In addition, personality background variables as well as contextual support or barriers are considered.

Design/Methodology

Utilizing a self-other design, the analyses concentrate on the convergence of the CMS self-reports collected prior to a counseling session (in total N=122) with two other sources: career counselor assessment of candidate’s CCR (N=122) and ratings of independent observer (N=71).

Results

Correlations of ratings belonging to corresponding dimensions range between r=.2 and r=.4. In general, the “other”-ratings show higher convergences with each other. Analyzed moderators are: type of consultation, duration of unemployment, primary topics discussed in the counseling session, change of specific CMS dimensions.

Limitations

The “other”-ratings had been collected immediately after the counseling session. Although the counselor knew the counselee from former meetings, other sources for CMS ratings (peers, relatives) would be fruitful.

Practical implications

In general, the results confirm the validity of self-reported CMS. The new instrument shows to be a suitable instrument to screen CMS to clarify improvements and to optimize the counseling process.

Originality/value

Validation study for a career counseling instrument.
1844 - THE IMPACT OF HUMOR STYLES ON TYPES OF PERFORMANCE VIA BURNOUT

Amélia-Rita Monteiro (1) - Liliana Dinis (1) - Pedro Neves (1)
Nova School of Business and Economics, Lisbon, Portugal (1)

Purpose – To survive environmental unpredictability, organizations have to come up with innovative ways of solving problems and find creative solutions. This study focuses on the impact that subordinate humor, which serves adaptive/detrimental functions (Martin et al., 2003), has on adaptive performance (Charbonnier-Voirin et al., 2012) and work effort, mediated by burnout.

Design/Methodology – We tested our hypotheses with a sample of 145 employees from multiple organizations that completed two surveys (t1+t2), separated by a six-week time lag and with a sample of 698 dyads in several organizations.

Results – We found the same pattern in both studies/samples: self-defeating humor was positively related to disengagement, damaging adaptive performance (study 1) and work effort (study 2). It was also positively related to emotional exhaustion. Affiliative and self-enhancing humor were negatively related to disengagement, improving adaptive performance and work effort, while they were also negatively related to emotional exhaustion. There were no significant relation between emotional exhaustion and both adaptive performance nor work effort.

Limitations – Our mortality rate between t1-t2 was rather high (43%) and performance was self-rated in the first study.

Research/Practical implications – It demonstrates the importance and differential effects of subordinate humor styles for performance (both work effort and adaptive performance), providing a new behavioral tool that can be developed in the workplace.

Originality/Value – It is the first study to examine how the different types of humor can damage/enhance organizations’ adaptation capacity, as measured by adaptive performance and work effort, while extending humor research in the workplace by including both its positive/negative facets.
1845 - THE ROLE OF THE FOUNDER IN FAMILY BUSINESS

Liliana Dinis (1) - Pedro Neves (1)
Nova SBE, Organizational Behavior, Lisbon, Portugal (1)
Liliana Dinis
Nova School of Business and Economics
Pedro Neves
Nova School of Business and Economics

Purpose:
Despite an impressive number of studies on the culture effects of founder’s leadership style, researchers and practitioners overlooked the benefits and drawbacks that the founder’s shadow (set of ideas, habits, processes influenced by the founder’s vision and still present in the business’s daily life) might bring to second generation family businesses (Davis & Harveston, 1999; Schein, 1983). Succession is rather more than a question of assets. It is about values, social responsibility and the community (Mandl, 2008). This study aims to enlighten the long-lasting effects of the founder’s shadow in leadership as well as strategic management of a family business.

Design:
We explored the nature and expression of the founder’s shadow by conducting semi-structured interviews on a sample of second-generation CEO’s and top management from multiple family businesses.

Results:
The founders’ shadow lingers in family businesses through physical and emotional aspects. Namely, the founder’s hometown community recognize the founder’s vision, by giving his name to important landmarks. Additionally, the shadow may be used by employees as an anchor to resist change or as a booster for innovation.

Limitations:
Our sample is based on small and medium-sized Portuguese family businesses, which might represent a rather specific context.

Research/practical implications:
It demonstrates the importance of examining the founder’s shadow, providing a new behavioral tool that can be developed in leadership and strategic management.

Originality/value:
It is the first study to conceptualize the shadow of the founder and how it can influence organizational life.
Workplace inclusion of persons with disabilities can be tricky for small businesses, given their limited access to human resources expertise to assist with accommodation. The purpose of our study is to conduct a qualitative assessment—in the small business context—of the Job Access Mobile App (JAM; Kocum, Robinson, Loughlin & Brown, 2018), a web application designed to help employers and employees produce more inclusive job descriptions.

Note that research is in progress. We are conducting 12 in-depth interviews with small business employers (i.e., workplaces with fewer than 100 employees) who currently employ at least one worker with a disability. We are inquiring about participants’ current disability accommodation practices, and any barriers and facilitators they have experienced in this process. We are also asking participants to use the JAM app and reflect on how (if) their current practice might be improved with its application.

Based on our queries, we expect that employers will identify financial resource barriers, but we also anticipate several creative accessibility solutions, given the sample frame includes small business employers who already accommodate individuals with disabilities. We also expect employers to provide us with novel feedback on the utility of the JAM app and practical adjustments needed for the small business setting.

Job analysis is normally used to identify competencies requisite to a particular job. The JAM app uses generic job descriptions as a starting point, allowing for context and individual tailoring, underscoring that core competencies can be demonstrated on the job in several, inclusive ways.
GOAL DIFFICULTY AND INCENTIVE EFFECTS IN MULTIPLE-GOAL SCENARIOS

Aaron M. Schmidt (1) - James W. Beck (2) - Win Matsuda (1)
University of Minnesota (1) - University of Waterloo (2)

Purpose

Multiple demands create an impetus to efficiently allocate resources. We propose that the difficulty of the goals and the incentives associated with them play a powerful role in how multiple goals are prioritized and pursued.

Methodology

253 participants were presented with a primary and secondary task. Participants were assigned one of four goal levels for the primary task, and a ‘do your best’ goal for the secondary task. Further, participants were either offered an ‘all or none’ bonus for attaining the Primary Task goal or a ‘piece-rate’ incentive. For all participants, a small piece-rate incentive was offered for secondary task performance. Participants freely allocated time across the tasks.

Results

Goal level and incentive structure interactively predicted allocation and performance. With a goal-attainment bonus for the primary task, an inverted-U was observed, with greatest allocation with a moderate goal. For the piece-rate incentive, the primary task given considerable time regardless of goal difficulty. These effects were mediated by expectancy.

Limitation

Additional research is needed to generalize these findings to a broader range of tasks and contexts.

Implications

These findings demonstrate that secondary tasks can siphon resources from the primary task when its goal either has been met or cannot be met, unless the incentive structure encourages continued prioritization of the primary goal.

Originality/Value

This research addresses a need to better understand multiple goal prioritization, and the boundaries of traditional approaches to goal setting and incentives. Understanding these processes is paramount for advancing self-regulation theory and practical application.
Purpose

Dark triad (DT) traits are linked to negative workplace outcomes, such as counterproductive workplace behavior (CWB) and leader derailment (Hogan, Hogan, & Kaiser, 2011; O'Boyle, Forsyth, Banks, & McDaniel, 2012) and thus pose risks to organizational success. However, screening for DT traits during personnel selection is uncommon because existing DT measures rely on self-report and are thus susceptible to faking (McFarland & Ryan, 2000). Therefore, the present research aims to develop a more implicit and thus less fakeable measure for DT traits based on the conditional reasoning technique.

Design

Two studies served to test our conditional reasoning DT measure. In Study 1, an online sample completed the DT measure, a CWB- and an organizational citizenship behavior scale (OCB). Study 2 used a mock selection setting in which candidates completed the DT measure and peers rated their CWB.

Results

Results from Study 1 showed correlations between our DT measure and CWB ($r = .13$ to $.29$) and OCB ($r = -.07$ to $-.24$). Based on factor loadings and reliability analyses, we reduced the number of items for Study 2. The results confirmed the positive link to CWB. Additionally, we found a characteristic correlation pattern with the HEXACO personality traits.

Limitations

In the first study, we relied on self-report measures for the criteria. Reliabilities for our measure are still expandable.

Implications

Our measure yielded promising results and might after some refinement be used for selection and research purposes.

Value

The measure represents a promising means to assess DT traits implicitly.
Purpose
In recent years, organizational scholars have started to adopt implicit measures of personality and attitudes. One of these implicit instruments is the conditional reasoning test (CRT; James, 1998). In the current study, we developed a CRT to measure trait self-control (the CRT-SC), and examined the validity of this instrument for predicting contextual performance.

Design/Methodology/Approach/Intervention
In an online study (N = 247), we administered the CRT-SC (26 items) together with measures of personality, a persistence task, and a self-report of contextual performance.

Results
CRT-SC scores were positively correlated with scores on self-control (r = .20, p < .001), Conscientiousness (r = .35, p < .001), and personal initiative (r = .15, p < .01), and negatively correlated with counterproductive work behavior (r = -.39, p < .001) and procrastination (r = -.29, p < .001). However, CRT scores were not significantly correlated with organizational citizenship behavior (r = .10, p = .11) and a persistence task (r = .08, p = .18).

Limitations
In future research we should further improve the items. Also, future research should use other-reports and objective outcomes, and examine the cross-cultural validity of the CRT-SC.

Research/Practical Implications
The CRT-SC yields benefits in assessment due to its implicit nature, which should diminish or eliminate the possibility of faking.

Originality/Value
The present study integrates findings from the field of social and cognitive psychology, and examines its potential value for the development of a novel selection instrument.
Occupational burnout has been the scientific research subject for many years (Maslach, Leiter, 2001, 2010, 2014, Santinello, 2014). Psychological literature brings a lot of research concerning the predictors of this phenomenon and proposals for organizational and individual support. A certain research gap is associated with the measurement of dynamics of burnout, especially in the context of psychological interventions dedicated to particular professional groups. Taking into account studies of Golembiewski (1996), Cherniss (1992), Leiter (2014, 2018) it’s possible to specify the course of individual burnout symptoms, however the significance of specific psychological interventions dedicated to selected professional groups is still not empirically documented. The author will present the results of a longitudinal study carried out in Poland on a group of employees performing professional work closely related to innovation and the creativity of the proposed solutions. The level of occupational burnout in the group of 25 architects and 30 IT programmers and developers of fintech projects in IT was tested at the beginning of the research project. A complex intervention was carried out in the group of architects, including a series of soft trainings (40 hours of workshops) concerning communication, team building, solving interpersonal conflicts and coping with stress. The scope of the intervention based on a qualitative study of training needs in both target groups. After a period of 8 weeks from the end of the intervention, a change of the professional burnout operationalized with the Maslach Burnout Inventory - General Survey is planned, as well as re-measurement in the group of IT specialists who will not be supported by training activities. Despite the initially similar level of burnout of employees in both groups, the author assumes a reduction in the level of emotional freeing, cynicism and an increase in the sense of personal achievement in the group covered by the intervention. Due to the fact of work in progress with the implementation of the intervention program, the results of comparison between both group will be presented during the conference.
Purpose. Startups development and growth is one of the Europe’s Priorities. However, about 50% of new European businesses fail during their first five years; conflicts between founders and effects of work stress being identified as two of the top reasons for this failure. The aim of this work is to elaborate on typologies of conflicts specifically characteristic for start-ups and to analyze their dynamic as related to stress, coping and health.

Design/Methodology/Approach/Intervention. This study has a mixed design: we conducted interviews with 18 startup founders/experts, followed by concept mapping, multidimensional scaling, and cluster analysis. Also, we carried out multilevel SEM on a diary data from 86 start-up founders.

Results. The results indicate four types of conflicts specific to the context of startups, regarding: money, norms, teamwork, and vision. These dimensions of conflicts in startups relate in time with stress, and different indicators of well-being.

Limitations. Self-report was used to measure conflicts and stress levels.

Research/Practical Implications. The results can contribute to create guidelines for startups on how to prevent and effectively deal with stress and conflicts, take early preventive actions to avoid startup’s failure, and to promote founders’ well-being and health and start-ups’ success.

Originality/Value. This work adds knowledge about conflicts and stress dynamics in start-ups that is practically inexistent. It addresses a timely issue of start-ups’ entrepreneurial success, making this work relevant for European economy.
WHAT DO STARTING MOTIVES SAY ABOUT SOLO SELF-EMPLOYED WORKERS?

Sjanne Marie van den Groenendaal (1) - Silvia Rossetti (2) - Mattis van den Bergh (3) - Dorien Kooij (4)

Department of Human Resource Studies, Tilburg University, Tilburg, Netherlands (1) - School of Governance (2) - Department of Methodology (3) - Department of Human Resource Studies (4)

Purpose. The central aim of this paper is to increase our understanding of the different types of solo self-employed workers based upon their start-up motive(s) and to advance knowledge on the effects of entrepreneurial motivations on proactive behaviors related to their career. To achieve this aim, we identified subgroups and investigated whether they differed in terms of their engagement in proactive career self-management behaviors, such as skill and knowledge development, networking, hiring and collaborating with fellow entrepreneurs, and hybrid entrepreneurship.

Results. We identified six subgroups of solo self-employed workers based on their start-up motives and found that they differed in their levels of engagement in proactive career self-management behaviors. Especially solo self-employed workers pushed by necessity tend to be more vulnerable because of their desire for paid employment but not succeeding the attainment of actual hybrid entrepreneurship as a career self-management behavior, due to a lack of employment opportunities.

Limitations. Due to the cross-sectional design, we could not examine whether start-up motives and its relationship with career self-management behaviors are stable over time.

Research/Practical Implications. With the knowledge generated in this study, institutions may develop more effective tailor-made policy-interventions to enable solo self-employed workers to reduce failure and sustain their business.

Originality/Value. The results will advance knowledge on the heterogeneity among solo self-employed workers and their career self-management behaviors using a person-centered approach (i.e. Latent Class Analysis).
The objective is to verify the relationship between trainee characteristics and their permanence in a web-based leadership training program. The study used secondary data from a large Brazilian public organization to pair trainee characteristics with their participation in each training module. Trainee sociodemographic and functional characteristics were obtained from a corporate information system and abandon, dropout and persistence rates from a web-based educational environment. A multinomial logistic regression was performed. Among those enrolled (n = 1,832), 51.4% didn’t even started the designed educational activities (abandon), 15.1% escaped after experiencing some stage of the course (dropout), and only 33.5% fully concluded it (persistence). In the comparison between persistence and dropout, the chance of evading the course was higher among those with an average level of schooling (OR: 1.79 -95%: 1.05-3.03). Comparing persistence and abandonment, the probability of leaving the course was higher not only among those with medium education level (OR: 2.68 - 95% CI: 1.79-4.00) but also among those with higher education level (OR: 1.99-IC95%: 1.34-2.96), compared to those with only a graduate degree. Dropout was also more likely among formal leaders (OR: 1.60-IC95%: 1.19-2.15), compared to potential successors, among those with the longest service (OR: 1.02-IC95% : 1.00-1.04) and among women (OR: 1.26 -95% CI: 1.05-1.58). This study helped to understand the distinction between trainee characteristics that are related, as antecedents, to the abandon, dropout and persistence in a web-based leadership training program. Limitations are the use of only secondary data and sociodemographic and functional trainee variables.
“MASTERING YOUR EMPLOYABILITY”: THE EFFECTIVENESS OF A CAREER COURSE INTERVENTION FOR POSTGRADUATE BUSINESS STUDENTS TRANSITIONING TO THE WORLD OF WORK

Jill Pearson (1) - Ailish Chawke (2) - Joy Schneer (3)
University of Limerick, Ireland, 2Rider University, USA, Limerick, Ireland (1) - University of Limerick, Ireland (2) - Rider University, USA (3)

Purpose – To maximize employment rates of graduates and support students in their transition to working life, many third-level institutions provide career services and interventions to their students. Drawing on behavioral learning theory, the theory of planned behavior, and social cognitive theory, this study evaluates the effectiveness of one such intervention on the job search behavior of postgraduate business students.

Design – The intervention, entitled “Mastering Your Employability” involved two courses that were incorporated into the core curriculum of several Master’s level business degree programs. Using a quasi-experimental design, 55 postgraduate business students completed a pre- and post-intervention survey; 50 students who had not completed the intervention served as a control group.

Results – Supporting the effectiveness of the intervention, paired sample t-tests, independent sample t-tests, and regression analyses showed that it had a positive effect on career exploration (both self and environmental), job search clarity, preparatory job search behavior, active job search behavior, and job search effort.

Limitations – While several attempts were made to maximize the response rate of both groups, the necessity to match pre- and post-intervention survey responses meant several participants who only completed one survey were excluded from the analysis.

Implications – This study has implications for research on graduate employability and more specifically on the role of personality and interventions. It also has practical implications for third-level institutions as it shows the importance of incorporating career interventions into the core curriculum.

Originality – There has been limited research on the effectiveness of core versus optional career services/interventions.
The objective is to estimate the effectiveness of a web-based leadership development training program regarding the transfer of training and the influence of its associated psychosocial support in the context of a large Brazilian public organization, according to some characteristics of training design, delivery and implementation. The sample had 214 respondents. Data were collected by self-assessment survey with two Brazilian scales: Training Transfer and Training Transfer Psychosocial Support. A linear regression was used to analyze the data. The trainees sample was predominantly males (56.4%), mean age of 43 years and complete upper level education (80.2%). The training is virtual, short-term and voluntary (66.3%), management and business content, time-spaced sessions, contain single source feedback, information-based method and comprised a training needs analysis. Considering a 5-point scale, the learning transfer is average to high (mean 3.563; sd=0.678) with Cronbach Alpha = 0.928 and KMO = 0.938 (sig. <0.05); and support medium to low (mean 2.907; sd=0.84604) with Cronbach alpha = 0.941 and KMO = 0.924 (sig. <0.05). Mean correlation (r = 0.555, sig. <0.05) and adjusted R2 of 0.304 (sig. <0.05). This study helped to understand the influence of psychosocial support on the transfer of web-based leadership development training to work, considering its design, delivery and implementation characteristics. The perception of support and transfer of training may imply that both trained leaders and their subordinates benefited from such intervention. This study was limited to the use only of self-report as a source of data about effectiveness.
Purpose – Graduate employability literature proposes that young adults should build their employability already during their studies. In this study, we apply Job-Demands Resources theory in an educational setting and examine whether career competencies and perceived institutional support impacts student academic performance and their employability before entering the labor market.

Design – Three-wave data were collected among Dutch university graduates at the start of the Master’s program (T1), six months into the Master’s program (T2), and at time of graduation (T3). We measured career competencies and perceived institutional support (T1), and study engagement and employability (T2). Objective indicators of academic performance (i.e., GPA and ECTs) were obtained via university records (T3).

Results – Findings show that career competencies (i.e., career resource) and perceived institutional support (i.e., organizational resource) were positively related to employability and study engagement, and subsequently employability was positively related to GPA at time of graduation. Employability mediated the relationship between career competencies and GPA, such that those students who developed career competencies at the start of the Master’s program, were more employable six months later and obtained higher GPA’s.

Limitations – We focused only on graduate students from an economics and business faculty.

Implications – Our findings show that students’ academic performance can be enhanced by developing career competencies and employability during the study career.

Originality – This is one of the first studies to examine the role of employability during the school-to-work transition using longitudinal data including objective outcomes.
Purpose:
Our research aim was to build an observation system to evaluate the firefighter teams’ coordination and communication behaviour under various workloads, since we wanted to understand their adaptation behaviour, especially in light of their leaders’ competencies. This observation or evaluation system can help their managers to apply a new development and training methods in the future.

Research design and methodology:
We worked out simulated scenarios for firefighter teams. We registered 6 firefighter teams and then we analysed the video recordings. By using a bottom up way, with “naked eye” technique we built our observation system. Then we evaluated the team leaders’ competencies and the whole teams’ performance with experts.

Results:
Based on the video recording we identified the following team leaders’ competencies: giving direction, situational awareness, stress management, communication, decision-making, safety-attitude. And to evaluate the whole team performance we determined these behaviour markers: success of problem solving, team motivation, coordination, cooperation and safety-attitude.

We found many correlation coefficients between team leader’ competencies and the team performance that confirm the role of the leader in the team’s success and in the team adaptation.

Value:
The value of the research is that it highlights the relationship between team leaders’ competencies and their influence on the teams’ performance under various workload conditions.

Limitations:
Subjective assessment of experts and other personality perception distortions.

Research/Practical Implications:
Development of team leaders’ competency training program in high risk environment.
2490 - ATTENDANCE ATTITUDES: A LATENT PROFILE ANALYSIS

Claus D. Hansen (1) - Ann-Kristina Løkke (2) - Sascha A. Ruhle (3)

Department of Sociology and Social Work, Aalborg University, Denmark, Aalborg, Denmark (1) - Department of Management, Aarhus University, Denmark (2) - Faculty of Business Administration, University of Duesseldorf, Germany (3)

Purpose

Research has gathered increasing knowledge regarding causes explaining presenteeism, such as constraints on absenteeism and work- and person-related factors. However, a person-centered approach regarding individuals’ attendance attitude is currently missing. This study aims at studying attendance attitudes from a person-centered approach.

Design/Methodology

Using questionnaires, two random samples of 11,835 members of the Danish work force and a birth cohort study of app. 2,000 young people born in 1983 in a rural county in Denmark were collected. We employ a latent profile analysis (Mplus).

Results

We plan to provide insights to the understanding of individual attendance attitudes, and contribute to the understanding of absenteeism and presenteeism. Individuals could be allocated to different profiles, which will then be related to other variables of interest. For example, we expect individuals in a high legitimate profile to show higher sickness absenteeism and lower sickness presenteeism.

Limitations

Due to the cross-sectional character of the data the causal inference is impossible. In addition, the generalizability is limited because of the sample characteristics.

Research/Practical Implications

Using a person-centered approach might improve understanding of the complexity of attendance. Thereby, we might be able to provide evidence for unexpected findings, such as the role of support in the formation of presenteeism.

Originality/Value

This study is the first to consider latent profiles in the field of presenteeism, especially when considering attendance attitudes. By highlighting the heterogeneity of individuals regarding the latent construct of attendance attitudes, it contributes to a deeper understanding of individual differences in attendance behavior.
ABSTRACT

Purpose
The current study conducted a reliability generalization analysis for alpha reliability coefficients on the measures of core self-evaluations (CSE). Although reliability is a sample-specific property, there needs to be some assurance that the measures produce reliable scores across samples and situations. This is critical for accurate estimation and interpretation of the observed relationships between CSE and criterion constructs of interest (e.g., job satisfaction).

Design/Methodology
Analyses of our study effects were conducted using Schmidt and Hunter’s (2015) meta-analytic methods.

Results
We found acceptable levels of reliability across measures ($\mu_\alpha = .83$, $\tau = .06$); however, inter-item correlations were higher for direct measures ($r_{MIC} = .29$) than for indirect measures ($r_{MIC} = .12$).

Limitations
Alpha coefficients in the primary studies may have been inflated by common method variance. Additionally, alpha coefficients and inter-item correlations may have been influenced by measurement-specific factors that render them less comparable.

Research/Practical implications
The multidimensionality in the composite of individual CSE trait measures suggests that alpha may be an underestimate of reliability. Thus, it may be desirable to model CSE as a latent factor with trait effects indicators, and estimating the ratio of the proportion of variance in scale scores accounted for by the higher-order construct.

Originality/Value
The focus on criterion-related validity evidence for CSE has been accompanied by relatively less attention to the reliability and internal properties of its measurement. Thus, we believe that it is
timely for meta-analytic evidence on psychometric reliability and associated study characteristics to inform the properties of CSE measures.
ABSTRACT

Purpose
The paper explores the direct and indirect links between the three positive organisational behaviour concepts of organisational career instrumentality, career adaptability and thriving at work within the boundary conditions of clients’ life stage (age).

Research design, approach, and method
A cross-sectional survey design was utilised to collect via LinkedIn primary data from a sample of (N = 606) white (56%) and black (44%) and male (54%) and female (46%) professional people (mean age = 37; SD = 11.08) employed across the globe (South Africa: 76%; Europe: 19%; Africa: 3%; Eastern countries: 2%). The Organisational career instrumentality scale (OCI: Coetzee, 2018); Career adaptability scale (Savickas & Porfeli, 2012) and Thriving at work scale (Porath et al., 2012) were utilised as measures. Moderated-mediation regression-based analysis was performed.

Results
Organisational career instrumentality positively explains thriving at work through career adaptability for the 30s transition candidates (25 to 39 years). The interaction effect between low organisational career instrumentality and age in explaining low thriving at work was significantly stronger for this age group when compared with the mid-life aspirants (40 – 56 years).

Practical/managerial implications
Supportive career development practices for the 30s transition candidates (young talent) may help them thrive at work with a sense of momentum and progress in their careers.

Contribution/value-add
This study contributed to positive organisational behaviour and demonstrates that the nature and meaning of career goals with the concomitant career adaptability attitudes and behaviours may differ at various life stages.
The purpose of this quantitative correlational research study was to determine if and to what extent formal social support and informal social support are correlated with the three dimensions of burnout among disability support workers in Missouri. The job demands-resources theoretical foundation provided the basis from which to measure the five variables in a non-probability convenience sample of 100 adult, full-time, disability support workers in Missouri. An online survey hosted by SurveyMonkey was used to collect anonymous data from the participants using three valid, reliable instruments: the MSPSS measured informal social support, the SPOS measured formal social support, and the three subscales of the MBI-HSS measured emotional exhaustion, depersonalization, and personal accomplishment. This data was then analyzed using SPSS. Informal social support and formal social support were moderately, positively correlated with the personal accomplishment dimension of burnout; \( r(98) = .31 \) \( p = .002 \); \( r(98) = .4 \) \( p < .001 \) respectively. Informal social support and formal social support were significantly negatively correlated with the depersonalization dimension of burnout; \( r(98) = -.35, p < .001 \); \( r(98) = -.54, p < .001 \). Informal and formal social support were also significantly negatively correlated with the emotional exhaustion dimension of burnout; \( r = -.21, p = .035 \); \( r = -.71, p < .001 \). Formal social support explained more than half of the variation in emotional exhaustion scores among the sample (\( R^2 = .5041 \)). These findings are significant as they extend the JD-R literature to include sources of job-related resources inside and outside of the formal employment organization, and provide key insights into correlates of burnout in an understudied population.

**Keywords:** burnout, JD-R theory, disability support workers, social support
ABSTRACT

Purpose
High work pressure and occupational burnout in the nursing profession have been investigated intensively. However, there are currently no reliable studies addressing the consumption of psychoactive compounds by nursing staff.

Methodology
127 graduate nurses completed questionnaires on demographic data, stress response (Stressverarbeitungsfragebogen) risk of burn-out (MBI-D), use of psychoactive compounds (WHO-ASSIST V3, use of caffeine) and caffeine dependency. Statistical analysis included an analysis of Pearson’s correlation, multivariate analysis of variance and linear regression modeling. Lastly, the study examined differences in the severity of burnout, caffeine consumption and dependency in correlation with age, field of work and mode of employment.

Results
Nursing staff more frequently experienced personal fulfillment and emotional exhaustion. Caffeine dependency and personal fulfillment increase with elevating age and duration of employment. 65.4% of the nursing staff showed symptoms of caffeine dependency (about 30% in the general population). Furthermore, a tendency of heightened emotional exhaustion with increasing age could be observed. Primarily, legal psychoactive drugs such as alcohol and tobacco were consumed – matching the general population. Furthermore, a correlation between alcohol consumption and burnout symptoms could be observed.

Limitations
Small sample size and possible reservations filling in the form concerning the consumption of psychoactive substances

Practical implications
Substance (mis)use (especially alcohol but also caffeine with its often-neglected negative consequences) should be considered as a target for health related interventions especially when co-occurring with symptoms of burn-out.
ABSTRACT

Purpose
Investigation of employees’ perception of organizational efficacy in order to find criteria which need to be improved.

Design/Methodology/Approach
The data were collected in a Russian plant after its acquisition by one Italian company. In that period the company faced many external and internal problems and the management was interested to investigate what was needed to be improved. Sixty seven employees from all departments excluding production participated in this study. They filled in a questionnaire of competing values approach about their perception of different aspects of organizational functioning.

Results
The employees and the top management had different perception of organizational functioning and emphasized different things as important for the company: the employees perceived goal-setting and information management as criteria which were needed to be improved while the top management believed that they needed to work on HR development and cohesion among employees. The agreement between employees and top management was found only for criteria of adaptability and control which both parties evaluated negatively. The present study exposed subjective nature of organizational efficacy: managers and employees perceive organizational functioning in a different manner.

Limitations
The results have not been compared to objective criteria of organizational functioning.

Research/Practical Implications
Not always top management sees the problems in organizational functioning in the same way as employees do. Employees’ perception of organizational efficacy determines how much effort they invest in their work, therefore managers need to assess and develop a sense of organizational efficacy. The present study provides a simple way of such assessment.
Although job characteristics have been found to increase performance at work and reduce employees’ intentions to quit (e.g., Allan et al., 2018; Humphrey et al., 2007), the evidence for the processes by which job design impacts organizational outcomes is scarce (Shantz et al., 2013). The purpose of this study was to examine the mediating role of work engagement on the relationship between a more comprehensive set of job characteristics than that included in Hackman and Oldham’s (1980) Job Characteristics Model and three facets of work performance (in-role, extra-role, and creative performance) as well as employees’ turnover intentions. Data were obtained via an online survey of 142 employees in an IT company based in Romania. The results revealed that employees who held jobs that offer high levels of autonomy, task significance, and social support enacted more in-role behaviors as a result of higher work engagement. Through increased work engagement, job characteristics as autonomy, task significance, and information processing positively influenced employees’ extra-role performance, whereas social support negatively impacted their intentions to quit. Finally, task variety, problem solving, and information processing positively influenced creative performance through work engagement. Our results indicate that the way jobs are designed has the potential to foster employees’ engagement at work and, as a consequence, increases their performance and decreases the willingness to leave the organization. Despite its cross-sectional nature, our study sheds light on which job characteristics are relevant for increasing work engagement, and how these characteristics can improve, through engagement, different facets of performance.
**ABSTRACT**

**Purpose**

According to Schaufeli’s (2015) work on the role of leadership in the Job Demands-Resources model, leadership plays a crucial role in managing the allocation and impact of job demands and job resources on their followers. Research on this indirect pathway is currently scarce.

Building on Self-Determination Theory we conceptualize poor leadership as neither inspiring, nor strengthening or connecting and thus increasing employees experience of high job demands and lacking resources (i.e. a negative social climate), which in turn profoundly impacts symptoms of job strain.

**Method**

N = 740 employees from a large organization in the Telecommunications & IT Services sector responded to the Salutogenetic Work Design Questionnaire (SALSA) measuring poor leadership and negative social climate. Additionally, perceived emotional and cognitive strain symptoms were measured using the irritation scale.

**Results**

Structural Equation Modeling revealed a full mediation of negative social climate between poor leadership and cognitive irritation and a partial mediation between poor leadership and emotional irritation.

**Limitations**

All variables were based on self-reports and cross-sectional data don’t allow firm conclusions about causality. Future three wave longitudinal studies may improve our design and provide more valid findings about the hypothesized mediation patterns.

**Implications**

Poor leaders influence and shape followers’ job experience directly and indirectly. Practitioners should be aware of how poor leadership creates work contexts in which employees suffer from strain.

**Value**

The present study advances our understanding of the underlying psychological mechanisms that explain the destructiveness of poor leadership in organizations.
ABSTRACT

Purpose

Counterproductive work behaviors are an ongoing concern for organizations. The purpose of this study was to examine generalized self-efficacy (GSE) and perceptions of ethical misconduct (PEM) to better understand underlying antecedents of counterproductive work behaviors (CWBs).

Methodology

Usable data was obtained from 190 participants who completed online measures assessing GSE, PEM and CWBs.

Results

CWBs were measured with two subscales, interpersonal and organizational deviance. Hayes’ procedure to analyze mediation revealed that (1) GSE significantly predicted PEM, $\beta = -.322, p < .01$; (2) PEM significantly predicted interpersonal CWBs, $\beta = .657, p < .01$; and (3) there was an indirect effect of GSE on interpersonal CWBs through PEM, effect = $.212, 95\% CI [.34, -.12]$. Similarly, (1) GSE significantly predicted PEM, $\beta = -.322, p < .01$; (2) PEM significantly predicted organizational CWBs, $\beta = .647, p < .01$; and (3) there was a significant indirect effect of GSE on organizational CWBs through PEM, effect = $.208, 95\% CI [.33, -.11]$.

Limitations

This study relied on an undergraduate sample. Future research should examine workers in an applied setting.

Research/Practical Implications

Organizations may want to support self-efficacy boosting tactics within training, recognizing its effect on PEM and CWBs. Organizations may benefit in hiring employees with higher levels of GSE to reduce employees’ tendencies towards CWBs.

Originality/Value

While previous research links CWBs to GSE and PEM, this study was the first to propose and demonstrate that perceptions of ethical misconduct mediates the relationship between self-efficacy and counterproductive work behaviors.
ABSTRACT

Purpose

Although courage has generally been understood as a powerful virtue, research to establish it as a psychological construct is in its infancy. We examined courage in organizations against the backdrop of positive psychology with a design in the Grounded Theory tradition that connects Positive Organizational Behavior and Positive Organizational Scholarship.

Method

The sample consists of organizations that define courage in their mission statement and organizations without such a definition. It includes employees and executives, exploring workplace courage on the macro as well as the micro level. Eleven organizations and 23 participants contributed to the interview study.

Results

Applying Glaser's theoretical coding, specifically the C-family, we propose that courage arises from a decisional conflict in three major domains: the self, social interaction, and performance. It is located on a continuum between apathy and foolhardiness and can take on reactive, proactive, or autonomous forms. Whether and to what extent courage manifests, is a dynamic process contingent upon organizational structure, culture, and communication climate as well as individual cognitive-affective personality systems.

Limitations

The model depicts the complexity of the phenomenon, rather than details of its individual components. It goes beyond pre-defined categories and prevailing definitions.

Implications

Modern organizations are characterized by volatility, uncertainty, complexity, and ambiguity (VUCA). Courage is crucial in such an environment and can be systematically fostered across the whole human resource management cycle.

Value

The study advances theory building on courage in the workplace and highlights its potential to be measured, developed and managed for more effective work performance.
Purpose
Organisations are not always preparing their managers for the use of a coaching skill and managers can be left alone with nothing other the instruction ‘to coach’. This study investigates if managers have coaching skills and whether they can increase their level in a short time frame.

Methodology
Participants of a leadership coaching course (N=98) filled in a survey about their demographics, coaching experience and perception pre- and post-training. Participants were asked to engage in a five minute, video-taped coaching conversations pre-and-post training. These video conversations were evaluated by peers as well professional coaches (N=18), resulting in 906 evaluations.

Results
Managers have an awareness of the importance of coaching skills and believe that coaching skills can be learned. Even during a short training course (15 hours), managers can improve their coaching skills markedly (verified by self, peers & experts). Managers and peers however are overestimating the level of their current coaching skills.

Limitations
This study focused on the coach perspective, future research should follow up on the coachee perspective.

Implications
Organisations should not assume that every manager has the necessary level of coaching skills. Investment in training courses, even in short-term programs could be beneficial to give managers an overview of the approach and ensure a company aligned understanding of coaching.

Originality/Value
This study contributes to the body of knowledge in leadership coaching, shedding light on how leaders learn how to coach and including evaluations by coaching experts.
This paper argues that the persistent existence of public service motivation (PSM) as a dynamic construct will depend on the extent to which successive generations of public service employees hold that PSM encourages ethical perceptions and behavior. Given the unique characteristics ascribed to Generation Yers and their ethical perceptions, coupled with the increasing retirement rate among Baby Boomers, it is becoming more important for public administration organizations to evaluate how this cohort’s unique characteristics interact with PSM to impact ethical perceptions of what is ethical or unethical conduct. This paper empirically examined the moderating effects of generational cohorts of Generation Y on the relationships between the constructs of PSM and perceived incorruptibility by drawing on a sample of 671 public employees across Israeli government agencies. The article finds different effects of generational cohorts of Generation Y on the relationships between PSM and varying levels of ethical perceptions.
59 - GENDER AND CHARISMATIC LEADERSHIP; A CASE STUDY ON THE ROLES OF HEAD OF DEPARTMENT IN UNIVERSITY.

Kanda Janyam (1)
Prince of Songkla University, Faculty of Liberal Arts, Songkhla, Thailand (1)

ABSTRACT

Background
The charismatic leadership construct has been explored and debated for the last few decades, and previous research has indicated a link between charismatic leadership and employee outcomes. Additionally, a large body of literature has been devoted to examining gender issues in leadership. However, what the literature has not done thus far is to investigate the potential differences between male and female leaders who employ a charismatic leadership style. This study aimed to address this gap.

Method
Charismatic leadership was measured in a sample of 217 subordinate staff in a university located in Songkhla Province, Southern Thailand through the use of an online questionnaire. Respondents were asked to assess how frequently their department heads engaged in behaviors or demonstrated attributes indicative of a charismatic leadership style. Each behavior or attribute was rated on a 5-point frequency scale ranging from not at all to frequently and responses were then analyzed using means, standard deviation and t-test.

Results
The results revealed that both male and female leaders employed a charismatic leadership style at a level defined as sometimes. The results showed that female leaders (mean = 2.35) had a higher level of charismatic leadership than male leaders (mean = 1.99). Male and female leaders had a significantly different level (t=2.591, p<.05).

Conclusion
The results suggest that gender may be a critical, yet previously overlooked, variable worthy of closer examination in future studies of charismatic leadership and its efficacy.
ABSTRACT

Working while attending school is now a way of life for most undergraduate students (Perna, 2010) but only a small body of literature focuses on how students balance academics and employment. In the current study, we examined how trait mindfulness, or the ability to be present in the moment through attention and awareness (Brown & Ryan, 2003), may provide benefits to working college students. In particular, we investigated two underlying mechanisms that may explain the potential benefits of trait mindfulness on work outcomes, specifically, the role of work meaning and work-school enrichment. In a survey of 128 employed college students, we found evidence for a serial multiple mediation model of work meaning and work-school enrichment in the relationship between mindfulness and work outcomes (i.e., job satisfaction, emotional exhaustion, turnover intentions). Even though our data were correlational in nature and based on a single source, our research is among the first to answer a call from Steger and Ekman (2016) to examine the interplay between mindfulness and meaning for those engaged in stressful work. Practically speaking, organizations and universities may wish to provide mindfulness training to students as this may result in greater work meaning, work-school enrichment, and ultimately better work outcomes. In addition, students and universities should look for ways to cultivate purposeful work for college students. To our knowledge, this is the first study to explore how trait mindfulness translates into positive results for working students.
WORK ENGAGEMENT AS THE STARTING POINT TO ENHANCE NURSES’ WORK ABILITY AND TO IMPROVE ORGANIZATIONAL STABILITY: TESTING A MODEL.

Marco Tomietto (1) - Eleonora Paro (1) - Rita Maricchio (2) - Riccardo Sartori (3) - Luciano Clarizia (1) - Paola De Lucia (1) - Giuseppe Pedrinelli (1) - Rosanna Finos (1) - Azienda per l’Assistenza Sanitaria n.5, Pordenone, Italia (1) - University of Ferrara, Ferrara, Italia (2) - University of Verona, Human Sciences, Verona, Italia (3)

ABSTRACT

Purpose
The purpose of this study is to test the impact of work engagement on work ability and to define the correlation with job satisfaction and turnover intention. Work ability and engagement are pivotal concepts in explaining nurses’ well-being, job satisfaction and turnover intention. The correlation between them is unclear and a comprehensive model could be useful.

Design
Cross-sectional

Method
This study involved 1024 nurses. The response rate was 70.7%. Path analysis was performed to test the research model, both in the whole sample and in the age-categories (<45yy and ≥45yy).

Results
The comprehensive model was validated. Fit indexes were RMSEA=0.058 (CI90%=0.037-0.081), CFI=0.976, TLI=0.956. Work engagement (vigor and dedication) predicted work ability and work ability predicted job satisfaction and it decreased turnover intention. Absorption was not significantly correlated with work ability. Correlations had different age-dependent patterns.

Limitations
The cross-sectional design allowed recruitment of nurses at work: so nurses off-duty were not involved, which could have resulted in different patterns of work engagement and work ability.

Research/practical implications
According to theory, work engagement could have detrimental consequences for employees. Previous research did not confirm this. This study confirmed the counterintuitive effect of work engagement and could be used as support to healthcare managers in tailoring organizational strategies through different motivational patterns.

Originality/value
This study highlighted how work engagement can contribute to enhanced work ability. Findings are theoretically counterintuitive and can be used to tailor strategies for different age-categories. This study validated a model to promote nurses’ work ability and organizational stability.
ABSTRACT

Purpose
The awareness of brand equity is reflected in its strength and number of positive and negative associations. The present study aimed at creation of the diagnostic tool that would enable assessment of attitudes, and intentions about a brand customers have.

Methodology
Four categories of products and the products linked to those categories were selected with the help of competent judges. The following sets were selected: sweets – cakes chocolate; alcohol - vodka, beer; motorization - car, motorcycle, and home electronics – television set, mobile phone. A questionnaire revealing associations and emotional attitudes of the participants was presented to 96 extramural students. The structure of associations was evaluated with the method of continued associations.

Results
A list of associations and their dominance scores was created on the basis of obtained data. Preliminary data revealed that motorization (4.9) and home electronics (5) have got the highest mean scores. At the same time, a car (5.3) and a mobile phone (5) proved to rise the highest emotions. The next step will be calculation of the inter-object affinity index computed by summing dominance scores across overlapping elements and across stimuli.

Limitations
The study comprised students who are a special group, therefore, the results need to be confirmed with the data obtained from other social groups.

Practical Implications
The evaluation of emotional attitudes of customers enables creating efficient marketing strategies.

Value
The perception that a consumer holds about a brand directly results in either positive or negative effects.
ABSTRACT

Purpose
The research focuses on the questions if nurses working in various health care facilities present different abilities of emotional adaptation to the work environment, if they differ in feeling job burnout, and what strategies of stress coping they tend to use.

Methodology
Questionnaire of Emotional Intelligence ((NTE), Link Burnout Questionnaire (LBQ), and Coping Inventory for Stressful Situations (CISS). The study comprised 104 nurses from various health care facilities located within 7 voivodships. Three groups were distinguished: depending on the type of work: general and specialized medical care as well as taking care of patients with life-threatening illnesses. Statistical analysis was performed with IBM SPSS Statistic 24.

Results
Intergroup analyses revealed differences in emotional intelligence index depending upon the type and place of work. Nurses working in wards which treat people with life-threatening illnesses showed lower levels of sensibility and compassion as well as lower interest in their own and others emotional states. Most frequent was task-orienting style but clear cut differences occurred in emotion-oriented style. Interestingly, the level of job burnout was low.

Limitations
The total group consisted of three smaller ones which means that further research on bigger samples should be performed.

Practical Implications
The study showed a need of providing psychological support for nurses working at wards treating patients with life-threatening illnesses.

Value
The study indicated that research on work environment requires use of a number of tool to get real picture of the situation.
ABSTRACT

Purpose
Creativity is seen as an important 21st century skill, which makes its accurate assessment crucial for recruiters. Although divergent thinking (DT) tasks are well-researched measures of creativity, they are time-consuming due to their scoring methods. Therefore the purpose of this study was to validate a fully digital DT task, the Divergent Thinking Task (DTT).

Design
Three studies were conducted using student samples (N = 66-76), assessment data (N = 168-226) and a sample of working people (N = 100). Content, discriminant, convergent and predictive validity were evaluated in these studies.

Results
Study 1 showed weak but significant correlations between the DTT fluency scores and other DT measures and between the DTT originality scores and self-report creativity tests. In Study 3, a hierarchical regression showed that the DTT shows incremental validity over general intelligence in the prediction of academic grades. This prediction could mainly be attributed to the fluency scores, with little additional information coming from the originality score. Data collection and analyses for other parts of the studies are ongoing.

Limitations
Results are partly based on samples of convenience or student samples reducing the generalizability of the findings.

Practical implications
Preliminary analyses show the DTT to be a valid measure of divergent thinking that can be used to make real-life predictions.

Originality/value
The DTT is one of the first fully digital DT tests validated specifically for use in recruiting. The automated scoring procedure makes creativity testing more accessible and usable for both scientists and practitioners.
ABSTRACT

Purpose
Managers deal with many employees who differ in how they want to be interacted with. We argue that managers need to take into account these individual differences when interacting with employees in order to be perceived in a positive way. To do so, they need to express leadership behavioral flexibility (LBF). In two studies, we tested whether LBF is perceived positively.

Design/Methodology
Participants watched two videos of the same leader interacting separately with two employees. We manipulated whether (1) the two employees preferred the same or different leadership styles, (2) the participants had information about the employees’ preferences, and (3) the leader expressed the same leadership style or changed his leadership style between the two employees. Then, participants answered questions assessing how they perceived the leader.

Results
Leaders expressing LBF were perceived in a more positive way than the ones expressing only participative or only directive leadership when participants knew the employees’ preferences. However, when participants did not know the employees’ preferences, leaders expressing only participative leadership were perceived more positively than the ones expressing LBF or only directive leadership.

Limitations
Participants were not involved in the interaction and rated the leader from an external point of view.

Research/Practical implications
Changing behaviour between employees can sometimes be perceived negatively. Leaders who adapt their behaviour according to their employees should ensure that all their team members know why they change their behaviour while interacting with different members of the team.

Originality/Value
First studies investigating how LBF is perceived.
ANALYSIS OF SUPPORTING ELEMENTS BASED ON BANDURA’S SELF-EFFICACY THEORY WHICH CAN INFLUENCE WOMEN IN ACHIEVING EXECUTIVE POSITIONS IN CORPORATIONS

Ronja Müller (1) - Uta Bronner (2)

Heriot-Watt University, Psychology, Edinburgh, United Kingdom (1) - Hochschule für Technik Stuttgart, Stuttgart, Germany (2)

Purpose
Although the proportion of women in management continues to increase, women are still underrepresented in management positions worldwide. Since previous studies have shown that career self-efficacy expectations can influence career advancement and support women in achieving a leadership position, factors that are positively related to women’s career self-efficacy expectations are examined.

Design/Methodology
An online survey was used to investigate and compare the career self-efficacy expectations of female executives (n = 125) and female employees (n = 44). The participants’ career self-efficacy was measured using the Occupational Self-Efficacy Scale by Schyns and von Collani (2002).

Results
Findings reveal that female executives have significantly higher career self-efficacy expectations than female employees. Moreover, it was found that women’s career self-efficacy beliefs are positively related to the corporate level of their workplace. A significant positive relationship was found between women’s career self-efficacy expectations and several constructs, for example, internal attribution of professional success, external attribution of professional failure, and the observation of successful female executives.

Limitations
The two target groups had different group sizes.

Practical Implications
Organisations that want to increase their proportion of women in management can take various measures, such as increasing the visibility and accessibility of successful female managers.

Originality/Value
While several studies have been published on women’s self-efficacy beliefs in a professional context, this is the first study to focus on factors positively related to women’s career self-efficacy expectations. It is a valuable resource for companies that want to sustainably increase their proportion of female managers.
The concept of ownership has many different facets. It can be individual, collective, legal or psychological, it can be directed towards material, immaterial targets and even people. The purpose of this study is to explore psychological and material possessions in a dematerialized environment. This study is based on 83 semi-structured interviews and their content analysis. It delivers three main important theoretical contributions to the field of psychological ownership studies. The first represents a categorization of material, virtual objects and people and their influence on team spirit. The second proposes an extension of the psychological ownership theory and carries the title “wandering psychological ownership”. It implies that some organizational targets become more important than others in certain situations. The third contribution extends the “dark side” of ownership and treats “reversed ownership” which means that individuals have the impression being owed by the organization and not vice versa. The main limitation of our study consists in the difficulty of generalizing some of the results due to the particularities of semi-closed military environment. However, we are able to draw numerous managerial implications from this research concerning the management of working space; creation of cohesiveness though experiences as well as the possibility for managers to choose the target of ownership of their employees and use the “wandering psychological ownership” concept to reinforce it. Hence, we contribute to the growing body of psychological ownership research, that mainly studies its antecedents and consequences, by investigating its yet unexplored facets.

Keywords: Psychological ownership, dematerialization, military environment
ABSTRACT

To confirm the occurrence of different hardiness profiles in nurses using a person-centered approach and to assess their differential relationships between stressors and strains. Nurses experience high levels of psychosocial stressors. Hardiness may help offset these and reduce burnout. In most of this research a variable-centered approach (e.g., regression, SEM) has been used to address the additive and interactive effects of hardiness dimensions on stressors and strains. A cross-sectional survey was carried out among nurses in five hospitals. Hardiness, stressors as antecedents of burnout, burnout, and consequences of burnout were measured. For the profile identification, data were analyzed by k-means cluster analysis and MANOVA.

Three profiles were identified, consisting of individuals who scored: (1) average on commitment and control, and high on challenge, classified as the novelty seeker profile, (2) average on commitment and challenge, and high on control, labeled as the rigid control profile, and (3) high on all hardiness dimensions, classified as the hardy profile. Importantly, this result reveals that non-hardy nurses do not form a homogenous group. The identified profiles revealed different burnout processes, and concomitantly different stressor and strain experiences.

Nurses with a hardy profile showed the lowest levels of burnout and consequences; for the other two profiles, nurses with the novelty seeker profile were more likely to experience burnout than nurses with a rigid control profile.
ABSTRACT

Purpose
This paper evaluates the organizational change literature to identify, review and synthesize the many typologies of employees’ responses to change at work, with the aim of developing a unifying taxonomy. Such a taxonomy provides a person-centric tool for understanding change responses.

Method
We conducted a search for theoretically- and empirically-derived typologies of employee response to change across the organizational psychology, change management and information technology disciplines. These typologies were integrated to develop a taxonomy of responses to change at work.

Results
The literature search identified 17 typologies and taxonomies; a spectrum of employee states in response to change at work is presented from the analysis and amalgamation of these typologies.

Limitations
While a thorough search was conducted, other taxonomies and typologies may exist. Validation studies are required to investigate the identified profiles and moderators.

Research/Practical Implications
A taxonomy of employee states in response to change at work provides a valuable resource for practitioners and researchers. Our overall aim is to encourage adoption of a human-centric perspective on responses to change at work, extending beyond the traditional management perspectives found in concepts of resistance or acceptance of change. More specifically, for practitioners, the taxonomy may have utility for interpreting employee behavior in organizations in response to change. For researchers, it may open up new perspectives on change at work.

Originality
While different typologies of employee reactions to change proliferate, our taxonomy is the first (to the best of our knowledge) that unifies these response profiles into a coherent, overarching taxonomy.
ABSTRACT

Purpose
Task type affects how group members interact with each other. We investigate how task type affects the hierarchy formation within groups and how task type affects the link between group characteristics (e.g., their hierarchical organization) and group outcomes.

Design
Participants formed same-gender 3-person groups. They were randomly assigned to receive either individual or group speaking time feedback and were either confronted with solving a high procedurally interdependent or a low procedurally interdependent task.

Results
Task type affected how steep a hierarchy emerged; confirming our hypothesis, high procedurally interdependent tasks lead to steeper emerging hierarchies. However, group performance was unaffected by hierarchy steepness for both the high and the low interdependent task. Exploratory analysis indicated that group performed better if the competent members were perceived as more dominant.

Limitations
The tasks used were not only different in terms of interdependence; they were also different in terms of difficulty. Future research on the effect of task structure might want to uncounfound task structure and task difficulty.

Practical Implications
Hierarchy steepness does not seem to play a role in higher group performance. It is much more important to ensure that the group acquires high task competence, and the most competent member is entrusted with the leadership position.

Value
This study highlights the importance of taking into account task type when trying to understand how group members interact and what makes them perform well.
ABSTRACT

Purpose
Expansion, excellence, and equity in the area of higher education sectors have been the three key terms since the last decade in the central policies of India. In the present study, we have explored the employment terms of multiple categories of casual teachers employed in the higher education sector of West Bengal. It also analyses the way government policies have undergone changes with changes in the political scenario.

Design
This qualitative research is based on the findings from semi-structured interviews. It has also analyzed several sources of secondary data; namely government orders, court judgments and media reports.

Results
The findings show that unfair treatments towards casual teachers are quite common and deeply rooted in the academic system. The employment terms have a rippling effect on other aspects of lives of casual teachers.

Limitation
The study is based on the cross sectional primary data which might limit the extended view of the problem.

Implications
The broader objective of government speaks volume to bridge the gaps of inequality. But in practice, the policies are drafted in a lackadaisical manner. This study attempts to highlight the loopholes in the policies.

Original Value
Only a handful of studies have considered the issue from multiple perspectives; taking into account macro factors such as political environment as well as micro factors such as experiences of marginalization on an individual level.
EMPLOYER BRAND: SIGNALING VALUE TO EMPLOYEES

Sophia Chiovitti (1) - Yu-Ping Chen (1)

John Molson School of Business, Management, Montreal, Canada (2)

ABSTRACT

The functions of an employer brand are to attract potential employees to a firm and to engage actual employees in its strategy. Previous research has strictly focused on the effects of employee-based brand equity in potential employees. The purpose of the present study was to investigate whether the perception of employee-based brand equity would affect current employees to engage in their work. Drawing from both signaling and social identity theory, this research proposed that employee-based brand equity would convey certain values to employees, thereby intrinsically motivating them to become psychologically engaged in their work. It was also proposed that the relationship would be dependent on whether the employees perceive congruency between their own values and their employer’s values. Participants working for Canada’s top 100 employers of 2017 were surveyed. We anticipate to receive over 300 responses from participating companies. Employee-based brand equity, motivation, engagement, person-organization fit and all other relevant variables (e.g., control variables, demographic variables) were measured using an online survey. Analyses will be available by the end of 2018. Although this study will demonstrate relationships between the above variables, reverse causation issues are a limitation. However, this study contributes to employer brand theory by demonstrating the generalizability of employee-based brand equity onto actual employees. It is suggested that practitioners should equally place employer brand efforts towards actual employees, to gain from its wide array of benefits. The originality of this research is demonstrated through the construct of motivation as a pathway between employee-based brand equity and employee engagement.
ABSTRACT

Purpose of the Study
To use quantitative survey methodology to explore whether Mean Girl treatment of women by other women in the legal workplace is associated with greater workplace incivility and lower levels of job satisfaction.

Design
This study employed a cross-sectional design.

Methods
Participants
Participants were legal professional women (N = 129) from across the USA (M=45, SD=11 years of age), including female associates, partners, paralegals, and administrative staff from law firms, legal corporations, governmental agencies, and legal nonprofit organizations in the USA.

Approach
This study utilized a quantitative descriptive/correlational approach using data acquired through an online survey.

Intervention
This quantitative descriptive/correlational study included no intervention.

Results
Perpetrating and receiving workplace incivility (direct and indirect aggression) were each significantly correlated each other and with lower job satisfaction. The greater the workplace incivility, the lower the job satisfaction.

Limitations
This study was limited to female legal workers in the USA. This study was limited by the lack of turnover intention measures and by the design, which did not include anti-incivility interventions or long-term follow-up.

Research/Practical Implications
Female-to-female workplace incivility and relational aggression diminish a women’s job satisfaction, which may potentially decrease productivity and increase turnover. Interventions towards prevention of Mean Girl relational aggression are obligatory.

Originality/Value
This study of female legal professionals demonstrated how Mean Girl behavior is associated with workplace incivility and lower levels of job satisfaction. Combined, the findings of this novel study highlight the detrimental effect of Mean Girl behavior in the legal workplace.
IS VUCA MORE THAN A BUZZWORD? SOME INITIAL EMPIRICAL EVIDENCE ON THE MEASUREMENT OF VUCA AND ITS RELATION TO EMPLOYEE WELL-BEING.

Chris Giebe (1) - Thomas Rigotti (1)

Johannes Gutenberg - University of Mainz, Mainz, Germany (1)

ABSTRACT

Purpose
Volatility, Uncertainty, Complexity, and Ambiguity have found their way into international business vernacular as suitable descriptors of the modern business world. However, this construct is little understood as psychological construct that could affect employee motivation and health. We have therefore attempted to (1) adequately assess employees’ perception of VUCA, and (2) investigate its relationship with employee outcomes (i.e. employee engagement and irritation).

Design
We collected a sample of 173 working adults in Germany who answered an assessment (25 Items) designed to assess Volatility (operationalized as frequency of change), uncertainty, complexity (operationalized as task variety, job complexity, and skill variety), and ambiguity. Principal component analysis showed good fit for a 4-factor model as proposed. We further analyzed the factors’ relations to three facets of employee engagement (vigor, dedication, and absorption) and two facets of irritation (cognitive and emotional).

Results
Uncertainty showed to be significantly related to cognitive and emotional irritation. Job complexity had a negative relationship to dedication, while increasing cognitive and emotional irritation. However, task variety was positively associated with all three facets of employee engagement and decreased emotional irritation.

Limitations
Cross-sectional design.

Implications/Value
The analysis showed that VUCA and be psychometrically assessed and some facets may be involved in employee well-being. Interestingly, while volatility, uncertainty, and ambiguity showed tenets of “typical” hindrance stressors, complexity showed the more complicated relationships typical of challenge stressors (by being associated with both positive and negative well-being outcomes). VUCA’s association with employee outcomes seems more complex than merely hindering.
170 - PSYCHOLOGICAL CONTRACT DIFFERENCES BETWEEN CHINESE AND BELGIAN EMPLOYEES

Jiahong Du (1) - Tim Vantilborgh (1)

Vrije Universiteit Brussel, Psychology and Educational Sciences, Brussels, Belgium (1)

ABSTRACT

Purpose

The majority of the psychological contract research uses Western samples and overlooks the impact of cultural differences. This study theorizes and qualitatively examines whether differences in cultural values between Chinese and Belgian employees result in differences in psychological contract content.

Design/Approach

In total, 41 interviewees from China and Belgium were interviewed through a mixed-methods design, meaning that respondents filled out a survey of cultural values in addition to being interviewed.

Results

The findings show that it is important to measure cultural values at the individual level, rather than using country-level averages. Four major themes describing Belgian employees’ psychological contracts correspond to balanced contracts, while finding compromises between these elements: Job commitment & Work-life balance, Stability & Self-Achievement, Support & Cooperation, and Self-Direction & Belongingness. Three themes emerged for Chinese employees’ psychological contracts are characterized by mixed contracts aligning with the ideology of ‘Utilitarianistic Guanxi’: steady security, hierarchy, and interpersonal relationship.

Limitations

The psychological contract research is not necessarily a perspective of individual and employees.

Research/Practical implications

First, the findings provide a basis for future research that could investigate the process and outcomes of balanced contract and mixed contract breach and fulfillment of Belgium and China. Second, employers need to be aware of the finding obligations that employees might perceive.

Originality/Value

The study provides new theoretical insights on how cultural values of Belgium and China can have different and similar contents on the psychological contract. It also stresses the importance for global organizations to manage the expatriate employees’ psychological contract.
Purpose: To identify how leadership can contribute to successful organisational change—including service integration, mergers and acquisitions, and joint ventures—and use these insights to develop a leadership competency framework to assist leaders navigating change.

Methodology: In two separate studies, Australian leaders and leadership experts were interviewed (Study 1, n = 7; Study 2, n = 15), to garner their perspectives on the key leadership elements of successful organisational change. The experts’ insights were analysed utilising content analysis techniques, and overarching themes were combined with themes from literature reviews to formulate a leadership competency framework.

Results: The perspectives of leadership experts aligned with themes from the literature reviews. The key leadership elements of successful organisational change were: (1) a strategic perspective; (2) a commitment to (and ability to clearly articulate) the case for change; (3) exemplary communication and relationship management skills, including the ability to engage in challenging conversations regarding change; (4) an open and accessible management style; and (5) personal attributes including integrity, self-management skills, and a sense of perspective. The leadership competency framework is outlined.

Limitations: The study obtains the opinions of leaders and leadership experts, rather than focusing on the effectiveness of the leadership elements.

Research/Practical Implications: This research adds to the body of knowledge regarding the leadership of change. The leadership competency framework is intended to be of practical use, as it describes specific behaviours that contribute to the effective leadership of change.

Originality/Value: This paper contributes to the under-researched area of leadership in service integration (an emerging form of organisational change).
CULTURAL DIFFERENCES IN THE PERCEPTION OF STRESS

Ludwig-Maximilians-University, Psychology, Munich, Germany [1] - University of Barcelona, Psychology, Barcelona, Spain [2]

Purpose
Stress can have severe consequences for organizations’ human and economic capital. To identify classic and “new” stressors emerging from work 4.0 in organizations, a questionnaire based on a theoretical model by Reif, Spieß & Berger (2018) was developed and tested in four countries.

Design/Methodology/Approach/Intervention
The questionnaire included 123 items on stressors (task, working conditions and workflow, team climate and cooperation, roles and responsibilities, attitudes and behaviors, organizational climate and communication), resources (control and clarity, leadership and social support), negative outcomes (illness and strain) and positive outcomes (engagement and satisfaction). 856 employees participated in the survey. We applied ANOVA to compare countries.

Results
The factor ‘country’ explained a significant part of the variance of most stressors and resources. The countries did not significantly differ regarding negative and positive outcomes.

Limitations
Future research should test and validate the questionnaire in further countries and consider branch-specific differences.

Research/Practical Implications
Differences in the evaluation of stressors and resources and in the relationship between stressors/resources and outcomes across countries show that stress related interventions and resource trainings need to consider cultural backgrounds.

Originality/Value
We offer a new categorization of stressors and resources, building on previous research and stress models but also consider new stressors related to digitalization. Results can help to derive practical interventions to manage stressors and to develop resources.
Abstract

Purpose: The objective of this study was to determine if a brief psychological intervention based on the Acceptance and Commitment Therapy (ACT) was able to improve the levels of depression, anxiety and stress of a group of professionals who perform their work in a highly stressful environment: a medical Intensive Care Unit. Methods: The study involved 21 health care professionals from a Spanish hospital (13 in the quasi-experimental group and 8 in the wait-list control group). Questionnaires were administered before and after the intervention to assess psychological flexibility, depression, anxiety and stress. The intervention was based on a standardized format and was developed in three face-to-face sessions. Results: the ANCOVA showed that the experimental group decreased levels of depression ($F = 6.98, p < .05$) and stress ($F = 5.95, p < .05$) significantly compared to the group on waiting list, not being thus in the case of anxiety ($F = 1.33, p > .05$) and psychological flexibility ($F = .004, p > .05$). One month after the participants attending the training, those who completed the follow-up measures showed a significant change in their stress levels ($t = 2.38, p < .05$), but not in the rest of the variables. Discussion: Enhancing the psychological flexibility of workers could be an interesting objective for promotion of mental health within health organizations. ACT offers a framework to do so. However, it is necessary to continue deepening on the mechanisms that can account for the changes observed within this type of intervention.
Purpose

Prior research on self-initiated expatriates (SIE) focused on the intention to self-expatriate. However, scholars have been stressing the need to address the “intention-implementation” gap, to understand what explains SIE behavior (Presbitero & Quita, 2017). Our study aims to evaluate the influence of variables known for affecting SIE intention in the emergence of SIE behavior. We explore the effect of demographics (age and gender), human capital (pre-international experience and educational level), personality (openness to experience and extraversion), the reasons to expatriate (career and adventure) and environment (GDP per capita and employer attractiveness), in the predicting SIE behavior.

Design/Methodology/Approach/Intervention

Data was collected through an online questionnaire. Our final sample is composed by 284 individuals: 166 with the intention to work abroad, and 118 who were in a SIE assignment at the time of the study.

Results

The results from logistic regression suggest that a SIE is a graduate individual (B=.89, SE=.31, p<.01) with greater openness to experience (B=.44, SE=.21, p <.05) and driven by career reasons (B=.43, SE=.22, p<.05)

Limitations

Because our study is cross-sectional we cannot infer causality.

Research/Practical Implications

We provide evidence about the predictive power of well-studied variables in real self-initiated behavior and offer practical insights to career counselors in universities to develop more effective interventions (e.g., career focus) with students that have the intention to work abroad.

Originality/Value

We are one of the few studies to explore actual SIE behavior.
184 - DO POSITIVE APPROACH AND ACHIEVEMENT EMOTIONS HAVE THE SAME IMPACT ON THE INTENTION TO ACT AND ON THE BEHAVIOURAL INTEGRATION OF FEEDBACK?

Amy-Lee Normandin (1) - Simon Trudeau (1) - Jean-Sébastien Boudrias (1)

Université de Montréal, Psychology, Montreal, Canada (1)

Abstract:

Purpose

Positive emotions lead to a better acceptance of feedback in a competency assessment context (Bell & Arthur, 2008). Thereby, we theorize candidates will have a higher intention to act on feedback and behavioural integration of feedback when experiencing positive emotions. Positive emotions can be separated in two categories; approach (ApE) and achievement emotions (AcE; Tran, 2004). We hypothesize that ApE, which motivate people to acquire new skills (García-Prieto and al., 2005), will be more strongly correlated with the intention to act and the behavioural integration of feedback than AcE, that bring stagnation and complacency (Tran, 2004).

Design/Methodology/Approach/Intervention

Participants (N=150) answered three self-reported questionnaires measuring emotions experienced during a real feedback in a competency assessment context, intention to act on feedback and behavioural integration (behavioural changes and developmental activities; Boudrias et al., 2014).

Results

When controlling for age and gender, ApE are associated with intention (β=.46), behavioural changes (β=.35), and developmental activities (β=.22) as are AcE (respectively β=.21; β=.15; β=.02). Betas above .20 are significant. As expected, the correlation is stronger between ApE and intention (z=3.68, p<.05), behavioural changes (z=2.88, p< .05) and developmental activities (z=2.92, p<.05) than AcE.

Limitations

Self-reports raise concerns about common method variance.

Research/Practical Implications

This study demonstrated the importance of ApE during a feedback rather than AcE to optimize the intention to act and the behavioural integration of feedback. Psychologists can be more aware of how they shape their message to avoid or generate certain emotions.

Originality/Value

To our knowledge, ApE and AcE haven’t been studied in a feedback context.
Abstract

Purpose: Given, first, the damaging influence that sedentariness has on health; second, the pervasiveness of physical inactivity; third, the stress buffering benefits of physical activity breaks for employees; and, fourth, the increasing prevalence of smartphone use worldwide, pedometer applications were explored as a means to increase employee physical activity.

Design/Methodology/Approach/Intervention: Fifteen employees completed a week-long pedometer application-based walking intervention. Participants then described their experiences with the application; its behavioural, well-being-related and occupational consequences; and the influence that their workplace has on their daily activity. Results: Thematic analysis of the data indicated that application use predominantly supported physical activity. Five psychological mechanisms were identified as underlying this perceived effect including increased physical activity awareness. Among some participants, physical activity facilitated the recuperation of psychological resources, and psychological detachment from work, which was described as benefitting well-being and work performance. Operating in a work-life imbalanced organisational culture and supervisors’ avoidance of work breaks were perceived as barriers to physical activity. Limitations: The findings are limited by the subjective nature of the data and the small sample size. Research/Practical Implications: The findings suggest how, practically, employees may be protected from the damaging effects of occupational sedentariness through use of a free, simple, accessible tool. Originality/Value: To the best of the authors’ knowledge, prior to this study, the usefulness of smartphone pedometer applications in supporting physical activity has only been explored, in-depth, with a patient sample.
Abstract

Common Method Variance (CMV), and its potential consequence Common Method Bias (CMB) that refers to meaningful distortion of relationship estimates, has received immense attention over the past three decades. It is a recurrent theme in the evaluation of research that utilizes same-respondent or single source data. In the past decade a substantial amount of meta-analytic, narrative review and simulation studies have emerged on CMV and CMV that allows us to reach an informed conclusion about the seriousness of the danger CMV imposes (in other terms the probability of CMB in a study). The purpose of the present work was to evaluate that evidence. The findings of summative and simulation studies that tested directly for the effects of CMV suggest that though CMV is a real phenomenon, the danger of CMB is extremely low and practically limited to the possibility of type II error. The findings of summative and simulation studies that evaluated remedial or post hoc methods – methods developed especially in order to detect and correct for the effects of CMB - leads to essentially the same conclusion. Furthermore, it appears that post hoc methods are becoming increasingly sophisticated and resource demanding but without any commensurate improvement in their reliability. Overall, therefore, available evidence suggests that CMB is rarely if ever a possibility. This leads to the dilemma of whether we should continue looking for evidence or whether we should seriously start thinking of leaving the “myth” behind.

Keywords: Common method variance; common method bias; post hoc techniques; evidence; simulations; reviews
191 - THE MODERATING ROLE OF EMOTION MANAGEMENT IN THE RELATIONSHIP BETWEEN MOBBING AND BURNOUT

Burcu Taskan (1) - Evrim Güleryüz (2) - Yonca Toker (3)

Instituto Universitário de Lisboa (ISCTE-IUL), CIS-IUL, Lisboa/Portugal (1) - Department of Psychology, Yasar University, Izmir/Turkey (2) - Department of Psychology, Middle East Technical University, Ankara/Turkey (3)

The purpose of the first study is to contribute to the literature by investigating the moderator role of emotion management (emotion regulation and emotional intelligence) in the relationship between mobbing and burnout by collecting data from participants who work in a service industry occupation (220 nurses) with using survey. In addition, consistent with the discussions about employees who have a non-service occupation may also experience burnout, the second study was conducted to replicate the first study by collecting data from a non-service occupation (220 engineers). Both in study 1 and study 2, emotional intelligence moderates the relationship between mobbing and burnout but the effect was not in the hypothesized direction; it did not buffer the effects of mobbing on burnout. Furthermore, the dimensions of emotion regulation did not moderate the relationship between mobbing and the burnout dimensions, with one exception. Expressive suppression moderated the relationship between mobbing and reduced personal accomplishment in study 1. In study 2, in terms of levels of burnout, engineers did not differ from nurses who need high levels of face-to-face interactions in the workplace. Besides the all the positive effects and consequences of emotional intelligence, the dark side of emotional intelligence should be investigated. Further studies are needed to understand the conditions, that makes highly emotionally intelligent employees more vulnerable to certain stress conditions. Despite the contributions to the field, the study has many possible limitations such as detecting the role of cognitive reappraisal and expressive suppression, longitudinal studies are needed to derive antecedent-consequence associations.
Title
Experiencing an Esteem Boost from Being Uncivil to Coworkers: A Dominance Interpersonal Motive Perspective

Purpose
Past research often suggested that people feel bad after treating others poorly. We challenge this and argue that being uncivil to coworkers might unexpectedly boost the self-esteem of highly dominant employees during work hours because they derive self-worth from having autocracy and control over others.

Method
One hundred and eleven full-time employees completed two surveys per day for ten work days.

Results
Results from multilevel modeling showed that employees with high (vs. low) trait dominance motive were more likely to enact incivility on days when they experienced low midday self-esteem due to poor goal progress. Their end-of-day self-esteem and goal progress for the second half of the day improved significantly from midday after being uncivil as compared to employees with low trait dominance motive.

Limitations
We did not measure other recovery behaviors (e.g., taking respite or loafing), so we are unable to address when employees might turn to interpersonal behaviors or other behaviors during work hours to restore their self-esteem.

Implications
We showed that employees, specifically the highly dominant ones, may feel an esteem boost from being uncivil to others. Managers who have highly dominant employees should encourage them to regain self-worth through instrumental, task-related actions rather than incivility toward their peers.

Originality/Value
We uncovered a paradoxically adaptive outcome of antisocial behaviors for the esteem of highly dominant employees. Our use of an implicit measure for state self-esteem was also a novel design that helped to overcome socially desirable responses in research involving antisocial behaviors.
**Purpose.** The aim of the present study was to investigate the perceptions of differently worded and illustrated public service announcements (PSAs) of varying actual effectiveness and to test whether lay individuals are capable of intuitively choosing effective versions of PSAs. This research was funded by a grant (No. S-MIP-17-134) from the Research Council of Lithuania.

**Methodology.** 480 individuals participated in the first experiment. Participants were asked to consider a randomly selected PSA (1 out of 6 possible variants). The first experiment was a 3x2 design: three possible appeals, presented with or without an accompanying image. The second experiment tested whether an amusing visual stimulus affects the ranking of PSAs in a pretend scenario of buying a PSA for the city; a total of 120 individuals participated in the experiment.

**Results.** An amusing image increases the subjective evaluation of a PSA regardless of how the appeal is worded; the effect is the least pronounced for negatively worded PSAs. When no accompanying image is presented, negative appeals are most often chosen as the best option; when an engaging image is presented next to the appeal – individuals tend to choose emotionally neutral appeals. Lay individuals did not tend to favor effective variants of PSAs.

**Limitations.** The design of the study did not allow for longer and more varied measures.

**Research and practical implications.** Lay individuals are bad intuitive judges of PSA effectiveness. More research should be carried out on what subjective factors drive the continued use of ineffective PSAs.

**Originality and value.** This study contributes to the understanding of PSA effectiveness and creation.
Tremblay & Badri (2018) underline that objective indicators of SME’s safety and health-management and -success are insufficient. Therefore, this study aims at identifying ways of measuring and developing a culture of prevention (CoP, conceptualized in accordance to Schein (1985), Elke (2000) and Cooper (2016)) within the context of small and micro enterprises.

Data collection (n=11 companies of the forestry industry in Germany) included semi-structured interviews, questionnaires and on-site inspections and thus combined objective and subjective sources. This information was aggregated into 13 empirically derived dimensions along four levels: Person, Organisation, Technology, External Situation. With regard to the development of the CoP, survey-feedback and face-to-face dialogues were used to initiate a process of reflection and planning within the companies. Evaluations with regard to this process was based on the CIPP model (Stufflebeam, 1971) and Sense of Coherence (Antonovsky, 1983).

Results show that most companies present developed CoP regarding accident prevention but lack of evolved values regarding health prevention and systematic approaches to manage OSH. Within company-specific hierarchies of values, “preventive values” are located within the last third. Managers experienced the process of developing a CoP as comprehensible, meaningful and manageable. Managers and employees derived 1-5 (Ø = 3) interventions.

Due to the small sample-size, the results are not generalizable. Besides, the design does not contain a control group.

This study offers a way to analyze and support small and micro companies’ CoP. It is essential to focus on the enterprises’ unique needs and resources in order to gain the management’s commitment.
201 - NATURE VS. NURTURE: THE INFLUENCE OF PERSONALITY AND INTERNATIONAL EXPERIENCE ON THE DEVELOPMENT OF CULTURAL INTELLIGENCE IN INTERNATIONAL MANAGERS

Ming Li (1)

University of Liverpool Management School, Work, organisation and management, Liverpool, United Kingdom (2)

Purpose: Cultural intelligence is considered to be an important cross-cultural competence for international managers. To understand whether cultural intelligence is nature, nurture, or the result of both, the present study simultaneously examines personality and various international experiences for their impact on cultural intelligence.

Design/Methodology Approach/Intervention: A survey method with data collected from 223 international executives and graduate business students in China and Ireland.

Results: Cultural intelligence is derived from both nature and nurture factors in that personality traits and international experience factors both contribute to cultural intelligence; and the degree of international experience partially mediates the relationship between personality and cultural intelligence. Additionally, a significant increase in the degree of international experience leads to only a slight enhancement in cultural intelligence overall. This phenomenon is termed as International Experience Inelasticity of Cultural Intelligence.

Limitations: Cross-sectional survey design that is measured by self-report psychometric instruments.

Research/Practical Implications: The findings provide evidence that cultural intelligence is both about nature and nurture, and the mediation effect of international experience on the relationship between personality and cultural intelligence. The findings also have strong implications for the selection and development of international managers and leaders.

Originality/Value: (1) The first empirical study to test the influence of personality and international experience simultaneously on CQ. (2) The study extends the conceptualization and operationalization of international experience construct. Length, amount, and frequency-based dimensions were considered for the measurement of international experience. (3) Introduce the term International Experience Inelasticity of Cultural Intelligence.
Over the last 100 years, a vast amount of research on interpersonal skills has been conducted. Unfortunately, the literature that has emerged is disjointed, siloed, and chaotic; the literature is not moving forward in a systematic way, and few recommendations for implementing that research can be made in applied contexts. Two key problems underlie this literature. First, dozens of constructs have been proposed and investigated within the literature, with little attempt to ensure that they are distinct. Thus, it is very likely that construct redundancy exists in this research domain. Second, there is no theoretically-grounded framework into which these constructs and research findings can be integrated. These limitations violate the scientific principle of parsimony and prevent the literature from moving forward. Our research is directed toward bringing order and clarity to this chaotic research domain through two objectives: (1) address the issue of construct proliferation/redundancy, and (2) establish a framework into which the key constructs can be structured. Working from the notion that most people can identify people they believe are particularly socially skilled, our qualitative study proceeds to ask people to talk about what it is that other individuals do that leads them to identify the other individual as highly socially skilled. Through these conversations and rigorous grounded theory analyses, we are able to identify the foundations for a taxonomy of social performance, but will also better understand how individuals define, interpret, understand, and use interpersonal skills in everyday interactions.
208 - ALL IS GOOD, SO LET'S NOT SPEAK UP: LEADER'S POSITIVE EMOTIONAL DISPLAY INHIBITS EMPLOYEE'S PROHIBITIVE VOICE

SinHui Chong (1) - Kenneth Tai (2)

Nanyang Technological University, Strategy, Management & Organisation, Singapore, Singapore (1) - Singapore Management University, Organisational Behaviour & Human Resources, Singapore, Singapore (2)

Purpose
Employees may engage in voice by offering ideas to improve the organization (i.e., promotive voice) or expressing concerns about objectionable issues (i.e., prohibitive voice) (Liang, Farh, & Farh, 2012). Extant research suggested that when leaders display positive mood, it creates psychological safety that promotes employee voice (Liu, Song, Li, & Liao, 2017). We challenge this by contending that a leader’s display of positive emotions may reduce employees’ focus on preventing negative outcomes (i.e., state avoid regulatory focus), thus reducing prohibitive voice (despite the presence of questionable organization issues).

Method
We conducted an experiment on 182 undergraduates in a US university. Participants imagined themselves as employees, and we manipulated leader’s emotional display in a vignette. Participants rated their state regulatory focus and wrote an email to share their thoughts related to the organization with the leader (out of a pool of promotive and prohibitive voice options).

Results
When leaders display high (vs. low) positive emotions, employees become less focused on avoiding undesirable conditions (i.e., lower state avoid regulatory focus), and are less likely to voice concerns about questionable organization issues.

Limitations
The vignette experiment study may not generalize to the real world.

Implications
We showed that a positive emotional context constructed by a leader may lead employees to censor their concerns about existing problems in the organization. This may trigger distal negative consequences because problems do not get identified and rectified timely.

Originality/Value
We demonstrated a counterintuitive negative impact of leader positive emotions on employees’ prohibitive voice.

211 - TAPPING THE FULL POTENTIAL: HOW LEADERS ENERGIZE PEOPLE BY COMMUNICATION

Lidewey E.C. van der Sluis (1)

Nyenrode Business University, Breukelen, Netherlands (1)

ABSTRACT

Purpose. It’s assumed that leaders can boost the motivation of employees by their communication and language skills (Van Quaquebeke & Felps, 2018, Carton, 2018). Theory in the field of strategic human capital and the field of organizational behavior (OB) is built to examine constructs and processes behind this assumption (Ployart, 2015). However, insights and evidence on the effectiveness of these social tactics is equivocal. The purpose of our study is to discover leadership practices that enhance the motivation, engagement, performance and ultimately the value creation of employees.

Design. To understand how leaders can tap the full potential of employees, we reviewed management literature, analyzed the communication between employees and their managers, and detected relational evidence on leadership practices and leadership effectiveness in terms of tapping the full potential of the people they were leading.

Results. We found that communication creates followership. Effective leaders are architects of energetic work processes by providing a structural blueprint that maps the connections between employees’ everyday work and the organization’s ultimate aspiration. Furthermore, effective leaders have motivational power by using inspirational language, asking open questions, and understand when and how to listen.

Relevance. The results of this study are very relevant and useful for leaders and organizations. A broader behavioral perspective on corporate governance could unravel communication and language as part of the corporate culture and tone at the top.
Purpose

The media helps to create a discourse on entrepreneurship that conveys values and images ascribed to entrepreneurship. In this sense, the media can promote entrepreneurial practices and encourage entrepreneurship in the society. The aim of this study is to analyze the influence on entrepreneurial intention of: (a) the social legitimacy attached to entertainment (i.e., media that stage entrepreneurship for entertainment purposes), and (b) the skills which individuals believe they ascertain when watching entertainment. Drawing on the theory of planned behavior, this influence is tested both directly and indirectly through the three components posited by this theory (i.e., attitudes toward entrepreneurship, subjective norms, and entrepreneurial self-efficacy).

Design/Methodology

In a cross-sectional study, a sample of 320 Spanish participants (65.6% female, 19-75 years old) filled out an online questionnaire.

Results

The results of partial least squares structural modeling revealed that positive attitudes and entrepreneurial self-efficacy mediated the social legitimacy – entrepreneurial intention and skills – entrepreneurial intention relationships, although subjective norms were not significant.

Limitations

Main limitations of this study relate to cross-sectional design and self-report measures.

Research/Practical Implications

Television programs and other formats are both attractive and pedagogical tools that can foster entrepreneurship within the general public. They can be also included in entrepreneurship education. Additionally, diverse types of entrepreneurs as role models should be displayed.

Originality/Value

While previous empirical evidence has indicated a direct link between these variables and entrepreneurial intention, the study of social legitimacy and perceived skills may benefit from considering a robust theoretical framework like the TPB.

Keywords: entrepreneurial intention, entertainment, theory of planned behavior, social legitimacy, perceived skills
Despite, gossiping is one of the most pervasive activities within the organizations, yet, few studies analyze that workplace negative gossip can cause harm to individuals and organizations. The present work begins to address this gap by empirically examining that how negative workplace gossip affects counterproductive work behaviors. Further, we enhance understanding of negative workplace gossip on counterproductive work behaviors by examining the mediating role of individual’s hardiness and moderating role of social media.

Using multi-source data from supervisor-supervisee dyadic working in energy of Pakistan, we find that there is positive relationship between gossip and counterproductive work behaviors. Moreover, social media moderated the relationship between gossip and counterproductive work behaviors, and that this relationship mediated by the hardiness.

We contribute to examine the relationship between negative workplace gossip and counterproductive work behaviors. We also introduce an important construct such as social media that helps in improving our understanding of the process (hardiness) through which negative workplace gossip affects counterproductive work behaviors. We also contribute to the gossip’s literature and outline a boundary condition to enhance our understanding of what factors mitigate or exacerbate gossip’s effects. Our results support to the notion that social media plays an important role in predicting gossip’s effects on counterproductive work behaviors. Since, social media can enhance the negative effects of workplace gossip, the managers must establish a mechanism in which they can monitor the excessive use of social media during working hours. Manager should arrange ethical trainings and educate employees about potentially harmful effects on targets.
Organizational researchers have recently begun exploring the multilevel nature of abusive supervision in the workplace (Farh & Chen, 2014; Peng, Schaubroeck, & Li, 2014). However, these studies have produced mixed results, unaccounted for under a single, unifying framework. Addressing incongruencies, we develop a theoretical model based in the social-evaluative threat literature to provide a comprehensive rationale for previous and current findings. We test this model with a time-lagged survey (Study 1) establishing external validity and a vignette experiment (Study 2) establishing internal validity. Study 1 suggests that employees with high social-evaluative concerns (SECs) feel ashamed when receiving incongruent abusive supervision in comparison to coworkers, which in turn increases their intentions to leave their organization. Study 2 demonstrates that receiving abusive supervision incongruent with that received by coworkers, triggers in employees SECs. As their SECs increase, so do their feelings of shame and turnover intentions. Together, our studies’ findings dispute the widespread view that abusive supervision has solely negative effects on employees (Tepper, Moss, Lockhart, & Carr, 2007) and indicate that 1) employees prefer supervisory treatment congruent with that of their coworkers, even if it entails abuse, and 2) incongruent supervisory treatment, even if preferential, is associated with greater turnover intentions. Although the external validity of our results is limited because participants were recruited solely in the United States, we nonetheless assert that perceptions of incongruent abusive supervision between employees and their coworkers generate in them social-evaluative concerns which spur experiences of shame and desires to leave their organization.
Purpose:
Despite its’ significant impact, grief has attracted relatively little attention in the organizational literature. With increasing frequency, younger generations are being left to care for, support, and grieve an aging population. These demographic realities suggest grief management and response will become an increasingly important workplace topic. This paper shines a light on grief as experienced and managed in workplaces, offering suggestions to help organizations address suffering effectively and compassionately.

Design / Methodology:
This paper provides a conceptual review of extant literature on grief, as experienced in work contexts. The multi-faceted nature of grief is explored, as are its’ individual and organizational outcomes. Finally, building on research from multiple domains, implications for HR policy and practice are discussed.

Results:
A literature review suggests specific strategies individuals, peers, and workplaces can take to help alleviate suffering. These include helping employees build their own resilience, providing training in various interpersonal skills (e.g., facilitating difficult conversations, boosting emotional intelligence), and taking large-scale steps to create supportive organizational cultures.

Limitations:
This paper provides a comprehensive multi-disciplinary review of the grief management literature. More research is needed to empirically test the propositions presented.

Implications:
Grief is a universal human experience and yet not all organizations help people manage grief effectively. Managing grief ineffectively, or worse, ignoring it completely, has a series of detrimental effects. As such, this work has important value to HR practitioner and scholars.

Originality / Value:
The paper provides an original, up-to-date, and broad-based review of the grief-related research.
221 - WHY DO INDIVIDUALS JOIN THE MILITARY? REFINEMENT AND VALIDATION OF THE REASONS FOR JOINING SCALE

Nancy Otis (1) - Carley Chiasson (2)

1Director General Military Personnel Research and Analysis, National Defence, Ottawa, Canada (1) - University of Ottawa, Psychology, Ottawa, Canada (2)

Purpose

The Reasons for Joining Scale is intended to measure prospective recruits’ reasons for joining the military. Despite its wide use within the Canadian Armed Forces, a strong theoretical underpinning of the scale is lacking, and limited research has examined its psychometric properties. As such, this study focuses on refining and validating the Reasons for Joining Scale.

Methodology

A sequential approach with four independent samples was used to refine the Reason for Joining Scale and consisted of a) qualitative analysis, b) exploratory factor analyses, c) confirmatory factor analyses, and d) predictive validity analyses.

Results

In study 1, seven additional items were added to the original 16-item scale based on qualitative analyses and a review of the literature. In study 2, exploratory factor analyses were conducted and 18 items were found to uniquely load onto four dimensions of motivation for joining the military: 1) internal self-interest motivators, such as self-fulfilment, adventure, and personal growth; 2) altruistic motivators, such as helping others, and serving the country; 3) external self-interest motivators, such as monetary benefits, and educational gains; and 4) family history. In Study 3, the 4-factor model was supported by confirmatory factor analyses. In Study 4, preliminary results supported the refined scale’s ability to predict positive and negative adjustment to the military.

Limitations

The use of a cross-sectional design and self-report measures are limitations of this research.

Implications

The investigation of what attracts or motivates individuals to join the military has implications for the development of military recruitment campaigns.
Purpose

Work-related stress is a growing phenomenon of modern societies that degrades workers’ psychological health. Although an internship is a potentially stressful transition from school to work, stress among interns is rarely examined. This is particularly true with respect to management school interns, even though internships are commonly used in these institutions and acclaimed by organizations. In this context, we seek to 1) determine whether internships generate stress and psychological distress among management students; 2) analyze the stressors they face; and 3) identify the stress coping strategies they use.

Methodology

Using an inductive analytical approach, this research was conducted in a Canadian management school. Interviews (N=19) were conducted with interns, internship supervisors, and internship coordinators.

Results

Organizational (e.g., degree of autonomy) and individual factors (e.g., work-life balance) were identified as stressors but perceived as challenges rather than hindrances to well-being, with social support playing a key role in this evaluation. Also, interns tend to adopt proactive strategies and impression management to reduce the effects of stress. Thus, although generating stress, internships tend to foster a state of well-being.

Limitations

The exploratory and inductive nature of our design prevents us from generalizing our results to other populations.

Implications

Our findings highlight the importance for organizations to provide interns with a supportive and stimulating environment to promote interns’ psychological well-being.

Originality/Value

This study is one of the first to examine stress among management schools interns and to integrate several perspectives in order to obtain a global understanding of the phenomenon.
Purpose: Our study explores how job crafting mediates the relationship between creativity, job autonomy, and certain personality facets on the one hand and subjective wellbeing on the other hand among nurses. We propose that job crafting might fully mediate the relationship between some of the antecedents and subjective well-being while partially mediate that relationship with other antecedents.

Methodology: We collected data from 547 nurses across several hospitals in Lebanon.

Results: Using structural equation modeling (SEM), we found that nurses who have high levels of job autonomy, conscientiousness, and agreeableness tend to job craft more and have higher levels of subjective wellbeing. We also found that job crafting partially mediates the relationship between creativity and subjective well-being.

Limitations: Our study was limited by the use of a cross-sectional design which prohibited our examination of causal relationships between the variables, as well as, our potential inability to recruit nurses who are overworked and on the verge of burnt-out.

Implications: Our study suggests that a strong link exists between job crafting and subjective wellbeing, which is an aspect that the nursing profession can capitalize on. Employers can also foster a work environment that provides employees with some freedom to choose the way they want to perform their tasks. Our research adds creativity as an antecedent in the general theoretical model of job crafting proposed by Rudolph, Katz, Lavigne, and Zacher (2017) and provides the first empirical evidence to support its addition. Our study also provided evidence to solidify the relationship between work-related factors and life-related outcomes.
Purpose

Unlike a written aptitude or personality test, the employment interview affords versatility in style and content (Posthuma, 2002). Thus, we propose the first interview structure model to integrate supplementary forms of fit assessment (values, goals, interests) alongside traditionally assessed complementary fit factors (knowledge, skills, abilities), and to account for recruitment behaviors alongside selection behaviors.

Approach

Strategic interview behaviors are proposed to vary along two continua (axes) regulating their function and impact on conversation. The recruitment–selection axis designates the chief decision-maker and the relational–transactional (i.e., supplementary–complementary fit) axis designates the criteria for judgment. We propose (1) a given behavior serves each axis pole to the detriment of its opposite, and (2) interviews strategically focused toward one end of each axis (i.e., those comprised of functionally consistent behaviors) better serve their intended function.

Results

A systematic review to test these propositions is underway. An initial pool across three databases yielded 6,127 articles; the first phase of coding reduced this to 1,183 articles.

Limitations

Assessment of interpersonal compatibility factors raises the potential for biased judgment and discrimination. The systematic review will shed light on this issue.

Research/Practical Implications

The proposed framework substantially increases the scope of interview research, and in turn, informed practice.

Originality/Value

The proposed framework accounts for interview behaviours in relation to a broader range of interview goals. Each relationship is proposed in relation to a testable proposition. Thus, the interview may accomplish more goals than existing frameworks purport, and retain its integrity as a staffing device.
The research investigated what management thinks of teleworking, its benefits and challenges, how does it compare to the managing of on-site workers, improvements that can be made and what and how they learned to manage teleworkers. Three focus groups were done with a total of 24, predominantly immediate, managers of teleworkers from two Brazilian public organizations with different teleworking norms. The participants' answers were transcribed by the researchers and submitted to Bardin's (2011) content analysis. Results show productivity and self-management capacity for teleworkers as common benefits and immediate communication and goal setting as common difficulties. It is noted a difference in between the organizations of how teleworking is perceived. In one of them, the preoccupation with the teleworkers' life quality and their integration with the on-site team stands out. In the other, it's the rise of performance and the parametrization of individual productivity. Both organizations regard that the dynamic with the on-site team is more prepared to deal with unpredicted situations due to the direct communication and team's availability. The managers also report the need for training of competences related to teleworking, stating that their learning happened with the practice. One of the study's limitation was the presence of managers of different hierarchies, which made it difficult the consensus about teleworking. The results evidences the need to train managers in mediated communication skills and goal setting. Future studies are needed to comprehend how the managing of hybrid teams works, which could improve telework in organizations.
THE IMPASSE OF HUMAN-ALGORITHM DECISION-MAKING: A REVIEW AND A WAY FORWARD

Jason Burton (1) - Mari-Klara Stein (1) - Tina Blegind Jensen (1)

Copenhagen Business School, Department of Digitalization, Copenhagen, Denmark (1)

Purpose: Despite abundant literature theorizing societal implications of algorithmic decision-making, little is known about the conditions that lead to the acceptance or rejection of the algorithmically-generated insights upon which individuals and organizations increasingly rely. Algorithm aversion—the reluctance of human forecasters to use superior but imperfect algorithms—embody this obstacle for human-algorithm decision-making systems. This paper reviews the topic of algorithm aversion and follows its conceptual trail across disciplines, synthesizing established knowledge, and making practical suggestions for human-algorithm interaction design and research.

Methodology: A systematic literature review was conducted through eight interdisciplinary databases. Thirty-one journal articles were analyzed; making note of the focal agents addressed (human, algorithm, and environment), underlying decision-making theory, and methodologies employed.

Results: A majority of research focuses on the human agent and assumes a traditional rational theory of decision-making. Antecedents to algorithm aversion are presented in five themes to inform future research and practice: misguided performance expectations, lack of decision control, lack of incentivization, ignoring intuitive processes, and conflicting concepts of rationality.

Limitations: Only published, peer-reviewed, academic journal articles from 2008 to 2018 were considered.

Implications: Integrating nonrational decision-making theory presents an opportunity for meshing decision processes upstream for more participatory, less confrontational human-algorithm systems—simultaneously satisfying human psychological needs and maintaining statistical rigor in decision-making. Methodologically, knowledge of algorithmic decision-making is disadvantaged by a lack of field research and overly-abundant monodisciplinary conceptual ideations.

Originality/Value: The illusion of the impossible-to-comprehend algorithm is deconstructed, and actionable solutions for synergistic human-algorithm decision-making are proposed to enable human participation in a data-driven society.
242 - THE NEGATIVE EFFECT OF THE WORKERS’ EMOTIONAL DYSREGULATION IN THE DAILY RELATIONSHIPS BETWEEN WORKPLACE INCIVILITY AND WELL-BEING AT HOME: A CROSS-LEVEL STUDY.

Luis Manuel Blanco-Donoso (1) - Alberto Amutio (2) - Bernardo Moreno-Jiménez (1) - Maria del Carmen Yeo Ayala (3) - Daniel Hermosilla (4) - Eva Garrosa (1)

Universidad Autónoma de Madrid, Biological and Health Psychology, Madrid, Spain (1) - University of the Basque Country (UPV/EHU), Faculty of Labor Relations and Social Work, Bilbao, Spain (2) - Guadalajara University, University Centre of Health Sciences, Guadalajara, Mexico (3) - University of the Basque Country (UPV/EHU), Faculty of Psychology, San Sebastián, Spain (4)

Abstract

Purpose: The aims of this study were twofold: firstly, to explore whether the effects of experiencing workplace incivility during work-time could explain the daily levels of nurses’ well-being at home from a within-person perspective, and secondly, to analyze if that relationship could be moderated by the nurses´ levels of emotional dysregulation. Methods: This is a multilevel study with diary methodology. The study was carried out in 18 primary health-care centres belonging to Spain. 94 nurses completed a general questionnaire and 54 of them a diary booklet over 5 consecutive working days in two different moments, immediately after work and at bedtime. Results: there were significant intra-individual fluctuations in workplace incivility throughout days. Moreover, emotional dysregulation significantly moderated the within-person workplace incivility-well-being associations. Specifically, emotional dysregulation showed to amplify the negative impact of workplace incivility on daily levels of fatigue, in such a way that those nurses with higher levels of emotional dysregulation showed higher levels of fatigue at home at night on those days that had experienced incivility at work. In the case of positive affect, emotional dysregulation showed also to boost the negative impact of the incivility, in such a way that those nurses with higher levels of emotional dysregulation presented lower levels of positive affect at night at home on those days that they had experienced incivility at work. Conclusion: the presence of difficulties in emotional regulation among nurses can increase the negative effects of daily workplace incivility on their health and well-being.
Many studies have analysed the uses of ICT for work, with some focusing on use at the office (e.g. Chesley, 2014) and others on use outside the traditional workplace and workday (e.g. Fenner & Renn, 2010). However, there is little research encompassing all work uses of ICTs, both in and out of the office, or on their respective effects. Thus, the present study aims to: a) explore the links between intensity, places and time periods of using the Internet for work; b) examine whether Internet uses for work affect work engagement, problematic Internet use, and perceived impact of work on personal life.

An empirical study was conducted based on a questionnaire survey of 502 managerial professionals. We measured their use of the Internet for business purposes during working hours at and outside of the standard workday/workplace; their work engagement (Schaufeli et al., 2006); their relationship to the Internet (Khazaal et al., 2008); and the perceived impact of work on their personal lives (Wagena & Geurts, 2000).

Four categories of Internet use for work were identified (Cluster analyses). They differed with respect to intensity, places (at standard workplace, at home, travelling), and time periods (during a typical workday, a day off or vacation) dedicated to Internet use.

ANCOVA reveal that the daily intensity of Internet use for work and the increased number of places and time periods associated with uses diminish managers’ dedication and vigour at work, favour problematic Internet behaviour, and foster the permeability between work life and personal life.
248 - WHY CUSTOMERS DO (NOT) TRUST THEIR BANK

Aviv Kidron (1) - Yvonne Kreis (2)

The Max Stern Yezreel Valley College, Human Services, Yezreel Valley, Israel (1) - Schüßlermann und Partner AG, Mainz, Germany (2)

-Oral Presentation-

Purpose: In banking services trust is crucial to any relational exchange situation; trust reduces the perceived risk of service outcome. The purpose of this study is to investigate the reasons for low trust in banks.

Methodology: 544 street interviews were conducted, structured to document the interviewees' level of trust toward Israeli banks. The answers were analyzed using a qualitative method.

Results: A 62.86% majority of the 544 respondents stated that they do not trust banks. The main concerns of those who do not trust their bank can be aggregated into three issues: misuse of customer funds, unequal power between banks and customers, and bank-customer relations. Three main reasons were also revealed where respondents’ trust their bank: the necessity of using bank services, one’s own experience, and quality of service. We utilized Mayer et al.’s 1995 model to analyze the reasons for respondents’ level of trust. The bank's competence on one hand to provide financial services is perceived as a reason to trust. By contrast, trust as a key element in exchange relationships is harmed when customers are exposed to behaviors that are incompatible with benevolence and integrity.

Limitations: Data has been gleaned from only one country, and the results may not be generalizable to other countries and across cultures.

Research/Practical Implications: Banking service providers may differentiate between the reasons for high and low trust in banks, and address the determinants of low trust.

Originality/Value: This study explores various aspects of low trust in banks during 'normal times'.
Purpose: This study utilized CSR perceptions, along with the influence of proactive personality and felt responsibility, to predict worker’s tendencies to engage in behaviors consistent with the “spirit” of CSR (e.g., helpful behaviors directed at non-organizational third-parties at work and beyond), and to refrain from anti-social behaviors at work.

Design: We surveyed a sample of workers at a company with an active corporate social responsibility (CSR) program to examine the relationship between proactive personality, feelings of responsibility, and CSR perceptions on several pro- and anti-social behaviors.

Results: Our findings revealed that employees’ perceptions of their company’s CSR moderated the link between personality and feelings of responsibility and pro- and anti-social behaviors. When CSR perceptions were low, personality was the best predictor of pro(anti)-social behaviors, whereas higher perceptions obscured the link. Implications for CSR communication are introduced.

Implications: We interpret this finding within a trait activation framework, suggesting that individuals’ perceptions of their company’s tendencies toward CSR act as an indicator of (un)acceptable behavior.

Limitations: These results are cross-sectional in nature and thus cannot speak to the causal relationship between personality and the reported pro/anti-social behaviors. The reported behaviors are also self-reported, and thus may be subject to social desirability effects.

Value: Corporate social responsibility (CSR) is often seen as a sign of organizational “good behavior, but is less frequently recognized as an indicator of behavioral expectations at work. This study is the first to utilize a trait activation model suggesting environmental influences borne of CSR on individual pro-social tendencies.
Purpose. The current study proposes and tests a model that explications how helping behaviors (i.e., OCB-I) in the workplace influence support provision and satisfaction at home on a daily basis.

Design/Methodology. We adopted experience-sampling methodology with two daily surveys over a two-week period. Our sample consisted of 81 couples from China. We measured self-rated OCB-I in the workplace (at work) and self-rated life and relationship satisfaction (at home). We also assessed spouse-rated helping behaviors at home.

Results. Controlling for positive affect, we found a positive indirect effect of OCB-I on life satisfaction (95% CI [.05, .24]) and relationship satisfaction (95% CI [.06, .33]) via support provision at home (spouse-rated). That is, employees who engaged in OCB-I in the workplace during the day were more likely to provide support to their spouses at home in the evening, which subsequently led to higher life satisfaction and relationship satisfaction.

Limitations. In addition to a small sample size, it may be more objective to ask colleagues to assess participants’ OCB-I.

Research/Practical Implications. Our results shed light on an underlying mechanism through which helping behaviors in the workplace can result in higher well-being at the end of the day, and provide a counterweight to the ego depletion hypothesis, which suggests that helping behaviors might lead to work-family conflict.

Originality/Value. This paper presents a model that explains the mechanism through which helping behaviors at work can enhance one’s daily well-being.
This study examines whether work engagement can be predicted by personality characteristics, in a particular workplace. The positive state of work engagement has been shown to differ between various professions with different demands and characteristics (Inceoglu and Warr, 2011), and its possible link with employees’ individual personality traits has been investigated by a considerable amount of studies, but research has reported mixed findings.

Thus, it is hypothesized that agreeableness, openness to experience, extraversion and conscientiousness will be positively and significantly related to work engagement (Hypothesis 1), whereas neuroticism will be negatively and significantly related to it (Hypothesis 2).

Data was collected from 76 nurses of a particular public hospital. Work engagement was measured with UWES-17 (Schaufeli and Bakker, 2003) and personality characteristics with the TPQue questionnaire (Tsaousis, 1999). Results of linear stepwise multiple regression analysis partly supported H1 (conscientiousness and openness to experience were found to predict work engagement, whereas agreeableness and extraversion were not), and did not support H2.

The results of this study add to the existing literature by trying to shed light to the potential relationship between personality characteristics and work engagement. The fact that this study concerned only a particular workplace (health; nursing) can be considered as a limitation, and thus, the results cannot be generalized. From a practical point of view, the particular findings could assist human resources managers in job selection, in order to maximize positive organizational behaviors.
For several years, the transportation industry has been concerned about a severe shortage of professional truck drivers. In particular, employers in the EU logistics sector are having a hard time recruiting long-haul truck drivers. A comprehensive body of EU and national regulations governs the sector that affects the costs to transportation companies as well as the labour supply. Studies investigating the reasons found that staffing shortage is mainly due to poor working conditions, stress, and strains resulting from psychological and physiological job demands. Consequences are decreases in drivers’ job satisfaction, health, and ability to work. Relatively low salaries are a further cause for a high fluctuation among drivers, occupational changes, and a lack of young drivers. Taken together, these conditions make professional truck drivers a “scarce commodity” in the logistics industry.

The aim of the current study was to investigate how the Job Characteristics Model (Hackmann & Oldham, 1976) can be applied to improve working conditions of long distance drivers and thus improve their work motivation, job satisfaction, and reduce fluctuation in this professional group. We used an adaption of the German version of the Job Diagnostic Survey (Schmidt, Kleinbeck, Ottmann & Seidel, 1985) to interview 50 professional truck drivers. Results revealed significant differences in core job characteristics between participants. Motivation Potentials Scores correlated significantly with job satisfaction, and job performance, even if individual growth need strength was controlled. Both outcomes could be predicted by the perception of core job characteristics. Further, satisfaction with the work itself best predicted overall job satisfaction. Implications for theory are discussed and recommendations for actions for employers deduced.

Purpose: Career transitions are processes that refer to changes from one occupational state or role to another. We develop and present a theoretical framework on flexible action regulation in career transitions which aims to better understand the dynamics of proactive and adaptive behaviors in transition processes as well as how the flexible use these behaviors relates to changes in well-being. We define proactive behavior, in line with the action-regulation theory, as being an internally driven goal engagement and action to initiate a change in the environment; adaptive behavior is defined as an action that indicates goal adjustment or disengagement in response to externally-initiated changes.

Approach: We integrate knowledge from different literatures to argue that the interplay of proactive and adaptive behaviors relates to individual well-being over time. Moreover, we specify the processes and individual differences in the interactions of proactive and adaptive behaviors to explain the effects of proactive and adaptive behavior changes on the outcomes of well-being.

Practical Implications: Our approach has some practical implications for individuals facing career transitions and for employment centers, organizations, and educational institutions to support people to effectively manage career transitions by engaging in proactive and adaptive behaviors and to develop interventions to promote well-being.

Originality/Value: Our approach extends fragmented extant work on proactive and adaptive behaviors, and combines an action regulation and resource-based perspective with literature on career transitions.
DEVELOPMENT AND VALIDATION OF THE GLOBAL WELL-BEING AT WORK INVENTORY® (GWWI®)

Richard Thompson (1) - Emily Johnson (2) - Nancy Schaubhut (3) - Martin Boult (4)

Purpose
Well-being is a topic of growing interest in positive psychology, and for people in general. Well-being is distinct from happiness. A number of measures of general well-being have been developed derived from Seligman’s work. The present study presents the measurement properties of a well-being instrument developed for use in the workplace, intended to provide organizations with a means of measuring the well-being of their workforce using a reliable and valid instrument.

Design
Three different surveys were conducted globally on three separate occasions (May-June of 2016, 2017, 2018). Over 3,000 people completed each of the surveys on each occasion. The surveys included the items comprising the GWWI® along with different criterion measures. The GWWI® assessment was examined for reliability (Cronbach’s alpha, test-retest) and evidence of construct validity (exploratory and confirmatory factor analysis) along with criterion related validity.

Results
The analyses demonstrate that the GWWI has sound measurement properties, consistent with other measures of general well-being. The internal consistency reliabilities of the measures range from .81 to .93. The exploratory and confirmatory factor analysis demonstrate reasonable construct validity consistent with the structure found in other measures of well-being. Correlations with other criterion measures were consistent with what would be expected.

Limitations
The study is reliant on self-report data.

Research/Practical Implications
The research demonstrates that workplace well-being can be accurately measured using the same assessment across countries, occupations, and age groups.

Originality/Value
There has been limited research in the area of workplace well-being. This research provides a tool for further study.
Personality, work and life satisfaction: mediating role of job crafting
Eva Rošková¹, Michaela Tašková¹
¹ Faculty of Art, Comenius University in Bratislava, Slovakia

Purpose: Job crafting is defined as the self-initiated changes that employees make in their own job demands and job resources to attain and/or optimize their personal/work goals. The study aimed to investigate association between job crafting, personality variables (conscientiousness and agreeableness), work and life satisfaction, and to verify the job crafting mediating mechanism between personality and work and life satisfaction.

Design/Methodology: Hypotheses around the objectives were tested on a group of 174 employed respondents, using self-reported scales.

Results: The results have shown a strong link between the two dimensions of job crafting (increasing structural job resources, increasing challenging job demands), conscientiousness and both work and life satisfaction. Interaction between increasing social job resources, decreasing hindering job demands (Job Crafting) and agreeableness have not been identified as significant. Furthermore, the full mediating effect of job crafting (increasing structural job resources, increasing challenging job demands) on the relation between consciousness and work satisfaction, and a partial mediating effect of job crafting (increasing structural job resources) on the relation between consciousness and life satisfaction have been demonstrated.

Practical implications: The received results indicate, that increasing job resources, e.g. work autonomy, learning and development possibilities, interesting, challenging projects play for conscientious employees an important role in increasing their work and life satisfaction, and provide useful implications for organizational practice.

Limitations: Limitations of the study, mainly limited number of participants, measurement context effects of the self-reported scales have been discussed.

The research was supported by Slovak Research Agency VEGA: 1/0273/18
Successful women in male gender-typed fields face a double bind. On one hand, they are seen as incompetent due to a perceived lack of fit between what a woman is like and what a successful person should be like (Eagly & Karau, 2001). On the other hand, when women have proven their competence beyond doubt they are seen as less likable due to a perceived lack of communality (Heilman & Okimoto, 2007). The current studies examine the notion that when women end up in their positions due to factors other than personal ambition they might be let off the hook. In study 1 participants read a story about an employee (man vs. woman) in a male gender-typed company, who achieved their success either through goal-directed choices and ambition or as a product of circumstances. Results indicated that a woman who actively strived for success in a male gender-typed field is less liked than a woman who did not, and less liked than a man in the same condition, \( F(1,85) = 8.38, p = .003 \). Study 2 focused on a leader of a STEM project. Results were marginally significant \( F(1,131) = 3.08, p = .08 \), but were in line with our hypothesis that a woman who put herself forward to be a project leader was less liked and more derogated than a woman who was assigned to be a project leader, or a man in the same condition. Overall, these findings suggest that while women are penalized for success in traditionally masculine positions, this does not happen when they arrive at their positions due to circumstances.
Purpose: To extend literature on affect and goal importance within goal hierarchies. Specifically, how differences, or incongruence between the direction and levels of affect and importance between subordinate and superordinate goals influence goal attainment speed and task performance, with goal commitment mediating the effect. Method: Participants completed two surveys, one week apart. Goal affect and importance were measured at both time one and time two, with goal processes being measured at time two. Results: Foremost, the affectivity level (both positive and negative) of the subordinate goal is highly correlated with their respective affectivity level of the superordinate goal. This was also present with the trait affectivity, which ultimately indicates minimal to no incongruence between affectivity of superordinate goals, subordinate goals, and trait. However, initial results still supported some of our hypotheses, with affective and importance incongruence predicting subordinate goal speed (p<.05). Limitations: Participants may have had a lack of understanding of the directions, as reflected by a range of goal types. Due to a small final sample size of 113, analyses controlling for goal types were unable to be performed. Implications: Our study can add to a new understanding of how affect and importance interact within goal hierarchies, and provide organizations with a new target to implement interventions towards, in order to increase employee efficiency. Originality: This is the first study to our knowledge which looks at an incongruence between goal hierarchies, specifically with regards to the affectivity and importance attached to goals within the hierarchy.
Despite numerous previous studies exploring predictors of unethical behavior at work, the mechanism through which fear of failure could lead to unethical behavior remains unknown. This study fills the gap in literature through analyzing how perceived failure results into unethical behavior during goal striving. Ego depletion plays a mediating role in this relationship. Furthermore, conscientiousness buffers the negative impact of perceived goal failure on ego-depletion on one side while moral identity moderates the relationship between ego-depletion and employee’s unethical behavior. Supporting previous literature, memories of past failure are also correlated with current fear of failure.

Preliminary findings of the data collected from sales professionals working in the United States supported the linkages among fear of failure, ego depletion, conscientiousness, moral identity, memories and unethical behavior.

On research side, the study contributes to the literature by exploring dynamics of goal striving in resource preservation perspective. While in practical area, it justifies the importance of interventions to enhance conscientiousness and moral identity as well as to promote ethical awareness at workplace to reduce employees’ unethical behavior.

Despite many strengths, this study has some limitations like data collected on two time points only. Future studies can test these relationships on more time points to explore reciprocity and multiple sources can be incorporated for measuring unethical behavior instead of relying on self-report.
Purpose: In simplest terms, mindfulness is a state of being present in a particular way. In the organisations, the employee’s state of mindfulness can provide workplace benefits in terms of employee’s well-being, relationships, and performance. Although the literature on mindfulness has focused on the workplace benefits but relatively limited is known about the individual and work related factors that might facilitate or hinder the state of mindfulness. In other words, it is not clear how specific context can impact the state mindfulness of employees. The purpose of this study is to explore the individual context to identify the factors associated with the state mindfulness of employees.

Research Design: The study adopts a phenomenological approach as a research strategy to understand the influence of context on the mindfulness from the perspectives and experiences of individuals in the workplace. The study intends to interview 30 professionals including faculty and staff of different Universities in New Zealand. The academic professionals will have a diversity of mindfulness experiences in terms of training and/or practice of mindfulness meditation at the workplace. The interview data will be analyzed using thematic analysis.

Implications: The findings of the study will expend literature on the context of mindfulness by underlining the individual and organisational factors that might impact the employee’s state of mindfulness. Practically, the study may benefit the organisational leaders to foster the state mindfulness of employees by incorporating the favourable and impeding the unfavourable contextual factors in order to obtain workplace benefits.
Purpose: The impact of transformational leadership on the working attitudes is well explored. However, the impact of its “darker side” – pseudo-transformational leadership is still not getting enough scientific attention. The purpose of the study was to examine the differences in the reflection of the selected leadership styles (transformational, pseudo-transformational and laissez-faire leadership) in attitudes (engagement, trust) and behaviour (innovation) of employees.

Design / Methodology: Vignettes have been used to manipulate transformational, pseudo-transformational, and laissez-faire leadership styles in the between-subject experiment on 140 employees. Work attitudes (engagement, trust) and behaviour (innovative) have been measured by self-reported scales.

Results: Employees’ engagement, trust and innovation have proved to be the highest in condition of transformational leadership. In case of pseudo-transformational leadership, participants perceived the lowest level of engagement, trust and innovation. The differences between the selected leadership styles were statistically significant with the large effect size in all investigated attitudes and behaviour.

Limitations: Limited number of participants, the use of self-reported scales.

Research / Practical implications: The results suggested that the unethical form of transformational leadership (pseudo-transformational leadership) influenced the employees’ engagement, trust and innovation significantly more negatively than laissez-faire leadership or transformational leadership. That type of leadership, therefore, had appeared to be detrimental in building trust, engagement and innovation of employees.

Originality / Value: We consider the added value of conducted research in contribution to the testing of the leadership concept (transformational, pseudo-transformational and laissez-faire leadership) and application of the unusual (vignette) experimental research approach. The obtained results could be useful in selection, evaluation and development processes.

The research was supported by Slovak Research Agency VEGA: 1/0273/18
Purpose

Mindfulness research has risen greatly over the past several years. Rees, Breen, Cusack, and Hegney (2015) proposed a model of mindfulness and workplace resilience. The model suggests that the relationship between interpersonal factors (mindfulness, self-efficacy, & coping) and psychological adjustment is mediated by psychological resilience. Additionally, neuroticism is suggested as a moderator. The purpose of this study was to empirically test their model.

Methodology

Participants were 127 undergraduates from a Southeastern U.S. university. Participants completed measures assessing generalized self-efficacy, coping, neuroticism, resilience, mindfulness, and stress.

Results

We tested the proposed model using Preacher and Hayes’ (2012) models 4 and 8. We found partial support for the proposed model. Specifically, a) neuroticism was not supported as a moderator; and b) resilience mediated the relationships between self-efficacy and stress, active coping and stress, and mindfulness and stress.

Limitations

This study is limited by a small sample size of students. Future research should seek to acquire a larger sample.

Research/Practical Implications

We empirically tested Rees et al.’s (2015) model of resilience and found evidence demonstrating at least partial support for the model. This provides evidence favoring the use of mindfulness-based practices.

Originality/Value

Our study is unique in its examination of the relationships between interpersonal factors, resilience, and health outcomes among students, a population that experiences high levels of stress.
THE RELATIVE EFFECTIVENESS OF THREE TYPES OF FAMILY-RESOURCES ON WOMEN'S WORK-FAMILY CONFLICT AND BURNOUT

Hedva Braunstein-Bercovitz (1) - Gal Shai (2)

The Academic College of Tel Aviv-Yaffo, Behavioral Sciences, Tel Aviv-Jaffa, Israel (1) - The Academic College of Tel Aviv-Yaffo, Tel Aviv-Jaffa, Israel (2)

Purpose: To examine the role of resources gained from the family in women's work-family conflict (WFC) and burnout. The perceived gain of three family resources were tested: Personal-empowerment (PE), instrumental and emotional supports (IES), and energy conservation (EC). Two dimensions of WFC were examined, namely, work-interferes-family (WIF), and family-interferes-work (FIW).

Methodology: A sample of 200 mothers of young children, most working in a full-time position, completed the following questionnaires: a work-family conflict measure, a burnout measure, the gain of resources in the family, and background information on work and family.

Results: Structural equation modeling analysis indicated that available resources reduced the conflict, which in turn diminished burnout. Specifically, the linkage between PE and burnout was mediated by both WIF ($\beta = -.14$) and FIW ($\beta = -.11$), and the linkage between EC and burnout was mediated by FIW ($\beta = -.12$). IES did not have any significant effects.

Limitations: The proposed model suggests causal relationships, although a cross-sectional design was used. The homogeneous composition of the sample may limit generalizability.

Research Implications: The most significant contribution to burnout and WFC alleviation among young women is by PE, as it increases resilience to various forms of stress. EC decreases burnout only through the alleviation of FIW. IES did not have any effects on WIF, FIW, or burnout.

Originality/Value: The current study is the first to evaluate the effectiveness of family-resource types that foster women's careers and their perseverance in the organization. The findings have important implications for individual and organizational counseling.
Purpose: This study examined the mediating effect of mental fatigue in the relationship between neuroticism and insomnia among Norwegian shift workers. The relationship between neuroticism and insomnia is well established, but the inclusion of mediating variables, e.g. mental fatigue, can help clarify the underlying mechanisms behind this association.

Design and methods: The participants were recruited from shift workers employed in health care, social services and education in a municipality in Norway. The online questionnaire was distributed in January 2013, and contained measures for demographic and background information, personality, insomnia and mental fatigue. The total sample size in the present study consisted of 295 shift workers. Covariance-based structural equation modelling (CB-SEM) was performed to examine the direct and indirect effect between the concepts.

Results: Both mental fatigue ($\beta = .39$) and neuroticism ($\beta = .27$) had a moderately strong positive relation to insomnia when controlling for gender ($\beta = -.07$), birth year ($\beta = -.01$), weekly work hours ($\beta = .09$) and children living at home ($\beta = .05$). In addition, neuroticism also had a strong positive relation to mental fatigue ($\beta = .53$). The model explained 33% of the variance in insomnia. Further, mental fatigue partially mediated the relationship between neuroticism and insomnia, and accounted for 44% of the effect neuroticism had on insomnia.

Limitations: Ideally, the sample size when conducting mediating analyses in SEM should be closer to 450. However, since both direct and indirect effects were significant at $p < .001$, the results indicate that mental fatigue is an important mediator in the relationship between neuroticism and insomnia.

Implications: The findings indicate that measures aimed at reducing sleep problems among shift workers should be personalized, and that prevention and treatment of fatigue can have a positive effect on sleep. Future research are encouraged to explore other mediating factors in larger samples.

Originality: This study has demonstrated the importance of examining mediating effects when investigating precursors to insomnia among shift workers and in the general population. A work and sleep induced variable as mental fatigue can help explain how certain personality traits are associated with insomnia.
THE ROLE OF CONSCIENTIOUSNESS AND JOB EXHAUSTION: A LONGITUDINAL STUDY OF FINNISH EMPLOYEES

Jennifer Pickett (1) - Joeri Hofmans (1) - Katja Kokko (2) - Lea Pulkkinen (2) - Taru Feldt (2)

Vrije Universiteit Brussel, Brussels, Belgium (1) - University of Jyväskylä, Jyväskylä, Finland (2)

Purpose
We study the consequences of (mis)fit between one’s level of trait conscientiousness and the extent to which one’s job contains personally challenging achievement goals and requires exerting effort toward mastering tasks. Drawing on the idea that person-environment fit is positively related to a wide range of wellbeing and performance outcomes (Kristof-Brown et al., 2005), we expect misfit to relate positively to job exhaustion. Moreover, since employees gravitate toward jobs that fit their personality (Wille & De Fruyt, 2014), we expect people with a misfit will change to jobs that are more in line with their personality.

Design
Data are from a longitudinal study on Finnish employees (N=396; see Pulkkinen & Kokko, 2017). Conscientiousness and job exhaustion were assessed at ages 42 and 50 and coupled with objective O*NET data measuring the achievement/effort level of the job (based on job titles).

Results
Regression analysis at age 42 (but not 50) revealed that the achievement/effort level of the job was positively related to job exhaustion for people low, but not for people high on trait conscientiousness; suggesting that people low on conscientiousness suffer from jobs that are too demanding. Contrary to our expectations, misfit at 42 was unrelated to change in the achievement/effort level of the job between 42 and 50.

Limitations
These were mid-career employees. More changes might be expected with employees who are at the beginning of their career.

Implications
This study shows the importance of the fit between one’s personality and the content of one’s job.
Purpose: First, we analyze six behavioral dimensions of individual intrapreneurship to construct an intrapreneurship scale. Second, we apply the scale and test the mediating role of intrapreneurship between organizational citizenship behavior towards the environment (OCBE) and circular purchasing.

Design/Methodology: Data was collected by an online survey among 124 purchasers working in non-profit and profit organizations in the Netherlands and Belgium.

Results: We found that five dimensions (innovativeness, risk-taking, opportunity recognition and internal and external networking) relate to a second-order construct of intrapreneurship. We found that OCBE was positively related to intrapreneurship. However intrapreneurial behavior of purchasers did not relate to the outcome variable circular purchasing. Also, there was a moderating effect of type of function on the relationship between OCBE and circular purchasing.

Limitations. The study focusses on purchasers. The generalizability of this study is therefore limited.

Research/Practical Implications. This research sheds a light on the behavioral dimensions of individual intrapreneurship and shows that networking and opportunity recognition is just as important as the more commonly used behavioral dimensions (innovativeness, proactiveness and risk-taking). This newly constructed scale was also used to investigate the role of OCBE on intrapreneurship and circular purchasing. The results are used to facilitate organizations to determine and stimulate intrapreneurship of their employees and increase sustainability-related actions.

Originality/Value. We combine the dispersed literature on intrapreneurship and construct and test a scale that besides innovativeness, proactiveness, risk-taking also include opportunity recognition and networking. We also connect the intrapreneurship and sustainability literature.
Abstract

**Purpose:** Our research seeks to further clarify when and why ethical leadership influences follower ethical behaviour. Specifically, we hypothesise that follower moral organisational identification – or an individual’s normative concern for membership with ethical organizations – mediates the positive relationship between manager ethical leadership and follower ethical behaviour, and this is heightened when peer co-worker ethical behaviour is also high. In short, we argue that a follower’s normative desire to work for ethical organizations is, at least in part, a function of their current leader’s and co-workers’ ethical behaviour and, in turn, explains their own ethical behaviour.

**Design/Methodology:** To test our hypotheses, we are collecting multisource (line managers/followers) survey data from Malaysian organizations. Our multilevel data will be analysed using Mplus.

**Results and Limitations:** Data collection will be completed by November 2018.

**Research/Practical Implications:** For research, we provide a more complete test of social learning theory, and the ‘trickle-down’ model of ethical leadership development, by presenting moral organisational identification as a new explanatory lens for the transfer of ethical/moral values between leaders and their followers. Moreover, we introduce peer co-worker ethical behaviour as a boundary condition of these effects. For organizations and practitioners, our research not only confirms the importance of line managers in transferring values, but provides new insight into when and how this transfer happens.

**Originality:** We provide additional research examining why and when ethical leaders influence their followers’ ethical behaviour, giving research and practice a more detailed understanding of the transfer of ethical/moral values within organizations.
Purpose: The goal of the present study is to provide insight into the underlying mechanisms impacting the relationship between cultural intelligence (the capability to function effectively in intercultural contexts) and team performance. We investigate the positive influence of cultural intelligence on team performance and analyze the mediating role of team processes (action and transition) and of team emergent states in multicultural teams.

Methodology: Sixty-one members comprising 20 different multicultural teams from various organizations completed an online questionnaire. We assessed the four factors of cultural intelligence (motivational, metacognitive, cognitive, and behavioral), action (goal specification, strategy formulation) and transition (coordination) team processes, as well as affective team emergent states (mutual trust, collective efficacy, team cohesion). Analyses were conducted on the team-level; all estimates (ICCs, rwgs) implied acceptable levels of agreement.

Results: Affective team emergent states mediated the positive relationship between average cultural intelligence in teams and team performance. Findings further demonstrated that average cultural intelligence in teams was positively related to both action and transition process; however, team processes did not play a mediating role in the cultural intelligence-performance relationship.

Limitations: Common-source bias; self-report measures.

Research/Practical Implications: We reflect the importance of cultural intelligence on teamwork within organizations and suggest incorporating it in team development and team training interventions to overcome challenges related to cultural diversity.

Originality/Value: We incorporated team psychological mechanisms when investigating cultural intelligence in multicultural teams and provided first findings with regard to the mediating mechanisms influencing the positive relationship between cultural intelligence in teams and team performance.
354 - LIFTING THE FOG: QUALITATIVE AND QUANTITATIVE REVIEW OF THE EMPIRICAL RESEARCH ON MEANING OF WORK

Sarah Krückels (1) - Timo Lorenz (2) - Julia Leydecker (2) - Kathrin Heinitz (3)

Medical School Berlin, Psychology, Berlin, Germany (1) - Freie Universität Berlin, Berlin, Germany (2) - Freie Universität Berlin, Work and Organizational Psychology, Berlin, Germany (3)

Purpose:
We qualitatively and quantitatively reviewed the body of empirical research on meaning of work, offering a comprehensive theoretical and empirical framework regarding its sources and consequences.

Design/Methodology/Approach/Intervention:
The literature scan resulted in a total of 78 included studies that reported correlations of meaning of work with either desirable or undesirable sources or consequences of meaning of work. For 27 variable clusters, random-effects meta-analyses and post-hoc moderator-analyses using mixed-effect meta-regression models were conducted.

Results:
Seven variable clusters could not be assigned to either represent a source or consequence. For the remaining 27 clusters, all estimated average effect sizes can be at least considered to be small, are in accordance with the expected direction of effect, and statistically significantly differ from zero. Post-hoc moderator-analyses could explain the large amount of residual heterogeneity found in most clusters to some extent.

Limitations:
The remaining residual heterogeneity as well as the small amount of high quality studies in some clusters limits the interpretability and informational value of the results.

Research/Practical Implications:
Future research should focus on high quality studies providing sufficient study information. Also, a classification system to qualitatively organize sources and consequences of meaning of work and a focus on organizational consequences is needed.

Originality/Value:
The present study presents the first overview of the research field of meaning of work since Rosso et al. (2010) and revealed important sources and antecedents of meaning of work leading to a better understanding of its processes for practitioners and organizations.
EXAMINING THE IMPACT OF UNCIVIL SUBORDINATES ON LEADER WELL-BEING: NEEDS FRUSTRATION IN MALE AND FEMALE LEADERS

Rhea Boettcher (1) - Camilla Holmvall (1)
Saint Mary's University, Psychology, Halifax, Canada (1)

Abstract

Purpose: We investigated whether subordinate incivility impacts leader well-being, whether this relationship is mediated by relatedness and competence needs frustration (Baard, Deci, & Ryan, 2004), and whether these mediation effects are stronger for females than for males.

Methodology: We utilized a between-subjects (N = 109) experimental manipulation of subordinate (in)civility. Undergraduate students were assigned to a leadership role based on a fictitious test battery, in a simulation to understand subordinate-supervisor interactions over email.

Results: Subordinate incivility decreased leader well-being via lower positive affect for both genders and increased the negative affect of male leaders. The relationship between subordinate incivility and leader well-being was mediated by relatedness needs frustration for both genders. However, male, but not female, leaders treated uncivilly experienced greater competence needs frustration leading to poorer well-being.

Limitations: We used an undergraduate sample and therefore the results may not be generalizable to working leaders. Further, we studied only a single encounter of incivility.

Research and Practical Implications: Our research suggests that leaders are impacted by disrespectful subordinate behaviour, and that gender is a variable worthy of consideration in understanding reactions to uncivil subordinates. Our research highlights the importance of an organization’s investment in leader well-being by fostering respectful relationships with subordinates.

Originality/Value: As the majority of the existing research exploring subordinate incivility is correlational (e.g., DeSouza & Fansler, 2003), we provide casual evidence of the impacts of disrespectful subordinate behaviour on leader well-being, and also highlight that needs frustration variables may be useful in understanding reactions to mistreatment.
Purpose: Organizational change is constant. Contemporary organisations need to be nimble, agile, collaborative, focused, continually improving and strategically aligned in order to remain competitive. However, such constructs have been the subject of very little construct validation. The research aimed to test a model showing how an agile culture directly and indirectly influences employee openness to change.

Design/Methodology: On-line survey data were collected from 772 professional staff working in a large Australian university. Survey items were adapted from previously published measures or developed for the purposes of the research. Participation was voluntary, responses were confidential, and the study was approved by a university ethics committee.

Results: CFA supported the convergent and discriminant validity and higher order modelling of four agile factors: innovative-nimble, collaborative, continually improving, and strategically aligned. The higher order factor was directly associated with openness to change and indirectly associated with openness to change through employee change self-efficacy. The model explained 28% of the variance in employee openness to change.

Limitations: Despite the large sample and rigorous analytic approach the study had a cross-sectional design.

Practical Implications: Validated culture diagnostics will enable organizations to measure and track the extent to which their culture is agile and supports openness to change.

Originality/Value: The study offers up a set of measures that will help organisations reliably measure and benchmark their levels of innovation, collaboration, strategic focus and continual improvement. The results also highlight the importance of organisations ensuring employees have sufficient, training, skills and self-confidence to deal with on-going change.
362 - DISABILITY AND RETURN-TO-WORK OUTCOMES: THE MEDIATING ROLE OF LEADER-MEMBER EXCHANGE

Zhanna Lyubykh (1) - Mahfooz Ansari (2) - Kelly Williams-Whitt (3) - Vicki Kristman (4)

University of Calgary, Haskayne School of Business, Calgary, Canada (1) - University of Lethbridge, Dhillon School of Business, Lethbridge, Canada (2) - University of Lethbridge, Dhillon School of Business, Calgary, Canada (3) - Lakehead University, Institute for Work & Health, Thunder Bay, Canada (4)

Purpose. Two independent studies examined the mediating role of leader-member exchange (LMX) in the relationship between employee disability and return-to-work outcomes (presenteeism, job accommodation, performance, job satisfaction, and resilience).

Methodology. Data were obtained from employees with musculoskeletal disabilities (Study 1, N = 264) and leaders who had supervised employees with musculoskeletal disabilities in the past two years (Study 2, N = 224). Participants in both studies were recruited through an online portal, Mechanical Turk. The survey data for both studies were analyzed using hierarchical multiple regression analysis.

Results. Study 1 demonstrated that higher perceptions of disability severity were negatively related to LMX, and LMX mediated the relationship between disability severity and resilience, presenteeism, and job satisfaction. Study 2 revealed that LMX was positively associated with job accommodation and performance evaluations for employees with disabilities.

Limitations. First, cross-sectional data do not allow conclusions regarding causality. Second, although we assessed the proposed model from two different perspectives, the studies were independent and did not allow to test the implications of congruence with regard to perceptions of disability and LMX. Finally, this research examined the effects of musculoskeletal disabilities. There are other types of disability that might yield different effects.

Implications. Understanding antecedents and consequences of LMX is crucial for both supervisors and employees. Our research demonstrated that high quality LMX was related to return-to-work outcomes for employees with disabilities.

Originality/Value. This research examined the return-to-work outcomes providing strong empirical support for these relationships and extending both LMX and disability management research.
Abstract:

Purpose: To cross-sectionally investigate if the beliefs patients with pain has about their physician’s opinion regarding both their ability and volition to return to work (RTW) predicts their RTW expectancy.

Methodology: The sample comprised 205 participants (83.9 % women; $M_{\text{age}} = 47.24$ years, $SD = 9.66$) on full-time sick-leave that had lasted less than 10 years.

Results: Hierarchical logistic regression showed that a positive expectation to RTW within a year ($0 = \text{Unchanged}, 1 = \text{Work more}$) was significantly associated with the beliefs about physician’s evaluation of one’s ability (OR = 1.44, 95 % CI = 1.13, 1.83, $p < 0.01$) and volition (OR = 1.42, 95 % CI = 1.11, 1.83, $p < 0.01$) to RTW, even when other variables independently associated with RTW expectancy was accounted for (i.e. age, pain duration, sick-leave duration, prevalence of a musculoskeletal or genitourinary disease). Beyond beliefs, only age made a significant contribution in our final model (OR = 0.94, 95 % CI = 0.90, 0.98, $p < 0.01$).

Limitations: The sample predominantly comprised women. Due to a cross-sectional design, longitudinal prediction was not possible.

Research/Practical implications: Beliefs about physician’s opinion may be an important predictor of prospective studies of actual RTW rates, of which RTW expectancy is strongly predictive. Rehabilitation might be facilitated if healthcare professionals address and affirm patients’ ability and volition to RTW, regardless of the patients’ pain characteristics and duration of their current sick-leave episode.

Originality/Value: The study is one of few accounting for various pain characteristics (origin, duration).
Objective:
Validity is a fundamental issue in psychological test development as it supports the meaningfulness of test results and advocates the usefulness of the inferences drawn from test results. This is especially important in the recruitment and development setting. Therefore, the main objective of this study was to evaluate validity of the Polish adaptation of LJI-2 in organizational context. One of our interests in this study was to examine how test results differ among managerial staff at subsequent levels of organization structure.

Methodology:
A group of 405 Polish managers representing organizations of diversified size and business profile completed the Polish adaptation of LJI-2. Following good practice, every person taking part in the study received written feedback about his/her results.

Managers were later manually assigned to one of the groups reflecting their seniority level in the organization structure, considering company size. Average results in LJI-2 scales were compared between the groups using analysis of variance.

Results:
As expected, more senior managers obtained higher scores in LJI-2. However, a distinct score pattern was observed for managers working in public and private sector.

No statistically significant differences with respect to gender or type of industry were observed - this might suggest lack of testing bias.

All results will be presented and discussed in detail on the poster also in relation to the results reported in the similar studies from different countries.

Practical Implications:
Our study shows that Polish adaptation of the LJI-2 has high standing psychometric validity. This suggests usefulness of LJI-2 in improving outcomes in both recruitment and development settings.
390 - QUALITY OF LEADERSHIP AND PRESENTEEISM IN HEALTH PROFESSIONS EDUCATION AND RESEARCH: A TEST OF A RECOVERY-BASED PROCESS MODEL WITH COGNITIVE IRRITATION AND IMPAIRED SLEEP AS MEDIATORS

Sibylle Galliker (1) - Achim Elfering (1) - Irene Etzer-Hofer (2) - Beatrice Brunner (3) - Corinne Nicoletti (2) - Julia Dratva (2) - Sonja Feer (2) - Martin grosse Holtforth (4) - Markus Melloh (2)

University of Bern, Institute of Psychology, Department of Work and Organizational Psychology, Bern, Switzerland (1) - Zurich University of Applied Sciences, School of Health Professions, Winterthur, Switzerland (2) - Zurich University of Applied Sciences, School of Management and Law, Winterthur, Switzerland (3) - University of Bern, Institute of Psychology, Department of Clinical Psychology and Psychotherapy, Bern, Switzerland (4)

Purpose
Research on corporate health management needs to explore why leadership problems (LP) correspond to more frequent presenteeism (PRES) in employees. This study tests recovery after work as an underlying process with cognitive irritation (COGIRR) and sleep problems (SP) as simultaneous mediators and explores three mediation pathways (path one: LP → COGIRR → PRES; path two: LP → SP → PRES; and path three: LP → COGIRR → SP → PRES).

Design/Methodology
Out of 293 employees of a university’s school of health professions in Switzerland 211 completed the questionnaires (90 % women, 56 % professors and lecturers). LP was assessed with the leadership quality scale of the Copenhagen Psychosocial Questionnaire, COGIRR with a standardized irritation scale, SP with a validated single item, and PRES with the Work Productivity and Activity Impairment questionnaire. PROCESS macro for SPSS, model 6 and bootstrapping were used to analyze indirect paths.

Results
LP and PRES were found to be positively related ($r(211) = .22, p < .01$).

No significant results for path one and two were yielded. The third mediation path LP → COGIRR → SP → PRES was positive and significantly differed from zero ($B = 0.83, CI95 = 0.33$).
to 1.69). Results confirmed a recovery-based mediation model to fit with empirical self-report data.

Limitation
Bias from common source variance may have boosted correlations. Preferably, the mediation should have been tested on longitudinal data.

Implications
Occupational health interventions should improve leadership quality to promote recovery after work in order to increase health and productivity by reduced presenteeism.

Originality
Research on leadership has hardly ever focused on sleep of employees.
Typically, scientists and practitioners debate on the positive characteristics of a leader who will lead organization to the highest financial and social results. However, the latest research emphasizes the interest in the dark side of leader’s personality (Furtner et al., 2017).

**Purpose:** The main purpose of the quasi-experiment was to analyze if hypothetical leaders with dark triad personality could be evaluated as transformational ones.

**Methodology:** 157 participants took part in quasi-experiment. They were asked to read one of four scenarios (2x2 design: manipulation of gender (male or female leader) and expression of dark triad traits (high or low)) and to evaluate leadership of a hypothetical leader (Global Transformational Leadership scale, Carless et al., 2000). Participants also filled in the questionnaire (SD3, Jones, Paulhus, 2014) about their personality.

**Results:** Results showed that hypothetical leaders with highly expressed dark triad traits were evaluated as less transformational. This tendency hadn't changed even when gender of hypothetical leader and evaluator as well as dark triad personality traits of evaluator were included into the analysis.

**Limitations:** The majority of respondents (82 percent) were females and the mean of age was 25 years. Therefore, further research should include more diverse sample.

**Research/ practical implications:** The focus on leader’s dark traits and leadership could broaden our understanding and can be utilized in leader development.

**Originality/ value:** The research combines the dark side of a leader with a “good” form of leadership - transformational leadership and questions if this relationship is always negative.
1. Purpose

The present project aims to investigate most relevant human factors issues of the helicopter landing task on naval units. Such task can be cognitively complex for pilots and several accidents have been associated with helicopter operations in the military. Most of them are associated with spatial disorientation due to low visibility and insufficient situation awareness (Smith, 2006; EASA, 2017). The study ultimately aims at gathering evidence-based recommendation for landing aid systems’ development.

2. Design/Methodology/Approach/Intervention

We interviewed 10 helicopter pilots to extract information about the cognitive demands and skills required for landing on a ship. Applied Cognitive Task Analysis has been used as it allows the interviewer to represent the information in a format that will translate more directly into applied products, such as improved training scenarios or interface recommendations.

3. Results

Helicopter pilots identified perceptual skills including cues and patterns needed in the landing phase. They also reported how they detect and compensate for misleading information. Task saturation and poor layout of cockpit instruments can preclude effective multitasking or noticing anomalies. Novices tended to get fixated on some tasks or instruments resulting in failing to self-monitor or losing situational awareness. Cross deck, hovering and touchdown phases are associated with high workloads due to head-down movement and communication’s issues with crew.

4. Research/Practical Implications

Results of the interviews could aid in developing innovative human-machine interfaces for visual landing aids, delivering an ergonomic, user-centered system that can reduce pilots’ and operators’ workload and increase overall situational awareness.

5. Originality/Value

Few studies focused on assessing human factors in such situation, with a specific intent to produce evidence-based recommendation for future products development.
Displaying Vulnerability in the Workplace

The popular press hypes the display of vulnerability when it comes to maneuvering oneself in the workplace (Brown, 2015; Cabane, 2012). Leaders especially, are urged to display their vulnerable side, as this would make them come across as more humane, and allows them to connect with their employees on an emotional level, thereby spurring authentic relationships as well as creativity in the workplace (Ito & Bligh, 2017). Thus, being able to display vulnerability in the workplace is now often propagated as a strength rather than a weakness (Brown, 2015). Even so, people are especially at work generally reluctant to display their vulnerability (Lee, 1997; Rosenfeld, 1979). Indeed, while displaying vulnerability may potentially have positive effects, research suggests doing so is not without risk (Caughlin, Afifi, Carpenter-Theune, & Miller, 2005). For example, displaying vulnerability can lead to negative evaluations, rejection, and alienation from the actor, and such compromise one’s career (Caughlin et al., 2005; Gromet & Pronin, 2009). To reconcile these stark contrasts, we develop a conceptual process model in which we explain how, why, and when displaying vulnerability in the workplace, which we define as intentionally exposing oneself to the possibility of being harmed either professionally or personally, and which includes deliberately displaying one’s insecurities, failures, weaknesses, shortcomings, emotions, and unpopular opinions in the workplace, is advantageous versus disadvantageous for actors, observers, and their relationship.
Workplace bullying has been identified as a chronic stressor that is associated with poor mental health outcomes (e.g., emotional exhaustion; Nielsen & Einarsen, 2012) for targeted employees by depleting their psychological resources (Einarsen, Hoel & Cooper, 2003). Although research to date has illustrated the professional consequences of workplace bullying (e.g., disengagement, turnover intention; Hoel & Cooper, 2000), little is known regarding its effects on individual functioning during non-work time (e.g., the need for recovery from work) as well as the psychological mechanisms underlying the negative effects of bullying. Nonetheless, exposure to workplace bullying engenders a considerable and sustained investment of emotional and cognitive resources that may give rise to affective rumination (i.e., intrusive and recurrent thoughts about work-related experiences; Pravettoni et al. 2007) and thus hinders employee recovery during non-work time (i.e., inability to replenish one’s energy after work). To this end, this study (n = 250 employees) examines the mediating role of affective rumination in the relationship between exposure to workplace bullying and employee recovery from work. Results from hierarchical regression analyses showed that workplace bullying positively predicts affective rumination, and that affective rumination explains the negative relationship between workplace bullying and employee recovery from work. These results suggest that exposure to bullying behaviors drives recurrent thoughts about work-related experiences. These intrusive thoughts harm employees’ mental health (e.g., fatigue, irritability), which in turn impedes psychological resources replenishment and thwarts employee recovery from work. The theoretical and practical implications of the results will be discussed.
420 - DOES FEEDBACK INCREASE DECISION AID USE IN PERSONNEL SELECTION?

Aneeqa Thiele (1) - Stacey Stremic (2) - Alexander Jackson (3) - Satoris Howes (4)

Louisiana State University, I-O Psychology, Baton Rouge, United States (1) - Middle Tennessee State University, I-O Psychology, Murfreesboro, United States (2) - Middle Tennessee State University, Psychology, Murfreesboro, United States (3) - Oregon State University, Psychology, Corvallis, United States (4)

Purpose

When making hiring decisions, decision aids can help managers make optimal decisions. Unfortunately, individuals often make decisions based on clinical judgment (e.g., intuition or heuristics) rather than superior statistical methods (Highhouse, 2008). The purpose of this study was to examine whether the effect of feedback regarding a selection decision’s accuracy would impact the use of a decision aid.

Design/Methodology

Participants were 521 hiring professionals who made a series of 20 hiring decisions. Participants were presented with applicant scores on cognitive ability, conscientiousness, and an interview. Participants were provided with a decision aid for each decision. Participants were randomly assigned to receive feedback about their accuracy, feedback about the decision aid’s accuracy, feedback about their accuracy and the decision aid’s accuracy, or no feedback.

Results

Repeated measures logistic and linear regressions revealed (1) a main effect of individual feedback on decision aid use, (2) no significant main effect of feedback about the decision aid on its use, (3) decision aid use decreased over time, and (4) no significant interactions between individual feedback, decision aid feedback, or time.

Limitations

In real selection decisions people often have access to more information than provided in this study.

Research/Practical Implications

This study demonstrates that providing people with feedback about their own (in)accuracy may increase their usage of decision aids, leading to better hiring decisions.

Originality/Value

Our research is unique and of value in that we answer calls to empirically test the effect of feedback on decision aid use.
Abstract

**Purpose:** Practicing for cognitive ability tests generally leads to higher IQ-scores, while this does not reflect true increases in general intelligence [g]. This *practice effect* is most likely caused by candidates learning test-specific strategies during practice. Learning depends on an individual’s available working memory capacity; in computerized adaptive tests [CAT] items continuously match the ability level of the participant, which requires more working memory resources than fixed items [FIT] that are not person-tailored. Thus, CATs may prevent learning during practice. Therefore, we predict a weaker practice effect when CATs are administered, as compared to FITs. Furthermore, given that participants with higher *g* and higher need for cognition learn more easily, we expect a stronger practice effect for this group.

**Design:** 200 participants from a research panel are randomly assigned to one of 2 (practice/non-practice) x 2 (CAT/FIT) conditions. Hypotheses will be tested based on differences in effect sizes between the groups.

**Results:** At the time of submission of this abstract, data are still being collected.

**Limitations:** Data are not acquired in a true high stakes situation.

**Research/practical implications:** This study will investigate whether CATs may be the solution to the problem of the practice effect. This will eventually enhance the validity of test scores obtained and thus it will also lead to better selection decisions in practice.

**Originality/value:** To our knowledge, this is the first study to investigate the effects of practicing on CAT’s compared to FITs.
Purpose

Individuals and organizations can learn from error. However, little is known which error attributes make learning from error more or less likely. We argue that otherwise identical errors lead to more learning if consequences associated with the error are severe rather than mild. A better understanding of these attributes contributes to a better exploitation of the rich information inherent in errors.

Methodology

We experimentally tested our assumption by prompting participants to react to error scenarios that reflect situations typical for employees at work (N = 121).

Results

As expected, severity of error consequences increased learning both in terms of subjectively experienced learning (self-reports) and in terms of correctly recalled scenarios. Regarding subjectively experienced learning, this pattern was reversed for individuals high in trait negative affectivity, who learned more from errors with mild consequences.

Discussion

We assume that individuals high in trait negative affectivity experience increased threat from errors with severe consequences and therefore respond defensively, which in turn decreases learning.

Limitations

Participants were asked to respond to described errors and error consequences. Participants might react differently to errors they have actually made.

Research/Practical Implications

As more learning occurs from errors with severe consequences, even though the error itself and its informational value are the same, organizations should support learning from errors with mild consequences. Thereby, organizations fully exploit the learning potential inherent in errors.

Originality/Value

The present research experimentally confirms previous correlational studies and highlights the importance of investigating attributes of errors, error consequences, and personal factors.
435 - STUDENT ORGANIZATIONS AS A SOURCE OF EMPLOYABILITY SKILLS: COMPARISON OF PERCEPTIONS OF MEMBERS OF STUDENT ORGANIZATIONS AND RECRUITERS IN ESTONIA

Tiiu Kamdron (1) - Laane Reti Västrik (2)

Tallinn University of Technology, Department of Economics and Finance, Tallinn, Estonia (1) - TransferWise Ltd, Department of Human Resources Compliance, Tallinn, Estonia (2)

Purpose. The aim of this research was to compare the perceived transferable employability skills of Members of Estonian student organizations with Recruiters ones an entry level job position after graduation.

Design/Methology. The questionnaire based on Rateau (2011), Lichtenstein, Thorme, Cutforth & Tombari (2011) and Schwarzer & Jerusalem (1995) was carried out. The list included 38 employability skills divided into 7 subscales. The students had to evaluate in what extent they had developed the skills as members of a student organization. The recruiters had to evaluate in what extent they believed a student could develop those skills as a member of Student Organization, and to what extent they believed those skills were important in the Estonian labour market. The samples were made up of 180 members of student organizations and of 108 recruiters from Estonian companies.

Results. Recruiters evaluated the extent of almost all employability skills development in student organizations significantly higher than students themselves, except Teamwork skills. Non-academic organizations members evaluated significantly higher Problem Solving, Teamwork and Individual Strengths skills than academic organizations members. The significant positive correlations were found between the development of Individual Strengths skills and Teamwork; and between the development of Individual Strength skills and Self-Efficacy.

Limitations. The recruiters had difficulties to think about a Junior Specialist position. Availability heuristic could have had an effect.

Practical Implications. Universities and companies have the opportunity to use the information provided here to their advantage.

Originality/Value. Comparison of results of two groups; practical outcome for labour market.
Abstract

**Objectives:** Several lines of evidence show that exposure to negative acts results in depression and anxiety among those that are targeted. However, the association between negative acts and sleep problems is limited. In the present study we examined the association between exposure to negative behavior, distress, miR-146a genotype and insomnia.

**Methods:** The study was based on a nationally representative survey of 1179 Norwegian employees drawn from the Norwegian Central Employee Register by Statistics Norway. Exposure to bullying in the workplace was measured with the 9-item version of Negative Acts Questionnaire – Revised (NAQ-R) inventory. Insomnia was assessed with three items reflecting problems with sleep onset, maintenance of sleep and early morning awakening. Genotyping with regard to miR-146a rs2910164 was carried out using Taqman assay. Age and sex were included as covariates.

**Results:** The data revealed that the relationship between distress and insomnia induced by exposure to negative behavior was significantly stronger for individuals with the miR-146a genotype GG than for other individuals.

**Conclusion:** The present data demonstrated that the miR-146a rs2910164 genotype GG strengthened the association between bullying-induced distress and insomnia.
The present study replicated some of the most robust findings of behavioral economics concerning anchor and endowment effects in a face-to-face negotiation setting on the basis of the German reality TV show “Bares für Rares”. There, six participants per episode negotiate with traders about the price of a rare and/or antique item. In total, 600 negotiations were analyzed using a specifically developed coding scheme. Per negotiation, 98 variables were coded to investigate (reversed) anchor effects and endowment effects. To our knowledge, this is the first study to integrate these effects in a face-to-face non-dyadic negotiation setting. The importance of the first offer as an anchor was replicated. The strength of the anchor varied depending on the degree of uncertainty concerning the specific negotiation. The results also substantiate a reversed anchor effect: There is a significant partial mediation, confirming that a low first offer leads to a high final offer if reduced entrance barriers lead to a high number of bids or active traders. Furthermore, people who value their item higher or bought it themselves sell it for a higher price. Nonetheless, the results concerning endowment effects remained weak due to the nature of the study: Since the participants entered the show willing to sell, this might weaken the endowment effect. To conclude, this is the first study integrating these effects in a face-to-face non-dyadic negotiation setting with a broad-ranged sample. In future research, moderators should be further investigated. Also, the role of interactivity, expertise, gender and age, should be explored.
LEADERSHIP SELF-EFFICACY AND INTENTION OF MANAGERIAL CAREER: THE IMPACTS OF GENDER IDENTITY AMONG GRADUATE STUDENTS

Anne-Marie VONTHRON (1) - Emilie VAYRE (1)

Paris Nanterre University, Psychology, Paris, France (1)

Gender identity is a major factor founding occupational self-efficacy and career intentions construction (Betz & Hackett, 1981; Bandura, 1997; Vonthron & Lagabrielle, 2012). Transformational style leadership, coupled with feminine stereotypical abilities, appears to be valued in contemporary organizational settings beyond transactional leadership, stereotyped as masculine leadership (Avolio et al., 2009; Gang et al., 2011) and the perceived incongruity of women in supervisory positions (Eagly & Karau, 2002) is currently being questioned (Koenig et al., 2011; Vinkenburg et al., 2011; Ryan et al., 2011). These stereotypical beliefs and processes that result would be an opportunity for increased access by women to managerial positions (Kark, Waismel-Manor & Shamir, 2012).

The study analyses the intention to quickly access, at the end of the academic career, a position of team supervisor among 355 future graduates (189 women and 166 men) completing a Bachelor's degree or a Master in management, trade or engineering and likely to integrate, upon graduation within a few months, a managerial job. The research model examines the combined effects of dimensions of gender identity (constructs of masculinity and femininity considered in the Bem Sex Role Inventory) and of self-efficacy in transformational and transactional leadership (the Multifactor Leadership Questionnaire was adapted to measure these 2 dimensions) on the firmness of the declared intention. The results obtained by causal analysis indicate direct effects of masculinity and femininity constructs on intention, with effects mediated by self-efficacy dimensions in transactional and transformational leadership.
“I’M A WORKING FATHER, AND I’VE JUST HAD A BABY”: THE ROLE OF WORK-FAMILY CONFLICT IN DEPRESSIVE SYMPTOMS

Marijana Matijaš (1) - Barbara Lovrić (1) - Sandra Nakić Radoš (1) - Maja Anđelinović (1)
Catholic University of Croatia, Department of Psychology, Zagreb, Croatia (1)

Purpose:
Fathers of young children can experience difficulties in balancing work with the new role in the family. According to the Job Demands-Resources model and the theoretical framework of work-family conflict, work characteristics and work-family conflict can influence employees’ well-being. This research aimed to examine whether job characteristics, particularly time demands (flexitime, working overtime, working in shifts) have an indirect effect on fathers’ depression symptoms through time-based, strain-based, and behaviour-based work-family conflict.

Design/Methodology:
The sample consisted of 155 working fathers of infants. The following instruments were administered online: Edinburgh Postnatal Depression Scale, Multidimensional Measure of Work-Family Conflict, and General data questionnaire to collect demographic data and information about work characteristics. We conducted a mediation analysis using Mplus 8.1.

Results
The results indicate that both flexitime and working overtime have an indirect effect on fathers’ depression symptoms but only through strain-based work-family conflict. Those fathers who have less flexibility and work overtime have higher levels of strain-based work-family conflict and consequently more depressive symptoms. This relationship was not confirmed for working in shifts.

Limitations:
Study is based on self-reported data from a cross-sectional study.

Research/Practical Implications:
These findings indicate that working fathers of infants would benefit if organisations offered more flexibility in time management. Special emphasis should be given to reducing strain-based work-family interference.

Originality/Value:
This study contributes to the scarce research of working fathers with infants and possible work-related risk factors that can contribute to the mental health of fathers.

Keywords: fathers, work characteristics, work-family conflict, depression symptoms
Purpose

According to career construction theory (Savickas, 2005), career adaptability is an important psychosocial resource in a period of transitions, such as from school to work. Previous research has shown the importance of students’ locus of control, as well as career adaptability for a number of career outcomes. However, there is a lack of research on students’ career concerns. The present study examined whether the locus of control has direct and/or indirect effects, via career adaptability, on different aspects of concerns about the completion of schooling.

Design/Methodology:

We conducted an online study among 192 university students in Croatia who were in their final years of study. The students completed Rotter’s Locus of Control Scale, Career Adaptabilities Scale, and Concerns about Completion of Schooling Questionnaire. We conducted a mediation analysis using Mplus 8.1.

Results

The students who express a more external locus of control are more concerned about their employment, acquired knowledge and skills, and adapting to the future work environment (significant direct effects). However, the locus of control has an indirect effect, through career adaptability, only on the concern about adapting to a future work environment.

Limitations:

The study was based on the cross-sectional data.

Research/Practical Implications:

These findings suggest that fostering adaptability resources can be beneficial for those individuals who have an external locus of control especially when focusing on the concerns they have regarding their future work-place.

Originality/Value:

The study provides a contribution to the research of career adaptability by filling in the gap in research on students’ concerns in a period of transition to work.

Keywords: career adaptability, locus of control, concerns, completion of schooling
Validation of the CPC-12 Using Bayesian Structural Equation Modeling

Timo Lorenz (1) - Jana Toppe (2)

Medical School Berlin, Psychology, Berlin, Germany (1) - Fernuniversität Hagen, Hagen, Germany (2)

Purpose

This study examines the validity of the proposed factorial structure of the German version of the Psychological Capital Questionnaire (PCQ) and the newly constructed Compound PsyCap Scale (CPC-12) through Bayesian structural equation modeling (BSEM).

Design/Methodology/Approach/Intervention

To test factorial structures, this study made use of three datasets with N1 = 321, N2 = 202 and N3 = 872. We calculated BSEM using the routine implemented in MPlus. The starting values of two MCMC chains were altered to ensure meaningfully converged estimations.

Results

The results speak in favor of the assumptions that the PCQ does not reach an acceptable fit despite small prior cross-loadings between items of different factors used in BSEM, and that the CPC will reach acceptable fit in all BSEM. However, the CPC-12 did not reach acceptable fit in a multi-group BSEM across all datasets due to issues with a specific item.

Limitations

All participants were recruited online, which entails that findings may not generalize to people not using the internet or social networks. The use of a nonprobability sample in this study raises further concerns about generalizability.

Research/Practical Implications

The results demonstrate the heterogeneity of the resilience construct. Further research should attempt to develop a clearer definition of this construct and its measurement.

Originality/Value

BSEM was used in this study as a mathematically more advanced approach to overcome theoretical limitations of standard CFA. Most importantly in comparison, CFA assumes completely independent clusters of items in multi-dimensional scales.
Burnout is a widely known phenomenon among employees in education. Teachers with burnout are not able to communicate joy of life to their students, thus our purpose with an intervention program was to renew teachers’ view on life, eliminate burnout syndrome and increase their well-being. In our design we applied two hour-long workshops weekly for six weeks supplemented with at-home tasks, applying the techniques of self-compassion. Five teachers participated in our program. We measured their burnout level, self-esteem, coping strategies, self-compassion, and well-being before and after the six week-long course. As the result of the Renewal program, teachers’ self-compassion raised and they became more aware of their over-identification with emotions and self-judgment. Although burnout syndrome is a slowly changing phenomenon, four of the five participants showed decrease in all burnout dimensions in the follow-up measurement. Among coping strategies, stress control appeared stronger and self-punishment and acting on emotions became less severe among the participants. Although participants’ level of self-esteem has been diminished slightly, their level of well-being raised considerably. The qualitative design of our research does not allow to make general conclusions, however the uniqueness of our research is that it implies that by becoming self-compassionate, one becomes more aware of one’s negative emotions simultaneously, thus one’s self-esteem may decline, however, this „becoming real process” enables one to feel higher well-being generally, and diminish burnout. Our program with improvements can be applied in schools for teachers in the future in order to eliminate burnout syndrome among them.
Purpose. This systematic review aims to give an overview of empirical research on what sort of consequences psychological detachment and work-related rumination might have on teachers in comparison to other employees. In detail, we examined which predictors might be helpful or detrimental in detaching from work during non-work time.

Methodology. A systematic literature search in PsycInfo and Web of Science revealed 18 peer-reviewed publications focusing on the topic at hand.

Results. Research indicates that low levels of psychological detachment or high level of work-related rumination during non-work time predict poor well-being (e.g. chronic and acute fatigue, low sleep quality). While job-related variables (e.g. higher job involvement, job demands like time pressure) were associated with lower psychological detachment, person-related variables like serenity and recovery-related self-efficacy were related to higher psychological detachment. Overall, interventions can lead to higher levels of psychological detachment and lower levels of work-related rumination.

Limitations. There is only a thin database comparing teachers to other samples concerning psychological detachment and its outcomes, which limits generalization of the results.

Research Implications. Since psychological detachment appears to be crucial in occupations in which home office is an integral part of the work, it is important to further examine the effect of difficulties of separation of work–non-work boundaries on psychological detachment and its effect on well-being.

Originality/Value. This review goes beyond prior research by focusing on a sample that is prototypical for an occupation in which employees use their home as part of their workplace. Differences between occupations are discussed.
Purpose. The aim of this method is to enable the modelling of action knowledge from fragmented and heterogeneous raw data. It has been developed for the detailed analysis and reconstruction of long-term processes like ERP-implementation.

Approach & Results. The method can transfer differently collected information about procedures into a standard format using content analysis. This allows managing the rules in DDBASE, a deductive database system. The system supports both the graphical representation and automated reasoning, so that conclusions are linked and contradictions are detected. Through continuous extension of the rule base an overall model can be extended and validated across methodologically different studies.

Limitations. The compatibility of this approach with the usual inference-statistical analysis is not yet formulated. As a result, there are yet no conventions regarding the evaluation of results.

Research Implications. The use and further development of this method for the modeling of complex work systems is promising. There are many fields where the exact role of human thought and action in the context of complex organizational and technical processes can be described much more detailed by using the extended data base generated by this method.

Value. The described approach opens up new possibilities for process studies in the areas of change management, project management and control of complex work systems. Models can be created that include a broader spectrum of findings, using information from heterogeneous data sources and successively including issues that later become relevant in the course of the investigation.
Purpose:
We developed the Agile Team Assessment (ATA) to provide established teams a self-assessment of agility along the higher-order factors of Trust, Clear Direction, Self-Organization, and Learning. According to atrain’s research, agile teams are built on these four factors: strong trust together with clear direction enables teams to respond to the environment by being self-organized and able to learn quickly. Teams develop by improving all four dimensions, which in turn fortify each other.

Design/Methodology
ATA Version 1.0 consists of 63 5-point Likert-scale items in English, plus 2 qualitative items. Version 1.0 was completed by 39 different teams (N=314 employees) at organizations in Europe, Africa, and Asia. Statistical analyses included descriptive, internal consistency, correlational, and principal component.

Results
The internal consistency of the four factors was supported. Correlation and principal component analysis showed strong support for the Trust factor, good support for the Clear Direction factor, and partial support for the Learning and Self-Organization factors. To improve the alignment of the ATA with the theoretical model, some items were revised/removed/replaced. ATA Version 2.0 consists of 64 5-point Likert-scale items, plus 2 qualitative items.

Limitations
The ATA is used with teams as part of their development process, but we do not have data such as team performance or progress after ATA use for criterion-related analysis.

Originality/Value
The ATA is a useful tool in team development interventions, to (1) find factor-level trends among team members, (2) identify key areas of (dis)agreement among team members, and (3) start conversations that lead to meaningful action plans and change.
Purpose
Organizations with highest degrees of altruistic behaviours are often found to outcompete their rivals. Appreciating only scant knowledge on the processes associated with Altruism in Organizations (AiO), this research explores how engagement in this type of behaviour is influenced.

Methodology
Three in-depth qualitative case studies involving 47 dyadic interviews with 94 individuals were conducted to meet the study’s objective.

Results
AiO was found to be facilitated and inhibited by a number of factors that could be considered at individual, team, and organizational levels. Whereas organizational characteristics had the biggest impact on AiO, the relative strength of these influencing factors was context-dependent.

Limitations
Although it was not the intention of this research, questions could be raised about the scientific generalisation of the findings to other organizations, industries, or regions. Future research should test the findings of this study in larger scale samples and in different contexts.

Implications
The results of this research allowed for an introduction of a model of AiO. It extends the limited understanding of when people engage in AiO and points out to key factors that have not been previously associated with it (such as situational empathy). Recommendations are made as to how, by introducing subtle and/or more significant changes in their environments, organizations may actively influence the levels of AiO.

Value
Directly responding to the challenges of increasingly interdependent organizational forms, this research challenges scholars’ tendency to assume that workplace helping is predominantly driven by reciprocity and assists practitioners in their efforts to create altruistic environments.
Purpose
To explore whether personality is changing over time in the managerial/professional population.

Design/Methodology
Data of 1,362,511 people, who completed the MBTI personality questionnaire online between 2007 and 2017, was analysed. Chi squared tests and ANOVAs were used to explore whether the proportion of people with different personality preferences changed year by year. A logistic regression was then used to test whether these changes in personality preferences by year could instead be explained by other factors, such as age and gender.

Results
Results showed that the percentage of people reporting preferences for Introversion, Sensing, Feeling and Judging increased year by year from 2007 to 2017. A logistic regression was then done to identify factors predicting personality differences. Results showed that year was a predictor of personality type, though not as large a predictor as gender, geographic region and employment status.

Limitations
The sample principally comprises managers and professionals so is likely most relevant for individuals working in organisations. Other factors, not measured in this study, may also affect personality changes.

Research/Practical Implications
If the personality of workers is changing, does this mean communication style, organisational culture and behaviour must change too? Further research could explore whether people’s behaviour is changing over time; personality preferences might remain stable and innate even if the way they are expressed is changing due to culture shifts.

Originality/Value
This study involves a large sample of over 1 million people, spanning a period of years.

499 - ENGAGEMENT AND VIGOR AT WORK: A SYSTEMATIC REVIEW ABOUT ITS HEALTH IMPLICATIONS

Daniel Cortes-Denia (1) - Manuel Pulido-Martos (1) - Esther Lopez-Zafra (1)

Universidad de Jaén, Social Psychology, Jaén, Spain (1)

Abstract

Introduction: Occupational psychology emphasizes the analysis of variables promoting workers’ health. Work is a place of social integration, with personal, psychosocial and work variables existing as the main health factors (García, 2004). From this approach, engagement is included as a positive and persistent affective-motivational state in employees, characterized by vigor, dedication and absorption (Schaufeli et al., 2002a; Schaufeli et al., 2002b); and vigor, considered an affect that mediates the relationship between resources, behaviors and attitudes related to psychological functioning and health characterized by physical strength, emotional energy and cognitive liveliness (Shirom, 2003, 2011).

Objective: To explore the relationships and implications of engagement and vigor in workers' health.

Method: We conducted a systematic review. In the absence of a review protocol in PROSPERO, a revision was made following the PRISMA statement. The databases consulted were Pubmed, PsycArticles and PsycInfo; and academic google for gray literature. No date restrictions were applied. As key words: vigor and engagement, together with terms related to general, physical and psychological health, symptoms of psychological illnesses and health-related behaviors.

Results: A total of 7328 studies (6939: 94.69% engagement; 389 vigor) were related to health concepts. Subsequently, they were screened by title and abstract by 2 reviewers to increase reliability.

Conclusions: The revised articles show that vigor has a greater involvement in health than engagement. Thus, the design of vigor promotion measures is recommended, within the framework of occupational health.

Key words: Engagement, vigor at work, health
PURPOSE - To present a civility intervention and its results, taking into account the challenges that the organization faced.

DESIGN/ METHODOLOGY/ APPROACH/ INTERVENTION - The person-centered intervention was inspired on CREW (Osatuke et al, 2013) and the Gordon model (Gordon, 1980), consisting of 12 biweekly sessions. Nine participants were interviewed post intervention. The data (in-depth interviews circa 50 min.) were analyzed with MaxQda.

RESULTS – as positive results, participants reported higher self-consciousness on their communication style; higher active listening skills, conflict management skills and empathy (both in organizational and in personal life); as challenges: irregular attendance, dependent on shift workload level and schedule and role reassignment (due to ministerial and subsequent organizational change); compatibility between training schedule and specific services; restraint due to leader presence. These results seem to indicate higher civility (and lower incivility) on a personal level.

LIMITATIONS – Interviewees had a variety of attendance and roles.

RESEARCH PRACTICAL IMPLICATION – Even in uncontrollable adverse conditions (national context) and with restriction policies, a growing workload and lack of resources (human and material), civility interventions can have a positive impact on civility behaviors, both in work and personal contexts.

ORIGINALITY/ VALUE – To share the importance of providing interventions to enhance the quality of interpersonal relationships at work, even in highly adverse conditions. Although somewhat limited, the possible results can be of importance for these professionals.
In this study, we provide a replication of past work (Ilies & Judge, 2003) that examines the extent to which the correlation between personality and job satisfaction is genetic using updated behavioral genetic statistical modeling, namely multivariate Cholesky decomposition. Ilies and Judge (2003) found high genetic correlation between five factor model (FFM) traits and job satisfaction, but that this genetic correlation is largely explained by affectivity. In order to isolate additive genetic vs. environmental factors, we conducted multivariate AE Cholesky decomposition within a structural equation modeling framework using twin data. Our models confirm that positive and negative affect explain the personality-job satisfaction correlation through additive genetic factors. Results indicate an even stronger genetic correlation between job satisfaction and affect than previous work (Ilies & Judge, 2003), and that affect explains nearly all the genetic overlap between personality and job satisfaction. Genetics account for 45% of the phenotypic covariation of positive affect and job satisfaction and 55% of the covariation of negative affect and job satisfaction. At a theoretical level, results call to question the path by which personality operates in workplace settings. At a practical level, they suggest a genetically predetermined point of job satisfaction. Future research should investigate the extent to which genetics explains changes in persons’ general affectivity over time, and also consider the influence of cultural context on the extent of these genetic relations. This research contributes a novel analytical method to the field while also supporting the movement for replication in the scientific community.
CONSCIENTIOUSNESS AND PERFORMANCE - REGULATORY FOCUS AS A MODERATOR OF CURVILINEARITY

Riley Hess (1) - Nathan Carter (1)

University of Georgia, Industrial Organizational Psychology, Athens, United States (1)

Abstract

Although researchers traditionally assumed a linear relationship between conscientiousness and job performance criteria, recent findings suggest extremely high levels of conscientiousness can lead to non-optimal performance. To better explain this relationship, we build on Regulatory Focus Theory, which identifies two self-regulatory systems: prevention focus, concerned with safety, responsibility, and obligation; and promotion focus, concerned with accomplishments, hopes, and aspirations. We suggest regulatory focus moderates the curvilinear relationship between conscientiousness and task performance, such that a prevention focus will hinder performance at extremely high levels of conscientiousness. In an online experiment, participants were primed with prevention or promotion focus before completing a measure of task performance, which we operationalize using a Transportation Security Administration job simulation task. Participants viewed x-ray images of luggage and quickly decided whether they were compliant with regulations. Findings support our hypothesis that experimentally induced regulatory focus moderates the functional relationship between conscientiousness and workplace performance as expected, but also that conscientiousness was unrelated to performance in the promotion focus prime, with high mean performance. Practically, findings suggest the potential for developing promotion-focus training that obviates the importance of conscientiousness, particularly in jobs requiring high vigilance and error detection, such as security, manufacturing, and transportation. One limitation to be addressed by future research is our lack of identification of the mechanism by which prevention focus decreases performance for highly conscientious workers, such as stress. This research blends personality and motivational research to add further clarity to the personality-performance relation using experimental methods.
Abstract

Although researchers continue to further explore the relationship between personality and job performance, there has been relatively little research about whether curvilinear relationships exist between personality and indicators of “occupational success” and their dependence on gender. The purpose of our current study is to explore differential personality-salary relationships by gender. Drawing from sex-role theory and past research (Judge et al., 2012), we made the general hypothesis that workers’ sex differentially predicts reported income. To answer our research question, we conducted five hierarchical quadratic regression tests for males and females separately (a total of 10 regression models) using the Midlife Development in the United States survey (MIDUS 3), a nationally representative data set (n= 2,732). Only one non-linear effect was found for the trait of agreeableness in female workers which suggests women either high or low in agreeableness made less than women with moderate levels of the trait, whereas for men the relation was linear and positive. However, results also suggest that female workers were “rewarded” more for higher levels of emotional stability and male workers were “rewarded” more for conscientiousness. Our study contributes the gender pay gap literature through exploration of potential systemic bias and gender prejudice. Although we controlled for age in our analyses, we did not investigate the potential influences of socioeconomic status and industry regarding these relationships. Future analyses should take these variables into account. We suggest I-O psychologists continue to investigate inherent attitudes surrounding gender differences and their potential influence on performance ratings and subsequent compensation.
518 - EVALUATION OF FIRE SERVICE COMMAND UNIT TRAININGS - VALIDATION OF THE FIRE-SCALE

Dzenita Hadzihalilovic (1) - Guido Hertel (1) - Meinald T. Thielsch (2)

University of Muenster, Organizational and Work Psychology, Muenster, Germany (1) - University of Muenster, Organizational and Work Psychology, Muenster, Germany (2)

Purpose – The Feedback Instrument for Rescue Forces Education (FIRE; Schulte & Thielsch, 2018) is a measure created for the evaluation of trainings for future operational firefighter leaders (e.g., group and platoon leaders). The present study’s purpose is to validate the instrument for tactical and strategic leader trainings, in particular Command Unit Trainings.

Design/Methodology - The FIRE Scale is slightly amended for the Command Unit and data is collected in several Command Unit Trainings. In an ongoing study, data of n = 250 Command Unit members are collected to test the underlying structure. Hereby we use confirmatory factor analysis and examine validity using scales from existing evaluation instruments for teaching evaluation.

Results – Preliminary results show a moderate fit for the postulated six-dimensional structure (trainer’s behavior, structure, overextension, competence, transfer) reflecting training process and outcome. The result pattern suggests high validity for the adapted measure; associations with corresponding scales display mostly large effects.

Limitations – The FIRE is tested for Command Unit Trainings in Germany limiting the interpretation to this country. Thus, further research and other language versions are highly welcome.

Research/Practical Implications – Command Units are indispensable for public safety and for rescue forces in general. Hence, providing a valid tool for evaluating Command Unit Trainings might thereby provide an evaluation instrument for various types of educations in public safety areas.

Value – Directing the attention to rescue services education leads us to a field where a highly qualitative training does not only influence one organization, but rather the society and the population itself.
519 - FOR THE GREATER GOOD: DOES VISION COMMUNICATION FOSTER UNETHICAL BEHAVIOR?

University of Potsdam, Department of Business Administration Academic Area Leadership, Organization, and Human Resource Management, Potsdam, Germany [1]

Abstract

Purpose: This research investigates the link between leader vision communication and follower’s unethical behavior. Many real world examples suggest that leader vision communication might induce followers to take actions that serve the realization of the vision, but are misaligned with common standards of ethical behavior. In other words, unsavory means may sometimes be accepted in the service of a greater good. Moreover, loss framing may provide the strongest incentive for individuals to act. We propose that people will engage in more unethical behavior when they are exposed to visionary, as opposed to non-visionary, communication and that loss framing of the vision will have a stronger impact than gain framing.

Design/Methodology: We conducted a computer-based experiment with 231 university students in four experimental groups. Participants received either a visionary video message from a leader in a loss-, gain-, or mixed-frame or a non-visionary video message, all advocating the protection of an endangered species. Afterwards, participants were provided with an opportunity to resort to unethical behavior, namely cheating in a competition, to benefit this noble cause.

Results: We found that visionary communication led to more unethical behavior than non-visionary communication, whereas the framing of the vision resulted in no significant difference.

Limitations: Further research should investigate mediation and moderation effects and ascertain the external validity of our findings.

Practical Implications/Originality Value: Results show that a leader’s vision advocating a good cause can also cause followers to resort to unethical means.
Purpose
This study was carried out in Portuguese higher education and tries to shed light about the relationship between the occurrence and management of conflicts and workplace bullying (WB). Previous research has identified conflict as an antecedent of WB, both on a theoretical and empirical level (Leyman, 1996; Einarsen, 1999; Vartia, 2001; Hauge et al, 2007). From previous studies we know that active strategies by targets are likely to further the WB escalatory process, being passive strategies most successfully used by victims of bullying; also "fighting" has been proven to relate positively with WB and "problem-solving" negatively with its occurrence (Bailien et al, 2009). Zapf and Gross (2001) have found that victims didn’t use a single strategy but often change it during the course of the bullying process.

Methods
Our sample was made up of 1182 participants from the main universities all over Portugal. Drawing on previous research we expect a positive relationship between the occurrence of conflicts and bullying; additionally, we hypothesize a negative relationship between problem-solving, “yielding” and bullying and a positive one for “avoiding” and “fighting”. To test these hypotheses we used hierarchical regression.

Results
The positive association between the occurrence of conflicts and bullying was confirmed as well as the assumed association between workplace bullying and conflicts for “problem-solving” and “yielding”. We found no statistically significant association between the occurrence of bullying and “avoiding”; the association between workplace bullying and “fighting” was also proven to be not significant.

Conclusions
Despite the study is limited to high education in Portugal, the results can be used as a contribution to the design of intervention policies in the field of workplace bullying and specific support programs for individuals, to help them managing the process in case of being targets of bullying behaviors. Given that bullying has been understood as an escalating conflict, individuals can learn how to manage the process if they are given the appropriate support and training on conflicts managing at work.

Originality / Value
Research about Workplace bullying is scarce in Portugal; hence the study has a real contribution to the existing research, in a sector where there is no previous research in this field.
The research related to leadership and personality is growing, since personality was found to be a predictor of various outcomes in professional settings. The importance of personality factors is prevalent in weak situations, where individuals feel free to express their own personality. This is the case of RIOT units, where the unknown and ambiguity are daily constraints. The objectives were: describing leadership style within RIOT units; differentiating the personality profiles of leaders and subordinates; explaining leader behavior by personality factors. 92 leaders completed LBDQ-XII (Stogdill, 1964) and NEO PI-R (Costa & McCrae, 2008). 73 subordinates completed NEO PI-R. The LBDQ scales were factor analyzed; the personality profiles of leaders, subordinates and general population were compared; regression analysis was used to explain the leadership styles through personality factors. The results showed that leadership behaviors are oriented toward organizing in uncertainty conditions, followed by production emphasis and people orientation. The profiles of leaders and subordinates differ on extraversion, agreeableness and conscientiousness. Regression analysis indicates that the first two factors of leadership behavior were explained by conscientiousness, while the third-by agreeableness. Study limits refer to the limited number of participants but still covering the entire population of leaders in Romanian RIOT units and a significant number of subordinates. Using self-describing questionnaires is usually seen as a limitation. These findings are useful in explaining leadership behaviours and in refining selection procedures. The predictors are confirming previous studies showing the role of conscientiousness, but it also brings into the light the niche trait of agreeableness.
542 - STRESS AND ORGANIZATIONAL CITIZENSHIP BEHAVIOR: BENEFICIAL ROLE OF RECOVERY AFTER WORK

Sabina Hodzic (1) - Charlotte Guiné (2) - Franck Zenasni (3)

ESSCA School of Management, Management and Corporate Environment, Paris, France (1) - Université Paris Descartes, Paris, France (2) - Université Paris Descartes, LATI, Paris, France (3)

Purpose: Previous studies have demonstrated beneficial effects of after work recovery experiences (primarily psychological detachment) for employees’ well-being, job performance, work engagement etc. This study aims at extending the research on the role of different recovery dimensions in stressful circumstances focusing on a specific outcome - organizational citizenship behavior (OCB). The aim of the study is to explore the role of recovery experiences in the relationship between stress and OCB.

Design/Methodology: 708 French employees of different professions (83% women; average age 31.6) completed the Perceived Stress Scale (PSS-10), OCB scale (OCB-24) and Recovery Experiences Questionnaire (REQ-16). Mediation and moderation were tested using hierarchical regression analysis in SPSS Statistics 23.

Results: In situations of increased stress, the employees with higher personal control during leisure time reported more OCB directed to others (β=.11, p<.01). Moreover, relaxation mediated the effects of stress on OCB directed towards the organization (b = -.021, SE = .008, 95% CI = -.0396, -.0052). Overall, the findings suggest that recovery experiences play a significant role in predicting some aspects of OCB.

Limitations: Unequal gender distribution of the sample and use of self-report measures limit the generalization of the study findings.

Research/Practical Implications: The findings provide practical implications for promoting OCB in times of increased stress by focusing on recovery activities.

Originality/Value: The role (moderating and mediating) of recovery experiences (all four studied simultaneously) in the stress-OCB relationship has not been previously explored. Insight into factors that could increase OCB and buffer the adverse effects of stress is provided.
MOVING BEYOND THE BRAG SHEET: PREDICTING STUDENT OUTCOMES WITH BIODATA MEASURES

Charlene Zhang (1) - Nathan Kuncel (1)

University of Minnesota, Industrial and Organizational Psychology Program, Minneapolis, United States (1)

PURPOSE: Biographical data, or biodata, provides information about one’s life histories and past experiences. Such information is commonly available during academic admissions processes, and there is a scattered body of research examining how biodata predict student behaviors and outcomes. The current meta-analysis examines how different types of biodata measures—overall scores, scale scores, or individual items—predict academic grades, absenteeism, persistence, and extracurricular accomplishments.

METHODOLOGY: Data from 43 independent samples were included, consisting of 17,491 students and resulting in 83 individual predictor-criterion relationships.

RESULTS: The results indicate that biodata measures predict student outcomes substantially. Overall biodata scores correlate with grades at .45, persistence at .21, and point-hour ratio at .35. Individual biodata scales developed to measure specific dimensions of student achievement are most predictive of criteria in line with the subject domain of the scales.

IMPLICATIONS: Findings of the current study provide support for the predictive validities of biographical data inventories for student outcomes and adds justification to the employment of biodata in academic selection.

LIMITATIONS: A limitation of the present study is that the second-order sample sizes are generally small, as relationships between different types of biodata measures and different student outcomes are analyzed separately. However, by not illogically compositing unrelated biodata items for the sake of increasing power, we have kept our results interpretable and meaningful.

VALUE: While the relation between biodata and job performance has been thoroughly studies, the current study is a first effort to meta-analytically review the predictive validity of biodata measures for student outcomes.
Purpose

The study investigated the relationship between trust and distrust, particularly if it was possible for both to coexist simultaneously, as well as whether different strategies in evaluation of trust exists in different relational contexts.

Methodology

The qualitative study was conducted following the principles of grounded theory. A semi-structured interview was conducted with 20 working adults from various industries. Frequency counts were utilized to determine the trust-distrust relationship patterns that emerged and intercoder reliability was measured by two independent raters.

Results

Participants conceptualized the relationship between trust and distrust mainly conforming to 3 models: antithetical, dialectical and context-dependent. Earlier stages of a relationship are described to be either antithetical or dialectical while later stages become context-dependent as they grow in complexity. For some individuals, a violation in trust does not necessarily promote immediate distrust. Instead, factors surrounding the transgressions committed will be evaluated before further decisions of trusting or distrusting are made. The dialectical model was found to be a more popular model overall, being cited particularly frequently in the workplace environment.

Limitations

The terms mistrust and distrust were used interchangeably during the interview, making it difficult to determine whether participants have nuanced understandings between the two terms.

Research/Practical Implications

The findings of the study contribute to understanding different thought patterns and strategies employed by individuals in building relationship with people in different relational contexts.

Originality/Value

Understanding the decision-making process involved in building trust and distrust allows for the promotion of healthier relational dynamics in the workplace.
Purpose
The study explored cognitive, emotional, and behavioral outcomes of trust and distrust across relational contexts (personal and organizational). It also examined the strategies employed to repair trust, preceded by violation in trust.

Methodology
Twenty working adults participated in a semi-structured interview on their experiences of working in teams. Each interview ranged between 60-90 minutes. Data was analysed using the thematic analysis approach by two coders supervised by the principal investigator. Prevalence of themes was measured using frequency counts.

Results
Trust contributes to more positive cognitive, emotional and behavioral outcomes than distrust. Trust fosters openness, positive affect, confidence, psychological safety and cohesiveness. Distrust disrupts cohesiveness and increases skepticism, inhibition, negative affect and monitoring.

When trust was violated, participants (n = 4) reported trust cannot be repaired while others indicated improvement in skills (n = 13), open communication (n = 6), and understanding of the circumstances (n = 7) may improve their trust.

Limitations
Interviewers’ and interviewees’ characteristics may influence the amount and depth of data that was elicited from the interviewees.

Research/Practical Implications
Understanding the consequences of trust violations and how they can be overcome helps to promote reconciliation between co-workers and trust. Increasing trust in the work environment could be beneficial to promote healthy work relationships.

Originality/Value
This study adds to the literature on outcomes of trust and trust repair, particularly in Asian countries. By studying trust repair efforts, we were able to identify the underlying mechanism of trust-distrust relations thus giving a more holistic view of the relationship.
Abstract

Sexual harassment and other forms of sexual aggression continue to be a problem in the contemporary workplace. Some argue rape and sexual harassment exist on a continuum of sexual aggression, with both stemming from similar underlying predispositions. Research into rape and other forms of domestic violence have demonstrated Envy, or the desire to have what others possess or achieve, to be a predictor of this deleterious behavior, warranting an assessment of its role in sexual aggression at work. In previous organizational studies Envy has shown both positive and negative outcomes, but little research has investigated its role in sexual harassment. Our study examined the role of Envy in sexual harassment with surveys measuring beliefs in sexual harassment myths, levels of trait Envy, and the proclivity to sexually harass. A diverse sample of working adults was recruited, providing data through an online survey tool. Results supported hypotheses the prediction that those who reported higher propensities to sexually harass would report higher levels of Envy, specifically Malicious Envy. Interestingly, the method of assessment of Envy determined its relationship with the likelihood to harass, with Benign Envy showing the inverse, and less harassment. Although the importance of sexual harassment myths was not supported in the current study, further research should explore how manipulated levels of envy may correspond to the acceptance of myths. Organizations leaders may also benefit from a more nuanced understanding of what sorts of motivational techniques may spark malicious forms of envy, and higher proclivities toward sexual aggression.
Purpose
So far, there are several approaches of measuring the Dark Triad traits, but still all of them are personality questionnaires with at least questionable usability for applied contexts such as Human Resource Management. The purpose of the study is the development of a structured interview with the aim of measuring the Dark Triad in a rather qualitative way that increases social validity for the respondents.

Design/Methodology/Approach/Intervention
In the present study, 15 executives from the telecommunications industry were interviewed on their personal evaluation of management success and derailment. Afterwards, their personality traits of the Dark Triad were measured with the help of the Short Dark Triad Scale. Subsequently, the data from qualitative and quantitative research were examined for correlations using the mixed-method approach.

Results
The results of the mixed-method approach showed a statistically significant correlation between the Short Dark Triad Scale and the ratings for narcissism, Machiavellianism and subclinical psychopathy in the Dark Triad interview.

Limitations
Replicating the results in a bigger sample and a deeper investigation of the criterion-related validity as well as an integration of multiple raters can provide more confidence in our results.

Research/Practical Implications
Structured interviews allow the measurement of personality traits in a more convenient way especially in personnel selection and development processes. Identifying subclinical traits in leadership candidates can, e.g. prevent management derailment.

Originality/Value
The present study advances the measurement methods of the Dark Triad.
Purpose

This project aims to develop a mobile game based on ranking of groups of adjectives to measure employees’ perception of their employers’ branding.

Methodology

53 participants listed the adjectives representing their current employer and also the most preferred and the least preferred employer in their minds, in an open-ended format. The adjectives derived in Study 1 were later shared with other participants (n = 110) in several organisations in a traditional Likert style format, and the participants were asked to rate the degree to which each adjective represents their current employers. Validation study for the final set of adjectives and the technical development of the mobile game are in progress.

Results

After item elimination and factor analysis, the final set of adjectives were representing seven different facets of perception of employer branding, and the number of adjectives corresponding to each dimension ranged from 3 to 7. Organization-specific clustering analyses revealed different employee profiles within each company.

Limitations

The evaluation of adjectives will be via forced ranking at the game and it may lead to difficulties for participants’ evaluation.

Implications

This project is primarily targeting practice, by developing an alternative to traditional measurement styles employed for measuring employer branding, but it can be used for scientific purposes as well.

Originality

Use of the principles of gamification in the workplace is gaining impetus, and this project is expected to contribute to the measurement of employer branding perceptions.
Perception of gender equality statements: explicit mention of non-binary gender identities as a strategy for creating a more inclusive organization image

Authors:
Amanda Klysing (Lund University), Anna Lindqvist (Lund University), Emma Renström (University of Gothenburg), Marie Gustafsson Sendén (Södertörn University)

Purpose: Many organizations include gender equality policy statements in their information material. Our aim was to explore if different types of equality statements influence organization appeal and estimates of organization diversity.

Design: We tested three types of equality statements in a between-groups design (N = 424): (1) gender-balance (equality between women and men), (2) gender-blind (equality regardless of gender), (3) inclusive-gender (equality between women, men and individuals with a non-binary or other gender identity). Dependent variables were organization appeal, estimated organization equity and estimated diversity within the organization.

Results: For organization appeal and organization equity, no differences were found between conditions. General diversity within the organization was rated as significantly higher in the inclusive-gender condition compared to the gender-balance condition. No other between-group comparison was significant.

Limitations: Potential positive effects of an inclusive gender equality statement for individuals with a non-binary gender identity could not be assessed due to lack of participants.

Implications: Gender equality statements which explicitly include individuals of all gender identities (i.e., does not treat gender as a binary variable) seem to be received similarly to the other types of equality statements tested, with the exception of higher estimated diversity compared to a gender-balance statement. Results support the use of inclusive gender equality statements since they are inclusive of a larger number of individuals and do not differ from a gender-blind statement.

Originality: This is the first study investigating the impact of different types of gender equality statements which include gender identities other than women and men.
Purpose: Although job boredom is experienced by more than half of the workforce on a daily basis, scientific research on the construct itself and its potential outcomes is scarce. In the present study we examined whether daily changes in job boredom are associated with daily fluctuations in Counterproductive Work Behavior (CWB) and Organizational Citizenship Behavior (OCB), and whether individual differences in trait conscientiousness moderated these relationships.

Design: Our hypotheses were tested using a daily diary study taking place over the course of 10 working days (N = 580 daily observations).

Results: Multilevel Poisson regression analyses revealed that job boredom was positively linked with CWB and negatively with OCB; however, contrary to our expectations, trait conscientiousness did not moderate these relationships.

Limitations: All measures were self-reported.

Practical Implications: The finding that job boredom influences employee’s performance-related behaviors demonstrates that both employees and organizations might benefit from designing jobs in a way that they do not trigger high levels of job boredom.

Originality/Value: In this paper, we integrate the episodic within-person and the stable between-person approach to the study of emotions, performance and personality.
Purpose

Stereotypes of minorities contribute to workplace inequality by creating biased negative evaluations of individual’s performance, resulting in discriminatory action. However, the impact of stereotypes also extends to vocational decisions based upon perception of career barriers. Despite facing many unique career challenges, such as concealment and high levels of discrimination, the role of stereotypes on lesbian, gay, bisexual and transgender (LGBT) individuals’ career decisions is yet to be explored. This poster outlines an approach to exploring the role of stereotypes on the career construction of LGBT individuals.

Approach

The poster demonstrates the way in which the combination of visual timelines and narrative interviews allow for exploration of the interaction between development of sexual or gender identity and career choices, and the role of gendered stereotypes in this relationship.

Results

The poster will present an example of the seldom-used visual timeline, and how this method has provided novel insight into the role of stereotypes on LGBT careers.

Limitations

The use of workplace LGBT networks for participant recruitment may limit the sample to those who disclose their LGBT identity at work.

Research/Practical Implications

In addition to utilising a novel approach to study experiences of LGBT individuals, the research contributes to organisational and educational practice by highlighting when career decisions are most impacted by stereotypes.

Originality/Value

The research includes bisexual and transgender participants who are seldom included in such research. Additionally, an intersectionally sensitive approach is used to observe unique experiences of individuals within the LGBT community, and across a range of organisations.
Purpose: Research indicates that the active support by management is essential for the sustaining implementation of workplace health promotion measures. However, little is known about managers’ perceptions of such health promotion measures. Based on Ajzen’s theory of planned behavior, our qualitative study explores the attitudes, perceived organizational norms and behavioral control of managers regarding the promotion of mental health at work.

Method: Semi-standardised interviews with N=36 middle managers (head physicians, senior physicians and head nurses) were carried out in one German hospital. A software aided approach according to Mayring’s qualitative content analysis was applied. The reliability of the coding system was acceptable (Cohen’s κ > .65).

Results: We observed that the majority of managers were aware of the importance of mental health at work. They reported a high variability of the perceived organizational norms in relation to mental health promotion. Moreover, the nursing and medical managers differed with regard to perceived behavioral control to implement mental health promotion measures.

Limitations: We can’t rule out the presence of selection bias, since we do not know if only previously sensitized managers participated.

Implications: Our results may contribute to a better involvement of managers in the development and implementation of mental health promotion measures for hospitals. For the sustainable implementation of such measures, it seems to be important that health-related organizational norms are defined by top-level clinic management and communicated to the middle management.

Originality: This study contributes to a better understanding of managers’ perspectives on mental health issues based on established theory.
Abstract

The current study will aim to systematically review the extant literature on objectively measured interventions designed to disrupt sedentary behaviour and increase physical activity within the workplace over the medium to long term. The study will extract data relating to objectively measured outcomes such as time spent sitting and pedometer step counts, which, if amenable, will be synthesised using a random-effects meta-analytical computation. A systematic search of several academic databases including; PsycInfo, SportDiscus and Academic Search Complete will be conducted to find relevant literature to review. Keywords and subject headings, which are pertinent to the research question, will be used to search the academic databases. Search results will be imported into EndNote for screening and data extraction on the included studies will be input onto an Excel spreadsheet. Meta-analysis will be conducted using an appropriate statistical software package. It is hoped that the results of the study will shed light on which interventions are most efficacious at disrupting workplace sedentary behaviour and increasing levels of physical activity in employees. The study will explore objectively measured interventions over the medium to long term in order to provide a more rigorous understanding of how to influence sustainable behaviour change in these areas.
The purpose of the investigation is to find out the levels of educational organization staff’s ambiguity intolerance and its relationship with the organizational tension.

The content of intolerance has been analyzed by S. Budner, N. M. Lipetska, O. V. Petrunko and others. However, some aspects of ambiguity intolerance in the context of organizations have not been the subject of psychological studies yet.

Design. The study was conducted using Tolerance for Ambiguity Scale (S. Budner) and Index of Job-Related Tensions in Organizations (R. L. Kahn, D. M. Wolfe, modified by L. M. Karamushka and K. V. Tereshchenko) on a sample of 508 secondary school headteachers and teaching staff in the central regions of Ukraine.

Results. It was found that the majority of the respondents (94.1%) had the average intolerance index. High and low intolerance indices were found in a small number of the respondents (3.2% and 2.7% respectively).

We discovered positive correlations between the levels of teachers' ambiguity intolerance and five types of organizational tension related to the organization of work (p<0.001), teachers' professional qualifications, certifications and career (p<0.001), organizational change-making (p<0.01), the teaching staff-managers interaction (p<0.001), teachers' occupational health (p<0.01), as well as the organizational tension index (p<0.01).

Limitations were related to the sample, which included only the educational organization employees.

Practical Implications. The obtained findings may be helpful for reducing organizational tension in educational organizations.

Originality. The investigation of staff’s ambiguity tolerance relationship with the organizational tension in Ukrainian schools was done for the first time.
What Kind of People Commit Cyber-Related Counterproductive Work Behaviors?

It is well established that counterproductive work behaviors (CWB) account for significant costs for organizations and their citizens. However, classic measures of CWB (e.g., Spector, 2010) do not include CWB related to modern technologies. Mercado (2017) presented a multi-factored measure of so-called cyber-CWB focused on negative behaviors in the modern digitalized work contexts (e.g., cyberloafing, adult Internet use during working hours, and spreading negative information about the organization on the Internet). Early findings suggested similar relationships to personality as for classic CWB. Later, Mercado (in press) presented a 12-items short version of the cyber-CWB, namely, the Abbreviated Cyber-CWB scale. The items used were those with the highest factor loadings on the respective factors in the full cyber-CWB measure. Here, we tested a Swedish translation of the Abbreviated Cyber-CWB scale. Specifically, we investigated the psychometric properties and its relationships to the bright and the dark side of personality. 118 participants completed the short cyber-CWB, cut-e’s personality test shapes (cut-e, 2017) measuring the bright side of personality, and the short Dark Triad (Paulhus & Jones, 2014) measuring the dark side of personality. Results showed that overall cyber-CWB could be predicted using either the bright side of personality or the dark side, with incremental validity using both. However, the frequency of participants reporting having conducted cyber-CWB was very low for most of the behaviors, causing restriction of range in the criterion. The cause of the very low frequencies is unclear; some possible causes and their implications are discussed.
Purpose: Common mental health problems (CMHP) in the workplace and their effect on long term disability, absenteeism and productivity loss are a growing concern among organizations and policymakers. CMHP are the leading cause of sickness absence in the western world with one-sixth of the working age population that suffers at any one time from CMHP and a lifetime risk of at least two in five. Therefore, there is a strong argument for more research emphasis on addressing CMHP in preventative strategies to stay at work rather than just reactive strategies. There is remarkably limited evidence about the concept ‘Stay at work’ among employees with CMHP and the role of the employer. Insight in enabling and impeding factors is needed to provide useful advice towards employers being responsible for interventions on workplace health and (inter)national policies. The aim of this literature review is to create a robust overview of current knowledge regarding factors that enable employees with common mental disorders to stay at work.

Methods: a systematic literature search in seven electronic databases is conducted in August 2018.

Results: 1855 titles are screened independently by two researchers on title, abstract and full text. The reviewers used an independent narrative synthesis to understand factors with regard to the individual, job design, team, employer and society. Preliminary results are expected by the end of 2018.

Key words: workplace, stay at work, common mental health disorders, employees, review,
The use of online psychometric assessments is becoming ever prominent in employee selection today. The rapid growth of technology means that now more than ever international borders and physical distance are little impediment to companies looking to recruit from a diverse, worldwide applicant pool. Job seekers use the internet to search for and apply to jobs and increasingly, companies are assessing candidates via the internet too. As with many other online services, occupational assessment tools have had to become mobile to continue to keep pace with what consumers, both clients and candidates, expect. Mobile-first recruitment has the potential to facilitate inclusivity through accessibility, but the current landscape is largely unstudied and under documented. Technology trends suggest that mobile device usage will only increase, and authors consistently note the importance of investigating device-type effects in the burgeoning field of unproctored internet-based testing, yet empirical evidence of the current usage is limited (Illingworth et al., 2015). This presentation paints the global map of mobile assessment, identifying current trends in device usage for psychometric assessments around the world. We explore regional differences in the use of mobile devices for completing unproctored occupational assessments with data obtained from millions of applicants from over 40 different countries. Implications for organisations and psychometricians using online psychometric assessments are discussed and future directions for academics and practitioners are proposed.

Reference

Due to its positive interpersonal nature, agreeableness – the Big Five personality trait embodying trusting, courteous, and tender-hearted characteristics (Costa & McCrae, 1992) – is expected to have largely beneficial effects on worker performance. Although researchers have largely assumed personality-performance relationships are linear, emerging research on the “too-much-of-a-good-thing” effect (Pierce & Aguinis, 2013) highlights the possibility that there can be deleterious outcomes for those who are extremely disagreeable or extremely agreeable.

As such, the current study tests for curvilinear relationships between agreeableness and self-reported task performance, contextual performance, and career success among a sample of 1,164 workers in the United States, leveraging advances in item response theory methodology (i.e., ideal-point scoring) to build an ideal point measure of agreeableness and its facets for more accurate detection of curvilinear relationships. In doing so, we aim to better understand the agreeableness-performance link and elucidate outcomes associated with different levels of the trait.

Results suggest a linear relationship between agreeableness and performance, such that greater agreeableness is positive for performance. However, results also reveal curvilinear relationships between agreeableness and career success indicators, such that those at more moderate levels of agreeableness are most favorably rewarded in pay and career advancement. These findings have implications for personnel selection decisions (e.g., disagreeableness as a “select-out” criterion) and call attention to unjust pay and promotion gaps. Albeit cross-sectional, this research underscores the importance of considering curvilinear relationships in the role of agreeableness at work and highlight a paradox between performance and reward at higher levels of agreeableness.
Purpose: Traditional psychological research has differentiated two complementary orientations to happiness: hedonia and eudaimonia. Accordingly, people who pursue both orientations at a high level live a full life, whereas people who do not follow either orientation live an empty life. Between these two extreme profiles, there can be a combination of the two orientations, leading to two other profiles, i.e., hedonic life or eudaimonic life. Previous studies have shown that these individual values have as predictors, personality traits; however we still know little about whether this also applies for the psychological capital. This study aims to identify these four profiles and to analyze whether psychological capital (i.e., resilience, self-efficacy, optimism, and hope) helps to characterize each of them.

Methodology: Sample is composed by 1647 Spanish employees. Data were analysed through cluster and discriminant analysis using SPSS Statistics software.

Results: Results suggests the existence of the four profiles. Moreover, discriminant analyses show that gender, educational level (as control variables), self-efficacy, and resilience are key variables in characterizing the profiles.

Limitations: The cross-sectional design prevents to establish causal relations.

Value: This study makes two important contributions: a) it offers a systematic analysis through the application of a configurational output variable, and b) it analyzes the relationship between orientations to happiness and a relatively malleable construct (trait-like), that is, psychological capital.
BIASED INFORMATION ACQUISITION AFTER GROUP DISCUSSIONS

Andreas Mojzisch (1) - Stefan Schulz-Hardt (2)

University of Hildesheim, Hildesheim, Germany (1) - University of Goettingen, Goettingen, Germany (2)

Authors: Andreas Mojzisch & Stefan Schulz-Hardt

Purpose: Previous research shows that, when acquiring new information after discussion, groups consisting of members with the same decision preferences exhibit a stronger confirmation bias than groups consisting of a minority and a majority faction (Schulz-Hardt et al., 2000). However, it is unclear whether this effect is due to (a) majority members showing a more balanced information search than members of consent groups, (b) minority members showing a particularly strong confirmation bias which counteracts the bias of majority members or (c) both (a) and (b).

Design: To pit these hypotheses against each other, we conducted two experiments in which we formed consent and dissent groups by either composing groups of individuals with the same choice preferences or with a minority and a majority faction. After discussion, group members had the opportunity to acquire additional information. For each member, half of the information was in favor of his or her preferred choice alternative and the other half was in favor of the opposite alternative.

Results: Majority members conducted an almost balanced information search whereas minority members who had resisted the majority influence exhibited a strong confirmation bias. However, if the minority members converted to the majority position, they searched for information in favor of the majority position.

Limitations: Since we used ad-hoc groups, future research should test whether our results can be generalized to teams with a shared working history.

Originality/Value: Our results contribute to a better understanding of the mechanisms underlying the effect of prediscussion dissent on biased information search.
Abstract

Females are often subject to bias and face challenges in the workplace that portray them as less effective leaders than men. Although research has explored gender differences in success, likeability and leadership, there is little contemporary research on gender bias in performance feedback. The present study was designed to explore differences in male and female 180-degree feedback evaluations of 160 employees in a UK national insurance company. Template analysis was used to analyse qualitative responses to three feedback questions with the goal of understanding how gender and leadership stereotypes may be shaping performance feedback.

Data generated by the 180-degree feedback reports revealed substantial negative bias towards females portraying them as less effective leaders than males. Female and male participants were ascribed leadership attributes based on their gender with women receiving more negative attributes, most often for traits not associated with the agentic stereotype of a successful leader. However, findings did reveal a novel encouragement of a more androgynous style of leadership (incorporating both feminine and masculine attributes) towards both male and female employees that may in the future, help females and their associated communal qualities be more positively evaluated. Recommendations to reduce bias are made that include organisations using performance systems that are more objective and the use of behaviour anchors.

Limitations arose due to the data being 180-degree in nature and the gender of the individuals who gave performance comments unknown.
Leadership style and employee well-being: The moderating role of mindfulness

**Purpose:** We investigated whether employee mindfulness moderates the relationship between leadership style and employee well-being. We hypothesize that employee mindfulness boosts the positive relationship between transformational leadership and employee well-being, and buffers the negative relationship between abusive supervision and employee well-being.

**Methodology:** The model was tested using a time-lagged (two months apart) survey of 246 employees (controlling for baseline well-being) in a wide range of industries.

**Results:** We found that employee mindfulness boosted the positive relationship between transformational leadership and employee well-being. Contrary to our hypothesis, we found that employee mindfulness intensified, rather than buffered, the relationship between abusive supervision and employee well-being.

**Limitations:** Trait mindfulness was measured (i.e. there was no mindfulness intervention), self-report data.

**Research/Practical Implications:** This study suggests that employee mindfulness may improve well-being only under certain conditions (i.e. having a transformational leader) and that there may be situations where mindfulness may be harmful to one's own well-being. This study demonstrates one potential ‘dark side’ of mindfulness at work. Future research should aim to further investigate these findings experimentally and longitudinally.

**Originality/value:** Very few studies have examined boundary conditions that might support or negate leadership’s impact on employee well-being. Furthermore, this is the first study to our knowledge to demonstrate the dark side of mindfulness in the context of abusive supervision.
The financial status has already been positively associated with men’s well-being (Oskrochi et al., 2018). Interestingly, this association for women is not clear yet. Moreover, in the study of Danigelis & McIntosh (2001) age has been shown to influence the relation between monetary resources and gender. The purpose of the present study is to examine the moderating effect of age on the association between women’s subjective perception of income and their well-being.

A sample of 641 women completed an online questionnaire assessing their subjective perception of income, age and well-being. Correlational analysis and the macro Process (Hayes, 2012) were used to analyse the results.

Results show that subjective perception of income was positively associated with the global score of well-being ($r=.12, p<.01$) as well as with the subscale purpose in life ($r=.20, p<.01$). Moderation analysis also reveals a significant interaction between subjective perception of income and age, indicating that as women get older, the association between subjective income and purpose in life becomes higher.

Our study was limited by its cross-sectional design and should be replicated with a longitudinal design in order to examine the evolution of the conceptions about income and purpose in life as the person ages.

Our results clarify the link between income and well-being for women, as well as the influence of age in this relation.

The results indicate that for older women the perception of income has a greater influence on their sense of purpose in life than for younger women.
A Meta-Analysis on the Role of National Context for the Relationship Between Resources and Work–Home Enrichment

Purpose:
Contextual resources in the work and home domains are antecedents of work–home enrichment processes. However, little is known about national differences in these relationships. In a meta-analytic review, we test a model of macro-level boundary conditions for resource-driven cross-domain enrichment. We draw on boundary theory and identity theory to test the moderating role of national culture and structure indicators.

Approach:
Seventy-six studies with 82 subsamples were included in the meta-regressions with robust variance estimation. National context indicators related to culture and structure were imputed and examined as moderators.

Results:
Our findings revealed that diffusion/specificity, work centrality, high unemployment rates, and low social justice strengthened the relationship between work resources and work-to-home enrichment, while collectivism/individualism, humane orientation, family centrality, and trade union density did not have moderating effects. No moderation effects of national context indicators were found for the relationship between home resources and home-to-work enrichment.

Limitations:
Primary studies included in this meta-analysis focused predominantly on work resources using samples from western countries. A large share of variance could not be explained, pointing towards additional moderators.

Research/Practical Implications:
This study contributes to a more holistic understanding of the work-home interface. It helps extend the knowledge of researchers, organizations and policy makers on the boundary conditions under which the provision of contextual resources at work can particularly enhance work-home enrichment.

Originality/Value:
In times of globalization and multinational organizations, we provide unique meta-analytic evidence for the role of national culture and structure in the relationship of resources and work–home enrichment.
645 - NEVER OFF DUTY? – EXTENDED AVAILABILITY AND THE ROLE OF SUPERVISORS AS WORK LIFE-FRIENDLY ROLE MODELS

Jana Biemelt (1) - Nicole Deci (1) - Christiane Stempel (1) - Jan Dettmers (1)

Medical School Hamburg, Psychology, Hamburg, Germany (1)

Purpose. Research shows that extended work availability is a double-edged sword. From an employer’s standpoint, there are various benefits if employees are accessible to supervisors, colleagues or costumers outside their regular workplaces and working hours. However, if extended availability is not properly organized, it is associated with impaired well-being. Here, supervisors are key figures that influence subordinates’ health through direct interactions as well as through the management and allocation of resources. Thus, we assume that supervisors’ role modelling regarding life-domain balance moderates the relationship between extended availability and well-being as well as performance.

Design/Methodology. We asked participants twice (interval: 7-11 months) to fill in an online-questionnaire about their availability requirements and their supervisors’ role modelling regarding life-domain balance. Additional, participants indicated their well-being and their performance.

Results. Longitudinal analyses revealed that low work-life-friendly role modelling strengthened the relationship between extended availability requirements and impaired well-being as well as reduced performance. The findings support theoretical assumptions that ascribe the supervisor a central role in the relationship between extended availability requirements and subordinates’ health.

Limitations. All variables were self-reported and therefore might be confounded by common method variance.

Research/Practical Implications. By focusing on the central role of the supervisor, the results offer a good starting point for interventions regarding availability requirements.

Originality/Value. New conditions at the work-life interface require looking at factors that utilise its benefits and buffer its detrimental effects to establish a healthy work environment.
651 - GENDER ROLES AND PERCEPTIONS OF LEADERSHIP IN A VIRTUAL REALITY ENVIRONMENT

Rupinder Kaur (1) - Diana R. Sanchez (1) - Dana Le (1)

San Francisco State University, Psychology, San Francisco, United States (1)

✓ Purpose
VR offers a fully immersive, realistic, and interactive experience. Given today’s dispersed workforce from globalization, VR and technological connection is more prevalent. However, research evaluating virtual interactions in VR is scarce. The purpose of this study was to evaluate leaders/subordinates in VR, specifically perceptions of leaders under different conditions (i.e., leadership style, leader gender).

✓ Design/Methodology/Approach/Intervention
Participants were teams of 3 with 1 confederate posing as the leader. Leader was either a female or male and used either agentic communication (assertive, controlling, confident) or communal communication (affectionate, interpersonally sensitive, concerned for others' welfare).

✓ Results
Given our prediction that leadership gender would be socially expected to communicate using specific styles (male being agentic, female being communal), our results were promising and provided evidence that will be discussed in detail. We will review group-level differences in responses to outcomes of perceived leader integrity, ambivalent sexism, team trust, team cohesion, and perceived value.

✓ Limitations
Further testing needed using a larger, generalizable sample. Participant familiarity in VR may have impacted performance.

✓ Research/Practical Implications
The promising findings establish the need for more research. Due to increased demands in the workplace that require proficiency with the latest technology, it is imperative we evaluate workplace interactions in virtual environments.

✓ Originality/Value
To our knowledge, this was the first study to attempt to measure the effects of gender roles and perceptions of leadership in a VR environment.
Psychological capital (PsyCap), defined as positive psychological state of hope, efficacy, resilience and optimism, has been extensively researched regarding its positive individual level outcomes (Luthans, Avolio, Avey, Norman, 2007; Newman, Ucbasaran, Zhu, Hirst, 2014). However, research on multi-level effects of individual PsyCap on team level outcomes remains scarce (Meyers, van Workom, Bakker, 2013; Walumbwa, Peterson, Avolio, Hartnell, 2010). Based on upper echelon view, which suggests that leaders influence various team process dimensions (Hambrick, 2007; Marks, Mathieu, Zaccaro, 2001), this study focuses on the effect of leaders’ PsyCap on three team dimensions of cohesion, value congruence and autonomy. The purpose is to identify team dimensions as underlying mechanism, mediating the positive effect of individual PsyCap on organizational outcomes.

This study is based on a national sample of entrepreneurs, from which 177 qualified responses were gathered via an empirical online survey. Validated scales were used for PsyCap (Luthans et al., 2007) and team dimensions (cohesion: Sethi, Smith, Park, 2001; value congruence: Jung, Avolio, 2000; autonomy: Amabile, Conti, Coon, Lazenby, Herron, 1996).

We expect results to prove a positive mediating effect of the three team dimensions on the relationship between individual PsyCap and organizational performance, thereby proving multi-level application of PsyCap.

Preliminary results seem promising, even though the study is limited to a narrow sample of social entrepreneurs and lacks dyadic data.

Our study substantially contributes first to the understanding of mechanisms through which PsyCap influences work outcomes and thereby answers research calls to examine its dependence on team-level variables (Newman et al., 2014). Second it provides theoretical support for PsyCap on different levels of analysis and creates practical value to practitioners by increasing understanding of how PsyCap will enhance single team dimensions.

The value of our study is to introduce PsyCap as important antecedent to promote cohesion, value congruence and ultimately team performance.

Emotional agency in organizational change

Although research on emotions in workplaces has expanded, there is still no comprehensive understanding of through which kinds of mechanisms and processes emotions affect in organizations and how the constructive emotions can be supported. Challenged by this, this research project aims to develop and study new kind of emotion intervention, which can enhance both employees’ and leaders’ work performance and well-being at work. The purpose of the intervention is to support emotional agency which refers to the kind of actions that takes advantage of perceiving and understanding the meaning of emotions at work. Furthermore, the project aims to gain new knowledge how emotional agency can support organizations in change. The intervention is implemented in two organizations representing health care and real estate services. The intervention consists of six workshops during six months period covering topics of how to i) strengthen awareness of emotions, ii) understand the power of emotions, iii) deal with negative and support positive emotions, iv) develop emotional skills, and v) collaboratively build the emotional climate of the organization. The research is being conducted within a mixed method framework utilizing various data collection methods (e.g. emotional agency questionnaire, observations, field notes, video-recordings, interviews, and documents). Longitudinal ethnographic strategy is used in studying the processes and the mechanisms of the changes. The project will produce innovative theorising on emotional agency at work in organizational change. It will also provide empirical evidence concerning mechanisms and processes for enhancing emotional agency in various organisational settings undergoing organizational transformations.
Does Organisational Fairness Influence Employee Behaviour Through Enhancing Social Identity or Social Exchange Effects?

Natalie Brown (1) - Les Graham (1) - Yuyan Zheng (1)

Durham University Business School, Management, Durham, United Kingdom (1)

Abstract

Purpose

This study draws upon social identity theory and social exchange theory and examines the two as competing routes for explaining the relationship between procedural justice and work engagement, and ultimately discretionary effort.

Methodology

Self-completion paper surveys were administered to fire service employees in the UK (347 surveys returned; 58.6% response rate). The measures were procedural justice (Colquitt, 2001), perceived organisational support (POS) (Snape & Redman, 2010), organisational pride (Blader & Tyler, 2009), engagement (Rich, LePine & Crawford, 2010) and voice behaviour (Van Dyne & LePine, 1998).

Results

Path analysis in Mplus 8 was employed to examine the indirect effects between procedural justice and voice behaviour (through POS, organisational pride and engagement). Procedural justice was positively related to engagement, and engagement was positively related to voice behaviour. The indirect effect of a) organisational pride and b) POS between procedural justice and engagement were significant. The results provided support for the hypotheses.

Limitations

Common-method data was collected as self-report surveys were used. An additional limitation of using self-report survey is a concern regarding causality.
**Implications**

The results add to practitioner knowledge of the importance of organisational justice and contribute to existing theory in justice literature; including social identity and social exchange theory.

**Originality**

This study contributes to the procedural justice literature by testing a previously unexamined competing model. Drawing upon social exchange and social identity theory, we demonstrate that POS and pride mediate the relationship between procedural justice and engagement, and that their competing impacts are not significantly different.

**References**

Entrepreneurial passion (EP) research is constantly growing (Baron et al., 2012; Cardon et al., 2012; Cardon et al., 2013; Cardon et al. 2015; Cardon et al. 2017; Davis et al., 2017; Gielnik et al., 2017; Foo et al., 2009)\(^5\). However, scholars are still unclear about factors influencing the three dimensions of EP: inventing, founding, developing (Cardon et al., 2012; Murnieks et al., 2014). Moreover, the relationship of EP and venture performance needs further evidence (Mueller et al., 2017; Stenholm & Renko, 2016).

While entrepreneurial research exists on the effect of positive character traits on passion (e.g. Rauch & Frese, 2007) as well as other contingencies and outcomes (Engelen et al., 2015; Haynes et al., 2015; Hayward et al., 2006), negative character traits remain largely unexplored (Anderson, Potočnik, & Zhou, 2014; Miller, 2014; Smith et al., 2017).

Therefore, we aim to investigate the relationship between the dark triad (DT, narcissism, psychopathy, machiavellianism) and EP as well as the link between the three dimensions of EP on venture performance.

We conduct an empirical online study on entrepreneurs. Data gathering will commence in November 2018 and will be finished by January 2019. Based on our past research, we are confident to base our analysis on a sample of over 200 entrepreneurs. The questionnaire draws on established measures (DT: Jones & Paulhus, 2014; EP: Cardon et al., 2013; Firm performance: Vorhies & Morgan, 2004).

We aim to find empirical results on the nine hypotheses describing the relationships between the three dark triad traits and the three dimensions of EP. We hypothesize positive relationships between narcissism and all three EP dimensions and negative ones for psychopathy and machiavellianism towards the EP dimensions. Furthermore, we expect EP to foster firm performance.

Given our research setup, the study will neither be longitudinal, nor will it be cross-cultural.

The expected results contribute to the EP literature by identifying further antecedents as well as outcomes of EP. Furthermore, we enrich the research on personality models by examining potential contingencies and outcomes of the DT character traits.

ABSTRACT

Purpose: Humor in work environments is a field of interest of the scientific community for several years. The purpose of this study is to investigate the presence of humor and its use to negotiate work experiences by workers in a professional context still under-researched as the funeral industry.

Methods: This two-years-project includes a qualitative research design and research tools used are semi-structured interviews and focus groups. Participants involved hold manager, supervisor and operator positions in four funeral industry sectors: morgue, cemetery, funeral services and crematorium services.

Results: Preliminary results show a consistent use of humor by the interviewed subjects. It emerges how workers use it primarily as a means of relieving stress and distancing from emotionally disturbing work experiences.

Limitations: The sample used is a convenience sample. The number of people reached is quite small so far due to the difficulty encountered by the researchers in identifying and reaching the subjects.

Practical implications: This study results may contribute to the use of humor in working contexts comprehension, especially in those contexts where workers are more exposed to high emotional experiences such as workers who daily deal with death and grief.

Originality: The peculiarity of this research concerns the studied work context, scarcely investigated from literature so far.

Keywords: Humor, funeral industry, death work, coping strategies.
Purpose: The aim of every organization is to maximize employee’s motivation and work involvement to reach higher output. Emotional bond between individuals and organization is essential/crucial for committed employees exhibiting high level of discretionary behavior. Our study is based on theoretical conception confirmed in previous researches as important for high level of organizational and work involvement: Organizational citizenship behavior, Organizational commitment, Leader – Member Exchange and the internal working attachment models. The aim of this study was to explore heterogeneity of employees, consisting on differences on individual level in variables positively contributing to emotional bonds to organization and prosocial work behavior.

Sample and methods: Research sample consisted of 222 respondents employed in diverse types of organizations in Slovakia. Battery of questionnaire measuring Organizational citizenship behavior (OCB), Affective and Normative commitment to organization (AC, NC), Leader – Member Exchange, (LMX), work autonomy, personality components represented by avoidance and anxiety attachment dimension have been applied.

Results: We utilized K – Means cluster analysis to explore different sub – groups of employees. Based on the results, three cluster solution was the most parsimonious: 1. High positive organizational concern, with high rate of OCB, AC, NC, LMX, and work autonomy 2. Indifferent organizational concern, with mean OCB level, significantly low NC, mean work autonomy, significantly low anxiety attachment dimension. 3. Withdrawn/passive organizational concern, low OCB, low work autonomy, high avoidance and anxiety in attachment dimensions. Limitations of the study such as sample size, measurement context and self – report measures are discussed.

The research was supported by Slovak Research Agency VEGA: 1/0273/18
Purpose – The concept of the Quality of Working Life (QoWL) and the resilience of Turkish City Council workers was explored. The research considered the extent to which family work-life conflict affected the perceived resilience and wellbeing of employees.

Methodology – In this study, semi-structured focus group interviews were conducted. 42 people formed six groups and the subsequent interviews were recorded and transcribed. Data were transcribed verbatim, analysed and validated in Turkish. Data were coded line by line using an inductive approach.

Result – Six main QoWL themes affecting the resilience of Turkish employees were identified: Job-related demands and stress at work, career satisfaction, organisational commitment and employee engagement, managerial support, work-life interface, and relationships at work. Overall, workers with better interpersonal relationships, awareness of social support systems and control over their work-life balance, expressed feeling less family-work conflict and greater wellbeing.

Limitations – Due to the demographics structure of the company more male employees (67%) were interviewed than female employees (33%).

Research/Practical implications – This study suggests that the QoWL of Turkish employees City Council is closely interconnected with the time they spend with their families. Organisations must ensure that employees get a sufficient amount of institutional support along with personal and family support to achieve higher perceived QoWL and resilience.

Originality/value – This paper is one of the first qualitative papers investigating the QoWL and work-family conflict of workers together in a Turkish setting. The importance of work-family balance on the wellbeing of Turkish employees should be noted when developing organisational commitment interventions.
Purpose

“It is not the strongest of the species that survives, nor the most intelligent that survives. It is the one that is the most adaptable to change.” Darwin c. 1854

Traditional practitioner training and meta-analysis has taught us Conscientiousness is the highest predictor of job performance (eg. Barrick and Mount, 1991). Others have since argued that this is not the case for all job types, in which innovation or cognitive ability may take over.

A growing set of validation studies, however, is suggesting that Adaptability is the new predictor of success in the modern-day work place.

Design/Methodology /Approach

Blended assessments including situational judgement, personality and cognitive tests were developed for recruitment across different countries and industries. These were validated using line manager ratings as the measure of job performance.

Results

Results consistently show competencies and personality traits measuring aspects of Adaptability are superseding those measuring Conscientiousness in correlations with performance. In some studies, this competency correlates more strongly than cognitive tests. Conscientiousness remains a significant predictor.

Limitations

Many of these studies have graduate samples; wider exploration of job levels would be desirable.

Practical Implications and Value

These studies suggest an important addition to what managers think they need in their employees; we believe they are right. What succeeds and survives in nature is now mirrored in the workplace. The new nature of work is more people-centric, requiring agility and divergent thinking for tasks that cannot be underpinned by a logical algorithm – these can now be performed by machines. The implication of this is to align selection, development and other talent management processes with what relates to success. With adaptability joining the critical list of conscientious and intelligent, we are asking a great deal of future employees.
SAME TALK, DIFFERENT REACTION? PREDICTING EMERGENT LEADERSHIP THROUGH THE INTERPLAY OF AGENTIC COMMUNICATION AND GENDER

Sofia Schlamp (1) - Fabiola Gerpott (2) - Sven Voelpel (3)

VU Amsterdam, Amsterdam, Netherlands (1) - Technical University Berlin, Berlin, Germany (2) - Jacobs University Bremen, Bremen, Germany (3)

Abstract

Purpose
Research has differentiated between communal (i.e., strive for group harmony) and agentic (i.e., strive for power) behaviors to explain gender differences in emergent leadership (i.e., the ascription of informal leadership responsibilities among team members). However, existing conceptualizations of communal and agentic behaviors have overlooked that behaviors within both categories can be further categorized into task- and relations-oriented functions. We develop a taxonomy of task- and relations-oriented communal and agentic behaviors and propose interaction effects between gender and these different types of behaviors.

Design/Methodology
We used a behavioral observation approach to code the meeting interactions of 200 members of 37 self-managed teams. Emergent leadership was measured using a round-robin design.

Results
Descriptive statistics indicated no gender differences in the overall amount of task- and relations-oriented communal and agentic behaviors and in emergent leadership. Zooming into the different types of behaviors, we found an interaction effect between gender and agentic behavior, such that agentic task-oriented agentic behaviors were positively associated with emergent leadership for men, while these behaviors decreased the likelihood of emerging as leaders for women.

Limitations
Future research should use a longitudinal design to capture changes over time.

Implications
We make a conceptual contribution to the gender literature and add to the discursive leadership literature. The findings are useful for the training of self-managed teams and for sensitizing people responsible for leader selection.

Originality/Value
This research is the first to apply an interaction coding approach for studying specific types of communal and agentic behaviors in team meetings.
Abstract

Purpose

Worldwide there is an underrepresentation of women in top leadership roles. We propose the glass pyramid hypothesis, the idea that aspects of women’s versus men’s psychology are less aligned with the hierarchical structures that are common to organizational contexts. Tall hierarchical organizations, characterized by competition and inequality, deter women from applying to and being selected for leadership roles. On the other hand, organizations with flatter hierarchies, characterized by equality and cooperation, are a more conducive environment for women to achieve leadership roles.

Design/Methodology

In Study 1, participants (N=200) completed a survey assessing their preferences for flat and tall hierarchical organizations. In Study 2, participants (N=221) were presented with job advertisements for leader/follower roles in tall versus flat organizations and indicated their application intentions.

Results

Although both genders expressed stronger preference for flat compared to tall hierarchies, women’s aversion to tall hierarchies was stronger than that of men’s. Furthermore, compared to women, men were significantly more likely to apply to leadership roles in tall hierarchical organizations.

Limitations

Future research should further test the glass pyramid phenomenon, and clarify the consequences of tall hierarchical organizations on women’s career paths.

Implications

We provide new insights into the causes for a low number of women in top leadership positions. Our findings also have practical implications – to encourage managers to question whether their organizational structure is equally conducive for all employees.

Originality/Value

This research is the first to analyze the impact of the hierarchical structure on the representation of women in leadership positions.
Purpose
This research demonstrates that highly engaged employees can be motivated to enact both ethical and unethical behavior.

Design/Methodology/Approach/Intervention
Drawing upon moral licensing theory, I present a conceptual model that demonstrates work engagement can be a double-edged sword, such that engaged employees are critical in fostering more ethical behaviors, but these actions can result in unintended consequences.

Results
The conceptual analysis demonstrates that while highly engaged employees are more apt to enact ethical behavior, these ethical actions can result two processes (i.e., moral credits and moral credentials) that morally license engaged employees to enact both constructive and destructive unethical behaviors, especially when these employees are risk-takers.

Limitations
This research focuses on the cognitive underpinnings of the work engagement and (un)ethical behavior relationship, but does not account for non-cognitive mediators.

Research/Practical Implications
Managers should foster greater levels of work engagement by supporting employees (e.g., provide job resources, limit job demands). Managers ought to role model ethical conduct on a daily basis. HR policies and practices must clearly communicate the unacceptability of destructive unethical conduct through various mediums (e.g., onboarding, training).

Originality/Value
This research highlights the double-edged sword of work engagement (i.e., highly engaged employees are critical in terms of fostering ethical behavior, but doing so can make these employees feel morally licensed to engage in unethical behavior). Moreover, unethical behavior is differentiated into constructive and destructive unethical behavior to better understand the positive and negative implications associated with unethical actions.
Purpose
This research addresses the lack of consensus related to the effects of workplace fun by demonstrating that fun activities can result in both positive and negative employee outcomes.

Design/Methodology/Approach/Intervention
Drawing upon appraisal and self-determination theories, we posit that fun activities can differentially influence employee well-being and performance depending upon how employees appraise workplace fun.

Results
The conceptual analysis demonstrates that fun activities can elicit both positive or negative emotions, but this effect is moderated by the extent to which employees are intrinsically or extrinsically motivated. Moreover, intrinsically motivated employees achieve better social-focused outcomes, whereas extrinsically motivated employees achieve stronger task-focused outcomes.

Limitations
We draw upon the emotion and motivation literatures to explain the differential effects of workplace fun, but we do not examine all potential mediators that could explain the workplace fun and employee outcomes relationship.

Research/Practical Implications
Managers who work for companies (e.g., tech-based start-ups) where workplace fun is a cultural hallmark must understand that workplace fun does not influence employees in a universally positive manner. Therefore, managers should consider other initiatives (e.g., engaging task-focused group activities) to motivate a greater number of employees.

Originality/Value
This research addresses the contradictory effects of workplace fun by showing that it can result in two different emotional responses that uniquely influence employee well-being and performance. This research also shows why and how to manage intrinsically and extrinsically motivated employees in terms of workplace fun.
"MY LIFE HAS BEEN EATEN BY WORK": UNINTENDED CONSEQUENCES OF EXTENDED SHIFT HOURS FOR ORGANISATIONAL OUTCOMES AND EMPLOYEE WELLBEING

Jane Suter (1) - Tina Kowalski (1) - Rowena Jacobs (2) - Martin Chalkley (2) - Idaira Rodriguez Santana (2) - Misael Anaya Montes (2)

University of York, Management School, York, United Kingdom (1) - University of York, Centre for Health Economics, York, United Kingdom (2)

Purpose
To evaluate the impact of extended shift hours in a large mental health trust on employee and organisational outcomes as employees adapt and respond to change.

Methodology
- Mixed methods case study analysis
- 35 in-depth semi structured interviews 6 months post-change
- Stakeholder interviews.
- Interrupted Time Series (ITS) modelling to identify longitudinal impact
- Follow-up interviews 1 year post-change

Results
Findings highlight how changes to working hours are accompanied by unintended consequences for employees and the organisation. Our results enable us to conceptualise how individuals adapt and respond to changes in work patterns and how this can translate to negative outcomes for employee wellbeing. Interrupted Time Series analysis suggests an increase in staff absence due to 12 hour shifts. Findings revealed a rise in absence 3-4 weeks after the introduction, and that this is not a transient effect.

Limitations
Sample limited to one Health Trust and analysis of routine staffing data uses secondary data.

Research/Practical Implications
We argue that blanket policies on organisation of work may be problematic in geographically dispersed organisations and are further exacerbated by tight labour markets and an aging workforce. We discuss practical implications in relation to control, flexibility and social support relative to employee wellbeing and job strain.

Originality/Value
This research contributes to research on shiftwork and organisational change, as one of the few that combines quantitative analysis with qualitative data. We add to knowledge by contextualising our evaluation with the nuances of work conditions which are often overlooked when evaluating extended shifts.
Abstract

**Purpose:** This study assesses the impact of the dark personality traits on work motivation and work outcomes, particularly on objective and subjective career success. The personality traits examined included three dimensions of narcissism, psychopathy, and Machiavellianism.

**Methodology:** The sample included 245 academic and administrative staff of selected universities in Germany and Uganda. Objective career success was measured only for academic staff using the number of publications as an indicator of success. Subjective success was measured with career satisfaction.

**Results:** Partial findings reveal that adaptive grandiose narcissism is positively associated with intrinsic work motivation and subjective career success. On the other hand, maladaptive grandiose narcissism is positively associated with amotivation (lack of motivation) and extrinsic motivation. In addition, vulnerable narcissism was positively associated with amotivation and extrinsic motivation but negatively related to intrinsic motivation, subjective career success, and objective career success. Psychopathy was also positively correlated with amotivation, while machiavellianism was positively related to amotivation and extrinsic motivation but negatively related to objective success. Interestingly, motivation and extrinsic motivation were both negatively related to objective and subjective success. However, findings indicate that intrinsic motivation is also only significantly related to subjective success.

A cross-cultural analysis will be applied to establish the differences between Germany (individualistic and developed country) and Uganda (collectivistic and less developed country)

**Implications:** The practical and theoretical implications of these findings will be discussed. Discussions of the need to focus on facet level rather than the global dark triad concepts, specifically in regard to narcissism.

**Originality/Value:** The study applies the dark triad and self-determination theory in explaining career success in the academia. Thus the study contributes to the understanding of the traits and motivations that drive the behavior and success of workers in the academy.
Purpose. The impact of the Organizational Citizenship Behavior on Job Crafting is evaluated in Italy’s main non-profit organization for blood collection (AVIS). These organizations are of fundamental importance in several European countries, but the studies on the OBC and JC of their volunteers are still scarce.

Design. 608 Italian AVIS volunteers (66.1% males, 33.9% females, 68.4% managers, 31.6% executives), compile the Italian version of the OCB Scale (Podsakoff et al.) and of the JC Scale (Tims et al.), adapted to the non-profit sector. A confirmatory factorial analysis of the instruments is then carried out. The incidence of the OCB on Job Crafting is assessed using structural equation models for latent variables (SEM).

Results. The factor analysis confirms the instruments structure (OCB: CFI = .81, RMSEA = .08, SRMR = .07; JC: CFI = .89, RMSEA = .09, SRMR = .07). The OCB (considered as a single factor) is a good predictor, in particular for the dimensions of Job Crafting: Increasing Structural Job Resources ($R^2 = .64$) and Increasing Challenging Job Demands ($R^2 = .69$).

Limitations. The study requires a larger sample. An investigation on the motivations behind the activities performed in these organizations will also be necessary.

Research Implications. The psychological aspects (such as OCB and JC) of volunteer engagement in such important organizations are increasingly relevant.

Originality. The present study expands our knowledge on the relationship between two central constructs which are fundamental in the running and organizational improvement of non-profit organizations devoted to blood collection.
715 - ORGANIZATIONAL AND PSYCHOLOGICAL FEATURES OF SUBJECTIVE WELL-BEING OF THE UKRAINIAN TEACHERS

Olena Bondarchuk (1)

University of Educational Management, National Academy of Pedagogical Science of Ukraine, Department of Management Psychology, Kyiv, Ukraine (1)

The purpose of the investigation is to find out the levels of teachers’ well-being and their organizational and psychological characteristics.

Design. The following research instruments have been used: a)The Satisfaction With Life Scale (E.Diener, etc); b)Index of psychological safety of educational environment (I.Baeva); c)Factual Autonomy Scale (P.Spector, S.Fox); d)Counterproductive Work Behaviors Scale (R.Bennet, S.Robinson) on a sample of 500 teachers of secondary school from different regions of Ukraine. The obtained data were analyzed using correlation, ANOVA (SPSS 21.0).

Results. High and fit levels of subjective well-being were found in mere 50% respondents (M = 23.3, σ = 4.8). At the same time female have less well-being than male (ρ<0.01). The levels of teachers’ well-being were found to positively correlate with the respondents’: 1) psychological safety of their educational environment (ρ<0.01) 2) factual autonomy (ρ<0.01) and negatively correlate with their: 3) length of professional service (ρ<0.01); 4) counterproductive work behaviors (ρ<0.01).

Limitations were related to the sample, which included only the secondary school teachers.

Practical Implications. The investigation findings can be used in to elevate subjective well-being Ukrainian teachers’ by means of special training courses based on the technology of psychological training of teachers which was developed and successfully tested by author.

Originality. The investigation of organizational and psychological features of subjective well-being of the Ukrainian teachers was done for the first time.
Headhunting: A Theory of Attracting and Hiring Employed Workers

While employers are often engaged in activities to increase the volume of active job seekers to vacant positions they are often missing a critical source of individuals which are the high-coveted top performers at competitor organizations who are not actively seeking new positions. Despite decades of research on finding and attracting employees, scholars have not addressed the controversial need to target specific employees from other organizations in order to find the best workers. Accordingly, there is no existing theory developed to examine the psychology of hiring currently employed workers. In this poster, we outline a comprehensive theory of headhunting which draws from recruitment literature pertaining to definition of market and candidate source effects as it relates to factors that influence voluntary career change and subsequent turnover. Beginning with grounded theory based on interviews with professional recruiters our proposed theory draws on literature from decision making, turnover models, organizational commitment, attitudes and persuasion, and individual differences on how to source and attract employed workers from competing employers. A testable model examining antecedents, processes and consequences of employee headhunting is developed and hypotheses related to specific aspects of the theory is presented.
Purpose:
Experts agree that seeking steady employment is crucial for ex-offenders’ successful reentry into society. While there has been an abundance of research on this topic from multiple disciplines, not much attention has been paid by work and organizational psychology scholars. In fact, applied psychology and management scholars have contributed only 3% to this literature (Figure 1). First, we highlight key insights from a comprehensive literature review. Next, we identify research gaps and pose research questions that are both practically and theoretically important.

Design/Methodology:
Using employment as a root keyword, other search terms like ex-offender, ex-criminal, and criminal record were used to identify relevant articles in all the major databases (PsycInfo, Google Scholar, etc.), resulting in 519 articles from 27 disciplines.

Results:
The articles were first organized into groups of related disciplines, and then aligned with major HR functions based on findings (Table 1). Finally, dominant themes within each HR function were identified to assess and address gaps in the literature. The proposed research questions seek to: a) explicate the generalizability of existing theories, and b) how unique characteristics of ex-offenders could broaden and enrich existing theories.
Research/Practical Implications and Originality/Value:

There is much to be learned about this vulnerable (yet often not perceived as such) population. Addressing these would not only promote hiring them but would also aid with their transition to becoming effective employees, reclaiming their identities, and becoming contributing members of society. That is truly working for the greater good.

Table 1

Distribution of articles by Domain, Stage, and HR function

Figure 1

Number of peer-reviewed articles by domain, published through 2017 (N=519)

Note. Journals that are not listed on JCR were categorized based on the journals’ descriptions (e.g. Journal of Offender Rehabilitation was categorized in domain Rehabilitation)
Purpose:
The knowledge of repatriates represents a valuable resource for multinational companies (MNCs). However, we have yet to understand how leaders facilitate the transfer of repatriate knowledge upon their return to the domestic work unit. This study employs social information processing theory to understand the effect of empowering leadership on repatriate knowledge transfer (RKT).

Approach:
We test our hypotheses with a moderated mediation regression model using multi-source data from 101 repatriates and domestic employees working in German MNCs.

Results:
We found that empowering leadership was indirectly associated with RKT via the repatriates’ perceived ability of domestic employees, but not via repatriates’ perceived benevolence of domestic coworkers. Second, our results indicated that the positive effect of empowering leaders on ability and benevolence was stronger when repatriate agreeableness was high.

Limitations:
By limiting our sample to MNCs on the German market, we cannot provide insights into how the concept of empowering leadership would affect RKT in other countries or cultures.

Research/ Practical Implications:
However, our findings deliver a more integrated analysis of the characteristics and their influence of the three most important actors during repatriate knowledge transfer (i.e., leaders, domestic employees, repatriates). In the context of practical implications, we suggest that organizations should highlight the important role of empowering leaders for RKT.

Originality/ Value:
In specifying the relevance of empowering leaders as a situational input for RKT, and the mechanisms and boundary conditions of their effect, we advance research on the antecedents of cross-border knowledge transfer via international assignees in multinational companies.
735 - MAKING SENSE OF THE NOISE: THE PH3 FRAMEWORK AS AN ORGANISATIONAL DIAGNOSTIC AND PRIORITISATION APPROACH TO DRIVE WORK ENGAGEMENT

Dieter Veldsman (1) - Cecile Benade (1) - Derek van der Schyff (1) - Ninette van Aarde (1)

MMI Holdings, Human Capital, Pretoria, South Africa (1)

The VUCA world of work has challenged organisations to re-evaluate their approach towards building sustainable talent practices. High levels of disengagement, a workforce devoid of purpose and people processes lacking meaning characterises the current way of work. Amidst this landscape, organisations are striving for people effectiveness as a source of competitive advantage to ensure the future of the enterprise.

The case study reflects on the use of a people effectiveness framework (PH³) in a financial services organisation (n=17 300) within South Africa over a period of 12 months. The PH³ was utilised during an organisational turnaround strategy as a prioritisation and decision-making framework to diagnose, measure and monitor people effectiveness focus areas as a method to drive work engagement. The case study provides insights into how the levers of meaningful work design, targeted employee experience, holistic wellness practices, storytelling and performance excellence was utilised to enable a highly engaging work environment.

The case study is limited to a single organisation in the financial services sector and further exploration is required regarding the applicability of the framework in terms of generalisability to other research settings. The PH³ has proven to be a useful framework to guide organisational development interventions and priorities during times of change and as such is presented as a useable framework for people practitioners aiming to drive work engagement in knowledge economy organisations.
WHAT HAPPENS TO THE THWARTED AND WORRIED LEADER?:

A GOAL BLOCKAGE – IRRITATION MODEL OF ABUSIVE SUPERVISION

Begum Bilgin (1) - Zeynep Aycan (2)

Koc University, Psychology, Istanbul, Turkey (1) - Koc University, Psychology and Business Administration, Istanbul, Turkey (2)

Purpose
The aim is to propose and test a model which improves our understanding of how and why leader’s goal blockage perception is related with abusive supervision. Moreover, we seek to understand what the role of leaders’ worries about their leadership roles (WAL) and leaders’ social problem-solving skills (SPSS) are in this relationship.

Design/Methodology
Data were collected from 190 participants [60% male, M_age=41 (SD=11.28); M_job_tenure = 8 years (SD=6.48)] employed in managerial roles through Mechanical Turk (MTurk; Amazon, 2014).

Results
The results showed that leaders’ goal blockage perception is significantly associated with higher abusive supervision through leaders’ irritation. Also, higher WAL intensified the relationship between goal blockage and abusive supervision and, leaders’ higher SPSS attenuates the relationship between leaders’ irritation and abusive supervision.

Limitations
Data were provided from a single source, which raises concerns of common method bias. Also, self-reports of intentions/history of abusive supervision may be biased due to social desirability concerns.

Research/Practical Implications
This study aims to contribute to the literature by examining leaders’ perception of a contextual factor threatening the essence of the leadership role, which is goal attainment (House & Shamir, 1993), as an antecedent of abusive supervision by taking an actor-centric perspective rather framing abusive supervision only as a leader’s response to adverse contextual factors. Also, these findings are practically important in that they provide suggestions on how to minimize abusive supervision in organizations.

Originality/Value
To our knowledge, this is the first study which empirically tests the ‘goal blockage’ in leadership literature.
Abstract

Understanding and predicting human behaviours especially in work contexts is a challenging task. Many of the constructs used to explain these behaviours are multi-dimensional and therefore require in-depth analysis of the complex relationships that exist among them. To this end, the current study structurally analyzed the relationship among the dimensions of leader behaviours and organisational citizenship behaviours. The study employed an ex-post facto design and systematic random sampling technique. The participants included 359 non-managerial employees from 17 service-oriented organisations in Lagos State. The theoretical background for this research model is the social exchange theory. Seven hypotheses were raised and tested using structural equation modelling and confirmatory factor analysis. The result revealed that leader behaviours of initiating structure and consideration significantly influenced organisational involvement, dutifulness and interpersonal relationship dimensions of organisational citizenship behaviours. Also, the dimensions of leader behaviours and organisational citizenship behaviours were confirmed as representative measures of the latent variables. This study concluded that both the initiating structure and consideration dimensions of leader behaviours promote employees’ demonstration of citizenship behaviours. It was therefore recommended that managers cultivate a combination of these dimensions of leader behaviours in order to foster team spirit within the work groups which will ultimately result in the demonstration of organisational citizenship behaviours.

Key Words: Leader, Behaviour, Initiating Structure, Consideration, Dutifulness, Interpersonal Relationship, Involvement, Organisational, Citizenship, Employees, Lagos.
Purpose: Drawing upon system justification theory, we posit that subordinates high (versus low) in power distance are more likely to justify their supervisors’ objectifying behavior. Such justification is more defined in prescriptive terms (i.e., the powerful *ought* to objectify employees) than descriptive ones (i.e., the powerful *typically* objectify employees). Furthermore, because of this prescriptive justification, high power distance subordinates are willing to afford power to their supervisors who objectify employees.

Design: A survey was conducted among 122 supervisor-subordinate dyads working in the Netherlands. Specifically, supervisors filled out the objectification scale, while subordinates completed power distance, descriptive and prescriptive justification, and power affordance scales.

Results: Supervisor objectification and subordinate power distance interacted in such way that particularly when power distance was high, supervisor objectification predicted greater power affordance via prescriptive justification, but not via descriptive justification.

Limitations: Because objectification and power distance were measured in our study, it is not possible to establish causality from it. That is, it is unknown if objectification and power distance drove the differences in power affordance.

Research implications: Despite the fact that objectification often has profound negative impacts on the victims, we found that objectification could have a positive effect on perpetrators. In the workplace where subordinates have high power distance, supervisors who objectify subordinates are more likely to gain power than their non-objectifying counterparts.

Originality: This research offers a new perspective on objectification by exploring its relationship with power affordance. Making a differentiation between descriptive and prescriptive justification also advances our understanding of system justification theory.
Lyudmila Karamushka (1) - Kateryna Lolenko (1) - Yaroslava Goncharenko (1)

G.S. Kostiuk Institute of Psychology of the National Academy of Educational Sciences of Ukraine, Laboratory of Organizational Psychology, Kyiv, Ukraine (1)

Purpose. To find out the levels of commercial organization staff’s customer orientation and analyze its relationship with the organizational characteristics.

Design. The investigation was conducted on a sample of 292 commercial organization staff in Kyiv using Company Customer Orientation (F. Nerlinger), Organizational Development (W. Siegert, L. Lang). The investigation was based on F. Nerlinger’s concept of customer orientation and W. Siegert and L. Lange’s concept of organizational development.

Results.

1. Only 27.0% of commercial organization staff had high customer orientation.

2. Commercial organization staff’s customer orientation had positive statistically significant relationship with organizational maturity (p < 0.001) and negative relationship with organizational development difficulties (p < 0.001).

3. Commercial organization staff’s customer orientation was higher in trade organizations than in industrial ones (p < 0.01) and in private organizations than in public ones (p < 0.01). The number of staff in commercial organizations had different relationships with staff’s customer orientation: the greater was the number of staff in commercial organizations, the poorer were the customer orientation standards (p < 0.01) but the better was staff’s customer orientation training (p < 0.01). It was also found that commercial organizations’ age did not have statistically significant relationship with staff’s customer orientation.

Limitations. The sample was limited to commercial organizations from the capital of Ukraine.

Practical implications. The obtained results may be useful for introducing client orientation into commercial organizations.

Originality. The research is one of the first to study the impact of organizational characteristics on commercial organization customer orientation on a Ukrainian sample.
Abstract

Purpose – Research has disregarded the boundary conditions of the effects of post-traumatic stress symptoms (PTSS) at work. This study aims to address this issue by examining the moderating impact of exposure to robbery on the relationship between PTSS and job satisfaction. Drawing on the conservation of resources (COR) theory, we hypothesize that when a traumatic event is experienced collectively, the victims affected by PTSS will be more likely to access group-related resources that enable them to cognitively reframe the adverse event and, thereby, experience enhanced job satisfaction.

Design/Methodology/Approach/Intervention – We conducted a two-wave, time-lagged study on 140 employees from a national bank in Italy to test our hypotheses.

Results – Consistent with our predictions, moderated regression analysis results indicated that exposure to robbery moderated the relationship between PTSS and job satisfaction, such that job satisfaction significantly improved in the case of shared (versus isolated) exposure.

Limitations – The self-report nature of our studies raises issues of common method variance.

Research/Practical implications – Our findings clarify the conditions under which PTSS following a bank robbery could be a driver of job satisfaction. This research also enhances our understanding of the resource gains associated with exposure to traumatic events, highlighting the shared nature of the trauma as a key condition upon which people can access the resources necessary to achieve such gains.

Originality/Value – Unlike prior research documenting the detrimental impact of PTSS on job satisfaction, our study is the first to show that PTSS might positively affect job satisfaction when the trauma is experienced collectively.
Purpose: Emotional labor - or the performance of various forms of emotion work guided by imperatives of work organizations, in the context of paid employment (Hochschild, 1979, 1983) - is an important topic in the healthcare environment (Mann, 2005). People who work in this field, need to regulate their emotions for the sake of the service they offer (Bondarenko et al., 2017). Despite some evidence suggesting a link between emotional labor and negative psychological consequences for workers (i.e., stress, burnout, diminished self-esteem) within the healthcare environment (Mann, 2005), no study has explored the relationship between emotional labor and use of medication for anxiety, depression, or sleep deprivation (behavioral consequences).

Methodology: We tested our hypotheses on a sample of 2350 Quebec workers in the health-care services, using binary logistic regressions in SPSS.

Results: Results supported a positive relation between emotional labor and use of three types of medication (anxiety, depression and sleep deprivation), while controlling for other major work conditions: decision latitude and time pressure.

Limitations: The cross-sectional nature of these data preclude a direct assessment of causal direction.

Research implications: These results imply that people who work in health care are at risks of living emotional labor as a very stressful demand that can do harm to their mental health, and their behavior of taking medication.

Originality/value: To our knowledge, the study is the first to highlight this negative type of consequence of emotional labor, in this type of sample.
753 - SYSTEMIC LEADERSHIP: CONSTRUCT CLARIFICATION AND DEVELOPMENT OF A MULTIDIMENSIONAL MEASURE

Vera Göllner (1) - Sandra Sülzenbrück (1) - Kai Externbrink (1) - Christine Sutter (2)

FOM Hochschule für Oekonomie und Management, Business Psychology, Dortmund, Germany (1) - Deutsche Hochschule der Polizei, Traffic Science & Traffic Psychology, Münster, Germany (2)

Purpose
Although the systemic approach to the leadership concept seems to fit well into our modern complex and dynamic work environment, only little research has been conducted to define and assess systemic leadership. In this study we therefore developed and assessed criterion validity of the multidimensional systemic leadership inventory (SLI, Sülzenbrück & Externbrink, 2017).

Methodology
We conducted two cross-sectional survey among managers and employees of various organizations (N = 143 and N = 150).

Results
We found a robust five-factor structure of the SLI, comprising systemic thinking, self-knowledge, solution-oriented communication, creating meaning and delegation. Regarding criterion validity, a significant positive correlation of systemic leadership was found with affective commitment, while a significant negative correlation with emotional strain in occupational contexts occurred. These overall positive outcomes for employees were not undermined by negative personality traits of the employee (Machiavellianism), while strong growth need strength further enhanced positive effects on affective commitment.

Limitations
Since all variables were measured as self-reports, common method variance could limit our findings.

Practical Implications
Systemic leadership is a very promising new approach for leaders to ensure committed and less strained employees.

Value
Systemic leadership, especially in terms of a leaders’ understanding of organizational and private systems influencing work behaviour of all members of an organization, is a promising novel leadership model suitable to address challenges of complex and dynamic work environments.
The main focus of this paper was the study of Workaholism, which is considered an addiction to work, and for that, we investigated its predictors and some of its effects, according to current investigations. On the one hand, there were analyses for some predictors, such as work passion and work engagement. On the other hand, the workaholism effects are psychological well-being and burnout. Hence, we aim to investigate the relation between workaholism, with its predictors and principal effects. A sample of 199 professionally active participants was obtained. The data was collected through a questionnaire which consisted in seven scales and demographic variables: passion at work from Vallerand and colleagues (2003); work engagement evaluated by UWES (Schaufeli, Salanova, et al., 2002); workaholism was evaluated by WorkBat from Spence & Robbins, (1992); psychological well-being by GHQ12 from Goldberg & Williams (1988); burnout by 14-item scale from Shirom & Melamed (2006).

The results emphasized the existence of the relation between predictors; the relation between all the variables considered; the contribution of workaholism and its dimension on the increased prediction on its effects such well-being and burnout. By such, we conclude that the predictors variables demonstrate influence on workaholism, which holds relevance on its effects.

Those results have practical implications of the development of human resources strategies.
Work analysis is a prerequisite for most human resources processes; its importance is widely recognized (Wilson, Bennett, Gibson, & Alliger, 2012). There is however no scientific evidence on work analysis processes being actually implemented in organizations.

A qualitative exploratory study was conducted to document the work analysis processes implemented by organizations and understand the motives sustaining them. Semi-directed interviews were conducted with executives and human resource advisors in 11 Canadian organizations of various size, structure and economic sector, followed by content analysis.

Results show that the process to develop job descriptions and lists of KSO is very basic. It is mostly managers that prepare those documents, with little assistance from human resources advisors, using examples found internally or on-line. Most respondents declared their organization is using job descriptions and KSO for staffing, half for performance appraisal and only a few for compensation and training. In a third of the organizations, the work analysis process is different for managerial jobs. No clear pattern of contingent factors influencing these practices seems to emerge.

This research is the first to investigate how organizations really conduct work analysis. Its results are aligned with the literature about the gap between research and practice (Rynes, Giluk, & Brown, 2007). It opens the path for further investigation of the factors influencing the choices made by organizations, namely the processes and replacement solutions they implement in lieu of traditional work analysis.
758 - ATTITUDES AND PERCEPTIONS OF WORKPLACE NAPPING & IMPLICATIONS FOR WORK OUTCOMES

Jiayin Qu (1) - Aaron Schmidt (1)

University of Minnesota, Psychology, Minneapolis, United States (1)

Abstract

PURPOSE
The current study examines antecedents and outcomes of napping in the workplace. It proposed that individuals’ personal attitudes towards napping, as well as their perceptions organizational support of or receptivity towards napping, are valuable and previously unexamined predictors of workplace napping.

METHODOLOGY
A preliminary measure of napping attitudes and perceptions of organizational attitudes was developed; exploratory and confirmatory factor analysis were carried out. Linear regression and zero-inflated negative binomial regression were used to examine the relationships between attitudes, perceptions, and napping behaviors.

RESULTS
Results indicated a multi-factor nature of both personal attitudes and perceptions of organizational support of napping. Results also indicated that napping attitudes were predictive of napping behaviors which, in turn, were predictive of Organizational Citizenship and Counterproductive Work Behaviors.

LIMITATIONS
The factor analysis, though shedding new light on the potential multi-factor nature of napping attitudes, is based on a somewhat small sample (n = 156); larger samples are needed for further validation. Future studies should also examine the causal links between variables in controlled experiment and examine the longitudinal effects.

RESEARCH/PRACTICAL IMPLICATION
These results indicate that napping attitudes and behaviors are important and potentially impactful constructs that warrant further consideration in theory, research, and practice, and may provide useful levers for mitigating the detrimental consequences of poor sleep for work outcomes.

ORIGINALITY/VALUE
This study is the first study to date examining individual attitudes towards and their perceptions of organizational support of napping and represents the first steps in a program of research examining napping at workplace.
Purpose:
Multinational companies (MNCs) are facing an accelerated change in technology that could benefit communication across borders in an increasingly interconnected world. Although several studies highlight international knowledge as a key factor in achieving global opportunities, none of the existing research examines the influence of digital communication media on knowledge transfer within International Human Resource Management (IHRM).

Approach:
Since this research field is highly unexplored, we used a qualitative design to conduct 25 semi-structured interviews with IHRM senior managers from MNCs. Following a grounded theory approach, we examined how digital communication media influences IHRM and how its use facilitates or hinders knowledge transfer processes.

Results:
Different experts analyzed our categories regarding their importance for the workplace, resulting in four main and 21 sub-categories. Our results indicate that the use of digital communication media could enable IHRM experts to be more cost-efficient and flexible, in order to compete with companies using international assignments for knowledge transfer. Additionally, we identified that knowledge transfer over digital communication media is limited by specific competencies and tasks.

Limitations:
Building our concept from experts working for MNCs in Germany, we cannot present insights into other countries or cultures.

Research/ Practical Implications:
However, our study lays the foundation for future research on the use of digital communication media for cross-cultural knowledge transfer in IHRM.

Originality/ Value:
We provide an empirical categorization for the first time in this field. With this, we strive to answer if the global digitalization, in particular, the use of digital communication media, can contribute as a competitive advantage within MNCs’ IHRM.
Purpose. To measure the levels of educational institution principals' innovative potential and their relationship with the organizational and functional characteristics of educational institutions. The investigation was based on L. Karamushka's concept of psychological support for educational organizations.

Design. The investigation was conducted on a sample of 1219 secondary school principals in different regions of Ukraine in 2018 using N. Klueva's Administration and Teaching Staff Interaction and A. Klocho's questionnaire.

Results.

1. High innovative potential was found in 34.3% of the respondents, while 46.6% and 19.1% of the respondents had average and low innovative potentials respectively.

2. School principals' innovative potential had negative relationships with the educational institution's age (p<0.001), the number of teaching staff in the educational institution (p<0.01) and the number of students in the educational institution (p<0.05).

3. The principals' innovative potential was higher, the higher was the educational institution's status (p<0.001) and innovation potential (p<0.01).

4. The type and location of the educational institutions did not affect their principals' innovative potential.

Limitations. The investigation studied only the general indicator of principals' innovative potential (without analyzing its components in relation to different activities of educational institutions) and its relationship with the educational institution's organizational and functional characteristics.

Practical implications. The obtained results can be used in psychological training of educational institution principals.

Originality. This was the first research in Ukraine to focus on the relationship between the secondary educational institution principals' innovative potential and the institution’s organizational and functional characteristics.
Purpose: The general objective of the research was to analyze if there was a relationship between work support and job satisfaction in cabin crew members over 18 years old in Argentina.

Design/Methodology: The sample consisted of 153 participants, both gender (64.7% Female), age between 21 and 62 years ($M=35.93; DS=8.33$). The design was non-experimental, descriptive-correlational. Measures: sociodemographic questionnaire, Job satisfaction questionnaire from Aguirre (2014) and Spanish version of Social Support scale (Gandarillas & Vázquez, 2014; House & Wells, 1978). Results There is a moderate relationship between work support and job satisfaction ($r=.431; p<.01$). We found sociodemographic characteristics such as seniority, having another job outside the airline and the area where they perform their tasks determine differences for job satisfaction. In turn, both job satisfaction and work support, there are no significant differences according to certain sociodemographic variables of great importance such as sex, age and position held in the company. Limitations: Sample was collected by a non-probabilistic sampling technique and is relatively small sample size of employees. Research/Practical Implications: This research will be a contribution and promote psychological research in the aeronautical field, which is a growing field and that requires scientific contributions for the understanding of the psychological variables involved. The results are discussed according to the previous bibliography and future lines of research are proposed. Originality/Value: This study has focused on the psychological characteristics of cabin crew, such as job satisfaction and social support that are involved in reducing stress levels and improving well-being at work.
Purpose
Technology impacts the selection process for both the applicant and employer. The current study investigated the differences in applicants’ perceptions of completing selection assessments through a computerized method and a paper-and-pencil method.

Methodology
Useable data was collected from 123 participants who completed parallel forms of the in-basket. Each participant completed a computer and a paper-and-pencil in-basket. Order was randomly assigned. Paired sample t-tests indicated that participants perceived performance to be higher after completing the computerized in-basket ($t(129)=-1.34$, $p=.09$). While performance perceptions were higher, actual performance did not differ by administration method ($\lambda = .99$, $F(1, 122) = .65$, $p=.42$, $\eta^2_p=.01$). Participants' performance based on the dimensions of communication, critical reasoning, relationship skills and overall performance was not significantly different based on method of assessment (computer or paper-and-pencil).

Limitations
Researchers aimed to collect data from participants with low computer experience, but participants had a higher level of computer experience than anticipated.

Research/Practical Implications
Utilizing computerized assessments are advantageous for organizations. Because perceptions of performance were higher after computerized in-baskets, applicants may perceive this process as fairer than paper-and-pencil administrations. Procedural justice in selection has repeatedly found to be an important aspect of an applicant's experience (Fodchuck & Sidebotham, 2005).

Originality/Value
While previous research has assessed performance differences in computer and paper-and-pencil assessments, this study focused on the applicant perspective, specifically aimed for applicants with lower computer experience. While performance on completing the simulation on either method was not significantly different, perceptions of performance were higher after completing the computerized version.
Purpose: The nature of performance distributions is a topic of current research, but has not been thoroughly studied within team contexts. In this study, we examined whether the interindividual performance profiles of teams tend more towards normal or non-normal distributions, and investigated how the nature of the distribution relates to overall team performance. Methodology: The sample consisted of teams and skaters from the 2014-2015 through 2017-2018 seasons of the National Hockey League (NHL). For multiple objective measures of individual performance behaviors and outcomes, we utilized the Kolmogorov-Smirnov (KS) statistic to compare the fit of each team’s performance profile with a Gaussian (normal) and Paretian (non-normal) distribution. We then analyzed the degree of normality as a predictor of team performance. Results: Behavior-based performance data generally fit a normal distribution better than a Paretian distribution. For teams in the playoffs, however, outcome-based performance tended to fit a Paretian distribution better. KS_{Gaussian} statistics (both behavior- and outcome-based) predicted playoff team performance indicating that the greater the normality of performance within a team, the better the team performed on average. Limitations: The findings may primarily generalize to team contexts with similar levels of interdependence and/or role differentiation. Research/Practical Implications: The results help to clarify the conditions and reasons for variability in how individual performance is distributed within work teams. Teams in high-pressure environments may benefit from structures that promote balanced contributions and interdependent collaboration. Originality/Value: By focusing on teams, this study contributes a unique perspective to the debate over the normality of performance distributions.
779 - CREATING AN INCLUSIVE WORK CLIMATE TO EFFECTIVELY LEVERAGE WORKFORCE DIVERSITY:

A JOB DEMANDS- AND RESOURCES PERSPECTIVE

Janna Behnke (1) - Evangelia Demerouti (1) - Sonja Rispens (1)

Technical University Eindhoven, Eindhoven, Netherlands (1)

Purpose. Creating inclusive work environments in which individuals feel that they belong and are valued for their unique characteristics, is important for managing diverse workforces. Based on Job Demands- and Resources (JD-R) theory (Bakker & Demerouti, 2014), we examine whether job/organizational demands and resources affect inclusion perceptions and consequently its relations with favorable individual outcomes.

Design. Data will be gathered in October 2018 using an online questionnaire that will be administered to academic and administrative staff of a technical university.

Results. We expect workplace demands (e.g. discrimination and unfair organizational procedures) to be negatively and workplace resources (e.g. inclusive leadership and information access) to be positively related to inclusion perceptions. Moreover, we expect inclusion perceptions to positively influence employees’ well-being, performance, and behaviors (i.e. networking behavior and organizational citizenship behavior). Finally, we expect employees’ diversity beliefs and the group diversity to moderate these relationships with the relationship being stronger in more diverse groups and groups with positive diversity beliefs where an inclusion approach is especially effective.

Implications. Studying diversity from the JD-R perspective, and demonstrating how work and organizational characteristics are related to perceptions of inclusion and individual outcomes offers implications regarding the underlying processes and how jobs and organizational procedures can be redesigned to foster equality and inclusion among employees.

Value. Previous work on inclusion did not integrate specific job and organizational characteristics as predictors for creating workplace inclusion. Further, our findings aim to provide evidence regarding the assumption that an inclusive climate generates beneficial outcomes.
Content:

Purpose: This study is intended to investigate how the expectations and values of young people before entering the labor market correspond with their real competencies and how they perceive their chances on the labor market. By conducting this study I intend to help young people from Generation Z entering the Czech labor market more efficiently.

Design: Using a student sample, I will conduct a questionnaire survey based on the model of successful entry into the labour market developed by Mareš, Vyhlídal and Sirovátka (2002). Evaluation of own chance on the labor market will be seen through partial replication of The Theory of Random Learning (Krumboltz, 2002) and measured using 5-points Likert scale. Career-Adapt Abilities Scale (Savickas, Porfeli, 2012) will be used for depicting the working potential. Life Values Inventory based on Values-Based Theory (Brown, 2002) will be used for analyzing values. I will use linear regression for studying moderation effect of expectations and values and possible relationship with young people real competencies.

Results: Still in progress. The pilot study (N=1000) is scheduled for spring 2019. I would like to involve the Czech university and high school students as Generation Z involves young people born after 1995.

Limitations: The study will be administered to a student sample and used cross-sectional design, both influencing its generalizability.

Implications: The results of the study support an investigation of employability of young people in the Czech context and provide an insight into the nature of expectation and values of Czech Generation Z.

Value: The study examines the factors of entry into the Czech labor market for Generation Z in order to make the process more efficient.
Brief Social Psychological Interventions to Reduce Leadership Gender Gap

Dilek Uslu & Asst. Prof. Yasemin Kisbu-Sakarya
Department of Psychology, Koç University

Purpose: Besides positive changes in terms of gender equality, women are still underrepresented in the higher echelons of management. Stereotype relevant worries have been suggested as partly responsible for this gap. Accordingly, the current study aims to explore the effectiveness of two brief social psychological interventions to reduce the perceived stereotype-threat of women in a leadership situation. Design/Methodology/Intervention: 159 Female college students were randomly assigned to a (1) self-affirmation intervention condition in which they are asked to select a value important to themselves and write about their relevant experiences, (2) role modelling intervention condition in which they read a letter from a female employee, and (3) a control group. Then they were given a leadership task to perform.

Results: Among participants who had no leadership experience, participants in the self-affirmation group significantly outperformed the participants in the control group in terms of leadership task performance; and participants in the role-model group had significantly higher scores than the participants in the control group in terms of leadership aspirations.

Limitations: College students served as participants in this study. A follow-up study with female employees is currently undergoing tough.

Research/Practical Implications: Findings will contribute to reduce the leadership gender gap in the workplace.

Originality/Value: The present research is the first study that adapts brief social psychological interventions that are mostly used to reduce gender gap in education, into the leadership context.
Perceived Transformational Leadership Style and Workaholism: The Mediating Role of Work Motivation

Modesta Morkevičiūtė (1) - Auksė Endriulaitienė (1) - Evelina Jočienė (1)

Vytautas Magnus university, Psychology, Kaunas, Lithuania (1)

✓ Purpose
The purpose of the study was to investigate the mediating role of work motivation in the relationship between a perceived transformational leadership style and workaholism.

✓ Design/Methodology/Approach/Intervention
The study involved 250 employees working in different Lithuanian organizations. The perceived transformational leadership style was assessed with the help of Podsakoff et al. (1990) Transformational Leadership Inventory. Employees’ workaholism was measured using 10-item Dutch Work Addiction Scale (DUWAS) by Schaufeli et al. (2009). Work Extrinsic and Intrinsic Motivation Scale (WEIMS) developed by Tremblay et al. (2009) was used for the measurement of work motivation.

✓ Results
Significant positive correlation between intrinsic, extrinsic work motivation and workaholism was found. It was found a significant positive correlation between perceived high expectations of the manager and employees’ workaholism. Perceived individualized consideration was related negatively to employees’ workaholism. The results also showed that perceived transformational leadership and workaholism are related indirectly through work motivation types as mediators: intrinsic and extrinsic work motivation (integrated, identified and introjected regulation).

✓ Limitations
Rather small sample size and the cross-sectional nature of the study are the major limitations.

✓ Research/Practical Implications
The study integrated both the positive and negative sides of transformational leadership in order to give a full view of their roles in influencing employee-related outcomes. Managers should be introduced to the concept of the transformational leadership style and to manage their leadership in a deliberate way.

✓ Originality/Value
The study adds to the limited empirical research on the negative effect of the transformational leadership style in determining employees’ health-damaging work behavior.
Threats and violence at work are major concerns for employees in many human service sectors. While physical assaults are rather seldom, coworkers are often be confronted with daily hassles like verbal abuse and personal insults which go hand with self-esteem threats. Up on the demands-resources model the present study focused the interactions of client-initiated workplace violence (type, frequency), indicators of psychological well-being and irritability as well as strategies of self-regulation and coping factors of the organizational and social setting.

Data were collected online with the self-report questionnaire “Critical Customer Survey” which included e.g. type and frequency of client-initiated workplace violence, demands and resources (team, leadership, and organization), personal coping behavior and outcomes variables.

A sample of 467 German workers, 36.5% men and 63.5% women, was obtained from various branches (e.g. public administration (39%), railway (34%), medical services (7.4%)). Interactions and moderator effects were tested by e.g. multilevel logistic regression analyses.

The results of the study underlines the importance of including the psycho-social work environment in order to improve the coworkers’ coping ability as a supplement to existing violence prevention methods and interventions aimed at reducing work-related violence. Despite its value, the study had several limitations for instance the self-reported retrospective method and the sample size. Vagaries in memory or the common method bias may also alter the data.
Purpose
The primary goal of this work is to use a social relationship framework to study differences in employees' responses to interactional fairness as revealed by their evaluations of a co-worker's flexible work arrangement (FWA) usage. Two types of employee relationships are examined: exchange and communal.

Design
We used experimental design and conducted two online studies.

Results
Results of two studies suggest that the type of employee's relationship (exchange vs. communal) moderates the effect of interactional fairness such that employees who have a communal relationship are more responsive to interactional fairness under conditions of low distributive fairness while those who have an exchange relationship are more responsive under conditions of high distributive fairness.

Limitations
More studies, such as field study, are needed to verify this effect in different contexts.

Research/Practical Implications
We bring together two distinct streams of literature: fairness and relationships in a worker–co-worker context of FWA usage to deepen our understanding of co-worker relationships. We contribute to the larger literature on fairness by providing evidence for the moderating effect of relationship types on interactional fairness. Specifically, when experiencing an unfavorable outcome, workers will respond more positively to increased interactional fairness in a communal than in an exchange relationship; in contrast, when experiencing a favorable outcome, workers will respond more positively to increased interactional fairness in an exchange than in a communal relationship.

Originality/Value
This research provides value for both academics interested in issues of fairness and for practitioners interested in issues of FWA.
Purpose. To investigate the relationship between employees' burnout and the levels of their organizational commitment.

Design. The investigation was conducted in 2017 on a sample of 209 business organization employees in the eastern regions of Ukraine using Maslach Burnout Inventory (adapted by N. Vodopianova) and Employee Organizational Commitment Scale (by D. Samoilenko).

Results. Depersonalization, reduction of personal accomplishment and burnout index had moderate negative correlations with employees' organizational commitment indicators (p <0.001).

High scores on the depersonalization scale (manifested in cynical, indifferent attitudes towards work) associated with employees' low organizational commitment.

Personal accomplishment had the strongest correlation with the organizational behavior component of organizational commitment (-0.501, p<0.01).

High scores on the reduction of professional accomplishment scale (manifested in the feeling of professional incompetence) associated with employees' low willingness to work for the benefit of the organization.

The investigation did not find any significant relationship between employees' emotional exhaustion and organizational commitment.

Limitations. The investigation was conducted on quite a small sample in only one region of Ukraine.

Practical implications. The findings can be used by organizational psychologists and HR-managers in shaping or improving employees' organizational behavior.

Originality. This was the first study conducted by Ukrainian researchers to investigate the impact of burnout on employees' organizational commitment and organizational behavior.
Purpose. The labor market is characterized by insecurity, economic instability, and ongoing turbulence (Di Fabio; 2017). In this scenario, a new area of research and intervention, is exponentially growing; it is the psychology of sustainability (Di Fabio, 2016, 2017) and in terms of employability as a key for career success (Lo Presti, Pluviano; 2016).

Methodology. The aim of this study is to assess how college students are approaching the innovative learning methodology typical of the entrepreneurship education. The analysis of operational model of the “Contamination Lab” an innovative Laboratory aimed at developing an entrepreneurial mindset, creativity and innovation at University of Salento (Lecce, Italy) according to the learning strategy of the Entrepreneurship Education.

Results. The sample (N = 30) had a mean age of 25.20 years (ds 4.11) (men: 57%); most of them were recent graduate students (77%). There are gender differences for the perceived subjective career success (Lo Presti, Pluviano; 2016). Moreover, regression analysis indicated that career and professional success affects the perception of the labor market in T1 while in T2 this perception changes.

Limitations. A study limitation is the use of a self-reported questionnaire. Moreover, the sample was limited.

Research/Practical Implications.
The laboratory involves all the University’s students with different backgrounds through an innovative extra-curricular learning program to create an entrepreneurial awareness, mindset and capability.

Originality/Value
The experience can be crucial for students, because it’s part of the career practices and career interventions useful to enhance a balance between personal attitudes and global needs.
Purpose: Previous research on team diversity and team performance focusses on objective diversity measures (i.e. gender, age, nationality, education, etc.) to identify relationships (e.g. Lauring & Villesèche 2017, Wegge et al. 2008). So far, research neglected the perception of diversity as a crucial factor. However, theory developed by Ormiston (2016) emphasizes the relevance of perceived diversity. Consequently, we need to understand the linkage of perceived team diversity and team performance.

Design/Methodology/Approach/Intervention: I performed a systematic literature review on theories and previous research about team performance, team diversity and perception of diversity to develop a conceptual model.

Results: Based on the findings from the systematic literature review, I propose an inverted U-shape relationship of team performance and perceived team diversity. The conceptual models implies that increasing the degree of perceived diversity within a team is only beneficial for team performance until a tipping point and decreases afterwards.

Limitations: This paper presents a conceptual model, further research is required to empirically test and confirm the proposed relationship.

Research/Practical Implications: The conceptual model illustrates the importance to include the perception of team diversity into future research. It provides help for practitioners to get insights into the linkage of team composition and team performance.

Originality/Value: The conceptual model takes a new point of view by considering perceived diversity as a crucial aspect. To our knowledge, this is the first paper to propose a relationship between perceived team diversity and team performance.
Purpose. The purpose of this paper is to discover opportunities digitalization holds for both companies and employees. While building on organizational support theory the authors go beyond and look at benefits stemming from signaling and from use of a digital tool.

Design/Methodology. A field experiment with Chinese blue-collar workers in a large garment factory has been carried out. After the implementation of an e-HRM tool the effects on turnover (actual and intention) and internal CSR have been analyzed.

Results. The findings of the experimental design proved that internal CSR and partially turnover intention are positively affected by the e-HRM tool. Although there were tendencies indicating a positive signaling effect, the use effect found stronger support for actual turnover, turnover intention and internal CSR.

Limitations. While the homogenous sample improves control over confounding effects, it potentially limits the generalizability of the findings. Further research is needed in other companies and cultures including other e-HRM tools to explore similarities and differences.

Practical Implications. The findings highlight the potential of e-HRM as a new instrument to improve favorable employee attitudes and behaviors. In addition, the results demonstrate that e-HRM improves perceptions of internal CSR which renders it to be not only valuable from an economic but also from a normative point of view.

Originality/Value. The study contributes to the existing literature by adding an ethical perspective on digitalization and providing empirical evidence from a field experimental and longitudinal setting. It further attempts to extend organizational support theory by examining the value stemming from signaling and from use.
832 - THE JOINT EFFECTS OF SITUATIONAL CONSTRAINTS AND BRICOLAGE ON DAILY CREATIVITY ACROSS CONTEXTS

LMU Munich, Munich School of Management, Munich, Germany [1] - Ruhr-Univ. Bochum, Center for Entrepreneurship, Innovation, and Transformation, Bochum, Germany [2]

Purpose

Knowledge about the determinants of creativity is of substantial relevance. However, the literature is still inconclusive as to whether constraining employees facilitates their creativity or whether providing them with more resources is beneficial in this regard. We theorize that both perspectives are true, but that they are dependent upon the individuals’ personality (i.e., their tendency for bricolage) and their context (i.e., bottom of the pyramid – BoP – vs. non-BoP).

Design/Methodology/Approach/Intervention

To test our hypotheses, we collected cross-cultural experience sampling data in India and the United Kingdom and used hierarchical linear modeling (HLM) of 2,405 daily observations from 310 individuals.

Results

Our results show that situational constraints facilitate (vs. hinder) creativity for those individuals being good (vs. poor) at making do with whatever is at hand. Moreover, our study reveals that this contingent role of bricolage for situational constraints translating into daily creativity is more critical in the BoP context than in the non-BoP context.

Limitations

Our analyses are based on self-report data.

Research/Practical Implications

Integrating prior research on daily fluctuations in creativity with person-environment fit logic helps to make sense of why simply constraining individuals in their everyday work falls short when aiming at fostering creative behaviors.

Originality/Value

With our contextual comparison, we contribute to the scarce research applying an experience sampling methodology across different cultures. Therefore, we develop theory on the particular importance of considering contextual differences when conducting research in the field of creativity in general, and on constraints and bricolage in particular.
ABSTRACT

Purpose. Although creating an inclusive workforce is high on the agenda of many organizations, contemporary organizational practices are often exclusive in nature. An increasing amount of resources are being invested in talent management practices, which aim to differentiate the so-called high potentials from the ordinary employees. The underlying rationale is that differential treatment (i.e., workforce differentiation) is deserved as it is based on an objective assessment of someone’s value, typically measured in terms of excellent performance on predefined competences combined with the presence of highly valued characteristics. This paper contests the “justification by excellence” rationale behind differential treatment by looking at the inequalities in and power dynamics behind talent decisions.

Approach. We performed a discourse analysis to identify 28 HR managers’ notions about what constitutes talent and how this (re)produce social inequalities in talent decisions.

Results. We claim that what is considered to be talent— and thus of value to an organization—represents qualities typically attributed to archetypical white men.

Limitations. No culturally differences in the talent construct were being investigated.

Implications. In order to create inclusive talent management practices, organizations should not solely think about removing obstacles for minority groups within their current policies, but first and foremost rethink their often normative ideas about what constitutes talent in the first place.

Value. Talent management researcher have investigated how to conduct talent identification objectively. However, no attention has been directed to how the construction of the concept of talent as such reproduces social inequalities in high-stakes talent decisions.
Bridging the information gap between current entrepreneurs and potential investors is particularly important for new ventures seeking investments. Nonetheless, discerning the value and commercial promise of embryonic ideas can be difficult, particularly for outsiders. Recognizing this dilemma, prior studies have investigated a range of mechanisms used to shape outsiders’ expectations about the quality and profit potential of new ventures, as well as about entrepreneurs’ commitment, among which third-party affiliations, patents or personal resources invested. However, relatively little attention has been placed on the role of passion of the entrepreneur as a value and a commitment signal for new ventures. Because investors are experts that habitually make investment decisions, their decision-making are highly likely include strong perceptual elements such as passion.

A passionate entrepreneur can be a signal of a valuable new venture idea, since there are high costs associated with becoming passionate for a poor-quality business idea. Moreover, passion is used by investors to uncover the entrepreneurs’ commitment to the new venture, since it has been demonstrated to drive tenacious pursuit of goals and to inspire stakeholders to support ventures. This study draws on signaling theory and in extant theory in entrepreneurship to explore whether and under which conditions investors take into account passion of the entrepreneur as a funding criterion.

The hypotheses will be tested based on a mixed sample of VC’s and angel investors (n=80 study participants).
Early employees are critical for the success of new ventures. However, new ventures do not have a lot to offer to job seekers in terms of pay or job security. So, how do entrepreneurs manage to persuade potential employees to join their newly-established firms? In this study, we answer this question by focusing on a definitional salient characteristic of entrepreneurs: passion. To our knowledge, no study to date has tried to understand whether passion plays a role in attracting job-seekers. This is surprising, considering that passion is the most widely noted and readily visible element attributed to entrepreneur, and that the person of the entrepreneur plays a crucial importance in acquiring resources.

We propose that displayed passion of the entrepreneur will positively influence the attractiveness of the new venture as an employer (1) directly, because passion signals motivation and goal commitment from the side of the entrepreneur; and (2) indirectly, as a moderating factor, because it increases the persuasive properties of other relevant information transmitted by the entrepreneur, such as information about the product innovativeness. We use an experimental methodology and test our main and moderating hypotheses on a job-seekers’ sample of 250 students close to graduation. The participants watch a series of videos where various real entrepreneurs present their venture, including their product/service. The participants then report the new venture attractiveness as an employer. The independent variables, displayed passion of the entrepreneur, and product innovativeness will be measured by external evaluators through analysis of the video and its transcript.
**Purpose:** Past research has indicated that antecedents such as psychological safety and team specialization were found to affect team-level behaviors. The use of virtual teamwork has become essential for modern work environments that require skill diversity and adaptability. This study investigated the relationship between those two antecedents and team related outcomes (i.e., team trust, team support, perceived team effectiveness, and team cohesion) in a virtual environment.

**Design:** Archival data was used from a previous study of 200 undergraduate students participating in a team-based virtual activity. We predicted that participants who reported higher levels of psychological safety and higher levels of team specialization would report higher levels of team trust, team support, perceived team effectiveness, and team cohesion.

**Results:** Higher levels of psychological safety were significantly associated with higher levels of team support and team cohesion, but did not support association with the other two outcomes. Higher levels of team specialization was related to higher levels of all outcomes except cohesion. Further analysis demonstrated that team cohesion significantly moderated the relationship between team specialization and team support.

**Limitations:** An undergraduate sample was used which may be not be representative in the population.

**Research: Practical Implications:** Further research is needed to understand how specialized roles impact the perceptions of virtual teams and positive outcomes for organizations.

**Value:** Our results highlight the value of highly specialized roles within a virtual team activity and the potential for team cohesion to enhance the positive effects of team specialization.
ABSTRACT

✓ Purpose: This study aims to investigate the role of empowering leadership in changing the effect of entrepreneurial demands on affect oscillation at work of startup employees.

✓ Methodology: Our data was collected in startup companies in Portugal, using an online survey through Qualtrics software. Our sample had a total of 103 startup employees.

✓ Results: Results showed that empowering leadership interacts with the felt entrepreneurial demands (regarding time and responsibility) in the prediction of employees’ affect oscillation at work. In fact, when startup employees reported lower levels of empowering leadership, experienced entrepreneurial demands were not associated with employees’ affect oscillation at work. Yet, for average and higher levels of empowering leadership, the more the employee felt time and responsibility demands, the more s/he reported feeling affect oscillation at work.

✓ Limitations: Due to the cross-sectional nature of the empirical design we cannot draw causal inferences from our results.

✓ Research/Practical Implications: Our study points to the need of giving training for people working in startup contexts (and not only for entrepreneurs) on emotional regulation, besides typical business education focused on how to manage a business.

✓ Originality/Value: Our study enlarges the entrepreneurship literature in two ways: focusing on affective dynamics in entrepreneurial contexts and centring on startup employees and not only on entrepreneurs. Moreover, we extend the affect literature presenting a new measure of specific state affect variability: affect oscillation at work.
ABSTRACT

✓ Purpose: This study aims to understand the relationship between creativity at work and work-nonwork enrichment. We propose that the impact of creativity at work and the work-nonwork enrichment experienced can be explained by the enhancement of meaningfulness at work associated with the enactment of creative behaviors in the workplace.

✓ Methodology: Our data was collected in a multinational consultancy company operating in Portugal involving 164 employees.

✓ Results: Results show that creative behaviors at work can contribute to employees’ work-non-work enrichment. Additionally, our findings suggest that meaningfulness at work mediates this relationship.

✓ Limitations: Due to the cross-sectional nature of the empirical design we cannot draw causal inferences from our results.

✓ Research/Practical Implications: Our study points to the need for managers to create conditions that encourage employees to enact creative behaviors at work. This, not only benefits organizational performance but also promotes meaningfulness at work and the ability of employees to transfer the resources and development experiences learned in the work to other dimensions of their private life.

✓ Originality/Value: Our study enlarges the creativity literature adopting a person-centred approach and focusing on creativity’s outcomes, instead of its predictors. Moreover, we extend the work-family literature expanding our focus to the impact of work on the general private life of the individual and not just for his/her family.
ABSTRACT

Research emphasizes the importance leaders’ behavior in creating healthier work environments that supports employees’ development and well-being (Haas et al., 2002). Authentic leadership (AL; Avolio et al., 2017) reflects self-awareness and self-regulation of positive behaviors that entice transparency, trust, openness, and guidance in the leader/follower relationship (Gardner et al., 2005; Harter, 2002). Although a lot of research is available regarding how authentic leaders contributes to creating healthy work environments for their employees, the literature is scarce about how their behaviors contribute to their psychological well-being beyond the workplace. In the nurse practice, work-life balance (WLB) represents a major challenge for many employees as the nature of their job regularly makes them put their patients’ needs before their own, as well as before the ones of their families. Atypical schedules and compulsory overtime are other examples of factors in the nurse practice that can undermine employees’ work-life balance, personal and professional well-being. The present studies draw from AL and WLB literatures to examine how perceived authentic behaviors from supervisors can help nurses to balance more adequately their work and personal lives, and ultimately, preserve or increase both personal and professional well-being. Specifically, we propose that nurses’ perception of their supervisor’s authentic leadership practices is positively associated with work-life balance, which promotes job satisfaction and life satisfaction. Data were collected from 364 registered nurses (88% women). The results of structural equation modelling support the proposed model and thus contribute to an improved understanding of how AL extends beyond the workplace. The theoretical and practical contributions are discussed in the light of AL theory (Avolio et al., 2017) and the work-life balance literature.

Keywords: Authentic leadership, Work-life balance, Life satisfaction, Job satisfaction
Purpose
Given the advancements of technology and the ever-increasing number of new tools available to researchers, it warrants interest to explore whether technology can be utilized to provide an alternative measure to self-report. In this proof-of-concept study, we set out to explore if Virtual Reality Environments (VRE) are a feasible application for assessing psychological variables, emotional intelligence (EI) and risk taking (RT), consistent with self-report measures.

Design/Methodology/Approach/Intervention
A preliminary sample of 27 students participated in a virtual reality experience intended to assess emotional intelligence and risk taking.

Results
Results suggest a relationship between measures gathered in virtual reality (VR) and convergence between VR and self-report measures. We will elaborate on these findings and possible psychological explanations for our results.

Limitations
Further testing required a larger, generalizable sample. Being a novel technology, the field lacks a solid foundation of established guidelines to follow. These guidelines were established by the researchers and decisions were made based on scientific literature.

Research/Practical Implications
We are unearthing a brand new methodology that could open doors for the future of psychology by exploring various types of activities and behavioral demonstrations, and different scoring strategies.

Originality/Value
To our knowledge, this was the first study to attempt to measure psychological constructs in virtual reality and converge those with self-report measures. We will discuss the promising future of VR as an assessment tool.
Abstract

**Purpose.** To investigate whether psychological capital scores vary according to generational cohort and workload among Italian hospital nurses.

**Methods.** A convenience sample of 220 Italian nurses (78.6% female, aged 26-60 years) from public and private hospitals completed the Psychological Capital Questionnaire-Short version and questions on sociodemographics (gender and birth-year) and workload in terms of number of patients assisted per day and number of night shifts in the last month. Generational cohorts were defined as Baby Boomers (BB; born 1946-64), Generation X (Gen X; born 1965-76), and Millennials (M; born 1977-1993).

**Results.** Compared to BB (7.7%), Gen X (28.2%) and M (64.1%) nurses showed moderately and strongly higher Hope, respectively, and strongly higher Resilience. Optimism reported by M was strongly and slightly higher than that reported by BB and Gen X, respectively. Nurses with >5 night shifts in the last month (48.6%) reported slightly lower Resilience than nurses with ≥5 night shifts. Psychological capital scores did not vary according to the number of patients per day.

**Limitations.** Participants were not randomly selected, and generational cohorts were not equally represented.

**Research/Practical Implications.** Training interventions aimed to increase nurses’ psychological capital should be tailored to specific generational cohorts. To preserve nurses’ resilience, a maximum number of 5-night shifts per month could be recommended, however, future studies should further explore how best the shifts could be adjusted to improve their psychological capital.

**Value.** The present study contributes to the understanding of generational differences and the role of workload in psychological capital at work.
Abstract

Purpose. The study had a twofold aim: to extend the support for Psychological Capital (PsyCap) as higher-order construct from the relationships with Work Satisfaction (WS) and Task Performance (TP) to that with Contextual Performance (CP); and to explore the type of employment contract (temporary vs permanent) and the length of work experience (below vs above 6 years) as moderators in the PsyCap-WS, -TP, -CP relations.

Design/Methodology. Within a cross-sectional design, 496 workers from the general Italian working population fulfilled a questionnaire. Data were analysed through Usefulness Analysis and Moderation Analysis using PROCESS.

Results. PsyCap explained more variance in WS, TP, CP over and above its subcomponents. Type of employment contract did not work as moderator; length of work experience moderated only the PsyCap-WS relation (stronger above 6 years).

Limitations. Cross-sectional design; overlooked variability within temporary contract forms; work experience limited to a 6-years span.

Research/Practical Implications. Practically, organizations are encouraged to foster the development of a high PsyCap level within their workforce as it is related to high WS, TP, CP without differences according to the form of employment contract and the length of work experience, except for the relationship with WS which is stronger in more experienced workers compared to those with less work experience. Theoretically, the support to PsyCap as higher-order construct is extended to CP as outcome.

Originality/Value. It is offered the first evidence of PsyCap as higher-order construct in relation to CP by means of Usefulness Analysis; new insights are provided into moderators of PsyCap.
THE MEDIATING ROLE OF CROSS CULTURAL ADJUSTMENT IN THE RELATIONSHIP BETWEEN CULTURAL INTELLIGENCE AND JOB PERFORMANCE. A RESEARCH ON A SAMPLE OF EXPATRIATE WORKERS

Ilaria Setti (1) - Valentina Sommovigo (2) - Piergiorgio Argentero (1)

University of Pavia, Pavia, Italy (1) - University of Pavia; University of Limerick, Pavia; Limerick, Italy (2)

Purpose. In a context characterized by global mobility and flexibility, managing diversity is a key determinant of productivity. Since expatriates represent invaluable assets for companies, it is important to consider individual characteristics, such as cultural intelligence (i.e., the capability to function effectively within culturally diverse situations), which may influence their cross-cultural work adjustment and, therefore, their job performance. The present study aimed to explore whether cross-cultural adjustment would mediate the relationship between cultural intelligence and job performance.

Methodology. The Cultural Intelligence Scale, the Expatriate Adjustment Scale, and the Expatriate Contextual/Managerial Performance Skills Scale were administered to a sample of 151 expatriates working in an oil and gas industry. SEMs were conducted.

Results. The SEM in which the meta-cognitive dimension of cultural intelligence influenced expatriates’ job performance through the (full) mediation of work-related cultural adjustment outperformed those which considered the other cultural intelligence dimensions ($\chi^2=52.40, p=.38$, RMSEA=.02, SRMR=.05, CFI=.99, TLI=.99). Meta-cognitive cultural intelligence was positively related to work adjustment which, in turn, facilitated expatriates’ job performance.

Limitations. This study was cross-sectional and limited to a single organization. Future studies should overcome these limitations by adopting a longitudinal design and by collecting data in different contexts.

Practical Implications. Highly culturally intelligent individuals adjust and, then, perform better in new cultural environments. Multinationals should consider expatriates’ cultural intelligence in recruiting and training practices, since it represents a key factor for organizational success.

Originality. This research contributes to the expatriate literature by acknowledging the influence of cultural intelligence on task performance through cultural adjustment.
Purpose. Human resources with international experiences represent invaluable assets in the current global marketplace, since they increase organizational competitiveness. The present study aimed to investigate whether cross-cultural adjustment may mediate the association between work-family conflict and job performance and whether social support may buffer the detrimental effects of work-family conflict on cross-cultural adjustment.

Methodology. The Expatriate Adjustment Scale, the Expatriate Contextual/Managerial Performance Skills Scale, the Leiden Quality of Work Questionnaire, and the Work-Family Conflict and Family-Work Conflict Scales were administered to a sample of 118 expatriates working in an oil and gas industry. SEMs were conducted.

Results. When expatriates perceived work-family conflict, they were less likely to successfully adjust to culturally different workplaces and to perform well, especially in presence of low ($\beta=-.02, p<.01$) and moderate (-.01, $p<.01$) support from their colleagues. This moderated mediation model ($AIC= 5122.09$) outperformed those which considered supervisor and family support as buffers ($AIC= 5286.01; AIC= 5198.52$, respectively).

Limitations. This cross-sectional study was limited to a single company. Future research should collect longitudinal data from different sources and settings.

Practical Implications. To facilitate a successful expatriates’ integration, companies should involve their families in the expatriation process and promote positive relationships among colleagues.

Originality. This research contributes to the expatriate literature by identifying the protective role of colleagues’ support against the impact of work-family conflict on cultural adjustment and, thus, performance.
The purpose of the study was to investigate whether an intervention aimed at enhancing self-control capabilities can be used for enhancing student well-being during the exam period. We used a popular approach in health psychology (i.e., implementation intentions).

Out of an initial sample of 122 volunteers, 107 students (mean age 21 years, 83% females) participated in an online intervention program, during the last two weeks of a four-week exam session. Participants offered daily input regarding their intentions and study progress, and underwent three major assessments (baseline N=107, intermediate – after one week N= 94, and final – at the end of the interventions N=86).

The students were randomly assigned to an active control condition (i.e., had to formulate intentions regarding their eating behaviors), or to one of the two experimental conditions. In one experimental group, students had to establish intention implementation plans for different obstacles they might encounter when trying to study. In the other experimental group, participants had to create intention implementation plans to follow a specific learning schedule. Outcome variables were state depletion, student engagement, and student burnout. When controlling for baseline levels of the outcome variables, we found significant differences between the three groups on state depletion ($\eta^2_p=.12$) and emotional exhaustion ($\eta^2_p=.08$). We did not find significant effects on academic engagement and cynicism.

Although the intervention was short, our study suggests that strategies for enhancing self-control can be useful in reducing fatigue complaints during highly demanding periods.

Keywords: intervention, stress, self-control, implementation intention
Increased insight to the multifaceted behaviour that is absenteeism has long been a foremost goal of absence theory development. Absenteeism management does not come with clear-cut resolutions but it is well recognized that developing coherent understandings into the context surrounding the absence behaviour is fundamental. The melting pot of current models of absenteeism is an amalgam of motivational structures, attitude-theories, and broadly empirical instances which attempt to yield a portrait of absence-taking. As these models are advanced and authenticated, they represent the conduit to absenteeism control and organisational management. However, what may be conceived of as the expectation for clean and tidy models that effectively encapsulate absenteeism, circumnavigate the untidy actuality of organizational context and within-person experience. Organisations are not closed, sealed entities that pursue rational pre-determined goals, context-free. There must be recognition that the elucidation of rich idiographic context makes possible the joining of data observations into the larger whole of theory. This research both captures and conceptualises the influences that determine individuals’ sense making of absenteeism. By utilising within-person experiential data derived through Interpretative Phenomenological Analysis (IPA), insights into the gap between what is assumed about absenteeism and what is experienced are generated. The data underlines how participants’ narratives instantiate absenteeism, and how participants shape, and are shaped by their relevant organisational context. Through the development of a novel heuristic continuum model of absenteeism, the data suggests powerful contextual influences where absenteeism has nuanced complexity and the exigency issues relevant to explaining how it is operationalised are indicated.

**Key Words:** absenteeism management, Interpretative Phenomenological Analysis,
Purpose

The purpose of this diary study is to identify if proactive strategies addressing the accumulation of personal resources and the offer of interpersonal resources are a key to WLB in small business owners and their spouse. This sample is a vulnerable group when it comes to Work-life balance (WLB) since they evince unique demands (e.g., highly integrated roles) as well as facilitating factors (e.g., supply of spousal social support) in creating a satisfying WLB. Drawing on COR-Theory, we investigate in this interdependent dyadic system if WLB crafting strategies promote a higher satisfaction in WLB through more resource replenishing experiences at work and during leisure time.

Design

The study tracked 55 couples who completed daily surveys twice over five consecutive days. We assessed WLB crafting strategies, flow, recovery from work, and WLB at bedtime as well as the state of being recovered in the morning.

Results

Preliminary results of multilevel analyses will be presented such as supplied support from the significant other sets the stage for resource creation by addressing situational needs.

Limitations

Due to the sample characteristics in this study - mostly married, middle-aged couples in Germany - the generalizability of our findings may be limited.

Practical Implications

Our findings suggest strategies to enhance WLB, which may improve interventions in this field.

Value

This study contributes to occupational health research of small business owners. Further, it shed light on the creation of personal and shared resources to promote WLB in the interdependent system of owners and their spouses.
In aftermath of the most recent Global Financial Crisis, many governments are challenged with insecurity, economic instability, and ongoing turbulence which may undermine the collective welfare and the promotion of a more inclusive society. To assess different motives that lead people to give their contribution to the common good, we developed a new metric, the Common Good Provision scale (CGP). Items were generated from a preliminary qualitative study investigating meaning and representations on the common good and its provision. The psychometric properties of the scale were investigated on 469 participants (61.4% females, mean age = 35.5, sd = 13.5). Both exploratory and confirmatory factor analyses were performed. The final scale, which consists of 7 items, contains two dimensions: Accessibility (i.e., making the common good accessible to anyone and fulfilling people’s basic needs) and Personal Gain (i.e., getting a return and personal advantage in exchange for one’s contribution). In addition, we tested a model in relation to a specific form of contribution: the financial provision for the common good through paying taxes and making charitable donations. It was found that when the Accessibility motive prevails, people are more willing to pay taxes and make donations, whereas when the Personal Gain motive prevails, people are more likely to commit tax evasion and less willing to make monetary donations. Potentialities and further applications of the CGP scale to other contexts are discussed, in particular in relation to the promotion of people’s wellbeing at both macro (i.e. societal) and micro (i.e. organizational) level.
Purpose
Research has demonstrated the significant influence of both age and gender stereotypes on workplace interpersonal relations (Heilman & Eagly, 2008; Posthuma & Campion, 2009), but has yet to consider the influence of multiple identity group membership on the content of these stereotypes. We wished to see if age stereotypes differ for men and women, and if gender stereotypes differ across age groups.

Method
In two studies, U.S. psychology students completed an online survey developed from methods used by Finkelstein, Ryan, and King (2013). Our first study assessed age stereotypes (qualities and traits) while varying gender across conditions; the second assessed gender stereotypes while varying age across conditions.

Results
The open-ended data was coded using 1) a validated list of age trait codes, 2) a validated list of gender trait codes, and 3) warmth and competence dimensions. Comparisons will be presented against the control group within each study, and between comparable conditions across studies.

Limitations
Sample age limited other-stereotype content explored. The richness of the qualitative data is a strength, though complementary quantitative findings will lend more support for this work.

Implications & Value of Contribution
Though research adopting an intersectional view has flourished in social policy and sociology, organizational psychology has not fully incorporated this perspective in theory or practice. This work lays the foundation for future intersectional examinations of age and gender issues in the workplace, and implications will inform sophisticated diversity training toward a broader goal of inclusivity.
References

Job Crafting is useful experience to model job and make it functional for personal needs and concerns. It makes performances and professional satisfaction better. There are few studies focused on student job crafting. Target of this research is to notice study-crafting and study-engagement experience in a group of 1900 engineering students from a politecnico of northwest Italy. An adaptation of job crafting and job engagement questionnaire was made. Results show a good factorial structure of the scales, coherent with literature, acceptable Cronbach alpha (all above .70) and significant relationships within sub-dimensions. From a descriptive point of view, 40% of the sample group shows that, during the preparation for the exams, difficulties with decreasing hindering job demands and increasing social job resources. A formative intervention to empower job crafting activities has been developed and the study crafting questionnaire are used to assess progress and give proper feedback to training participants.
Exploring the Positive Individual Experience within Virtual Teams: Understanding the Outcomes of Perceived Value and Motivation. Diana R. Sanchez, Adriana S. Y. Lee, Rene A. Vasquez, Dana P. Le, & Wesley H. Hale, Department of Psychology, San Francisco State University, 1600 Holloway Ave, San Francisco, CA 94132.

Due to the dynamic nature of work, organizations are increasingly moving towards team-based models within their company structure to accommodate the needs and demands of their customers (Bibu, et. al. 2013). One important factor for successful team interactions is the continued positive response team members have to the tasks and activities completed within the team during interaction times. Previous research has shown that when team members report favorable experiences, they perform more efficiently (Gabriel, et al. 2017).

This study investigated the relationship between psychological meaning, confidence in the activity, and engagement in the activity with the perceived value of the activity and the level of motivation participants experience after the activity. Using data collected from a previous study of 200 undergraduate students participating in a team-based virtual environment, we predicted that participants who experienced higher levels of psychological meaning, confidence in the activity, and engagement with the activity would also report higher levels of perceived value and motivation.

Consistent with previous research, our findings indicated higher levels of psychological meaning, confidence, and engagement were significantly correlated with higher levels of perceived value and motivation. Our results demonstrate team interactions that take individual dispositions into account may have positive effect on team-level outcomes.

Keywords: psychological meaning, engagement, confidence level, perceived value, motivation, virtual team
Purpose: The positive relationship between subjective socioeconomic status (SES) and psychological well-being (PWB) is well established (Adler et al., 2000), but has been sparsely studied among nonprofit workers. Interestingly, those employees would be more intrinsically motivated in their jobs and less driven by monetary rewards than employees from public or private sector (Benz, 2005; Melnik et al., 2013). Nevertheless, precarious working conditions appear as an important detractor of PWB for nonprofit workers (Laliberté & Tremblay, 2007). This study therefore aims to compare the relationship between SES and PWB among workers from nonprofit organizations and other types of organizations (TO).

Methodology: Employees from various sectors (n = 794) responded to an online questionnaire assessing their SES, PWB and TO. The moderating effect of TO (nonprofit organizations versus other types) on the association between SES and PWB was tested using the macro PROCESS (Hayes, 2018).

Results: Results indicated a marginally significant moderating effect of TO on the association between SES and PWB (p = .0507). The positive association between SES and PWB was stronger for employees from nonprofit organizations than for employees from other TO.

Limitations: Considering the marginally significant results, this study should be replicated to validate the moderating effect of TO in the association between SES and PWB.

Research implications: These results refute the assumption that nonprofit workers’ well-being would be less affected by their SES.

Originality / value: To our knowledge, this study was the first to assess the relationship between SES and PWB of workers among nonprofit organizations and other TO.
Research purpose: The majority of the current academic workforce is reaching its retirement age. It is therefore important to understand factors influencing younger academics to ensure sufficient information and skill transfer. The purpose of the study was to investigate factors influencing intention to leave of younger employees in an academic institution.

Research design, approach and method: Purposive sampling was utilised. The participants identified in the research were under the age of 35, in possession or in the process of obtaining a master’s degree. Seventeen semi-structured interviews were conducted and transcribed, after which a thematic analysis was conducted.

Results: Main findings of the study reveal that employment practices, job satisfaction, work engagement and well-being are among leading reasons for the intention to leave of younger academics.

Limitations: Lack of supporting literature as the study focused on a specific age group and other academic institutions are not represented in the study.

Practical/managerial implications: Inform human resource management practices of academic institutions to reduce younger academics’ intention to leave.

Contribution/value-add: The study adds value to institutions in terms of exploring factors that can result in younger academics leaving the profession and finding meaningful methods to encourage them to stay in these academic institutions.
Purpose

The present research encompasses an opportunity to investigate psychological fatigue in the offshore wind industry (OSWI) and promote positive organisational behaviour for employee safety and wellbeing.

Poorly managed fatigue can compromise employee safety in the short term and negatively affect health and wellbeing in the longer term.

This is especially relevant in high risk working environments with work which encompasses multiple mental and physical strains such as the OSWI.

Method

The first stage of data collection will consist of interviews with two teams of technicians. Team 1 ‘live’ on service operation vessels (SOVs) near to the turbines during a period of shifts (two weeks). Team 2 commute for each shift and are taken to and from turbines on a crew transfer vessel (CTV).

Aims:

1. Gain an understanding of how stressors give rise to fatigue and how fatigue affects technicians during a period of shifts.
2. Compare answers of teams 1 and 2 to determine whether shift and living arrangements moderate their experience of fatigue.

Results

Interviews will be qualitatively analysed using a thematic method (expected completion-February 2019).

Limitations

A small sample size and subjectivity of data may cause limitations. Follow-up studies are planned to address this.

Research/practical applications
This applied research will have a direct impact on a relatively new industry. It will be used to suggest necessary improvements for fatigue management.

**Originality/value**
This research is the first which examines fatigue in this setting.
Purpose
The implications of an ageing workforce are of concern across Europe. This is identified as a particular issue in the transport and logistics sector where health and safety performance is recognised as poor. This research investigates health impacts of working in the sector, and how driver age affects health.

Design
A two-phase qualitative study with professional drivers and managers. Phase 1 interviews in five medium to large transport companies were conducted with heavy goods vehicle (HGV) drivers over the age of fifty (n=14), and their managers (n=7). Data was analysed thematically. Phase 2 extends the research from HGV to light goods van (LGV) drivers.

Results
Drivers report high physical and mental demands, unsociable and long hours, lack of access to healthy food and long periods of sedentary work. Health consequences include stress, musculoskeletal disorders, tiredness and weight-related issues. Age is linked to increased issues with the physical elements of work, but improved coping with mental job demands.

Similarities and differences in the health and wellbeing needs of ageing HGV and LGV drivers will be identified and incorporated into network-led best practice guidelines.

Limitations
The research focuses on the transport and logistics sector meaning generalisability is limited.

Practical implications, Originality / value
A network of transport sector firms, industry representatives and unions has been created (Age, Health and Professional Drivers’ Network https://sites.manchester.ac.uk/ahpd/network/). The research team is working with network members to produce industry led age and wellbeing best practice guidelines for dissemination across the sector.
Purpose
Job crafting (JC) captures what employees do to redesign their own jobs to foster job satisfaction and engagement (Wrzesniewski, Dutton, 2001, AMR). As crafting a job incorporates various cognitive processes of problem solving and reasoning (e.g. how to increase support from supervisor, how to make a job less repetitive), thus it seems reasonable to predict that cognitive abilities and JC should be related in such a way that more cognitively capable employees are better job crafters. Surprisingly the research on relationships between JC and cognitive abilities are spare, thus to fill this gap in literature we postulate that working memory capacity (WMC), as ability to store and process information in memory, and fluid intelligence (Gf), as ability to analyse novel problems, are positively related to job crafting.

Approach
To investigate the relationship between WMC, Gf and job crafting we create SEM model in which WMC and Gf predict job crafting, job crafting predicts job resources and job complexity and these two predict work engagement. To test our model we use data of 126 multi-occupational employees collected in online study.

Results
We have found that WMC, but not Gf, predicts job resources via increase in job crafting.

Limitations
This analysis is based on small sample, thus needs further replication.

Research Implications
Our findings might spur further debate on unexplored problem of a role of cognitive abilities in job crafting.

Originality
This study is one of the first attempts to test possible relationships between employees' cognitive abilities and job crafting.
Purpose: This paper presents a novel experimental setup in virtual reality (VR), using haptic gloves with force feedback to examine performance differences in an assembly task. Many assembly tasks in industry require sensorimotor skills that can only be performed reliably by humans. How humans learn these tasks and how their learning process can be improved with cyber-human technology are therefore interesting and important questions.

Methodology: Our participants’ task was to assemble a real tractor clutch. We conducted three training treatments in a between-subjects design with 240 subjects. Before performing the assembly task, one group of subjects received traditional paper-based instructions, a second group received training in VR with standard controllers, and a third group was trained in VR with force feedback gloves.

Results: Preliminary results indicate significant differences in performance outcomes between the three groups, with VR training and standard controllers showing the highest performance.

Limitations: The technological development of haptic gloves is still in its early stages.

Research implications: The effects of haptic feedback on learning in VR are not fully understood. This research contributes new insights on how haptic force feedback improves human performance outcomes of training in VR.

Originality/Value: Although touch is an important human sense for simulating real world experiences, there is a lack of experimental research examining the effect of tactile sensations in a VR environment. We contribute one of the first experiments with haptic force feedback gloves and their effect on human training in VR.
Purpose: The aim of the study is to design and evaluate a training on coaching tools for leaders in health care organizations.

Methods: A review of the literature and a workshop with 17 experts of different areas, e.g. research, clinic, counsellors/coaches, were carried out to design the training programme. In the expert workshop the topics “content, condition for implementation, characteristics of coaches and methods for evaluation” were discussed in four subgroups and afterwards the results were presented in the plenary session. For the evaluation of the training programme a questionnaire was used at the end of the training.

Results: The training consists of two modules, which are carried out on two separate training days with eight weeks in-between. It was decided that any leader of a healthcare team could participate in the training. The training includes, among others: the role of a coach, team’s goal orientation, methods of systemic counselling and self-reflecting exercises. The process evaluation (N=35) showed positive results, e.g. the participants liked the training (M=8.57, SD=1.44) and would recommend the training (M=8.43, SD=1.53) on a scale from 1 (does not apply at all) to 10 (fully applies).

Limitations: The evaluation is only a formative evaluation and based on a very small sample.

Research/ Practical Implications: The participants can implement internal coaching in their clinics. Further evaluation of conditions for the implementation and the improvements in teamwork by the training is necessary.

Originality/Value: It is a promising approach for implementing internal coaching in the health care setting.
Abstract

Leadership is one of the most important factors to create more inclusive organizations and society, and the million-dollar question of leadership science is ‘What kind of leader behaviors make a leader effective?’ Thus, the aim of this research is investigating the effectiveness of four leadership behaviors in terms of higher follower performance, using the path-goal theory.

The current research is expected to make contributions to both science and practice. First, three new follower outcomes, creative and innovative performance (CIP), adaptive performance (AP), organizational citizenship behaviors (OCB) will be examined. Thus, this study will be the first one studying these outcomes using the path-goal theory. Second, the mediating role of psychological safety on the relationship of four leadership behaviors to the above-mentioned follower outcomes will be examined. It will be the first to test psychological safety in the context of path-goal theory. Third, one task and one follower characteristic will be tested as contingencies determining the efficiency of four leadership behaviors. It is expected and ‘task structure’ and ‘core self-evaluation’ (CSE) will be the contingencies of this relationship. Lastly, it is expected that this approach to path-goal theory will be a practical and scientifically supported theory for practitioners.

To test the proposed model, the scales of leader behaviors, task structure, CSE, psychological safety, CIP, AP and OCB will be administered to employees from different occupations using Amazon’s MTurk platform. As limitation, all data will be provided from a single source.

Note: The research is on the data collection process, thus the results could not be reported. However, if the abstract is accepted, the data will be collected and analyzed until the congress date and all results will be presented in the congress.
ABSTRACT

The relationship between artistic domains (such as music, painting, dancing, etc.) and creativity is not a novel idea, but researchers have yet to identify the exact relationship that exists. This study seeks to shed light on the relationship between artistic domains and creativity in regard to expertise, novel production, generalizability, and personality. The domains in question include music, visual arts, creative writing, dance, soccer, and softball/baseball.

For this study, participants from the Psychology Research Pool completed a survey that was made up of three components: a portion of the HEXACO-PI-R, a Biodata Questionnaire, and a creativity measure called the Alternative Uses Task (Guilford, 1967). For this task, participants were asked to come up with as many creative and practical uses for the item pictured within two minutes. Significant relationships were only found within the music domain. Music experience ($B = .401, p = .003$) and production of novel work ($B = .337, p = .014$) were found to predict the number of creative uses and that the interaction of music experience and openness to experience was the strongest predictor ($B = .464, p < .001$). Creative productivity was found to generalize across domains when correlating number of uses of an item within the music domain compared with number of uses outside the music domain ($r = .49, .68, p < .05$). These findings resolve ambiguity from related studies, demonstrating that experience, novel production, and personality, are key factors in creativity, and that creativity is not restricted to one medium.
Abstract
International operations have become one of the main tasks for the Swedish Armed Forces (SAF). The SAF and Swedish National Defence College organize annual international staff exercises with the purpose of training officers to carry out effective staff work. This study analyzed a staff exercise using Edmondson’s team learning model in a military setting. The model was developed by including group cohesion. As defensive routines are a threat to team learning behavior, the possible presence of these was examined. The results indicate that team leader coaching is crucial to support all the variables in the model. The added variable of group cohesion contributed with insights on how the commander used task solving to create group cohesion. Some examples of defensive routines were also revealed but there seemed to be challenges in identifying such routines in this type of exercise setting.

Keywords
team learning, military staff exercises, context support, team leader coaching, cohesion, team psychological safety, team efficacy, team learning behavior
Purpose. Research on job crafting is increasing nowadays. Job crafting has been studied in terms of a mediator variable useful to improve positive organizational behaviors, and it has crucial theoretical and practical implications.

Methodology. In order to facilitate its measurement in large surveys, in different settings, we aimed to develop a brief 12-item version, the Job Crafting Scale-Short Form (JCS-SF). This study presents the main psychometric properties of a brief JC scale based on JC scale developed by Tims and colleagues (2012).

Results. EFA results show support for the original Four factor solution. Results have been confirmed using CFA. The four subscales showed adequate reliability.

Limitations. A convenient sample was used. Most of the companies involved are small or medium, employees had similar sociodemographic characteristics which could limit the generalization of results. A further study limitation is the use of a cross-sectional research design that does not permit the establishment of definitive relations of causality between variables.

Research/Practical Implications.
Having a brief scale to measure JC behaviors will contribute to facilitate research in several organizational contexts.

Originality/Value
The brief scale could be used for researchers and practitioners in public and private organizational sectors; it also can be used to study well—being at work, in order to develop new strategies for human resources management.
931 - THE EFFECTS OF STRESS LEVEL, COPING STYLES AND BIG FIVE PERSONALITY TRAITS ON BLUE-COLLAR EMPLOYEES’ COMMUNICATION SKILLS

Zeynep Agirbas (1) - Ebrar Yenice Kanik (1)

Istanbul Electricity, Tramway and Tunnel General Management, Mental Health Center, Istanbul, Turkey (1)

Content: Purpose: In the literature there are many studies about stress, coping styles and personality, but studies on the effects of these variables on communication skills are quite limited. Therefore, we aimed to study the effects of stress level, coping styles and personality traits on the communication skills.

Design: A cross-sectional survey was conducted with the blue-collar workers (n = 181), who served as the supervisor of public transportation in Istanbul (supervising bus drivers, meeting the needs of the passengers). Stress Symptoms Scale, Coping Style Scale and Big Five Personality Scale were used in the study.

Results: Communication skill was positively predicted by extraversion and agreeableness and negatively predicted by neuroticism when stress symptoms are control variable. Self-confident coping style partially moderate the relation between extraversion, agreeableness, neuroticism personality types and communication skill. On the other hand, helpless coping style partially moderate only the relation between neuroticism and communication skill.

Implications: In service sector, communication skill is an important performance criteria of all employees who are working for customer satisfaction. For this reason, in recruitment process it is beneficial to examine the predictors of communication skill which are personality and the styles of coping with stress. Besides the recruitment process it is also important for organizations to increase the work performance by organizing training on coping with stress.

Limitations: The cross-sectional structure of the study hinders causal inferences; therefore, longitudinal studies are needed.

Originality/Value: This study contributes to theoretical work on predictors of communication skill of blue collar employees.
Purpose

With 47% of employees still observing ethical misconduct in the workplace, ethics cultures within organizations has not notably improved since 2000 (Ethics & Compliance Initiative, 2018). Therefore, this study sought to develop a scale for measuring perceptions of ethical misconduct in organizations.

Methodology

A total of 714 participants were recruited from Amazon’s mechanical turk and undergraduates at a Midwestern U.S. university. A 60-item scale was developed based on the most frequently reported acts of ethical misconduct. Participants were asked to rate the ethicality of the 60 work-related behaviors using a 7-point Likert scale (1 = Very Unethical to 7 = Very Ethical). Participants also completed a self-report measure of counterproductive work behaviors.

Results

An exploratory factor analysis was conducted which identified four dimensions including: Deceit, Use of Drugs and Alcohol, Sexual Misconduct, and Theft. The survey was then reduced to 22 items. A confirmatory factor analysis will be conducted on a separate data set to confirm these dimensions.

Limitations

One limitation of this study is that a large portion of the sample was comprised of students, who may not have yet observed ethical misconduct in the workplace.

Research/Practical Limitations

This scale could help organizations better understand when and why employees engage or continue to engage in ethical misconduct, despite ethics training.

Originality/Value

Most scales that exist regarding ethics focus more on moral development or the ethical culture of an organization. This scale is unique because it measures perceptions of ethical misconduct.
Orientation: The constructs perceived stress, emotional intelligence and psychological well-being have been extensively researched throughout literature. Although these constructs have been researched within the health industry in general, the interest of this current research is in the population of first-year nursing students enrolled at a university institution.

Research purpose: The purpose of this research is to explore the relationship between the perceived stress and psychological well-being experienced by a sample of first-year nursing students based on different levels of emotional intelligence.

Motivation for the study: To gain more knowledge and a better understanding of the importance of the role emotional intelligence plays in the lives of first-year nursing students and its influence on their psychological well-being when having a certain perception of stress.

Research design, approach and method: A cross-sectional research approach was used, with a convenience sample \((N = 110)\) of first-year nursing students enrolled for a program at a university in South Africa. Amos in this study is used for testing different levels of emotional intelligence, perceived stress and psychological well-being. Pearson’s correlation coefficient is applied to test the relationships of these variables with one another.

Main findings: Relationships between perceived stress and psychological well-being and perceived stress and emotional intelligence were negative and significant. Furthermore, a positive relationship was found to exist between emotional intelligence and psychological well-being. It was found that students are more likely to experience low levels of perceived stress while demonstrating high emotional intelligence and vice versa. The results further indicated that high levels of emotional intelligence are more likely to be found in these students with high levels of psychological well-being and vice versa.

Practical/managerial implications: This study will make tertiary institutions aware of the impact emotional intelligence can have on the psychological well-being of first-year nursing students while experiencing perceived stress, and will also guide institutions to reduce stress and ensure psychological well-being.

Contribution/value-add: This research will contribute to the Industrial Psychology discipline to provide more scientific research in the healthcare industry of South Africa and even more specifically in the nursing sector.

Keywords: Perceived stress, emotional intelligence, psychological well-being, first-year nursing students
Purpose: The aim of the presentation is to analyse the power of the personal brand of knowledge workers and show its relation to the current and prospective employer brands.

Methodology: The research was conducted online on a group of 80 knowledge workers, using the author’s own questionnaire for measuring a personal brand. It contained items regarding the physical and psychological characteristics, as well as the professional competence of respondents. The employer brand questionnaire containing five component dimensions.

Results: The analyses have led to the following conclusions: a) the personal brand of respondents is at a high and balanced level; b) the analyses based on the r-Pearson correlation have shown a positive relation between the personal brand and the present and prospective employer brands in all five dimensions studied but the significance of this correlation was different; c) there were no differences in the level of the personal brand due to gender, work experience, age and distance between home and workplace.

The Limitation of research were relatively small research sample and self-report method of measuring of the personal brand.

Research Implications: The research draws attention to the factors that are particularly valued by knowledge workers in an employer brand and give some guidelines for employers which want to attract and retain the high-class professionals.

Originality: This is one of the first scientific attempts to measure a personal brand and its associations. It uses the author’s tool for measuring a personal brand with Cronbach’s alpha (reliability) of 0.899.
Despite a call within scientific literature to take more into account contextual factors within team studies, very little research has systematically looked at their possible critical role, thus limiting organization’s ability to provide contextual conditions that would foster team effectiveness. The Supportive Organizational Context for Teams (SOCT) construct well captures some of these factors (rewards, information, education and resource allocation). However, even if the internal consistency of the SOCT has been analyzed, its multidimensional representation has never been empirically tested. In the present study, we address these limitations through an assessment of the factor structure of a measure proposed by Wageman et al. (2005) and of its distinctive nature in relation to Perceived Organizational Support (POS).

Using a sample of 235 participants from multiple organizations within the province of Quebec and the newly developed Bifactor-ESEM framework, the present study supported the superiority of a higher-order model over a first-order model as well as the distinctiveness between SOCT and POS. It is, however, important to note that the current study relied on a convenience sample of French-Canadian workers which restricts the generalizability of the results.

The results of this empirical validation allow future studies to focus on getting a better understanding of the different forms of organizational support and their respective contribution in promoting team effectiveness. At a more practical level, this study demonstrates that organizations based on teams should keep in mind that a different kind of support might be necessary to support teams and to support individual team members.
955 - THE REVISED THEORETICAL MODEL OF UNIVERSITY EMPLOYEES’ PSYCHOLOGICAL WELL-BEING

Giedrė Genevičiūtė-Janonė (1) - Aurelija Stelmokienė (1) - Loreta Gustainienė (1) - Kristina Kovalčikienė (1)

Vytautas Magnus University, Department of Psychology, Kaunas, Lithuania (1)

Studies on university employees’ psychological well-being are still fragmentary, i.e. analyse either cognitive or emotional components of well-being (life satisfaction, job satisfaction, various emotional states). Therefore there is a lack of a comprehensive model that would integrate different understandings of psychological well-being. The purpose of this paper is to present the revised theoretical model of university employees’ psychological well-being.

Methodology. Firstly, based on theoretical analysis of scientific literature the theoretical model of university employees’ psychological well-being was developed and introduced to academic community. After scientific discussion the model was revised.

Results. The revised model is integrating job demands (quantitative demands, work pace, emotional demands, role conflicts, sexual harassment, work-family conflict) which are related to biopsychosocial health of university employees (stress, professional burnout), and job resources (task, interpersonal and leadership resources) which are related to positive attitudes towards job and organization (job satisfaction, job engagement, organizational commitment). Personal resources of employees (occupational self-efficacy, optimism, professional identity, competence, autonomy, relatedness) are also included in the model as moderators.

Limitations. The proposed model is based on theory and experts’ comments and lacks empirical verification.

Research/Practical Implications. University employees attract far less attention from researchers than other public or business sectors although their role in the development of a society is crucial.

Originality/Value. The presented model is an attempt to fill the gap in exploring the university employees’ psychological well-being by integrating eudaimonic and hedonic understanding of this phenomenon (Self-Determination Theory, Job Demands-Resources Theory, etc.) as well as including different work-related levels.
Purpose
Commitment is “a force that binds an individual to a course of action of relevance to one or more targets” (Meyer & Herscovitch, 2001, p. 301). Commitment to the organization has been extensively studied and the object of several meta-analyses. In the meantime, commitment to other targets – such as the supervisor and the workgroup – has received a growing attention during the last twenty years. Our objective is to perform a meta-analysis to synthesize the accumulated knowledge about commitment to the supervisor and workgroup. We consider the various forms of commitment (affective, normative and continuance) and the nomological net (i.e. antecedents, consequences and correlates) of these commitments.

Methodology
We conducted a literature search using several databases and reference lists of published articles. Each study was independently coded by two researchers. We followed Hunter and Schmidt’s (1990) recommendations to perform the analyses.

Results
Preliminary findings are congruent with social exchange theory and the target similarity model (Lavelle, Rupp, & Brockner, 2007). Antecedents pertaining to the supervisor (workgroup) predict commitment to the supervisor (workgroup), while commitment to the supervisor (workgroup) predicts outcomes related to the supervisor (workgroup).

Limitations
Because we synthesize original empirical studies, it leads to a loss of information making it difficult to analyze the results in a detailed and contextualized fashion.

Implications
Our findings highlight the importance of the supervisor and the workgroup as psychologically proximal foci of commitment (Reichers, 1985).

Originality
To our knowledge, this is the first meta-analysis on commitment to the supervisor and workgroup.
Purpose: The aim was to test the relationships among personality trait, self-efficacy at work, and job performance. A lineal multiple regression was carried out in order to analyse how personality trait and self-efficacy at work predict job performance.

Design/Methodology: In total, 219 employees from three occupational sectors (blue, pink, and white collar) (Female: 72%), Mean age 35.30 years (SD=11.07) and Mean job-experience 13.97 (SD= 11.04). Measures: Sociodemographic questionnaire, Personality Inventory NEO-FFI (Costa & McCrae, 1992), Self-efficacy at work Spanish version (Robalino & Musso, 2018) and Job Performance Scale Spanish version (Robalino & Musso, 2018). Stepwise regression analyses supported the hypothesis. Results: On one hand, a model involving conscientiousness (β=.250; p< .001), extraversion (β=.265; p<.001) and Task self-efficacy (β=.350; p<.001) predicts a 42% (R² adjusted= .419) of Task performance variance. On the other hand, a model including social self-efficacy (β=.335; p< .001), Emotional Self-efficacy to helps others (β=.169; p<.01), and agreeableness (β=.169; p<.01) predicts the 31% (R² adjusted= .312) of the contextual performance variance. Furthermore, a model with only two personality traits (extraversion, β=.239; p<.001; conscientiousness, β=.231; p< .001) and global self-efficacy at work (β=.384; p< .001) predicts 44% of total job performance variance (R² adjusted= .442). Limitations: Sample is relatively small and was collected by a non-probabilistic sampling technique. Research/Practical Implications: This study provides information on how personality traits in conjunction with self-regulation variables such as self-efficacy at work predict work performance. Originality/Value: Predicting job performance continues to be of interest to organizations, thus studying the variables that are involved is a contribution to knowledge.
Abstract

The industrial psychology practitioner provides short-term counselling in the workplace and should therefore be equipped to effectively address counselling situations that affect the employee. The general aim of this poster is to provide a conceptual paper of a counselling framework for the industrial psychology practitioner as a workplace counsellor. This study was motivated by foregoing research, which findings reported that industrial psychology practitioners were not adequately trained in counselling, multicultural techniques and approaches. A four phased framework following the metaphor of a tree is presented that could be used to train the industrial psychology student as a workplace counsellor.
Introduction: Albeit massive progress has been made in the workplace, women still face many work–life challenges. While an increasing amount of research shows work–life initiatives serve a purpose in highlighting the need for professional development, we also argue that family–friendly practices can also create perceptions of unfair treatments into organizational context among non–parents. Behaving counterstereotypically may lead to work intensification and perpetuate stereotypes, with the potential negative outcome of “work–life backlash” characterized by experience of poor well-being.

Aim: The purpose of this qualitative study was to explore the implications of work–life backlash for preserving stereotypes in the culture and the gender status quo.

Methodology: By using a qualitative approach, 15 female managers were interviewed to gain insights about their subjective experiences. The data analysis process was facilitated with the use of ATLAS.ti software.

Results: The fallout from backlash effects likely contribute to higher rate of women’s disaffection with their careers, which in turn may lead to increases in negative emotions. Because work–life backlash outcomes likely stem from prescriptive and implicit gender beliefs, women found themselves in double bind and perceive their work environment difficult to navigate.

Limitations: Caution must be applied when drawing conclusions from the results since participants are at different stages of their career.

Practical implications: Organizational culture should play a key role in building more diversity-friendly workplace.

Originality: Additional field in research is needed to shed light on the factors that reinforce work–life backlash effects in preserving cultural stereotypes.
Purpose
The poster introduces the first Czech diary study in the field of I/O Psychology. It focuses on work stress, subsequent psychological detachment from work during leisure time and their effect on well-being and perceived work performance. The study also considers the influence of personality characteristics and negative/positive work-related thoughts, and tests their role as moderators and mediators of the above-mentioned relationships.

Design
225 employees from various Czech companies completed short online questionnaires twice a day for five consecutive work days.

Results
The preliminary results showed that neuroticism and agreeableness moderated the effect of occupational stress on well-being and perceived work performance. Detachment from work had a positive effect on the subsequent morning’s well-being of people with a medium to high degree of neuroticism. The effect of psychological detachment on work performance and the moderation effect of positive/negative work-related thoughts were not found, nor was the direct effect of positive thoughts on well-being. However, the results indicated that negative thoughts mediate the negative effect of neuroticism on well-being.

Limitations
All the variables were measured using self-reports. The diary study provides only limited evidence on the causality of the relationships between the measured variables.

Implications
Detachment is not a universal mechanism for coping with work-related stress. It mainly helps employees with a high level of neuroticism.

Originality/Value
This study is the first to analyze the effect of detachment in the context of personality, work stress and performance. The design allowed us to consider causality by analyzing the influence of the day-to-day level of variability of independent variables.

Keywords: diary study, detachment, work stress, neuroticism, well-being, work performance
Purpose

Levashina and Campion (2006) developed a model of faking likeliness in interviews based on employees’ capacity, willingness and opportunity to fake. Powell, Roulin and Bourdage (2018) showed the viability of designing questions using a S.T.A.R. format to investigate when applicants fake on interview questions (e.g., about a situation that happened versus the actions they took). This study explores if and how applicants fake on “honeypots” (i.e., questions about made-up knowledge) and faking-resistant questions (i.e., past-oriented questions including verifiable information).

Design/Methodology

Participants partook in a 12-question mock interview (three past-behavioral, three faking-resistant, three about real knowledge, and three “honeypots”). They were randomly assigned to one of two conditions: Participants in the honest condition tried to appear as qualified as possible without lying or misrepresenting their qualifications. Those in the faking condition tried to appear qualified but could exaggerate or lie.

Results

Preliminary findings suggest that participants in the faking (vs. honest) condition reported more faking for all question types. The difference between the honest and faking conditions was similar for the real knowledge questions and the “honeypots”. It was also similar for the traditional past-behavior questions and faking-resistant questions.

Limitations

Limitations include using a student participant pool and only having four possible jobs.

Research/Practical Implications

Our preliminary results highlight the potential of “honeypots” to identify fakers in interviews, but show that faking-resistant questions might not reduce faking.

Originality/ Value

This study advances the very limited literature on faking detection in interviews by highlight potential effective vs. less-effective questioning strategies.
Abstract

Since the generation born between 1946 and 1964, known as the baby boomer, entered the retirement age, the question of the usefulness of flexible work arrangements (FWAs) as a way to keep older workers in the workplace while retaining their positive work outcomes (e.g., engagement, performance) at a good level has become pressing. The purpose of this paper is to systematically gather and analyze all academic journal articles on the topic of flexibility in the workplace and older workers. Three major online databases were systematically scanned for journal articles written directly on the topic. In doing so, database search criteria were strictly followed, studies were collected, and the PRISMA 2009 flow diagram was used for the selection process. The selection process went from searching for the relevant terms (gathered from a previous literature search), to screening each study individually, to selecting all the papers that directly discuss the topic, to appraising the quality of the selected papers by two prominent academics. This resulted in the selection of 16 articles for analysis.

Four categories have been identified: 1) the perceptions of flexible work arrangements (FWAs) in relation to older workers among employees and employers; 2) outcome variables such as engagement, performance, well-being, recruitment, and retention; 3) technology as it is a central component in promoting FWAs as an adoptable option; 4) organizational characteristics and how they come to play with FWAs and older workers.

In most studies, FWAs appeared to enhance engagement, performance, recruitment, retention, and organizational image. Moreover, even employees who have lower capabilities to succeed using FWAs can be trained to be significantly better.
Pediatric Oncology Departments are substantially stressful places for the nurses to be employed as they take care of the children diagnosed with cancer and deal with their mournful parents. To understand their experiences we conducted a qualitative study on 12 pediatric oncology nurses working with children with leukemia through semi-structured in-depth interviews in İstanbul, Turkey. These interviews were tape-recorded and deciphered and analyzed by using a thematic-analysis approach. Three main and three subthemes were attained. The first theme of the interviews were related with the difficulties of working as a pediatric oncology nurse with subthemes like psychological difficulties working with children with cancer, working conditions, and problems with patients’ parents. These themes showed that the nurses somehow attached with the children and experienced the fear of losing them as there is a risk of death. For working conditions they emphasized the work-load, working hours, working with shifts, dealing with chemotherapeutic drugs and difficulties of providing the drugs on time. They mentioned that most of the families with pain showed their anger and insurrection to them as they are the closest service providers. For the second main theme most of the nurses had chosen the profession with economic concerns, and it revealed that they had shared similar socio-economic backgrounds as students. The third theme was about the person-job fit showing that these nurses had common traits such as tolerance, patience, calmness, and responsibility. The interviews revealed that these nurses work in stressful conditions and experience burnout symptoms and sometimes they can be traumatized with the death of children.

**Key Words:** Pediatric Oncology Nurses, Experiences, Work-Load, Stress and Burnout
Abstract

Purpose The introduction of the agile framework Scrum results in new roles within companies, e.g. Scrum Masters. Scrum Masters play a key role in the success of agile projects by supporting the Scrum teams in their role as servant leaders and agile experts. Nevertheless, there has been little research so far on what kind of competencies Scrum Masters need and how they can be further developed. Therefore, the purpose of the study is to create a personal development program for Scrum Masters based on a scientifically developed competency model.

Design/Methodology In accordance to the grounded theory (Glaser & Strauss, 2008), the competence model was developed in iterative loops and validated using a qualitative, multi-level approach. The study comprises seven phases including expert interviews (n=17), focus groups (n=42) and the observation of agile teams (n=20).

Results The results reveal that for a successful execution of the Scrum Master role ten core competencies are required: facilitation, conflict resolution, agile coaching, training, agile mindset & methods, organizational learning, networking, coordination, self-mastery and business knowledge skills. Furthermore, the results indicate that the widespread approach of leadership development programs as “one-size-fits-all” is not suitable for Scrum Masters. They should only be accompanied by certain offers and take it upon themselves to ensure their development.

Limitations The used methodological approach does not allow a generalization of the results. Moreover, the designed development program has not yet been evaluated.

Practical Implications The ten identified competencies can serve as a framework for a self- and an external assessment of Scrum Masters. Based on these results development opportunities can be determined.

Originality/Value Whereas several studies concerning the role of a Scrum Master have already been published, this is one of the first focusing on the required competencies and development options for this role.
The emotion regulation literature has focused primarily on comparing the strategies of surface acting and deep acting, yet scholars have also noted the importance of considering naturally felt emotions as a means of achieving a desired emotional display. The nascent research that has focused on the display of naturally felt emotions has done so exclusively in positive display contexts, which has led to an emerging consensus that displays of naturally felt emotions are better for individuals’ well-being and performance than displays cultivated through surface acting or deep acting. We challenge that consensus by examining the displays of both positive and negative emotions on an episodic basis, and we illuminate the factors that precipitate natural versus acted emotional displays. Results of a three-week experience-sampling study of 218 employees revealed that, within individuals, mood was associated with the natural display of positive emotion, promotion focus was associated with deep acting, and prevention focus was associated with surface acting. In positive display contexts, our results generally conformed to extant theory and research, such that displaying emotion naturally was “best” for individuals (in terms of effects on emotional exhaustion, job satisfaction, and work withdrawal), while surface acting was “worst.” However, in negative contexts, these relationships reversed. Although a potential limitation of our study is that we collected our data through Mturk, our findings indicate that surface acting negative emotions is actually “good” for individuals, and regulatory focus can be used as a theoretical basis for understanding why individuals engage in emotion regulation.
Purpose: Wellness in the workplace is an important factor to explore as it holds benefits for the employee as well as the employer. The aim of this study was to explore wellness amongst sales and marketing staff in a global automotive company.

Design: A qualitative research design was utilized with a quota sample that consisted of 12 participants who function in the sales and marketing division of a global automotive company. Data was collected by conducting semi-structured interviews.

Results: Employees feel that their wellness in the workplace is being neglected. They reported that employers can do more to assist employees in obtaining a well-balanced well-being state. Their wellness definition consisted of occupational, physical and psychological wellness which, in terms of the workplace.

Limitations: Most of the participants were in junior or middle management positions. Therefor very few participants were in lower management levels. There was a lack of qualitative interviews with African females as they reported to be very busy and did not have time to meet with the researcher.

Practical implications: Employee wellness should receive more attention in the workplace as it contributes to the overall wellness strategies that the company implements. The company can have a more tailored approach in terms of wellness initiatives.

Value add: This study provides new knowledge with regards to how employees define wellness and what the possible wellness needs are of employees that function in high pace positions such as sales and marketing. Employee Wellness Programmes can be tailored according to the employee needs. By assisting employees in their overall well-being, organisations can achieve a state where employees function optimally while at the same time remaining ‘well’ by doing so.
Purpose: Through the digital revolution, not only the way we live changes a lot. This is true for online assessments, too, which are no longer restricted to desktop computers. This poster presents the degree of mobile device usage for multiple online assessments. In addition, test scores for mobile first cognitive ability tests that were completed either on a mobile or non-mobile device are compared with regards to device equivalence.

Design/ methodology/ approach/ intervention: Data from recruitment processes was collected from 2016 to 2018. $N =$ over 15 million candidates completed the assessments on mobile or non-mobile devices. Mobile usage was tracked over the years and $t$-tests were applied to investigate differences in mean performance between different devices.

Results: The results reveal a rising number of test takers using mobile devices for online assessments. The $t$-tests reveal ambiguous results regarding the equivalence between mobile and non-mobile devices.

Limitations: The propensity score matching method was used to control for confounding variables. However, the formed statistical twins lead to smaller sample sizes and might distort the results.

Practical implications: The results of the study demonstrate the need to be prepared for the increasing administrations of assessments on mobile devices. To meet this challenge and to ensure equivalent results between mobile and non-mobile devices, building online assessments mobile first can be considered.

Originality/ value: While recent research started to investigate equivalence between mobile and non-mobile devices, this study is the first looking at what different device characteristics mean for designing assessments mobile first.
Purpose: Recent research showed that coaching can exhibit unintended effects for clients. Whereas these unintended effects have been primarily investigated as negative side effects, little is known about positive side effects. To close this gap, this study explores positive side effects of coaching for clients. It also investigates the working alliance between clients and coaches as their potential antecedent.

Design: In a first step, 40 coaches reported which positive side effects have occurred in their coaching processes. Their answers built the basis for a categorization system. In the second step, 54 coaches evaluated which positive side effects have occurred and rated the working alliance to their client.

Results: Five categories of positive side effects emerged: psychological health, physical health, private life, communication skills, and work environment. Positive side effects of coaching on client's psychological health occurred most frequently. Working alliance was positively related to positive side effects for clients.

Limitations: This study surveyed coaches only. An investigation of the clients' perspectives would be beneficial to compare their perspectives.

Research/Practical Implications: This study introduces that coaching can exhibit positive side effects that are unintended but positive for clients. Coaches should establish a high quality working alliance to foster positive side effects.

Originality/Value: This study is the first to systematically explore positive side effects of coaching for clients. In the field of unintended consequences of coaching, it closes the gap towards the established negative side effects. Both a qualitative and quantitative design was used.
1008 - WHY DIDN’T THEY VOICE? METASTEREOTYPES AND VOICING MISTREATMENT

Julie Olson-Buchanan (1) - Lisa Finkelstein (2) - Rushika De Bruin (2)

California State University, Fresno, Management, Fresno, United States (1) - Northern Illinois University, Psychology, DeKalb, United States (2)

Purpose. Research has examined the dynamic processes and relevant contextual and individual factors surrounding the decision whether to voice workplace mistreatment (e.g., Olson-Buchanan & Boswell, 2008). Although the importance of others’ reactions has been identified in previous work, the role of others’ anticipated reactions has not been examined. The concept of metastereotypes – what we believe another group thinks of our group (Vorauer, Main, & O’Connell, 1998) - provides a conceptual framework for our understanding of these anticipated reactions. We examine the content and valence of metastereotypes held by voicers and nonvoicers of sexual or racial harassment/discrimination in the workplace.

Methodology. Using established methods drawn from the age metastereotypes literature (Finkelstein, Ryan, & King, 2013), we developed a survey (open and closed ended questions) to measure business students’ (N>200) experiences with harassment/discrimination and their metastereotypes of their self-identified group (voicers/non-voicers).

Results. Data will be reported that examine (a) whether there are shared metastereotypes about voicers/non-voicers, (b) the content and valence of these metastereotypes, and (c) whether the latter depends on their intersecting identity group(s).

Limitations. Sample is limited to young working adults in the United States, whose metastereotypes may not reflect the general population.
**Implications.** This foundation will be used for a stream of planned research to examine how metastereotypes shape decisions whether to voice mistreatment experienced in the workplace, with the ultimate goal of working toward a psychologically safer, inclusive workplace.

**Originality.** This is the first study to examine the role of others’ metastereotypes in deciding whether to voice mistreatment.

References

Research Question. Companies spent billions of dollars on negotiation trainings of their employees to reach better results in negotiations – even though there is only very few systematic evidence on the effectiveness of negotiation trainings. Results of a first meta-analysis provide initial evidence for positive effects of negotiation trainings (ElShenawy, 2010). However, it remains unclear, which factors (e.g., training method) influence the effectiveness of negotiation trainings. This study examines the overall effectiveness of negotiation trainings. Moreover, training length, training content, and training methods are considered as moderating factors.

Research design. We use meta-analytic techniques to answer our research questions. We conducted an extensive electronic keyword search and screened more than 5,000 abstracts resulting in approximately 30 training studies that met our inclusion criteria. Coding of these studies is currently underway.

Results. Meta-analytic results for the effectiveness of negotiation trainings will be presented at the EAWOP congress.

Limitations. The findings of our meta-analysis are limited by the data available for analysis. Furthermore, publication bias can possibly be a problem.

Implications. First, the study will provide a general measure of the effectiveness of negotiation trainings. Second, it will advance our understanding of what makes negotiation trainings more or less effective by introducing and testing several moderators.

Originality/Value. The findings of this study lay the foundation for evidence-based negotiation trainings and may thereby help to improve the utility of negotiation trainings.
Strange as it may sound, we do not yet know what alternative routes or pathways of planned change in organizations exist. As such, we do not know what change –effective or not– actually ‘looks like’ as a pattern over time. Of human patients recovering in hospital, critical parameters such as blood pressure, oxygen saturation or EEG’s are monitored in real time. Having deep knowledge of healthy and unhealthy life sign patterns, doctors know how the patient is doing and whether their interventions are working. We don’t have such critical ‘life signs’ for planned change, nor the knowledge of their patterns –but we should. Moreover, we need instruments and theory to measure/monitor and, ultimately, interpret them. In this paper we intend to make a first step by proposing that the ‘vital signal’ of a progressing planned change program is the extend to which a set of critical behavioral ‘switches’ or turnarounds are being completed. We forward a process typology of prototypical behavioral switch patterns and suggest a measurement instrument and an existing behavioral theory (Ajzen’s Theory of Planned Behavior) that can help interpret and support ongoing change in organizations.
1030 - EMOTIONAL LABOR AS AN APICAL EXPRESSION OF ORGANIZATIONAL CITIZENSHIP IN THE PUBLIC ADMINISTRATION

University D'Annunzio of Chieti Pescara, Dept. of Neuroscience, Imaging and Clinical Sciences, Chieti, Italy [1] - University of Milano Bicocca, Dept. of Sociology and Social Research, Milan, Italy [2] - University of Padua, Centro Linguistico di Ateneo, Padua, Italy [3]

PURPOSE

Organizational Citizenship represents a constellation of non-formally prescribed altruistic, conscientious, civic, courteous and sportsmanship behaviors functional to the organization's goals. We propose to empower the characterization and application of this fuzzy behavioral constellation by combining OC with Emotional Labor (the employees’ strategical emotional performances) and investigating the heuristic power of this original conceptual synergy in the Public Administration.

METHODOLOGY

Ninety-Two Italian ministerial officials were profiled on the five OC dimensions and through an annual series of structured telephone interviews and daily diaries, the most common patterns of their emotional expressiveness were investigated and matched with their OC profile. We focused on their discrete emotions (joy, serenity, happiness, enthusiasm, admiration, pride, disappointment, anger, boredom, sadness, fear, contempt, pleasure, wonder) analyzing antecedents and EL strategies of 4,062 "emotional events".

RESULTS

The five OC dimensions were associated with specific configurations of EL. For example, institutional commitment/pride, courtesy/admiration, sportsmanship/serenity, altruism/joy. These emerging patterns were useful for disambiguating, qualifying and better characterizing the behaviors typically related to the OC dimensions.

LIMITATIONS

"Surface acting" EL strategies were associated with superficial OC behaviors while “deep acting” ones were related with apical OC expressions, higher job satisfaction and commitment. Our explorative methodology did not allow us to define the causal relationship between EL strategies and OC.

PRACTICAL IMPLICATIONS AND VALUE

The original emerging matches between OC and EL patterns may help to more accurately define, recognize, measure and promote non-formally prescribed functional behaviors in the Public Administration.

Furthermore, training employees on EL strategies could boost stronger OC.
**Purpose.** To be able to refrain from job-related thoughts and activities during non-work time is important for health and well-being. It has been acknowledged that detachment do not simply occur but likely require self-regulatory effort. However, previous research has mainly attended to how work-characteristics or leisure activities contribute to detachment. The role of person characteristics has yet received limited attention. Using mediation analyses we explored the role of person characteristics, by investigating the complex interplay between emotion regulation strategies (reappraisal and suppression: processes used to shape emotional experiences and expressions) and detachment from work/affective rumination – on exhaustion.

**Design.** Data was collected with a web-based survey answered by participants from three human-service occupations in Sweden (teachers, psychologists, and ministers: n = 1 891).

**Results.** Reappraisal was beneficially, and suppression unfavorably, related to exhaustion. We found significant indirect effects of reappraisal and suppression on exhaustion – through detachment and affective rumination, respectively. Furthermore, we found significant indirect effects for detachment and affective rumination on exhaustion – through reappraisal and suppression, respectively.

**Implications.** Emotion regulation interventions/training may have beneficial effects for the detachment from work/affective rumination – exhaustion relationship.

**Originality and Limitations.** Our results illustrate the importance of attending to person characteristics in order to understand how detachment from work and affective work rumination relate to exhaustion. The present data is cross-sectional.
Categories: Employee Selection

**Purpose:** Weight discrimination has been shown to be a factor in the hiring decisions of employers (Agerstrom & Rooth, 2011), as well as in work assignment decisions and disciplinary actions within the workplace (Bellizzi & Hasty, 1998). The current study extends this research to promotional decision-making. In addition, little research has explored possible weight discrimination against very thin individuals. This study also predicted that participants would be more likely to recommend candidates based on the similarity-attraction theory (Powell & Butterfield, 2002).

**Design/Methodology:** Participants were 91 undergraduate and graduate students. Participants were presented with the personnel information and photos of four candidates (two men and two women) seeking a promotion. Two of the candidates were overweight, and two were thin. Participants completed surveys rating each candidate on relevant job skills, whether the candidate was qualified for the position, and ultimately ranked candidates based on qualifications.

**Results:** Using a two-way within-subjects ANOVA, no main effects were found for weight or gender, but an interaction was found such that overweight females and thin males received the lowest qualification ratings, as was expected. There was no evidence of similarity-attraction theory.

**Limitations:** Only Caucasian individuals were represented as promotional candidates and weight was manipulated by the photo.

**Implications:** By recognizing the role that weight discrimination plays in the workplace, employers can make efforts to reduce bias.

**Originality/Value:** The findings of this study add to the literature showing that weight discrimination can occur against both overweight and thin candidates.
1040 - WORK IDENTITY OF DIFFERENT GENERATIONS IN GENDER CONTEXT

Agnieszka Czerw (1)

University of Social Sciences and Humanities, Warszawa, Poland (1)

Author: Agnieszka Czerw

Purpose: Work identity seems to be one of the most important identity areas in an adult human (Kirpall, 2004). Work identity has the same processes as the organization of a general identity: commitment, exploration in depth and reconsideration of commitment (Crocetti, Rubini, Meeus, 2008). These processes may be related to age (development process) or a cohort effect. The aim of the presented study is to 1) check whether representatives of different generations (Baby boomers, X, Y and Z) differ in the intensity of processes of formation of work identity, 2) whether gender is important for these processes within the generation.

Methodology: the study was conducted on a representative sample of working Poles (N = 747). Work identity was diagnosed with WMiCS (Karaś, Cieciuch, 2015). Subjects were divided into 4 groups representing generations: Baby Boomers (N = 254), X (N = 174), Y (N = 161) and Z (N = 158).

Results: Intergenerational differences in the work identity formation processes: commitment and reconsideration of commitment. However, taking into account gender, there were more differences in the identity processes in groups of women from different generations than in men.

Limitations: Prevalence of respondents with secondary and higher education, small generational groups

Research Implications: Starting point for longitudinal studies related to the formation of work identity as a development process depending on the subject and situational characteristics of the employee.

Value: Knowledge about intergenerational differences in the shaping of work identity and the diversity of processes of shaping work identity due to gender.
Purpose: Workaholism and work engagement are two forms of heavy work investment, involving different consequences on employees’ life. Nevertheless, research has highlighted an overlapping zone between workaholism and work engagement, due to confounding findings about their relation and features they seem to have in common. Recovery—the process that allows employees to replenish individual resources after an effort—could be a critical construct in order to distinguish workaholic and engaged workers. This study aims therefore to consider the capacity to recover as influencing variable on workaholism and work engagement, respectively, and, further, it aims to observe what they, in turn, entail on perceived health.

Design/Methodology: This study is based on a cross-sectional design. 265 employees filled in an online questionnaire assessing recovery, workaholism, work engagement, and general health. Data were analyzed through structural equation modeling method.

Results: Recovery significantly and negatively predicts workaholism, but it shows no relation with work engagement. Workaholism and work engagement significantly predict individual perceived health in negative and positive direction, respectively.

Limitations: The conclusions advanced are limited by the use of self-report measures, cross-sectional design, and a rather small sample size.

Practical Implications: HR managers should pay attention to organizational practices protecting employees' recovery from efforts made at work, since it can prevent health impairments caused by extreme, workaholic approaches to work.

Originality/Value: The current study investigates recovery by considering its possible influence simultaneously on workaholism and work engagement.
Purpose. To test an evidence-based organisational change approach in Australian hospitals and its effect on patient experience. The approach proposed supports healthcare leaders to turn change theory into practice.

Method. A quantitative, longitudinal design is being used. Pre and post surveys are being delivered to assess change activities. Moderation analysis will be used to assess the interaction between the various aspects of the change approach used to improve clinical practices and their effect on patient experience. The design will strengthen to the moderation effects to allow for causal assumptions to be made. Participants are NSW Health Australian employees involved in an organisational-wide change project.

Results. The study is in progress and final results and implications will be presented at the conference.

Limitations. The study is limited to Australian healthcare organisations and may not generalise to other contexts. There is another potential limitation regarding attrition at the second survey. To maximise response rates, local survey champions will support participants and share reminders.

Research/Practical Implications. Extends the literature on organisational change impact on patient experience. The outcomes of this study will help leaders manage change and its effect on patients.

Value. Healthcare systems are complex and it is challenging to ensure reliability in patient care. In an already complex environment, organisational change has the potential to create systemic disorder if not managed well. This study initiates an evidence base for a change approach applicable to other healthcare change initiatives that reinforces positive patient and staff experience.

Primary researcher and presenter: Sarah Fischer, PhD candidate at Deakin University, Australia
1051 - OFF-THE-SHELF GAMES AND MULTIPLE-CHOICE ASSESSMENTS: A MULTI-STUDY COMPARISON

Diana Sanchez (1) - Lafayette Waters (1) - M Langer
San Francisco State University, Psychology, San Francisco, United States (1)

Abstract

Purpose: Recent applications of game-based methods in the workplace have included off-the-shelf games (i.e., stock games for immediate availability without customization). These applications have sometimes used games for purposes other than what they were designed for (e.g., entertainment games used to assess an employee in a specific area or skill). Thus, it is important to determine how off-the-shelf games relate to traditional assessment methods. The purpose of this paper was to compare off-the-shelf game-based assessments (GBA) to traditional assessments (i.e., multiple-choice tests) to determine the convergence between the two methods.

Design: In a series of three studies we compared scores participants received while playing an off-the-shelf game with scores received from a traditional, multiple-choice assessment on the same content. These games varied in content but were all relevant to the workplace (e.g., specialized roles on a ship, surgical knowledge).

Results: Findings showed promising results for the use of off-the-shelf games for assessment purposes. We will present findings and a full discussion on the types of knowledge that were assessed (e.g., declarative, procedural), variations in scoring method that were applied (e.g., evaluating mistakes, time taken), and recommendations for future research.

Limitation: Used primarily student samples, provided limited feedback for participants to review mistakes, and have limited generalizability of results.

Implications: Findings suggest off-the-shelf games have potential for applications in workplace assessment.

Value: This research contributes to a deeper understanding of the relationship between off-the-shelf games and traditional assessments.
Our aim is to examine the hitherto untested assumption that diversity in team member agreeableness leads to optimal functioning of creative teams, such that members of low agreeableness would provide their team with divergent perspectives through dissent while members of high agreeableness would buffer such task conflict roused from harming their team’s collegiality. As such, we assessed the impact of such diversity on both team creativity and satisfaction, via levels of task conflict and relationship conflict experienced.

279 participants from a large Singapore university were randomly assigned to teams of three. Participants completed the Big-Five Inventory personality measure before engaging in a team idea generation task. Independent judges provided creativity ratings for the ideas generated by each team. Participants then indicated the extent to which their teams experienced task and relationship conflict and provided their satisfaction rating with regards to working with one another.

Path analysis conducted via MPlus revealed that diversity in agreeableness predicted increased levels of task and relationship conflict experienced, which, in turn, predicted decreased team creativity and satisfaction respectively. Results held even when mean agreeableness and the means and dispersions of all other personality factors were accounted for.

Our findings indicate that rather than complementing each other, team members with differing agreeableness were discordant till the extent that both team creativity and satisfaction were significantly undermined. This questions the longstanding assumption that such diversity is beneficial for creative teams and suggests that team managers may be better off reducing, as opposed to encouraging, such diversity instead.
1058 - EVALUATION OF FIREFIGHTER DEVELOPMENT – VALIDATION OF A FEEDBACK INSTRUMENT FOR BASIC TRAININGS

Lena Kläpker (1) - Lisa Streppel (1) - Guido Hertel (1) - Meinald Thielsch (1)

University of Muenster, Department of Psychology, Muenster, Germany (1)

Purpose
To promote quick and reliable work of fire brigades, high quality firefighter trainings are indispensable. While there is an instrument to evaluate the quality of firefighter leadership trainings, there is no such instrument for basic firefighter trainings. To bridge this gap, we developed and validated the FIRE-G questionnaire.

Design/Methodology/Approach/Intervention
The FIRE-G was adapted from the FIRE scale for firefighter leaders (Schulte & Thielsch, 2018) and analysed via exploratory factor analyses (N = 257). Then, the factorial structure was tested by confirmatory factor analyses based on a web-based study with N = 421 firefighters. Additional validation criteria were asked.

Results
The FIRE-G consists of 30 items on six scales (structure & didactics, support & encouragement, group, practice, materials & facilities, competence). Confirmatory factor analyses supported the expected factor structure. Reliabilities reached sufficient to good levels. Providing evidence for construct validity, we found positive associations with corresponding scales of existing evaluation instruments and no or slight associations of the FIRE-G scales with the trainees’ mood, level of education and experience. Besides, all scales predicted participants’ overall satisfaction and their learning success, indicating criterion validity.

Practical Implications
The FIRE-G can be judged as a reliable and valid evaluation instrument that is easy to apply.

Limitations
The scale was tested in Germany, thus further research on other language versions is highly welcome.

Originality/Value
The FIRE-G can be used to assess the quality of basic firefighter trainings as well as to identify possible potentials for improvement.
This contribute focuses on how trade unions are redefining their organisational identity to respond to the neoliberal changes that have affected the labour market, mainly as a result of the Global Financial Crisis of 2008. Such changes brought about a profound crisis of representation among the workers in various sectors. Trade unions have had to redesign their identities to meet new demands from the workers. Based on 30 interviews with unionists from one of Italy’s major unions, the study identifies four discursive variations and as many potential evolutions in the identity of trade unions. The respective positionings generated by these four discourses for the union its members are examined. The study also highlights certain contradictions in these discursive variations, which may either encourage a redefinition of the union’s strategic objectives or, on the contrary, act as regulating mechanism that hampers change.
Purpose

Workers use emotional Labor (EL) to express emotions aligned with the demands of their work roles. Although researchers have mostly studied the individual consequences of EL (Mesmer-Magnus et al., 2012), some research has shown that leader EL can influence followers (Humphrey et al., 2008). Given that gender stereotypes (1) can modify followers’ perceptions of leaders’ emotional displays (Brescoll & Uhlmann, 2008) and (2) seem to influence how emotional display strategies are perceived (Hess et al., 2016), our study seeks to determine whether leader gender and EL strategy moderate the relationship between leader emotional expression and follower’s perceptions of leader effectiveness. Thus, we hypothesize that female leaders will be perceived as more authentic and trustworthy, and less efficient than male leaders. These relationships should differ according to the expressed emotion and EL strategy.

Design/Methodology

Participants read a fictitious interview where a manager (male or female) explained the strategy (surface acting, deep acting, or no acting) he/she used when the work role requires communicating an emotion (anger, sadness, joy, or neutral). Participants then rated the extent to which they trusted the managers and perceived them as efficient and authentic.

Results

We expect results in line with our hypotheses.

Research implications

This study contributes to the development of research on gender stereotypes in organizational contexts by extending the literature on gender stereotyping of emotions to that of gender stereotypes of EL.

Originality/Value

To our knowledge, this is the first study to examine the role of gender on followers' perceptions of leader EL.
Purpose: Although work has changed over the past decades, detailed studies on what employees do in these changing jobs are lagging behind. Job analysis is used to uncover and understand what employees do, however, current developments challenge the underlying assumptions about the standardization and stability of jobs. Methods such as text mining could provide a viable means of addressing these issues.

Design: In a survey among nurses we compare two task lists, one collected by means of a task inventory and the other by means of automatically extracting and analysing online vacancies through text mining.

Results: Text mining complements rather than substitutes job analysis methods. The text mining method extracted tasks with a lower level of detail and more contextualized tasks from a larger sample of jobs, whereas the task inventory yielded more detailed and mundane tasks. In addition, not all tasks were equally related to employees’ job satisfaction, work overload, and emotional exhaustion, making it worthwhile to include task data in studies on employee well-being.

Limitations: Our comparison between a task inventory and text mining method is limited to online vacancies, which despite clear advantages sometimes are of questionable quality.

Research/practical implications: Insights on how individual tasks explain variance in employee well-being inform researchers and practitioners alike about how work could best be organized to facilitate employee well-being.

Originality: We add a new method that exploits the recognized potential of alternative (big) data sources to the job analysis literature which could help solve some of its issues.
Abstract

Purpose: Drawing on LMX theory (Graen & Uhl-Bien, 1991), we examined links between a subordinate’s personality (i.e., conscientiousness, proactive personality, positive and negative affectivity, emotional intelligence) and leaders’ affect and justice behaviour toward the subordinate. We used new behavioural scales of interpersonal and informational justice to understand leader actions.

Methodology: In a between-subjects experiment with a sample of employed leaders (N=148), participants were randomly assigned to consider the employee they like either (a) the most or (b) the least (reflecting leader affect). Leaders then rated the employee’s personality, and indicated the extent to which they engage in behaviours reflecting interpersonal and informational justice.

Results: t tests showed differences in all employee personality traits measured as well as interpersonal but not informational justice, as a function of experimental condition (leader affect). Collapsing across experimental conditions, proactive personality uniquely predicted interpersonal justice and positive and negative affectivity uniquely predicted informational justice.

Limitations: All scales were completed by leaders, raising concerns about common method variance. Social desirability may also have reduced variance of reported justice behaviours.

Research and Practical Implications: Our research contributes to the LMX and justice literatures by demonstrating that employee personality, especially proactive personality and positive and negative affectivity, may impact fairness directed at specific employees by leaders.

Originality/Value: The majority of research investigating antecedents to leader interpersonal justice has relied on perception-based (e.g., judgments of respect) rather than behaviour-based measures. Our research contributes to understanding variability in specific justice actions taken by leaders as a function of employee personality.
**Purpose:** Occupational titles activate gender stereotypes and male biases. In reading, gender stereotypical occupational role nouns (e.g., ‘nurse’) followed by a pronoun of incongruent gender (‘he’) leads to changes in reading behaviour such as longer fixations and refixations (Kennison & Trofe, 2003). Such changes indicate that gender stereotypes can influence who we think we are reading about. In Swedish, the gender-neutral pronoun ‘hen’ was recently implemented to reduce gender stereotyping and male bias. This study tests how ‘hen’ affects reading behavior, and whether there is an interaction with the gender of the noun’s stereotype (female/male), and the type of noun (occupational title or gendered role title).

**Design:** We used an eye-tracking experiment (n = 109) with a 2 (Role noun: occupational/definitional) x 2 (Role gender: masculine/feminine) x 2 (Pronoun: congruent/hen) within-participants design.

**Results:** We found that ‘hen’ decreased reading speed in comparison with congruent pronouns. We found no difference in reading speed when ‘hen’ followed feminine or masculine role nouns. Furthermore, there was no difference in reading when encountering ‘hen’ after stereotypical occupational role nouns or gendered role nouns.

**Practical implications:** When writing or describing occupations, ‘hen’ may be able to delay gender stereotype activation. Importantly, ‘hen’ does not activate the male bias that is often found for other neutral words.

**Limitations:** This study used reading behavior to investigate male bias and stereotype activation. How ‘hen’ affects reading in real-world settings should also be examined.

**Originality/Value:** The use of eye-tracking to investigate the details of gender extraction from occupational titles.
THE IMPACT OF DAILY EMOTIONAL LABOR ON HEALTH AND WELL-BEING

Satoris Howes (1) - Mathias Simmons (2) - Clive Fullagar (3) - Sarah Riforgiate (4)

Oregon State University, Bend, United States (1) - Army Research Institute, Leavenworth, United States (2) - Kansas State University, Manhattan, United States (3) - University of Wisconsin Milwaukee, Milwaukee, United States (4)

Purpose

The current study employs a daily diary design to examine how emotional work requirements are related to emotional labor and how emotional labor might impact individuals on a daily basis. Specifically, we address how emotional labor on a given day relates to physical health and psychological well-being on that same day. We further explore how daily emotional labor over time may be related to global perceptions of burnout.

Design/Methodology

Participants were 43 employees at a small website development company. Participants completed a survey regarding their perceptions of their emotional work requirements. Participants then responded to a survey at the end of their workday for ten consecutive working days that assessed emotional labor, physical health, and their psychological well-being for that day. Finally, a week later participants indicated the extent they felt burned out from their jobs.

Results

Results indicated that daily emotional labor was significantly negatively related to daily psychological well-being, but not to daily physical health. In addition, after aggregating emotional labor across days, results revealed a significant positive relationship between emotional labor and burnout.

Limitations

Our study is limited by our use of self-report measures and the fact that our data remain correlational and therefore do not allow us to make causal inferences.

Research/Practical Implications

Organizations requiring emotional displays should beware of the negative side effects emotional labor.

Originality/Value

Unlike this study, most research that has examined emotional labor and psychological and physical outcomes has been cross-sectional.
1093 - A MULTILEVEL PERSPECTIVE ON CITIZENSHIP BEHAVIOR MOTIVES

Clara Lee (1) - Justin Weinhardt (1)

University of Calgary, Calgary, Canada (1)

Purpose:
This theoretical piece adopts a multilevel perspective to examine the probability of engaging in citizenship behavior, and the motives behind such behavior, as different levels within the organization and individual interact.

Approach:
Both individual differences and situational contexts are integrated, whereby macro and micro levels interact to predict the motive and subsequent behaviour. Centered around the trait activation theory, the macro level variables that are examined here are organizational politics, leadership, and performance appraisals. The micro level variables that are outlined in this paradigm are personality and resource allocation. In outlining this paradigm, this piece expands on the literature regarding the motives (Good Soldier or Good Actor) behind citizenship behavior, and how impression management can be integrally related to these seemingly prosocial behaviours. Furthermore, a temporal component is implemented in this paradigm, as it is predicted that these interactions between the macro and micro levels vary in strength over the course of performance evaluations.

Originality/Value:
Overall, the current piece aids in the recognition of the characteristics of the workplace and individuals that cultivate Good Actor motives. It is suggested that these qualities should be reined in, while also encouraging the aspects of a workplace that foster Good Soldier motivated OCB, for the long-term betterment of the organization. It is encouraged that others broaden this framework to include other important variables, both on the macro and micro level, and to consider the dynamic complexity behind citizenship behavior and its motives.
COOPERATIVE VS. UNCOOPERATIVE BEHAVIORS IN WORKING TEAMS - A QUESTION OF RELATIONAL PREFERENCES AND PERSON-TEAM-FIT?

Johannes F.W. Arendt (1) - Franziska J. Brotzeller (1) - Katharina G. Kugler (1) - Felix C. Brodbeck (1)
Ludwig-Maximilians-Universität München, Psychology, München, Germany (2)

Purpose
When people work together in teams, they have rules and norms about how to share resources or when to help each other. At best, the teams’ rules and norms are in line with team members’ preferences; but what if team members have to act against their fundamental preferences when working with each other? Relational Models Theory (Fiske, 1992) posits four elemental relational models (RMs), which people use to regulate their social relationships. These RMs are used to plan, interpret, understand, remember, anticipate and evaluate our own and other’s actions (e.g., our teammates’). We examined how a fit between the relational models an individual perceives and the relational models an individual would prefer in his or her team (“RM-Fit”) is related to group identification and relationship conflicts, and whether these in turn related to (un-)cooperative behaviors towards other team members.

Design
We conducted a field study with n=90 individuals. We calculated the RM-Fit (discrepancy between preferred and perceived RM) and tested our mediation hypotheses using bootstrapping methodology.

Results
First, we found significant indirect effects between RM-Fit and cooperative behaviors (helping, knowledge sharing) mediated via group identification. Second, we found significant indirect effects between RM-Fit and uncooperative behaviors (knowledge hiding) mediated by relationship conflict.

Limitations
Due to its cross-sectional design our study doesn’t allow causal conclusions.

Research/Practical Implications
Our study shows the importance of a person-team fit regarding relational models for (un-)cooperative behaviors in teams.

Originality/Value
Our study enriches research on person-team-fit by focusing on elemental aspects of relationship regulation.
Theorists have described the benefits of using agent based modeling (ABM) in psychology (e.g. Jackson, Rand, Lewis, Norton, & Gray, 2017; Smith & Collins, 2009). These include, but are not limited to, (a) studying emergence of behavior, including its complex and dynamic underlying processes, (b) comparing competing theories concerning a particular effect, and (c) iteratively changing components for validating the model. When using ABM, different approaches can be applied (e.g. simulating a theoretical model), offering different benefits as well as limitations.

The goal of the present study is twofold. First, it is to systematically compare and evaluate different uses of ABM in team research and to characterize benefits and limitations of the different approaches. Second, we exemplify how ABM can be integrated in the research process by reconstructing experimental studies in ABM. It can for instance be utilized to extend a preexisting experimental study by changing parameters such as sample or team size or duration of interaction.

In the present study we used ABM to reconstruct a published team study in order to investigate the comparative effects of combinations of team members with high meta-knowledge of expertise location and low meta-knowledge on team performance. Furthermore, new simulations were run to simulate the effects when comparing larger groups over an extended period of time. The simulation offers similar results as the original study.

Comparability of ABM and empirical results as well as future directions of ABM use in team research are discussed.
Purpose

For today’s organizations user adoption in the context of digitalization is a multinational endeavor. A deeper understanding of cultural influences on the success of digitalization projects is required. An important aspect of investigating cultural influences on digital adoption is analyzing measurement invariance (MI) across nations. Recent methodological developments promise to enrich classical approaches to examine MI. This study applies classical and recent approaches to assess MI across nations and compares their results.

Design/Methodology/Approach/Intervention

Data on a digital adoption were gathered in a multinational company from 2,105 employees in five countries (India, Philippines, China, Denmark, USA). Multi-group confirmatory factor analysis (MGCFA) was used as classical approach to examine MI. Additionally, the recently developed alignment method was employed, as it is supposed to be more flexible and detailed regarding item-specific performance.

Results

MGCFA supports metric invariance of measures across nations. Overall, results of the alignment method are comparable to the MGCFA results. Additionally, the alignment method points to specific items as sources of (scalar) invariance.

Limitations

Data of only five countries were used, yet they cover three continents. Future studies should include more countries to ensure generalizability of findings.

Research/Practical Implications

Rigorous development of the measures is a prerequisite for MI in assessing digital adoption. In establishing MI, the alignment method provides valuable item-specific information in addition to the MGCFA.

Originality/Value

Until now, applications of the alignment method are rare. This study illustrates how the use of alignment can enrich conventional methods for assessing MI.
Purpose. Organizational dehumanization refers to employees’ perceptions that their organization treats them like less than a full human being but rather as an object/tool (mechanistic) or as an animal/child (animalistic). Recent studies have focused mainly on the mechanistic form of organizational dehumanization. However, it has been suggested that the animalistic form might also be present in organizational settings. That is why, in this exploratory study, we sought to investigate the distinction between the two forms of dehumanization and their association with different antecedents and consequences.

Design/methodology. 732 employees from a variety of jobs and organizations participated in this study.

Results. Path analyses showed that, while workload is only associated with mechanistic dehumanization and informational justice with the animalistic form, antecedents such as supervisor support, participation in decision-making and interpersonal justice were associated with both forms of dehumanization. Whereas stress and affective commitment were found to be related to both forms, work-family conflict and turnover intentions were only influenced by the mechanistic form and in-role performance by the animalistic form.

Limitations. Data were collected through a cross-sectional design and self-reported measures.

Research implications. On a research level, our results suggest that both forms of dehumanization should be considered while studying organizational dehumanization. However, further investigations should be conducted to further investigate the underlying mechanisms that could explain the different results.

Originality/Value. This research expands the recent and scarce knowledge on organizational dehumanization by distinguishing two forms of dehumanization and identifying the nomological network of each form.
Purpose
Throughout Europe, challenges associated with attracting and retaining apprentices are reported (Fuller & Unwin, 2004). In Germany, about half of the apprentices are showing stress-related warning signs (Badura et al., 2015). As personal variables play an important role for successful organizational socialization as well as for stress-interventions (Schraml et al., 2011; Song & Chathoth, 2010), enhancing career conducive personal attributes – such as core self-evaluations (CSE; Judge et al, 2003) is important for apprentices.

Design/Methodology/Approach/Intervention
A core self-evaluation training was administered for two samples of apprentices of a German vocational school (N₁=103; N₂=291). The data from the pre-post-post-design was analyzed via latent growth models (Mun et al, 2009).

Results
In Sample 1, apprentices in the experimental condition reported significantly higher scores in self-esteem and self-efficacy directly after training. In Sample 2, apprentices with low initial CSE score showed stronger improvement in self-esteem, self-efficacy and emotional stability directly after training. Yet, no long-term effects were observed.

Limitations
Sample 2 was completely assigned to the training without a comparison to a control group.

Research/Practical Implications
Some facets of CSE are malleable by a training intervention, which is important for research (French, Butts, & Allen, 2016) and for practice regarding apprentices’ development (Judge & Hurst, 2008).

Originality/Value
The study shows that self-theories interventions (Dweck, 2008) can have a positive effect on the self-concept of apprentices which is hardly considered in Germany (Badura et al, 2015). Yet, the study also shows that more is needed to establish measurable long-term effects.
Purpose. In this research, we examined the negative relationship between leader-member exchange (LMX) and organizational dehumanization (i.e., employees’ perceptions that their organization treats them like tools). More precisely, we investigated the consequences of this LMX-dehumanization relationship in terms of employees’ emotional exhaustion, affective commitment, and voice behavior. Further, given that supervisors act as representatives of the organization, we argued that these relationships would be stronger for employees identifying their supervisor with the organization (high supervisor’s organizational embodiment).

Design/methodology. 227 employees from a variety of jobs and organizations participated in study 1 and 202 in study 2.

Results. Results showed that LMX was negatively associated with organizational dehumanization. Specifically, organizational dehumanization was found to mediate the relations between LMX and outcomes (i.e., emotional exhaustion, affective commitment, and voice behavior). Moreover, the mediation model was moderated by supervisor’s organizational embodiment. More precisely, the negative effect of LMX on organizational dehumanization was stronger when leaders were perceived as sharing many characteristics with their organization.

Limitations. Data were collected through a cross-sectional design and self-reported measures.

Practical implications. Our findings suggest that organizations would be well advised to increase awareness among their managers of their crucial role in the development of more or less positive perceptions toward the whole organization with consequences in terms of employees’ well-being, attitudes and behaviors.

Originality/Value. This research expands the recent and scarce knowledge on the determinants, boundary conditions and outcomes of organizational dehumanization.
1111 - INVESTIGATING THE EFFECTS OF RESOURCES AND DEMANDS ON STUDENT BURNOUT AND
STUDENT ENGAGEMENT IN RUSSIA AND GERMANY

Tammo Straatmann (1) - Marina Schefer (1) - Valentina Lukina (2) - Anna Maria Engel (1) - Kai-Christoph
Hamborg (1)

Osnabrück University, Work and Organizational Psychology, Cross-Cultural Business Psychology,
Osnabrück, Germany (1) - North-Eastern Federal University, Institute of Psychology, Department of
Social and Ethnic Psychology, Yakutsk, Russian Federation (2)

Purpose

After changes of the Bologna Process in 1998, students in Europe report increasing exhaustion (Gusy
et al., 2010), more stress and lower life satisfaction (Sieverding et al., 2013) and study dropout
(Heublein et al., 2017). While the Job Demands-Resources model (JDR; e.g., Bakker & Demerouti,
2007) suggests effects of demands and resources on burnout, it also highlights their relationship to
engagement. This balanced perspective seems promising for examining the formation of student
burnout and engagement in the academic context of German and Russian students.

Design/Methodology/Approach/Intervention

The study is based on data from a Russian (N=399) and a German (N=362) student sample. After
establishing equivalent measures, the JDR model was tested in both samples via moderated multiple
regression analyses.

Results

JDR model was largely supported in the Russian and German sample. Qualitative demands were found
to be stronger related to burnout. Personal resources were mitigating the effect of demands on
dimensions of burnout and personal resources were positively associated with student engagement.

Limitations

The study relied on self-report data. The Russian sample reported more exams during the
questionnaire period.

Research/Practical Implications

Based on the results of the JDR Model interventions can be derived to improve the situation for
students, e.g. in form of university health management programs intensifying students’ resources and
therefore improving engagement, health and performance.

Originality/Value

The JDR model found support in academic contexts of Russian and German students and hence,
provides guidance for research and practice concerned with student burnout and engagement.
Purpose
Networking is defined as goal-directed behavior focused on building and cultivating informal relationships to obtain work-related resources. Gibson, Hardy, and Buckley (2014) present a theoretical model of the antecedents and outcomes of networking. We use meta-analysis to synthesize research on an important group of individual antecedents, the relationship between networking and personality.

Design/Methodology
Our comprehensive literature search in PsycInfo, Psyndex and Business Source Complete databases identified 33 studies (k=36, N=7608) that examined the relationship between networking and personality. 19 studies (k=22, N=5106) focus on the Big Five personality dimensions, and 14 studies (k=14, N=3066) on three relevant stand-alone traits: proactive personality, core self-evaluations, and locus of control.

Results
Networking is positively associated with three of the Big Five personality dimensions: extraversion, openness and conscientiousness. Effects for agreeableness and emotional stability are not significant. Networking correlates positively with all three stand-alone traits. Potential moderator variables (i.e., gender) will be discussed.

Limitations
Our results are limited due to the small number of studies. Publication bias may pose a threat to our conclusions.

Research/Practical Implications
Knowledge on their dispositional standing and how it relates to networking may help people improve their networking by playing their strengths and work on their weaknesses. Furthermore our findings may help to tailor trainings on networking to individuals with different dispositions.

Originality/Value
Findings corroborate (e.g., relationship with extraversion) and revise (e.g., no sign. relationship with neuroticism) Gibson et al.’s narrative review on dispositional antecedents of networking. Due to moderator analyses we explain heterogeneous effects in primary studies.
Purpose: Most research in occupational health psychology investigated the negative aspects in the teaching profession. Following the Bandura’s Social Cognitive Theory, the aim of the study was to explore the associations among job satisfaction, mental well-being, and efficacy beliefs, organizational justice and school climate, also taking into account the age and gender of participants. A further aim was to examine whether job satisfaction moderated the relationship between work variables included in the study and mental well-being.

Methodology: A non-random sample of 609 Italian school teachers participated. A cross-sectional design was used in order to collect data by means of a self-reported questionnaire. We investigated the relationships between our variables and mediational patterns in a path analysis model.

Results: The model fitted the data very well. The results showed that school justice, efficacy beliefs, and school climate were significantly associated with job satisfaction. We also found that the relationships between these psychosocial variables and mental well-being were mediated by job satisfaction.

Limitations: The absence of longitudinal data do not permit to define a causality process. The sampling procedure was not randomized.

Practical Implication: Planning development programs to promote teacher’s well-being and improve their evaluation methods in a more targeted and effective way means to take into account the empowering effect of these variables for both job satisfaction and mental well-being.

Originality/Value: Our findings pinpoint the importance of imparting teachers with personal social and organizational skills in order to promote job and mental well-being.
Purpose
Although evidence reveals severe effects of sexual harassment on care workers’ mental health, there is a scarcity of studies that focus on care workers’ experiences of sexually inappropriate behavior from patients or clients. One reason for this lack of research is that validated instruments that measure different types of sexual harassment experienced by employees working with patients and clients are lacking. Therefore, the aim of this study is to develop and validate a questionnaire for assessing sexual harassment from patients and clients in healthcare work.

Design/Methodology/Approach/Intervention
We examined the factorial structure of the measure using exploratory factor analysis with a calibration sample (N = 179) and confirmatory factor analyses with a cross-validation sample (N = 305). We evaluated criterion validity by investigating relationships with different indicators of mental health.

Results
The analyses revealed three underlying factors: nonverbal, verbal, and physical acts of sexual harassment. Examination of the measure comprising 14 items revealed acceptable internal consistencies and substantial correlations with indicators of care workers’ mental health.

Limitations
Due to the cross-sectional design, reverse causal effects of employee health on the perception of sexual harassment are conceivable.

Originality/Value
The results indicate that elaborating a theoretical framework underlying sexual harassment from patients and clients in healthcare work is a promising approach.

Research/Practical Implications
This study provides a useful and sound tool for assessing sexual harassment from patients and clients and paves the way for the investigation of risk factors for sexual harassment and protective factors helping care workers cope with sexual harassment from patients and clients.
PURPOSE

One of the processes through human resources improve their working conditions is Job Crafting. The latter explains how any physical and cognitive changes that employees undertake in their task or in the interpersonal boundaries of their work (Wrzesniewski & Dutton, 2001). Job crafting is also an essential process to encourage work engagement in an employee who is dissatisfied with their work (Conference Board, 2010). Therefore, the aim of the present study is to test whether Work Satisfaction and Proactive Personality can be a mediator of the relationship between Job Crafting and Work Engagement.

METHODOLOGY

Data were analysed with structural equation modelling. Questionnaire were administered to 366 employees (151 Males, 215 Females) belonging to the Public Administration.

RESULTS

Increasing work Satisfaction partially mediated the relationship between Job demand Resources and Vigor and structural job resources and Vigor and Absorption; Moreover, increasing work Satisfaction fully mediated the relationship between social job resources on one side and vigor, dedication and absorption on the other side;

LIMITATIONS

Cross-sectional measurements (therefore a reverse influence might occur as well) and single source nature of the data were the main limitations.

PRACTICAL IMPLICATIONS

Organizations should encourage workers to use Job Crafting strategies because they can respond to the complexity of contemporary work and to meet the needs of the current workforce.

ORIGINALITY

In previous studies, job crafting and work engagement have already been related but the indirect role that individual variables have (satisfaction and personality) in their relationship
Purpose
The idea that increased levels of extraversion are beneficial to wellbeing is widely accepted. However, studies that supported this claim have either focused on the trait- or the state-level, failing to consider that, in everyday life, traits and states act together. Indeed, the Behavioral Concordance Model (BCM) posits that behaving discordant to one’s trait level is demanding and effortful to maintain and therefore should cause impaired levels of wellbeing. Drawing on the BCM, the current study sets out to study the potential negative effect of counterdispositional extraversion on well-being. More specifically, we test whether deviations from one’s trait level of extraversion hamper employee wellbeing.

Design
Data was collected by means of an experience sampling design among 92 employees. Participants rated their level of state extraversion and wellbeing five times a (work)day over a four-week period (N=4,828).

Results
We first calculated an index of trait extraversion by averaging per person his/her state extraversion scores. Subsequently, counterdispositional behavior was operationalized by calculating, per week, the average squared deviation between the trait extraversion score and that week’s state extraversion scores. Finally, we predicted weekly employee wellbeing using the person-centered counterdispositional behaviour scores using multi-level regression analysis, revealing that higher levels of weekly counterdispositional behaviour related to lower levels of weekly wellbeing ($\beta = -.40; p = .006$).

Limitations
All data were self-reported.

Practical Implications
By cultivating trait congruence at work, employee wellbeing is also cultivated.

Originality/Value
We nuance the idea that more extraversion is always better. Instead, being true to one’s personality benefits wellbeing.
Some researches have shown the negative effects of unemployment. Indeed, unemployment affects the family, the social friendly life and psychological well-being (Mousteri, Daly & Delaney, 2018). We investigate the relationships between unemployment and psychosocial adjustment in familial, professional and personal/social fields. This study is primarily qualitative and comprehensive. To characterize the Activity System of 14 long-term unemployed people, we listed their activities (260). Then, we used the Activity System Inventory (Curie, Hajjar, Marquié & Roques, 1990) which is divided into three homogeneous dimensions. The results highlight that activities are deeply-rooted in unemployed people’s lives so that they can maintain a co-relativity of familial, professional and personal/social fields. The results show a complexity for these unemployed people to improve and maintain a psychosocial balance, however they value much more their familial and personal/social fields. Indeed, these two fields of life replace the lack of employment. When they value professional field, it is mainly to evoke implicit skills they had in employment. The results show a higher aspiration index to the personal/social field ($M = 0.62$) than to the familial field ($M = 0.59$). Unemployed people get more involved in personal/social activities ($M = 7.84$) than professional ($M = 7.23$) and familial ($M = 6.08$). Our main limitations concern the unemployed people’s sample. These results are descriptive and transferability of the finding to other unemployment contexts needs establishing. As a complement to studies (Paugam, 2006) this research underlines unemployed people can create their own life norms and values (Canguilhem, 1945/1975) while unemployed.

Keywords: unemployment, activity system, norms and values, action and life models.

References:

Purpose: Working in teams become more and more important. Creativity and innovativeness are essential skills in work environments, therefore it is necessary to explore how to support creative processes in teams. Previous research found that team processes have an impact on individual learning outcomes. Moreover, creative self-efficacy, a predictor of creativity, depends on satisfaction with the team. The first purpose of this study is to explore the influences of action processes on creative self-efficacy. The second purpose is to validate a German version of the team process scale originally developed by Mathieu et al. (2018).

Methodology: We evaluate university courses in which multidisciplinary teams develop their own product or solution for a real problem. Subjective assessments of team processes and creative self-efficacy are collected at the beginning and the end of the courses.

Results: First results show acceptable internal consistencies for the team process scale. Data analysis is ongoing to validate the scale and to test the relationship between team processes and creative self-efficacy. Data will be available in November 2018.

Limitations: The sample consists of student teams. More research is necessary to determine to what extend the findings are transferable to work settings.

Implications: Results will shed light on which team processes promote individual creative self-efficacy.

Value: This research contributes to the literature on teamwork which largely neglects individual development through team processes so far. This study provides first ideas how team processes must be shaped so that people act more creative. Moreover, the validated German scale can be useful for other researchers.
Emotions can be sources for agency and they can be used in generating reflexivity and changing social order (Ruebottom & Auster, 2017). Different organizational members experience different empowerment and the institutional norms and logics can influence the enactment of emotions. The paper builds on previous research that identifies the significant role that emotions play in the workplace in both individual and social dimensions, e.g. through emotional competence (Kim, Cable, Kim & Wang, 2009). The paper seeks better understanding of emotions in workplace and the role of emotional skills in building agency in the workplace.

This paper explores, what kind of agency is built among the organizational members during an emotional skills training in a health care organization. This multimethod study design uses both qualitative and quantitative data gathered during a period of six months. Quantitative data were collected by a survey, looking at the training participants’ perceptions of emotions in their work and workplace. Qualitative data include observations and interviews in the workplace, focusing on the experiences of the participants of the training and on the role of emotions in their workplace.

The results illustrate how individuals were empowered by the tools provided by the training and how they were used in the everyday practice. The participants perceived emotional competence especially in terms of understanding their own emotions and managing them. Influencing others’ emotions in the workplace represented another aspect of emotional agency. The exploration of these experiences have implications for organizations that wish to develop their emotional climate.
Over the last few decades, it has been said by many academics that the nature of career is changing and the notion of traditional careers based on a hierarchical, highly rigid structures and linear direction of prescribed advancement is no longer applicable to the contemporary labour market. In particular, fast development in different areas such as organizational structures, international economy and business technology are assumed to be the factors that accelerated the pace of changes in planning and managing careers.

Accordingly, the main purpose of this study is to identify the extent and nature of any changes over time by analyzing the representation of contemporary career concepts in print media, the nature of any career advice given, metaphors used, and the narrative forms employed. The aim is not to come to an objective conclusion about whether careers have changed. Instead, the intention of study is to examine whether and how the ways in which career is represented have changed in line with the broad claims described by academics.

The study will explore whether the anticipated changes that academics discuss are aligned with popular discourses on careers. To achieve this, a structured comparison of the articles concerning careers in selected and contrasting printed media outlets during the last 30 years will be analyzed alongside academic papers published in key academic journals. The analysis will then identify how popular discourse and academic discourse overlap, diverge and feed into one another.

Investigating both academic literature and popular media in parallel allows the study to develop a contextual perspective which has rarely been the focus of academic research in career studies. In other words, assessing the similarities and differences of the dominant academic discourses and inherently social characteristics of the press can provide a setting to draw conclusions about social implications of career theories.

From the methodological perspective, this study offers an innovative way of observing the development of career theories and mapping out a comparative study, by investigating simultaneous portrayals of the changes in academic literature versus popular discourse.

In this study, articles from UK print publications (The Times, The Guardian and The Daily Mail) will be analyzed over the last 30 years (1985-2015) using a combination of quantitative and qualitative content analysis.
How do social comparisons influence daily levels of job satisfaction? Job satisfaction levels remain relatively stable over time (Steel & Rentsch, 1997), but are susceptible to short-term fluctuations (Ilies & Judge, 2002). The current research used an experience sampling methodology to test hypotheses related to the influence of upward and downward social comparisons on daily levels of job satisfaction. Multi-level modeling was used to analyze data from 56 participants who completed surveys for 14 consecutive days. The results showed that, controlling for baseline job satisfaction and job satisfaction instability, daily job satisfaction decreases on days when an upward social comparison is made. This was true at the within-subjects level, but not between-subjects. Daily job satisfaction was also predicted by a significant 3-way interaction between baseline job satisfaction, job satisfaction instability, and comparison direction such that highly satisfied individuals who have low levels of job satisfaction instability showed less of a decrease in daily job satisfaction after an upward comparison. Theoretical and practical implications of these findings are discussed.
Within the employee resilience literature, there is little research investigating differences in trajectories following significant workplace adversity (Britt et al., 2016). The current study takes an exploratory approach to identifying risk and protective factors that contribute to resilient (e.g., positive adaptation) versus non-resilient (e.g., PTSD) trajectories following workplace sexual harassment. Using a mixed-method approach, an online survey was administered to individuals who reported experiencing workplace sexual harassment. We collected qualitative responses detailing the nature of the harassment; the victims’ initial response and experiences following the sexual harassment; and personal and organizational factors that impacted the victim’s (in)ability to recover.

Preliminary results (N = 30) reveal underlying collective themes that distinguish resilient and non-resilient trajectories. Commonly reported protective factors associated with recovery include external relationships, therapy, and supportive management. Within non-resilient narratives, HR and coworkers were frequently reported as significant risk factors exacerbating effects of the harassment via inaction against and coming in defense of the harasser, bullying or degradation, and doubting the victim. Overall, participants provided similar accounts of resulting life changes including personal (e.g., increased caution, anxiety, distrust) and professional (e.g., quitting, inhibited career progression) outcomes. Findings, currently limited by the cross-sectional design, will be bolstered by follow-up data being collected prior to the conference. Albeit preliminary, this research applies a unique resilience lens to experiences following workplace sexual harassment. Further, results highlight actionable implications for integrating ways of leveraging protective factors and mitigating risk factors into harassment training to support resilient recovery processes (Medeiros & Griffith, forthcoming).
ORGANIZATIONAL COHORENCE: HOW PEOPLE UNDERSTAND COHORENCE AT WORK

Fernando Toro (1)
Organizational Behavior Research Center, Medellín, Colombia (1)

Purpose
To explain how perceived elements of an organizational reality interact with a subjective referent for people to produce a Coherence Judgement (CJ) about such reality.

Design
Vignette experimental design examined six characteristics of the integrating element (IV) of a Coherence Judgement (CJ) and its main effect, the situation’s subjective meaning (DV).

Results
Current study proposed the Coherence Judgement concept as a cognitive process by which diverse elements of reality are integrated, according to a personal concept or idea (Integrating Element), to attain a personal meaning, which assigns a degree of positive or negative value to the situation. Six different contents of the Integrating element were examined in order to observe its triple role of integrating situational elements, attaining a subjective meaning and judging a degree of coherence. Results supported the hypothesis related to the Integrating Element roles.

Limitations
Several sample bias due to highly educated participants (80% professional and graduate), only 20% were blue collar workers, over 80% of participants lived in the same industrial city and were recruited as availability sample.

Research and practical implications
The CJ: Suggests how employees decide if an organizational situation is more or less coherent; makes clear that a coherent organizational reality may not be judged as such by everybody; suggests that is not enough to create coherent facts, it is needed that people identify and understand them; coherence must be managed.

Originality/Value
CJ is a concept never before defined and studied in previous research. Current study provides initial evidence of its relevance and heuristic value.
Purpose
Soft skills are defined as intra- and inter-personal (socio-emotional) skills, important for personal development, social participation and workplace success (Kechagias, 2011; Andrews & Higson, 2008). The University of Turin has developed a model comprising 12 soft skills for academic and job success and performance (Bennett et al., 1999; Heckman & Kautz, 2016), divided into 4 areas: task, self, motivation and relations. The Passport.Unito Project aimed the creation of an online platform for the evaluation and reinforcement of soft skills in students (through readings, exercises, videos, ...). The objective of the study is to observe differences in soft skills levels before and at the end of compiling the online activities.

Design/Methodology/Approach/Intervention
The study involved students (N = 154) who, to date, have completed activities in e-learning platform, filling-out the self-assessment test of soft skills (PassporTest, Ricchiardi, Ghislieri, & Emanuel, in press - validated on 1048 students of the University) at the beginning (T1) and at the end (T2) of the online activities in platform. Data analysis were performed using SPSS 25.

Results
Paired t-test results show significant differences in soft skills levels: at T2 students show higher scores in all the skills considered.

Limitations
Self-report data, lack of monitoring and follow-up discussion during the online activities are the main limitations.

Research/Practical Implications
Results underline the importance of designing project to evaluate and reinforce soft skills in higher education, in order to sustain students in academia and promote their employability (Jackson, 2013).

Originality/Value
This study emphasised the importance of soft skills in higher education.
1172 - SECONDARY TRAUMATIC STRESS: RELATIONSHIP WITH SYMPTOMS, EXHAUSTION AND EMOTIONS AMONG CEMETERY WORKERS

Lara Colombo (1) - Federica Emanuel (2) - Margherita Zito (3)

University of Turin, Department of Psychology, Turin, Italy (1) - University of Turin, Department of Philosophy and Education Sciences, Turin, Italy (2) - Università IULM, Department of Business, Law, Economics and Consumer Behaviour “Carlo A. Ricciardi”, Milan, Italy (3)

Abstract

Purpose: Cemeteries workers are daily exposed to death experiences. Secondary trauma develops from the contact with others’ suffering, and operators working with traumatic contents and dynamics could experiment emotional disorders (Figley, 1995). Therefore, the secondary traumatic stress (STS) is considered an occupational risk factor (Bride et al., 2004).

Methodology: 114 participants in a cemetery organization, divided into technician employees (TE), technicians and specialists of decoration and garden (TS), gravediggers (GR), administrative and front office employees (AFO), completed a self-report questionnaire. This study assessed: levels of STS and psychophysical symptoms; correlations between the STS dimensions and the psychological/physical symptoms, exhaustion, and the positive/negative emotions at work; differences among occupational tasks considering the contact with clients and trauma contagion.

Results: AFO and TS showed the highest levels of STS and psychophysical symptoms, in particular anxiety, sadness, insomnia and gastric, and musculoskeletal disorders.

Limitation and practical implications: even if it was involved a small sample in an unique organization, this study highlights the importance of considering STS among these workers, since they are daily exposed with death, and also with suffering people often asking for grief and emotional skills that cemetery workers are not trained to give. It is important to monitor symptomatic levels to avoid chronicity, and to provide employees with psychological support and training about secondary trauma and its consequences.

Originality: The studies on the topic have focused on the operators of emergencies, social and health, little attention has been dedicated to cemetery workers.
Purpose. Safety behavior is the most critical task for air traffic controllers (ATCOs). One of its important antecedents is leadership, but yet, theory formation and empirical evidence remain limited. As servant leaders focus on the changing needs of employees, they may have the right skills and attitudes to increase ATCOs’ safety behavior. This research will examine this proposition, drawing on social learning, social exchange, and performance theory.

Design and Methodology. We will invite the 290 ATCOs of a European air navigation service provider to participate in a diary study and apply a crossed random effects model.

Results. As the data collection and analyses will be executed between January and March 2019, we do not have any results yet. However, based on the literature, we expect a positive relationship between servant leadership and ATCOs’ safety behavior, sequentially mediated by a) role modeling and social exchange and b) ATCOs’ safety motivation, efficacy, and knowledge.

Limitations. This research is restricted to one organization, leading to limited generalizability. Additionally, it is prone to common method bias, as we will collect all data from the same source and at the same measurement points.

Implications. The results will provide important practical implications concerning desirable ATCO leadership behaviors, and theoretical implications concerning the three applied theories.

Value. This research helps to clarify the underlying relation between (servant) leadership and ATCOs’ safety behavior. It also makes a theoretical contribution by applying social learning and social exchange theory simultaneously to a context they have not been applied to yet.
Purpose. The aim of this study is to examine whether respondents perceive qualifiers in item stems of a survey and if so, whether this is reflected in response behavior.

Design/Methodology/Approach/Intervention. In a within-subject design, respondents filled out two versions of an attitude survey (with vs. without qualifiers), while their eye movements were tracked. We suggest that qualifiers in item stems are fixated longer and more frequently, and subsequently means of items with and without qualifiers differ significantly. Further, the longer a qualifier is fixated the stronger the effect on response behavior.

Results. The length and frequency of eye-movements were significantly higher in the qualifier condition tested against zero. Also, item means were significantly lower for items using qualifiers compared to items without qualifiers.

Limitations. This is a laboratory experiment with university students, which limits the generalizability to other contexts. Also, the head-mounted eye tracking device might have increased respondents’ awareness for the experimental setting.

Research/Practical Implications. In survey research measuring the “true” attitudes of respondents is equally important in research and practice alike to derive meaningful insights and measures. This study finds effects of qualifiers on data quality, thus supporting the use of qualifiers to clarify the item content toward the respondent.

Originality/Value. The effects of the use of qualifiers on cognitive item processes has been restricted to “Think Aloud” studies thus far. This study contributes to the field of research by examining the effects of qualifiers in item stems on response behavior and data quality using eye tracking technology.
1192 - EXPLAINING AND ASSESSING EMPLOYEES' READINESS FOR DIGITAL TRANSFORMATIONS: A MIXED-METHODS APPROACH

Thea Nieland (1) - Tammo Straatmann (1) - Leonie Fahlenberg (2) - Patrick Hofschroer (1) - Karsten Muller (1)

University of Osnabrueck, Work and Organizational Psychology - Cross-Cultural Business Psychology, Osnabrueck, Germany (1) - University of Osnabrueck, Osnabrueck, Germany (2)

Purpose

Given the accelerating pace of innovations in IT, organizations are pushed to integrate digital technologies for staying competitive. The strategic imperative of digitalization however is challenging: Endeavors to digitalize organizations rarely exploit its full potential and often fail. Within this context, there is a need to investigate individuals' reaction to the associated transformational process in organizations. Hence, integrating managerial and psychological factors, a model based on the Theory of Planned Behavior (Ajzen, 1991) and the Content-Process-Context framework (Armenakis & Bedeian, 1999) is postulated for explaining the readiness for digital transformations.

Design/Methodology/Approach/Intervention

This deductive-theoretic approach is complemented by an inductive, qualitative exploration of employees' perception of digital transformations. Data were gathered from 168 employees from various industries in an online-survey.

Results

The proposed model for explaining digital readiness largely receives support. Psychological and managerial factors have substantial impact on digital readiness. Additionally, results show convergence with qualitative data.

Limitations

The survey relies on self-report. Future research should include objective indicators, i.e. the actual use of digital technologies.

Research/Practical Implications

Results suggest that creating a positive vision of digital transformation promotes digital readiness. Overall, a theory-based understanding of digital readiness and of mechanisms to facilitate it enables practitioners to take informed decisions on the selection of management interventions.

Originality/Value

This study extends existing research on digital transformation management from technological or economic perspectives by a psychological perspective. The model can serve as a basis for systematically assessing employees' digital readiness during transformations, allowing for a potential adjustment of management strategies.
AN EXAMINATION OF STEREOTYPE THREAT IN A SIMULATED SELECTION TESTING: EFFECTS FOR YOUNGER JOB SEEKERS

Irina Gioaba (1)

University of Lausanne, Organizational behavior, Lausanne, Switzerland (1)

Introduction and Purpose
Age bias in the workplace is not only a problem for older workers but also for younger adults entering the workforce. Younger adults are described as demanding, unreliable and uncommitted. The prevalence of such stereotypes coupled with a high unemployment rate, suggests that younger adults are likely to be susceptible to stereotype threat. The purpose of this study is to examine whether subtly activating different stereotypes, either positive or negative, would affect the performance of younger individuals in a simulated hiring scenario.

Design/Method
Participants were 114 students in their final year of studies taking a simulated employment test. The study followed a between-subject design with participants randomly assigned to one of the three experimental conditions: (a) stereotype threat condition, in which they were presented with job ads requiring traits associated with negative younger-workers stereotype, (b) stereotype boost condition, in which they were presented with job ads requiring traits associated with positive younger worker-stereotype, or (c) control condition, in which they will be presented with job ads requiring age-irrelevant traits (e.g. location).

Results
Results showed that participants in the stereotype threat condition performed lower on the employment test than participants in the control and boost condition.

Limitations
Small sample size across conditions.

Practical Implications
This study provides additional evidence for the occurrence of stereotype threat in selection contexts.

Originality/Value
This is one of the first studies to provide evidence for stereotype threat among younger workers.
1203 - THE ROLE OF PARADOX MINDSET IN THE CONTEXT OF ORGANIZATIONAL TENSIONS

Svenja Schumacher (1) - Cosima Koßmann (1) - Tammo Straatmann (1) - Christopher Klanke (1) - Karsten Mueller (1)

University of Osnabrueck, Work and Organizational Psychology with Emphasis on Intercultural Business Psychology, Osnabrueck, Germany (1)

Purpose. At work, increasingly complex environments lead to organizational tensions (Smith & Lewis, 2011). Individual and organizational strategies are needed to successfully deal with these tensions. The paradox mindset of employees is suggested as a relevant factor for embracing tensions (Miron-Spektor et al., 2018). The purpose of this study is to examine the role of paradox mindset in the relationship between experiencing tensions and performance- and health-related outcomes.

Design/Methodology/Approach/Intervention. An online-survey with 311 employees working in a broad range of organizations was conducted.

Results. The results show that paradox mindset moderates the relationship between experiencing tensions and engagement: Especially, for employees with lower paradox mindsets experiencing tensions is more negatively associated with engagement. For innovation or emotional exhaustion no moderation by paradox mindset was found. Further analyses reveal that the relationship between paradox mindset and emotional exhaustion as well as engagement is partly mediated by experiencing tensions.

Limitations. The survey relies on self-report measures. Future research should use multi-source data (e.g. other-report, performance indicators) and longitudinal or experimental designs to examine causalities in this field.

Research/Practical Implications. Paradox mindset is shown to affect organizational factors, individual performance and health-related outcomes. Thus, it would be beneficial to conduct further research into possible antecedents to create a benefit for employees and organizations in dealing with tensions.

Originality/Value. This study contributes to the relatively new research on organizational tensions at the micro-level. Specifically, it looks at positive and negative outcomes in the context of experiencing organizational tensions to gain insights into effective strategies.
Purpose

Job crafting is a proactive behavior on the part of employees aimed at shaping their job to better suit their needs and preferences. Three strategies of JC (i.e., increasing structural and social resources and challenges) are often distinguished as proactive, whereas the reduction of hindering demands is considered passive, since, in contrast to increasing resources and challenges, it does not lead to effectiveness and satisfaction of the employee. The aim of our study was to investigate how teachers craft their jobs during the time of educational reform in Poland.

Design/Methodology/Approach/Intervention

We conducted a quantitative study among teachers (N = 528) measuring job crafting (JCS; Tims, Bakker, & Derks, 2012), meaning of work (WAMI; Steger, Dik, Duffy) and work engagement (UWES; Schaufeli & Bakker, 2003).

Results

Using k-means cluster analysis we indicate four profiles of JC among teachers, which differ in terms of work well-being indicators. Additionally, we found that employees who craft their
jobs through four kind of JC strategies (active profile) had highest levels of meaning in work and work engagement.

Limitations

The study has a cross-sectional design, which raises concerns about common-method bias.

Research/Practical Implications

This project demonstrates that it might be beneficial to enhance employees to craft their jobs through the four strategies of JC, including reducing hindering demands.

Originality/Value

To our knowledge, the study is the first to demonstrate the profiles of job crafting among teachers and their relations with well-being at work. The novelty in this study is proving that decreasing demands is not a bad strategy, when employees simultaneously utilize the three proactive strategies as well.
Purpose
In this conceptual paper, we propose a model that outlines leader decision making as a capacity and we discuss how this process needs to be managed. We draw on Tversky & Kahneman’s (1985) Prospect Theory, Mumford, Zaccaro, Harding, Jacobs, and Fleishman’s (2000) Skills Model and Vroom and Jago’s (2007) Contingency Leadership. The relationship between leader skills and decision making capacity presents the key underpinning logic. Two points are noteworthy here. First, decision making is not just about information processing, problem framing, and option evaluation. It is also a capacity that is dependent on problem solving, social judgment, and emotion management. Second, because decision making is sensitive to environmental changes, contextual factors such as time pressure and the environment will cause variations in leader decision making capacity.

Research/Practical Implications
This model provides insights about decision making capacity from an information processing perspective. It add values to the decision making literature with the integration of individual and contextual factors.

Originality/Value
Decision making research has been a dominant subject in behavioural economics, and has shed light on the impact of rationality on decision making. However, decision making research has recently departed from this more mathematical approach, and has begun, through experimental studies, to explain the phenomenon of violations of rational behavior (Oppenheimer & Kelso, 2015). We go one step further, calling for a wider range of methods considering both individual and contextual factors from rational and emotional perspectives that may not have been previously considered in “rational” decision making models.

References:
Purpose: The present study's goal was to examine the relation between team-level diversity and team process outcomes (conflict, cohesion, satisfaction, and interdependence).

Design/Methodology: Participants were 20,131 US college students (153 different institutions) working in 4,965 project teams (mean time size = 4.61, SD = .851) between 2014 and 2018. Participants worked together over the course of a 15-week semester on projects that contributed to their final course grade. Participants provided demographic information and later in the semester completed measures of team conflict (Jehn & Mannix, 2001), satisfaction (Van der Vegt, et al. 2001), cohesiveness (Carless & de Paola, 2000), and interdependence (Van der Vegt, et al. 2001). Participants also provided peer ratings of each of their teammates. Scores were aggregated to the team level and correlated with measures of diversity related to gender, race/ethnicity, class year, English language proficiency, and an overall diversity index.

Results: Results indicate little relation between team-level diversity measures and team process outcomes. The relationship between overall diversity and team satisfaction was moderated by team interdependence. Differences also emerged at the dyad-level with respect to peer evaluation scores.

Implications/Limitations: We extend research on team-level diversity by exploring the impact of diversity on team process outcomes in a large sample of project teams. Results indicate that diversity does not necessarily impact process related outcomes directly but that the diversity-process relationship is moderated by task characteristics. The study is limited to an examination of largely surface-level diversity measures. Future research should examine additional moderators suggested in the literature.
**Purpose:** So far, scientific research reported indifferent results concerning the impact on health and productivity during and after a relocation from cell offices to an activity-based flexible office. However, the discovery of relocation-supporting competencies has become a desideratum. Therefore, this study aimed at identifying competencies for leaders and subordinates necessary for a successful relocation.

**Design / Methodology:** A total of 48 semi-structured interviews was performed in six companies in the banking, insurance, real estate, health promotion and communications services sectors in Switzerland. The 48 interviews consisted of 23 leaders and 25 subordinates. A structuring qualitative content analysis was used to analyze the interview transcripts in order to unveil necessary competencies.

**Results:** A model of competence could be established consisting of five competency-clusters and a total of 18 competencies. The clusters are: Spatial Competence, Workplace Interactions, Prospective Anticipation, Situational Resilience and Adequate Leadership.

**Limitations:** The subject nature of qualitative interpretation.

**Research / Practical Implications:** The established competency model presents empirically based insights into individuals’ knowledge, skills and abilities necessary for successful work in modern activity-based offices. It is therefore of practical value for workplace managers, HR personnel, change representatives etc.

**Originality / Value:** This research is the among the first studies to investigate and analyze competencies that have a positive impact on health and productivity during a relocation to an activity-based flexible office.
THE ROLE OF PERSONALITY PROFILES IN THE LONGITUDINAL RELATIONSHIP BETWEEN WORK-RELATED WELL-BEING AND LIFE SATISFACTION AMONG WORKING ADULTS IN SWITZERLAND

University of Lausanne, NCCR LIVES, Lausanne, Switzerland [1] - University of Lausanne, Institute of Psychology, Lausanne, Switzerland [2]

Purpose
Drawing on spillover theory and using a person-centered approach, the present study examined the role of Big-Five personality trait profiles in moderating the relationship between work-related wellbeing and life satisfaction over a one-year period in a sample of working adults in Switzerland. Work stress and job satisfaction were used as the negative and positive indicators of work-related well-being.

Design/Methodology
Latent profile analysis was carried out to derive and compare alternative latent personality profile models. A two-wave cross-lagged structural equation model using three personality profiles (resilient, average, oversensitive) as moderators was tested on a working adult sample (N = 1204).

Results
In the overall sample, T1 work stress predicted T2 life satisfaction, while T1 life satisfaction predicted T2 job satisfaction. Moderation analysis showed that the effect of T1 work stress on T2 life satisfaction disappeared in the average and resilient personality profiles, but remained salient in the oversensitive profile. In the average profile, T2 job satisfaction was predicted by T1 life satisfaction. Interestingly, a significant effect of T1 life satisfaction on T2 work stress was found in the resilient profile.

Limitations
The study was based on two waves of data only.

Practical Implications
Interventions aiming at stress-reduction at the workplace may gain in effectiveness and efficiency through the development of tailor-made trainings addressed to specific target-groups, compared to general and mainstream programs addressed to all employees.

Originality/Value
We found a moderating role of different personality profiles on the spillover effect of work-related well-being on life satisfaction.
OBJECTIVE RISK ASSESSMENT OF MENTAL STRESS AT WORK FOR SMALL AND MEDIUM ENTERPRISES

Simone Brandstädter (1) - Nadine Seiferling (1) - Elisa Feldmann (2) - Karlheinz Sonntag (1)

Heidelberg University, Work and Organizational Psychology, Heidelberg, Germany (1) - khs worklab GmbH, Heidelberg, Germany (2)

Keywords
Objective risk assessment, mental stress at work, critical load combination, small and medium-sized enterprises

2.1.1. (word count: 246/250 words)

Purpose
For SMEs (small and medium-sized enterprises), implementing a risk assessment of mental stress at work, in compliance with § 5 of the German Occupational Safety and Health Act, presents a challenge. Assessing psychological stress and deriving adequate measures for risk reduction though is of particular importance for preserving individual health and organizational success.

Approach
The GPB is an objective, consensus-based screening method for identifying mental stress at work, which is used successfully in large companies. We adapted this analytical tool to the needs of SMEs and evaluated it with N = 23 SMEs and N = 75 different jobs.

Results
Results confirm the reliability and validity of the tool. A majority of representatives from occupational safety/medicine, HR and works councils stated that the identified mental stress factors were adequately evaluated. The most common critical mental stressors were due to monotone activities (low variability and decision latitude) or high task complexity/responsibility and low work time flexibility.

Implications
Findings indicate that this method can be used successfully across industries as a cost-effective brief version of the GPB. The objective assessment of mental load is suitable for identifying critical stressors in order to derive specific measures for hazard avoidance.

Limitations
The objective approach focuses only on task-related stressors. A supplemental employee survey can be used to identify other relevant areas such as leadership, team climate or job satisfaction.

Originality
This method can be used in small companies where interviewing would pose a problem with respect to participants’ anonymity.
Purpose

The construction of the first German Meaning of Work (MOW) questionnaire measuring an employee’s subjective experience.

Design/Methodology/Approach/Intervention

A Pre-Study examined the topic-specific use of language through qualitative interviews with 15 both employed and self-employed subjects. Based on the results, a 12-item German questionnaire was constructed proposing a three-factorial model. According to it, employees experience meaning through self-actualization, purpose and affiliation with others. The three-factorial structure’s fit was tested conducting a CFA-based approach with a sample of N=247.

Results

The model’s cut-off criteria were reached for the following fit indices: SRMR = .041, RMSEA = .036, CFI = .984, TLI=.980. This is in line with other internationally conducted studies’ findings highlighting MOW’s cultural specificity.

Limitations

Generalizability may be threatened due to the use of a nonprobability sample. Furthermore, it was solely recruited via online-channels. Even distribution of various occupations was not achieved but further research is needed to estimate its actual effect on the results.

Research/Practical Implications

This Questionnaire makes MOW accessible for both researchers and practitioners in German-speaking countries in the form a diagnostic tool enabling new ways of surveying employee satisfaction, quality of work and other key constructs effectively.

Originality/Value

This questionnaire is the first of its kind utilizing the German language. Considering findings suggesting MOW’s cultural specificity, it will be important to replicate international results on the various correlational relationships to other central constructs such as job satisfaction and overall employee’s health.
Purpose
Organizational cynicism harms supervisor-subordinate relationships, but the mechanism through which the impairment operates remains unstudied. We propose that cynicism impacts loyalty and this effect will be particularly pronounced among those employees who are less loyal in general. Specifically, we hypothesize that loyalty to supervisor will mediate the relationship between organizational cynicism and LMX and that trait loyalty will moderate relations between organizational cynicism and supervisor loyalty and organizational cynicism and LMX.

Design/Methodology
Employed participants (N = 335; 61% male; Xage = 35.89) completed measures of trait loyalty, negative affect, organizational cynicism, supervisor loyalty, and LMX over three time points.

Results
We tested our moderated mediation hypotheses using Conditional Process Analysis. As hypothesized, trait loyalty moderated the relationships between cynicism and supervisor loyalty, and cynicism and LMX, such that individuals high in organizational cynicism report less loyalty and LMX and this is most pronounced among those low in trait loyalty. The conditional indirect effects provide support for the moderated mediation effect of supervisor loyalty on the relationship between organizational cynicism and LMX.

Limitations
The data was a single source, time-lagged, cross-sectional design.

Research/Practical Implications
We demonstrate that organizational cynicism leads to lower feelings of loyalty toward one’s supervisor and that loyalty may be a key mechanism through which organizational cynicism impairs organizational relationships.

Originality/Value
This paper is the first suggest that organizational cynicism may impair supervisor loyalty, affecting supervisor-subordinate relationship quality.
EXPLORING KNOWLEDGE THEFT AT WORK

David Zweig (1) - Alycia Damp (2)

University of Toronto, Management, Toronto, Canada (1) - University of Toronto, Centre for Industrial Relations and Human Resources, Toronto, Canada (2)

Purpose

Although people taking credit for or stealing others’ ideas has received much attention in the popular press, the occurrence of intentional knowledge theft at work has yet to be developed and validated as a construct in the organizational scholarship landscape. We build upon existing work that explores the barriers to effective knowledge management by creating a new measure of intentional knowledge theft at work for perpetrators and targets.

Design/Methodology

Initially proposed as credit stealing and idea repackaging, the first phase of scale development included collecting qualitative accounts of personal experiences with workplace knowledge theft from perpetrators and targets (N=193) and created a pool of items to measure the proposed dimensions. Eleven subject matter experts were administered a Q-sort task to determine which dimension each of the items reflected. To confirm the reliability of the measures, the factor structure, and to aid in item reduction, data were collected from separate samples of perpetrators (N=200) and targets (N=200).

Results

The results support a highly reliable (α=.97) and, consistent with the Q-sort, robust single-factor for both perpetrator and target measures of knowledge theft.

Limitations

This research is in the preliminary scale development stage. Convergent and Discriminant validation studies are ongoing.

Research/Practical Implications

Based on the results from four studies, we present a measure to assess knowledge theft at work that can aid in explaining barriers to effective knowledge sharing.

Originality/Value

This is the first set of studies to identify and measure intentional knowledge theft at work.
HOW I TREAT YOU DEPENDS ON WHETHER YOU ARE ABOVE OR BELOW ME?

CONCEPTUALIZING AND MEASURING KISS-UP-KICK-DOWN BEHAVIORS IN ORGANIZATIONS

Laura M. Math (1) - Fabiola H. Gerpott (2)

Vrije Universiteit Amsterdam, Faculty of Behavioural and Movement Sciences, Amsterdam, Netherlands (1) - Technische Universität Berlin, Fakultät für Wirtschaft & Management, Berlin, Germany (2)

Purpose

Practitioners repeatedly note that some leaders only treat those people well who might help them to get ahead in the organization. Yet, despite the widespread recognition of this phenomenon, this practice is currently under-theorized. We formally define the behavioral configuration of abusing lower-level subordinates and flattering higher-level supervisors as “Kiss-Up-Kick-Down” (KUKD) leadership. Notably, only if both behavioral strategies are used in combination, the phenomenon comes into existence.

Design/Methodology

We integrate abusive leadership theories with the impression management literature to provide a conceptual account of the antecedents and consequences of KUKD behaviors. Based on our theorizing, we develop the KUKD-scale and validate it in an organizational sample using a 180-degree design (i.e., evaluation of the target employee by subordinates and supervisors).

Results

The data collection to explore antecedents and consequences of KUKD behaviors and to confirm the discriminant validity of the KUKD-scale in relation to related constructs (e.g., impression management, abusive leadership) is ongoing. Results will be presented at the conference.

Limitations

Future research should use an experience sampling design to understand the dynamics of KUKD behaviors.

Research/Practical Implications

This research makes a conceptual contribution to the leadership literature and can help practitioners to avoid recruiting KUKD-leaders.

Originality/Value

We are the first to develop a theoretical framework that explicates an everyday phenomenon (i.e., leaders’ KUKD behaviors), differentiates it from related constructs and explores its antecedents and consequences in organizations.
Purpose: The presented study addresses the issues of value measurement in organizational research and practice. Specifically, the study aims to systematically assess the impact of response format design to avoid typical distributional difficulties of skewness, kurtosis and non-normality associated with value measurement in organizational settings.

Methodology: Organizational values were measured with the German version of the Organizational Culture Profile (OCP). In a randomized experiment, the study compares four different response formats varying in the degree of extreme labeling. The 381 participants were randomly assigned to one of the four experimental conditions. Differences in distributional parameters, mean values and nomological correlations we used as dependent variables.

Results: Results indicated a substantive impact of the labeling of value measures on response distribution, nomological correlations and mean values. Results further indicate that unipolar and moderate extreme labeling of response formats leads to a more differentiated and normal distribution of values measurement.

Limitations: The suggested response labels could be further improved in regards to their distributional properties.

Research/Practical Implications: Values measurement in organizational research and practice has been plagued with challenges regarding skewness, kurtosis and non-normality. This research makes specific suggestions for the improvement of response formats in value measurement that aids to remedy these challenges.

Originality/Value: The effects of response format labeling has been rarely addressed in organizational value measurement. This study systematically addresses this issues and gives advice for creating response scales that improves the usefulness of value measurement in organizational settings.

Keywords: organizational values, verbal qualifiers, Organizational Culture Profile, rating scale, response scale construction, normal distribution, differentiation of values, value measurement
Ethical behavior is a desired characteristic of employees in all professions (Petrick, 2008; Pope, 2017). Moreover, professional ethics for organizational psychologists is crucial.

**Purpose:** The longitudinal survey was designed to analyze which students’ ethics competencies could be developed during the course of Professional ethics in Organizational psychology master program.

**Methodology:** 27 participants (3 males and 24 females) took part in the longitudinal survey. During the period 2015-2018 four groups of students from Organizational psychology master program filled in questionnaires two times: before and after the course Professional ethics of organizational psychologist. Students were asked to evaluate their ethics competencies and business integrity capacity (Petrick, 2008).

**Results:** Results showed that both students’ ethics competencies and business integrity capacity improved significantly. Differences of pretest and posttest responses related to cognitive and affective prebehavioral ethics competencies were significant. However, managerial ethics competencies didn’t change significantly.

**Limitations:** The majority of respondents (89 percent) were female students. Only 33 percent of them had work experience. Therefore, further research should include more diverse sample.

**Research/practical implications:** Ethics educators are expected to successfully address the challenge - growing number of business criminals and unethical behavior of employees. Successful practices of ethics education in universities could be transferred to organizations.

**Originality/value:** The three-component model of ethics competencies (cognitive decision-making competence, affective prebehavioral disposition competence and context management competence) was tested during longitudinal survey.
Purpose
This theoretical piece proposes a job search process model that examines the challenges facing refugees when finding employment and integrating into the workforce.

Approach
Influencing factors are outlined at each stage of the job search process for both applicants and organizations. At the Job Search stage itself, we expand upon existing job search models, integrate refugee-specific factors, and incorporate several theories, such as Image Theory and the Theory of Planned Behavior. With Job Applications, we integrate considerations on the part of the refugee applicant, such as cultural congruency, as well as on the side of the organization, such as skill discounting. We also include factors influencing the Interview stage, such as self-promotion behaviors and stereotypes and biases. Finally, we examine the applicant’s Integration/Socialization into the Workplace, drawing on theories such as the intergroup contact theory.

Originality/Value
With the large influx of Syrian refugees into Canadian society, it is integral for these individuals to find employment. The authors have developed a job search model that identifies key factors to lay out a research agenda in this area. These factors include the examination of refugee-specific variables that are outlined in this model and the skill discounting phenomenon, which is a barrier to many skilled refugees. The current piece is a new integration of disparate theories of job search and is helpful to researchers who are examining these stages, as many of these factors apply to all job applicants, in North America and Europe.
Dana Tomeh (1) - Paul Sackett (1)

University of Minnesota, Industrial Organizational Psychology, Minneapolis, United States (1)

Purpose: This study applies Sackett, Shewach, and Kaiser’s (2017) head-to-head comparison methodology for meta-analysis by reevaluating the relationship between interviews, cognitive ability tests, and performance. Results are compared with those of Sackett et al., who compared cognitive ability tests and assessment centers as predictors of performance. Possible explanations for the differences in the results between the two studies are explored.

Methodology: A head-to-head comparison is used to conduct a meta-analysis. Only studies in which participants were both interviewed and took an ability test were included. Differences between our results and norms are compared with the respective differences in the initial application.

Results: The correlations found for the relationships between ability and structured interviews for job performance (.281 and .381, respectively) and training performance (.381 and .131, respectively) mirror existing norms. This is contrary to the initial head-to-head Sackett et al., comparison application, which showed a reversal of commonly accepted relationships.

Limitations: Only a small number of studies were included in the training performance (k=7). The complexity of jobs included in this study were generally lower than those reported in the original Schmidt and Hunter (1998) study of these relationships.

Research/Practical Implications: Using head-to-head comparison adds confidence to our understanding of meta-analytic relationships by eliminating several confounding variables. This will allow us to reexamine known relationships and begin using the updated values in research.

Originality/Value: Unlike existing meta-analytic methods, the novel head-to-head comparison method allows us to eliminate a variety of confounding variables in meta-analysis, and accept results with more confidence.
Abstract

Perception shapes the way we do things, including our behavior in organisations. Conflicts are inevitable in organisations and employees perceive conflicts differently. The way conflicts are known and handled matters a lot to both employees and organisations. Conflict perception and management are known to have important outcomes. Conflict perception and conflict outcomes are known to affect organisations in many ways, including organizational citizenship behavior (OCB) of employees. Not so much is yet known about the relationship between conflict perception and organizational citizenship behavior among bank employees in Nigeria. The present study attempts to fill this research gap. The study investigated how and to what extent perceived organisational conflict influences organisational citizenship behaviour of employees of bank employees in Lagos, Nigeria. The study utilized an ex post-facto design while using standardized questionnaire to gather data. The questionnaire consisted three sections, namely, socio demographics, perceived organisational conflict and organizational citizenship behaviour. The study used a sample of one hundred and sixty eight (168) randomly selected employees of some banks in Lagos, Nigeria. The subjects were made up of 95 (56.5%) males and 73 (43.5%) females. Ages of participants ranged from 26 to 49 years. The results showed that perceived organizational conflict significantly independently predicted organizational citizenship behavior of bank employees \( r = .31, df (166), P < .001 \), whereas sex \( r = -.14, df (166), P > .05 \) and education \( r = .045, df (166), P > .05 \) did not significantly independently predict OCB. The aforementioned results were extensively discussed in relation to the extant literature on conflict perception and organizational citizenship behavior. Recommendations were made with implications of the study also highlighted.

Keywords: Conflict perception, Organizational citizenship behavior, Organisational development, Bank employees, Lagos, Nigeria
Are competencies acquired in voluntary work considered relevant for a professional environment? Do employees engaged in volunteering also show organizational citizenship behavior? These questions will be answered with the presented study. It connects results of economic psychological studies on the role of competencies in a professional environment and pedagogical studies on learning in volunteering. An online questionnaire was used to assess the acquisition of three competency dimensions (methodical competencies, social competencies and self-competencies) in volunteering, the professional relevance of these competencies and the employees’ organizational citizenship behavior in a sample of 175 employed volunteers. For all competency dimensions their acquisition in volunteering as well as their relevance in a professional environment was confirmed (one-sample-t-tests). The extend of acquisition in volunteering and of relevance for a professional environment were correlated positively (with a Pearson correlation coefficient between $r = .25^{**}$ and $r = .42^{**}$). Moreover, the employees outstandingly showed organizational citizenship behavior, which is positive correlated with the duration of experience in volunteering. It should be noticed that the results based on self-assessment and show no causality. Altogether, we highlighted that there are different forms of benefit for organizations from employees with experience in voluntary work: On the one hand, competencies are applied in professional environment and on the other hand organizational citizenship behavior increases corporate success. Therefore, the study shows that voluntary work should be (increasingly) considered in personal selection.
The lack of skilled employees is a great issue in the German economy, particularly in small and medium-sized enterprises. Practical guides suggest employer branding (EB) as a potential solution to enhance positive outcomes like employer attractiveness and job satisfaction. Moreover previous studies showed a correlation between EB and these variables. The present study was conducted to explore the effects of EB on employer attractiveness and job satisfaction with an experimental design adding some new variables to explain the effect. EB was manipulated in a between-subjects-design through different text vignettes: one vignette described an enterprise focusing on work-life-balance and the other portrayed a company centralizing career progression. Additionally, a neutral control vignette was used to compare the effects. It was found that both experimental vignettes were associated with significantly higher employer attractiveness and job satisfaction. Furthermore, the influence of fit between employee and organization was explored as a potential mediator. In the first study fit was analyzed by the difference of warmth and competence between potential employee and organization which showed no significant effects. Therefore, in a second study with a similar design, fit was examined directly. It was found that fit showed high correlations with job satisfaction in this context. In conclusion, the perception of fit seems to be an important variable in the effect of EB on job satisfaction. In following studies, this effect will be explored considering new variables (e.g. mindset). Furthermore, the different strategies of EB will be analyzed in detail.
Purpose: The aim of the current study is to contribute to both the research avenues on the antecedents and outcomes of workaholism by testing a mediation model in which workaholism mediates the relation between organizational career growth (OCG) and work–life balance (WLB). Although OCG is considered a good indicator of the quality of life in the workplace, we believe that it may trigger a negative mechanism, including workaholism and work-family imbalance. Moreover, drawing from J-DR theory, a moderating protective role both from supervisor support and organizational justice was hypothesised in the process.

Design/Methodology/Approach: A self-report questionnaire was administered to a sample of 584 researchers. The hypothesised model was tested using conditional process analysis.

Results: Results supported the mediating role of workaholism. Moreover, the relationship between OCG and workaholism was moderated by the supervisor support, in the way that when the supervisor support is low and the OCG is high, workaholism is significantly higher than when the supervisor support is high. Moreover, results supported the moderating role of organizational justice, such that high organizational justice scores, both with low and high workaholism scores, are linked to high scores of WLB.

Limitations: Cross sectional nature of the study and the use of self-report questionnaires.

Research/Practical Implications: The current study provides some useful insights on practices by which organizations can better face workaholism and work-family conflict.

Originality/Value: The present study showed that OCG might have a positive impact on the genesis of the workaholic behavior that, in turn, may lead to precarious work-family balance.
Objective: Employee resilience or the ability to bounce back and thrive after a disruption at work shows to be essential for both employee and employer. Theoretical underpinnings suggest that the way in which employees allocate or interpret a disruption at work, will impact their resilience. Employees with a strong prevention focus are likely to view adversity and disruption as an obstacle that needs to be avoided, whereas employees with a strong promotion focus are likely to appraise the same event as a challenge from which they can learn. Thinking about adversities or disruptions can be defined as ‘rumination’. Rumination can hamper recovery at work and is therefore particularly relevant in the context of resilience. Our study tests the joint effect of mental regulatory foci (promotion and prevention) on resilience at work and the role of affective and problem focused rumination.

Design/Methodology/Approach: Data is collected from 330 Belgian employees. We use polynomial regression analysis with surface response analysis to test the relationship between motivational foci interactions and employee resilience, moderated by the extent to which one ruminates over a setback.

Results: Polynomial analyses indicated a positive similarity-line and a negative dissimilarity-line of the foci on resilience. Preliminary results suggest a curvilinear moderating effect of rumination.

Limitations: Cross sectional data.

Conclusion/Originality: Our study resolves a limitation of previous resilience studies, which have not accounted for rumination as an individual characteristic. The presented dynamic represents the potential cognitive and motivational process behind coping with setbacks and development of resilience at work.
Purpose. In two studies we investigated (1) the role of study crafting behaviors in building resources and challenges at the origin of study engagement (2) whether interventions focused on behavioral change techniques are effective to sustain student’s proactive behaviors during the university experience. We hypothesized that (1) students make self-initiated changes to the levels of their demands/resources to better align these with their own abilities, which reflect in different levels of demands/resources; (2) a tailored intervention focused on reflection and goal setting would have been effective to sustain students’ crafting behaviors.

Design/Methodology. In study 1, 245 students from two universities in Italy self-reported data on study demands/resources, engagement, and crafting behaviors. In study 2, 25 students took part to a crafting intervention, completing pre-post questionnaires with the same measures of study 1.

Results. Results from study 1 showed that students engaging in promotion-focused behaviors report higher cognitive focus, students’ and professors’ support. Results from study 2 showed that the intervention was effective to sustain students’ crafting behaviors.

Limitations. All study variables were assessed via self-report.

Originality/Value. This research investigates whether and how students craft their study resources/demands and whether a crafting intervention among students can be effective to support their proactive self-management of demands and resources.
Purpose: The goal of this research was to test whether transformational leadership in companies located in northern Spain (Basque Country, Navarre) was more strongly associated than other leadership styles to the perception of the workers regarding: a) satisfaction with the leader, b) the effectiveness of the leader, and c) the motivation to work.

Methodology: A cross-sectional study with convenience samples was used. This study was developed in four organizations in a sample of managers (n=47) and subordinates (n=107). The evaluations of leadership style, as well as the outcome measures of effectiveness, satisfaction with leadership and motivation at work were obtained from the Multifactor Leadership Questionnaire - 5X (Bass & Avolio, 1995).

Results: Transformational leadership stands out as one of the most suitable type of leadership to guide organizations towards change and innovation and was more strongly associated with satisfaction with the leader, the perceived effectiveness of the leader, and motivation to work in the case of subordinates than transactional leadership. In the case of managers, transactional leadership was associated with the same strength than transformational leadership to satisfaction and effectiveness. However, there was a stronger relationship with motivation than transactional leadership. In addition, transformational leadership predicts motivation to work overtime through increased satisfaction.

Limitations: The design precludes inferring causal relationships. The study is based only on self-reports.

Research/Practical Implications: Results are discussed in relation to the dominant values and organizational culture.

Originality/Value: This is one the first studies in organizational leadership in Spain to show the superiority of transformational leadership.
Abstract.

Purpose. Both the scientific literature and the popular press have recently started to associate entrepreneurs with mental health symptoms such as hyperactivity and narcissism. Built upon this emerging discussion, we investigated the links between four psychiatric symptoms (i.e., attention deficit, hyperactivity, narcissism, and hypomania) and entrepreneurial intention. Drawing on reinforcement sensitivity theory, we further explored whether the relationship between psychiatric symptoms and entrepreneurial intention is mediated by behavioral activation system (BAS). Method. Survey responses of 182 university students were collected. Results. Our results showed that, when examined independently, both hyperactivity and narcissism are positively associated with entrepreneurial intention whereas hypomania is negatively associated entrepreneurial intention. Furthermore, only hyperactivity and narcissism remained significant when all psychiatric symptoms are considered together. Interestingly, when BAS and psychiatric symptoms are examined in the same model, BAS dominated the association with entrepreneurial intention. Lastly, our results lend support to the mediating role of BAS. Implications. Our study is the first study that investigated the independent and joint effects of multiple psychiatric symptoms on the intention to become an entrepreneur. Our study also provided further empirical evidence that BAS mediated the link between psychiatric symptoms and entrepreneurial intention. By doing so, we shed light on the potential role of these so-called psychiatric or “dark” personality traits in entrepreneurship. Limitations. However, since we focused only on entrepreneurial intention as an outcome, we encourage future study to examine the intention-action link and extend our model to other entrepreneurial outcomes.

Keywords: Behavioral Activation System, ADHD, Narcissism, Hypomania, Entrepreneurial Intention
Purpose
Recent contributions in supervised work-group dynamics assume that workers use all their capacity. In particular both theoretical contribution and empirical analysis with human participants do not consider benefit for time spent in activities different from work. In this contribution we relax this unrealistic assumption and study the optimal allocation of effort in life and work activities.

Design
Capacity allocation and work-life satisfaction was studied in a classroom experiment with human participants. The productive activity has been simulated asking the participants to allocate their capacity in two costly activities and providing them feedback in terms of salary and overall satisfaction.

Results
The results only partially confirmed the theoretical prediction of effort allocation in order to obtain a balance between work and life. The interaction, although simplified, highlighted some of the dilemmas modern organizations face.

Limitations
The limitation of this study depends on having considered the result of a laboratory experiment with well known external validity problems as discussed in Dipboye and Flanagan (1979). Further research needs to address how participants converge to the optimal effort allocation.

Implications
The inability to reach the optimal balance between work and leisure in a short time may indicate the complexity of the issue, how even a well conceived incentive mechanism may suffer from coordination problems, and the importance of human resource professionals who may assist companies and employees (Lockwood, 2003).

Originality/Value
The study tries to fill the gap between the theoretical economic prediction of interactions in work groups and actual behavior of human participants providing data that may help a better understanding of complex interactions.
Purpose: Scholars and consultants in the field of sport psychology are becoming increasingly interested in the role played by psychological skills for athletes’ performance. SFERA (Vercelli, 2005) model is a specific tool used for the optimisation of mental performance. It is a reference for CONI (Italian National Olympic Committee) and it was developed by qualitative research. This study aimed to provide a first validation of SFERA Test, defined by 5 subscales: Synchrony, Force, Energy, Rhythm, Activation.

Methods: A sample of 159 athletes has completed a self-report questionnaire. Data were analysed with SPSS 25 and Mplus7 to test the factorial validity of scale through exploratory factor analysis (EFA) confirmatory factor analysis (CFA). The reliability was calculated by examining the internal consistencies of each subscales.

Results: EFA (total variance: 66.41%) and CFA [χ²(240)=358.189; p < .001; RMSEA=.06 (.04, .07); CFI=.94 TLI=.93 SRMR=.06] have shown a 5-factor structure: synchrony (4 item, α=.83), force (6 item, α=.90), energy (3 item, α=.70), rhythm (5 item, α=.81), activation (6 item, α=.88).

Limitations: The sample is not representative, this is only the first validation of tool, with further administration of questionnaire will carry out additional test.

Practical implications: This tool could be easily used for coaching and training to monitor the level of psychological skills over time or before and after a specific mental training.

Originality: This study could provide strong practical implication on psychology of sport, starting from the validation and development of a new tool to measure mental skills.
Supervisor assessment of employees’ promotability has been recognized as a key indicator of their potential to effectively perform at higher level jobs, impacting directly on their upward mobility and career success. Still, research about the predictors of promotability evaluations is still limited in the literature. The purpose of this study is to examine the joint impact of employee job satisfaction and individual key performance dimensions on supervisor’s promotability evaluations. To our knowledge, the role of job satisfaction on promotability remains relatively unexplored in the literature. Data were obtained using a predictive design and a sample of 191 software engineers pertaining to a multi-national information technology firm. Employees reported their overall job satisfaction on a first data collection phase and their performance and promotability ratings were collected from their direct supervisors after six months. Results revealed that job satisfaction is positively related with task, citizenship and innovative performance ratings, as well as with promotability. Further structural equation modelling analysis provided support for a model according to which the influence of job satisfaction on promotability is indirect via these performance dimensions. These results have theoretical implications, since they suggest that a core job attitude might influence employee career prospects by translating into valuable performance behaviors that supervisors will take into account when assessing the employee potential for promotion. From a practical point of view these results emphasise the importance of promoting high levels of job satisfaction as a path to enhance employee’s performance and promotability.

Keywords: job satisfaction, individual performance, promotability evaluations.
Abstract:
The underutilization of immigrants’ skills in the Canadian labor market has become a pressing issue, costing the Canadian economy over $11 billion annually (Reitz, Curtis, & Elrick, 2012). In this context, the current study investigated the extent to which an attributional training intervention (Weiner, 2010) led to positive job search strategies for unemployed immigrants. The primary objective of the current research was to discover whether training immigrant job-seekers to make controllable attributions is an effective way to foster effective job search strategies. The secondary objective of this research was to examine whether attributional retraining is more effective for newcomers when the attributional retraining message is delivered by a member of an ethnic minority group (vs. a White protagonist). The study used a 2 (attributional retraining condition: attributional retraining vs. control) x 2 (ethnicity of the protagonist: White vs. member of ethnic minority group) experimental design. Analyses from the sample of 60 unemployed immigrants indicated that attributional retraining is an effective way to foster more controllable job search attributions. Moreover, having the attributional retraining message delivered by an ethnic minority led to greater job search self-efficacy. These findings contribute to evidence-based practices that can be used to facilitate the economic integration of unemployed immigrants.
Matthias F. C. Hudecek (1) - Mona Lehleiter (1) - Birgit Melanie Stephan (2)

Purpose
The self-determination theory (Ryan & Deci, 2017) suggests that the experience of autonomy, competence, and relatedness enhances performance, persistence, and creativity. Purpose of this study was to examine how different HR methods of employee development affect employees’ affective organizational commitment (OCA) with basic need satisfaction (BNS) as a mediator.

Design/Methodology /Approach/Intervention
Conducting an online study, participants ($N = 216, 62.5 \%$ female) from different organizations were asked to rate their work-related BNS (van den Broeck et al., 2010). Further, affective commitment (Felfe et al., 2014) was measured as well as satisfaction with and success of four HR methods: Annual Performance Review, Job Rotation, Career Planning and Mentoring.

Results
Mediation analysis revealed significant relationships between HR methods, BNS and OCA. All bias-corrected bootstrapped confidence intervals with 10,000 samples for indirect effects were above zero except Job Rotation. Results show that autonomy is a key mediator for all HR methods followed by relatedness (Annual Performance Review, Job Rotation) while competence was positively influenced by all HR methods but had no effect on OCA itself.

Limitations
The present study is based on self-reports with participants being not representative for the whole population. In addition, HR methods were measured across different organizations.

Research/Practical Implications
Results imply that HR should specifically focus on BNS when designing concepts for HR development and training. Future samples should comprise more participants within the same organization. Thus comparisons between organizations would be possible.

Originality/Value
The study incorporates a cross-organizational sample to better understand which basic needs are relevant for HR and how they relate to OCA.
Abstract

Recent studies suggest that job resources can increase managers’ resilience to challenging events, in addition to reducing potential strain of job demands. Using activation theory, we extend this idea by investigating the influence of three organisational psychology development practices – leadership training, job rotation, and mentoring – on public managers’ resilience. Results from a sample of 1,832 New Zealand public managers show several different curvilinear demand resilience relationships. Leadership training shows a linear relationship to resilience, regardless of demands. Managers who participate in mentoring programs demonstrate more resilient behaviour in response to intermediate rather than low or high levels of job demands than managers who did not participate in such mentoring. In contrast, for managers who participated in a job rotation program, high levels of job demands stimulated more resilient behaviours. These findings indicate that while leadership training is associated with high resilience, job rotation has particular strengths in building resilience for staff heading for highly demanding managerial jobs. In contrast, mentoring programs are possibly harmful to resilience in the face of high demands, possibly through mechanisms of overdependence on a mentor. The implications of these findings for public management are discussed.
Purpose: Given the importance of individual consumption behavior to foster sustainable development, a variety of psychological factors (e.g. emotional, rational, value-, or knowledge-based) has been analyzed. This study examines how the presentation of photographic material and message framing affects different emotions, awareness constructs, and intention to behave sustainably in the context of smartphone consumption.

Methodology: In study 1 (N=110), photographs related to the ecologic and social sustainability of smartphones were tested for their valence and arousal. Pictures with a high arousal level and either high (positive condition) or low (negative condition) valence were selected. In study 2 (N=418), these pictures were combined with different message framings in a 2x3 (positive/negative message framing x positive/negative/no picture) experimental design. Each picture condition contained one pair of pictures depicting ecologic and social sustainability. The messages emphasized the positive (or negative) outcomes of sustainable (or detrimental) consumption behaviors of smartphones.

Results: Results indicate that displaying pictures leads to a higher awareness regarding the problems associated with smartphones compared to the display of a message only. However, no effect was found for the intention to consider sustainability in future buying decisions.

Limitations: Further research should focus on actual consumption behavior instead of solely measuring intention.

Value and Implications: Understanding the mechanisms of displaying different types of information constitutes the basis for the successful design of marketing campaigns or sustainable certification systems in the environmental sector beyond solely offering 'positive' information.
Abstract

Purpose: Despite several calls to incorporate diversity-related behaviors into evaluation systems, research has yet to comprehensively examine the nature of this novel performance domain. Thus, this study first examines the originality of diversity performance, examining whether it is distinct from or similar to contextual performance. Second, it identifies the dimensionality of this construct, exploring whether it is composed of separate allyship and discriminatory behaviors or whether these behaviors encompass opposite ends of a single continuum.

Approach: We are in the process of collecting responses from 800 full-time employees via MTurk. These participants are completing measures of allyship behaviors, discrimination behaviors, organizational citizenship behaviors (OCBs), and counterproductive workplace behaviors (CWBs).

Analysis: We will conduct a series of nested confirmatory factor analyses on models that a) freely estimate the four factors, b) fix correlations between ally and discrimination behaviors, b) also fix correlations between OCBs and CWBs, and d) fix correlations between diversity and contextual performance factors to identify the best fitting model.

Limitations: There are inherent limitations of using MTurk and self-report performance measures. We have minimized these limitations by incorporating attention checks, excluding low quality/incomplete data, and filtering participants based on a social desirability measure.

Research/Practical Implications: This study provides both scholars and practitioners with important information regarding best practices for structuring organizational diversity training programs and implementing other diversity management practices.

Originality/Value: This study is the first to examine the dimensionality of diversity performance. This will spur future research on this unexplored yet critically important performance domain.
An investigation of work design and individual differences as antecedents of employee moral disengagement.

Anupama Bharadwaj (1) - Patrick Dunlop (1) - Sharon Parker (2) - Leon Straker (3)

University of Western Australia, School of Psychological Science, Perth, Australia (1) - Curtin University, Future of Work Institute, Perth, Australia (2) - Curtin University, School of Physiotherapy and Exercise Science, Perth, Australia (3)

Purpose

Unethical behaviour at work is incredibly common. Such behaviour can be rationalised through moral disengagement (MD; Bandura, 1991), where individuals deactivate the self-regulatory processes that usually prevent them from behaving unethically. Parker (2014) theorised that individual differences and work design may have a long-term effect on moral cognitive processes. Given that work is increasingly embedded in social and interpersonal connections, this study tests the interactive effect of personality and relational work design (RWD, characterised by high levels of social work characteristics; Grant & Parker, 2009) on employee MD.

Design

Participants from a two-wave study (N=414 at Time 1) completed surveys (two years apart) containing the Work Design Questionnaire, the HEXACO personality inventory, and a workplace MD scale. Data collection for Time 2 (current N=210) is ongoing and will finish in November 2018.

Results

Preliminary analyses on Time 1 data indicate a significant moderating effect of conscientiousness on the relationship between RWD and MD. Specifically, for individuals high on conscientiousness, the greater the level of RWD, the less their MD. This study will also test for a negative lagged effect of RWD on MD when Time 2 data is available.

Limitations

We could not measure the incidence of actual unethical behaviour.

Research /Practical Implications

Work that connects employees to others is important, given that even conscientious individuals are prone to moral disengagement.

Originality/Value

This is the first known study to investigate and show the interactive effect of personality and RWD on MD.
Understanding the negative consequences of psychological contract breach (PCB) (Zhao, et al., 2007) remains a dominant research focus. While this is an important issue to empirically examine, breach has traditionally been conceptualized as a discrete event that occurs within an ongoing relationship (Dulac, et al., 2008). More recent work has highlighted the processual nature of the experience of breach from employees’ perspectives (Wiechers, et al., 2018) with implications for how organizations manage psychological contracts as PCB often develops from several connected triggers which, processed in a cumulative manner, build up pressure in the employment relationship. A better understanding of how these triggers impact this process of breach will offer employers alternative modes for handling and managing perceptions of PCB. Therefore, this study focuses on the impact of the different types of triggers within the process of PCB.

We conducted a content analysis of trigger clusters through the use of a (daily) diary study over six weeks in five universities. 117 employees reported over 600 triggers. Preliminary results indicate several clusters of triggers, for example interpersonal, managerial or goal-disruptive triggers, showing a unique relationship with levels of impact on the psychological contract. Further results will be presented in May.

Our findings allow managers to actively build and sustain a stronger psychological contract with their employees, even in turbulent changing contexts.

Research in other environments (e.g., banking) would further disentangle connected triggers.

With our classification of triggers and our temporal conceptualization of breach, we contribute to a more accurate understanding of PCB.
Purpose
Research led to the theory that team planning may be a key variable influencing the performance and efficiency in working teams. Based on the 4-factor model of team planning by Santer (2017) and Wang (2017) with the four planning aspects exploration, strategic planning, detailed planning and forecast team planning was examined in this study. Furthermore, it was examined which general conditions and influencing factors can affect team planning.

Design/Methodology
Severity of consequences and time pressure were identified as potential influencing factors and manipulated according to the policy capturing methodology within an online questionnaire. The participants were supposed to put themselves into short scenarios in order to then give a self-disclosure about their own planning behaviour in a team measured through a scale of team planning.

Results
Regression Analyses established as main effects a positive correlation between subsequent severity and team planning and a low negative correlation between team planning and time pressure. An interaction effect could be shown at the level of strategic planning.

Limitations
A total of 82 participants took part in the study. Future research should use the methodology on more participants and examine further influencing factors apart from subsequent severity and time pressure.

Research/Practical Implications
Perceived high severity of consequences and low time pressure can contribute to increased performance in teams.

Originality/Value
The present study is one of the first of its kind for team planning and attempts to detect potential influencing factors and scale them through a policy capturing methodology.
Purpose: Many employees suffer from stress causing health problems and absenteeism. Early and efficient measurement of stress-related aspects could offer possibilities for stress monitoring and interventions. Previous attempts to capture stress focused on self-report questionnaires or complex measures of biological stress indicators. We introduce a smartphone-based stress diary tool that should provide an easy and efficient way to capture self-reported stress and participants’ voice characteristics as an additional, more objective way to capture stress.

Design: For one week (seven-day longitudinal study), participants in white-collar jobs ($N = 51$) used their smartphones to respond daily to four questions via voice recordings (e.g., “What was the highlight of your day?”) and to report their daily stressors (e.g., working longer than intended) as well as their current stress level. The voice recordings were automatically analyzed regarding participants’ vocal behavior (e.g., speechrate).

Results: Stressors, daily stress, and speechrate showed a quadratic trend throughout the week (i.e., stressors, daily stress, and speechrate were higher on working days). Daily stressors predicted stress and specific vocal features (e.g., increased speechrate) in hierarchical linear models.

Limitations: Rather small sample size, especially regarding male participants.

Implications: Results highlight the value of smartphone-based stress diary studies for field investigations. Additionally, vocal characteristics can be a valid indicator of daily stress.

Value: We introduce a methodology for smartphone-based diary studies and thus contribute to research and practice by showing how to measure stress-related aspects longitudinally and objectively.
Purpose. The purpose of the study is to verify if a positive employees’ perception of HR practices can have impact on two important organizational outcomes, such as organizational citizenship behaviors and turnover intentions, considering Work Engagement and Perceived Organizational Support as mediators of this relationship.

Design/Methodology/Approach/Intervention. 408 employees of a healthcare company were involved in the study. Participants filled in a questionnaire consisting of a first section containing socio-professional data and a second part composed by measures of HRM Perception (Gould-Williams & Davies, 2005), Perceived of Organizational Support (Battistelli & Mariani, 2010), Utrecht Work Engagement (Balducci, Fraccaroli & Schaufeli, 2010), Organizational Citizenship Behaviours (Argentero, Cortese & Ferretti, 2008) and Turnover Intention (Mobley 1978).

Results. Results showed the relevance of HR practices’ perception on organizational citizenship behavior and turnover intentions and the mediating role of both work engagement and perceived organizational support.

Limitations. Limitations referred to the cross-sectional nature of study; second, we relied on individuals’ self-reports for the assessment of the variables investigated and this raised concerns about possible common method bias; Finally, the study accounted for a specific professional context, therefore results could not be generalized.

Research/Practical Implications. Results confirmed the strategic role of psychological capital for HR management and suggested the enhancement of sustainable organizational performance (Spreitzer & Porath, 2012) through the improvement of communication and the development of a positive working climate.

Originality/Value.

The present research work contributed to enrich the debate about the need for a people-based approach to the study of organizations.
Purpose
This study explored cultural differences in Narcissism, Machiavellianism, and subclinical Psychopathy between U.S. and U.K. responses to the Dark Triad of Personality at Work (TOP).

Methodology
A total of 2376 employed, working-age participants were recruited from survey panels in the U.S. and the U.K. to complete the TOP. After data cleaning for inattention, N = 2001. Coefficient alpha estimates of the reliabilities were 0.65 to 0.95, with a median of 0.85.

Results
Thirty-one items (16 Narcissism, 10 Machiavellianism, 5 Psychopathy) had significant (p<0.01) DIF but the average R2 change was only about 0.007.

Limitations
Results are correlational and in need of replication.

Research/Practical Implications
These results suggest small cultural differences between the U.S. and U.K. in perceptions of Narcissism items and, to a lesser extent, Machiavellian use of power. Regarding the cultural dimension of Individualism/Collectivism which has been studied mostly in relation to dark triad traits, while both countries are thought to be individualistic, U.S. participants reported considerably more Narcissism than U.K. participants, particularly on the Claim to Leadership subscale (Cohen’s $d=-0.39$) and slightly less on subclinical Psychopathy driven mainly by the Flexibility subscale ($d=0.56$).

Originality/Value
A cultural explanation is offered, with implications for organisational practice.
Purpose

The amount of time workers spend commuting continues to increase across the globe. The purpose of this study was to conduct a meta-analysis in order to examine the relationship between commute length, commute satisfaction, and life satisfaction.

Methodology

Twenty-six primary studies on the relationships between commute length, commute satisfaction, and/or life satisfaction were included in this study.

Results

Results indicated a significant negative relationship between commute length and life satisfaction ($r = -0.13, p < .01$), between commute length and commute satisfaction ($r = -0.25, p < .01$), and between commute satisfaction, and life satisfaction ($r = 0.24, p < .01$). Tests of a meta-analytic mediation model revealed that long commutes negatively impact life satisfaction by impacting commute satisfaction ($r = -0.06, p < .01$).

Limitations

An important limitation of this study is the possibility of unmeasured confounding variables (e.g., socio-economic status).

Research/Practical Implications

Future research should examine the effects of commute length on life satisfaction with stronger longitudinal and experimental designs and should also assess what aspects of commuting (i.e., mode of commute, activities engaged in while commuting, commute stress, and flexibility/timing of commute) can mitigate the effects of commute length on commute satisfaction and life satisfaction. Our research can also be used to inform government initiatives on transportation and affordable housing, relevant organizational policies, and employees’ commute-related decisions.

Originality/Value

This study provides a clearer understanding of whether and why commute length impacts life satisfaction.
Purpose: The poster presents proposed research design of a longitudinal study focusing on development of positive psychological capital (PsyCap) composed hope, self-efficacy, resilience and optimism. PsyCap is known as a predictor of desirable employee attitudes (job satisfaction, organizational commitment, psychological well-being), desirable employee behaviors (organizational citizenship), and multiple measures of employee performance (self-rated, supervisor-rated, and objective). Moreover, its malleability and openness to development have been documented. As a consequence the construct received considerable attention during the 16 years of its existence. Recent research has identified a number of trait (e.g. proactive personality), and situational (e.g. supervision, task complexity) predictors of PsyCap. However, to our knowledge, the development of PsyCap has only been examined in working adults so far and antecedents that influence an individual’s PsyCap between early childhood and first employment have not yet been studied. Our research aims to address this gap in the understanding of PsyCap’s development. Based on theories of the development of individual parts of PsyCap, we will explore the impact of close relationships in adolescence on PsyCap in young adults. We want to get a feedback to our purpose, to get an inspiration for improvements of the design, to inspire the peers and eventually to arrange collaboration with other researchers.

Design/Methodology: We will build on the unique longitudinal study ELSPAC, thanks to which we can link data on participants’ close social relationships gathered from multiple sources 16 years ago with newly acquired data on their work-related PsyCap and perceived work-related stress at the age of 27-29. More in detail, attachment style was measured by Peer attachment style questionnaire (Širůček & Širůčková, 2008), and parental scale from Inventory of parent and peer attachment (IPPA) (Armsden & Greenberg, 1987) at the age of 16. Parenting style was assessed by Parenting Styles Questionnaire (Čáp & Boschek, 1994) answered by both the adolescents and their parents, with respondents aged 11, 13 and 15. Quality of Peer relationships was measured by the Peers Problems subscale of Strengths and Difficulties Questionnaire (SDQ, Goodman, Meltzer, & Bailey, 1998) completed by parents and teachers when the adolescent was 11 and 15, and by the adolescent him/herself at the age of 15. We will recontact participants of the ELSPAC study and ask them to fill in the Compound PsyCap Scale (Lorenz, Beer, & Heinitz, 2016), and a Brief Symptom Inventory-18 (Derogatis, 2000) measuring the level of psychological distress over the previous 7 days.

Limitations: The major risk and limitation of the study is the sample mortality.

Implications: The results will provide a better understanding of the natural development of PsyCap, which in turn can help to design effective PsyCap development interventions.

Originality/Value: Unique longitudinal research design allows us to measure dependent variables 16 years after measuring independent variables. The results will allow us to formulate conclusions about causality between social support and PsyCap.
Key words: longitudinal study, positive psychological capital, psychological well-being, work performance
Purpose: In employee selection unsupervised ('unproctored') internet test administration is growing rapidly. The unstandardized test conditions and opportunity to cheat on unproctored cognitive ability tests might introduce response distortions that threaten the test validity. To reduce this threat current best practice is a computerized adaptive test (CAT) with a supervised ('proctored') confirmation test. Previous studies investigating response distortions by comparing proctored vs unproctored test scores, reported inconsistent differences. However, response distortions might not be visible at group-level in observed scores. Studies using other psychometric methods to identify response distortions are scarce. Therefore, in this study person-fit statistics will be used to detect response distortions in proctored vs unproctored testing in real-world test situations.

Design: In a 2 (proctored vs unproctored setting) x 2 (employee selection vs career advice test situation) design (estimated N=600 per group) participants complete a validated general mental ability CAT. Two non-parametric person-fit statistics (CUSUM and normed G) are calculated. Data collection will continue until March 2019. Results: Preliminary results suggest that response behaviour is more inconsistent in proctored testing and low-stakes test situations. Limitations: Recruitment by convenience sampling and no random allocation to study conditions. Implications: This study provides further insight in response distortions in real-world unproctored CAT administration and strategies to detect inconsistent response behaviour. Originality: Although person-fit statistics have been used to detect inconsistencies in CAT, to our knowledge this study is the first to use person-fit statistics to compare response distortions in unproctored vs proctored testing in real-world high- and low-stakes test situations.
Purpose: Humour is an essential element in interpersonal and public communication. This paper explores the difference between perceived creativity in messages using affiliative and aggressive humour as well as the extent to which gender and need for cognition moderate this relation.

Design/Methodology: Data was collected through an online survey using messages developed by participants in the public protests that took place in Romania in 2017. Two messages (one using aggressive and one affiliative humour) were selected after an initial assessment by independent evaluators for further use. Then, we asked a sample of 297 individuals to rate the creativity of these two messages and the other measures included in the study.

Results: The results show that: a) participants tend to perceive messages using affiliative humour as being more creative than the ones using aggressive humour, b) the evaluative discrepancy between the two types of messages is higher for women, and c) the evaluative discrepancy is higher for people scoring high rather than low in need for cognition.

Limitations: Considering that humor is influenced by cultural factors, the model should also be tested in other cultures.

Research/Practical Implications: We tested the implications of humor for the perceived creativity of messages used during political protests in Romania.

Originality/Value: This study is among the first attempts to explore the role of humor types on the perceived (collective) creativity of messages used to express public opinions.
Since the 1980s, a dominant neoliberal ideology has assumed that markets are more rational than governments Friedman (1980). Combined with claims that self-interested employees should be disciplined by market principles and criteria, this underlay the case for New Public Management (NPM), High Performance Work Systems (HPWS) and High Involvement Work Systems (HIWS).

This paper qualifies this by recovering the legacy of Elton Mayo (1932) and the Hawthorne Studies that high performance depends on wellbeing. Drawing on the case for New Public Services (Osborne et. al., 2015; Osborne, 2018) it supports the claims of Denhardt and Denhardt (2015), Guest (2017), and Wellman (2017) that HRM systems should centrally recognise that employee wellbeing is a moderator of high performance.

It reports on a qualitative case study over time (2011-2015) in a European university hospital which had been subjected to performance demands and protocols within a NPM paradigm and then was merged with two other hospitals. Based on a grounded theory approach, fully transcribed semi-structured interviews (n=54) were undertaken with board level organisational managers as well as health professionals as operational managers of services and units. Content analysis used MAXQDA.

In distinguishing macro institutional, meso organisational and micro operational levels, the findings indicated that relative autonomy is needed from base and middle up to enable both improve performance through enhanced motivation and improved work-life balance. The findings could gain from wider based questionnaire surveys on a cross cultural and longitudinal basis to enhance policy making within a recovered human relations perspective.
Because of the increasing number of people on sick leave in Sweden, the government has taken action to deal with the situation which has mainly focused on the escalating costs. One of the most frequent diagnoses is Exhaustion Disorder (burn out syndrome), which has quickly increased, predominantly among women. In 2018 a memorandum for a legislation, a new function, rehab coordinator has been presented to the parliament, with the aim of enhancing the process of successful return to work for people on sick leave. The function of rehab coordinator is new and how this position is defined and constructed will have implications both for the individual rehab coordinators and the activities they will be carrying out.

The health labour market is heavily divided by gender, horizontally as well as vertically and women are over represented in the caring professions. In this paper, the construction of rehab coordinator is scrutinized through the lens of feminist theory. The effects of neoliberal politics in this case exemplified by women with Exhaustion Disorder, needs to be taken care of and managed, presumably by other women. The analysis is conducted as a discourse analysis of policy, legislations, memorandums and job descriptions documents for rehab coordinators. Inspired by the feminist intersectional analysis on power and discipline, the paper discusses who is doing the “dirty work”, i.e. taking care of and managing exhausted bodies and have these bodies once again workable in the new public management work life.
1379 - JOB DEMANDS CONTROL MODEL AS RELATED TO OBJECTIVELY MEASURED PHYSICAL ACTIVITY IN WORKING WOMEN AND MEN

Kristina Larsson (1) - Örjan Ekblom (1) - Lena Kallings (1) - Maria Ekblom (1) - Victoria Blom (1)

The Swedish school of Sport and Health sciences, Stockholm, Sweden (1)

Purpose

A physically active lifestyle incurs health benefits, and previous studies have found that physically active individuals show reduced reactivity to psychosocial stressors such as Job demands, control and support (JD-C-S). However, the findings are inconclusive, and are based on self-reported physical activity (PA). The present study aims at studying the association between JD-C-S and objectively measured PA on various intensities from sedentary time to vigorous PA.

Design/Methodology/Approach/Intervention

The participants were 292 employees from a cross-sectional study in two different office-based work sites. PA-data was collected with the accelerometer ActiGraph GT3X and sedentary time with the inclinometer activPAL. Data regarding demographic, stress and JD-C-S was collected by a web questionnaire. A linear regression model assessed the association between JD-C-S and objectively measured PA-patterns.

Results

Moderate to Vigorous Physical Activity (MVPA) was negatively associated with control ($\beta = -0.13$, $p < 0.05$), after adjustment for age, gender, education, management, stress, overtime and work engagement. When analyzing men and women separately, this association only occurred in the female participants ($\beta = -0.18$, $p < 0.05$) and was affected by work engagement.

Research/Practical implications

High decision authority and work engagement, previously found to have positive health effects, may be related to less time in MVPA in women, suggesting the potential benefit to address the level of PA in this group.

Limitations

Limitations involve a small sample and cross-sectional data which limits studies of directions.

Originality/Value

This study is novel in investigating how objectively measured PA is related to JD-C-S.
Purpose: Structural empowerment focuses on a set of organizational policies and practices initiated by management with the purpose of addressing conditions that produce powerlessness situations and cascading decision-making down the organization hierarchy (Eylon, & Bamberger, 2000). Our aim is to analyze the influence of structural empowerment on both psychological empowerment and work engagement (as defined by Schaufeli, Salanova, González-Román, & Bakker, 2002), and to test the mediator role of psychological empowerment in the relationship between structural empowerment and engagement.

Design/Methodology: A cross-sectional research design was used, collecting the data among 155 workers. Regarding the analysis, several regression analyzes were performed, and also a mediation analysis with the PROCESS macro.

Results: Results confirmed the significant and positive influence of structural empowerment on both psychological empowerment and engagement. Moreover, the mediation analysis reveals that psychological empowerment acts as a significant mediator in the relationship between structural empowerment and engagement.

Limitations: The cross-sectional nature of this research; the shortage of global investigation on workplace empowerment; the lack of variety in the labor sectors of the used sample.

Research/Practical Implications: The model should be reanalyzed using structural equations, in order to provide deeper explanations of these potential relationships. Furthermore, the results also provide direction for the professional practice, allowing to develop interventions aimed at the generation of a strong and effective work environment.

Originality/Value: Given the increasing status of empowerment and engagement in understanding the motivational basics of employee’s work attitudes and behaviours, the study allows to explore which organizational measures influence the workers’ health and wellbeing, the quality of work and the organizational success.
Purpose:

The Myers-Briggs Type Indicator (MBTI®) assessment has long been questioned for its reliability and validity. This presentation reanalyzed the internal consistency reliability and underlying structure of a revised MBTI assessment, Global Step I (GS1), with a large global sample.

Design:

The global sample consisted of 13,865 respondents (53.9% women) who completed the 92-item MBTI GS1. Twenty country and language groups were included for analyses if each contained at least 200 respondents. The confirmatory factor analysis with WLSMV estimator was applied to 15 hypothesized models (one factor to four factors) given the categorical property of data.

Results:

Results suggested good internal consistency reliability with Cronbach’s alpha ranging from 0.87 to 0.89. The CFA was performed by the lavaan package in R 3.4.2. Among 15 models, only the four-factor model indicated good model-data fit ($\chi^2 = 105,245.55$, $p < .001$, $CFI = 0.925$, $SRMR = 0.041$, $RMSEA = 0.042$). Moreover, over half of country and language groups also indicated good fit of the four-factor model.

Limitations:

The reliability and validity evidence was limited to 20 groups in this research. Respondents from more countries or used other languages are expected.

Implications:

The new MBTI GS1 is a psychometrically sound assessment tool that is well adapted to individuals from different cultural backgrounds.

Originality/Value:

This research responded to criticisms and misconceptions that the MBTI assessment is not reliable and valid. Regarding the categorical property of data, this research employed an appropriate approach to measuring the underlying structure of this assessment.
The aim of this research is to investigate the predictive relationships between exclusion at work, organizational trust, felt trustworthiness and organizational citizenship behavior in culturally diverse workplaces when it comes to subordinate-supervisor relationship.

In the scope of this research, existing surveys are used in order to collect data. The data is collected on the internet via an online data collection tool. The participants of this study are white collar employees who are fluent in English and work in Germany.

We have interpreted and discussed the results keeping in mind the data is collected from a culturally diverse organizations and more than 20 cultural backgrounds have been presented. The results have provided wide range of information on the suggested predictive relationships. It is found that exclusion by supervisor has no direct effect on organizational citizenship behavior which is an interesting finding. It is also observed that exclusion by supervisor has a significant negative effect on felt trustworthiness and the power of the effect changes according to the dimensions of felt trustworthiness. Moreover, the dimensions of felt trustworthiness have positive effect on organizational trust as well as organizational citizenship behavior.

Based on all these outcomes, suggestions for future research and implications for organizations are presented.

**Keywords:** exclusion at the workplace, trust, felt trustworthiness, organizational citizenship behavior, subordinate-supervisor relationships
Purpose
This study aims to examine the self-determination theory’s (Ryan & Deci, 2017) suggestion that the effect of a performance-contingent reward on intrinsic motivation is dependent on the functional significance of the promised reward. The present study will test this hypothesis by examining whether an individual’s interpretation of the reward’s functional significance (controlling vs. informational) at time point 1 is responsible for the observed changes in intrinsic motivation at time points 2 and 3, and whether the changes in intrinsic motivation are mediated by psychological need satisfaction and frustration.

Methodology
The data will be collected from 7 knowledge-intensive organizations using a longitudinal survey design. The first wave of data collection will be implemented in November 2018 while the second and third waves will take place in winter and spring 2019. Data will be analyzed using structural equation modeling.

Results
The study is ongoing, and preliminary results will be discussed.

Limitations
All measures are self-reported.

Research/practical implications
The study will advance our understanding of the effects of performance-contingent rewards on intrinsic work motivation by exploring the role of the reward’s functional significance and psychological need satisfaction and frustration in this process.

Originality
Contributes to the ongoing debate on the effects of performance-contingent rewards on intrinsic work motivation by demonstrating how the functional meaning of a reward is associated with a subsequent decline or enhancement of intrinsic work motivation. Theoretically, the present study will contribute by advancing our knowledge of the psychological mechanism through which performance-contingent rewards affect intrinsic motivation.
The present research tackles a problem in the candidate reactions literature: the replicability of results that emerge when using in vivo and in vitro designs. The current study was designed to provide a conceptual replication of Konradt, Garbers, Erdogan, and Bauer’s (2016) dynamic model of change in fairness perceptions during the hiring process, using a different research design, different measures, and a different sample than the original paper. A sample of 209 participants in a simulated selection process reported their level of perceived fairness three times: before the testing, after the testing, and after the results were communicated. These results support the results of Konradt, et al., that the construction of fairness perceptions declines in a non-linear way over time, with high initial levels of fairness perception corresponding to a lower rate of decline, and vice versa. Further analysis revealed no change in the individuals’ conceptualization of perceived fairness nor any shift in the respondents’ use of the measurement scale (i.e., no beta and gamma change were detected).

Keywords: fairness perception, candidate reactions, simulated selection, change, conceptual replication.
A SYSTEMATIC REVIEW ON THE ASSOCIATION BETWEEN AGING AND TOLERANCE TO SHIFT WORK

Teresa C. D’Oliveira (1)

King’s College London, London, United Kingdom (1)

Purpose
The aging workforce has been a major topic of study for researchers and policy makers. The capability of the aging workforce to tolerate and recover from the contemporary demanding work rhythms and schedules as shift work needs to be addressed. The purpose of the study was to conduct a systematic review of the literature exploring the associations between shiftwork and affective disorders.

Design/Methodology/Approach/Intervention
A literature review was conducted using Medline, PsycINFO, Web of Science, and ScienceDirect. Inclusion criteria included aging, shift work, including irregular shift work, fixed shift work, rotating shift work or night work and shiftwork tolerance.

Results
The 24 articles extracted provided controversial results: 11 studies suggested better shift work tolerance among younger workers, seven studies reported opposite results, and 6 studies found no association between age and shift work.

Limitations
The controversial results do not allow recommendations regarding the inclusion or exclusion of older workers in shift work or the suggestion of mitigating interventions.

Research/Practical implications
Major limitations regard the lack of consensus on the definition and measurement of shift work and shift work tolerance. Guidance is also needed in the study of aging and the use of classifications as “young” or “old”. Longitudinal designs are required to fully explore the associations between aging and shift work.

Originality/Value
The study considered a broad approach to the concept to tolerance to shift work resulting in the identification of both physical and psychological repercussions. The use of the term aging leads to controversial classifications of age.
Purpose
In recent years, an increasing number of organizations has started digitalizing their recruitment processes. Thus, drawing on Technology Acceptance Model (TAM; Davis, 1989) the aim of this study was to investigate the relationships between Organizational identification, Perceived Usefulness (PU) and Perceived Ease of use (PEU) of a technological system in predicting organizational attractiveness starting from an initial browsing of its website and, subsequently, candidates’ intention to apply using the same website.

Method
A study was carried out with a sample of 33 university students who were asked to visit the website of five Italian companies, with a total of 165 cases.

Analyses and results
Regression and SEM analyses were performed. Results showed that PU and PEU predict organizational attractiveness and intention to apply, in line with TAM assumptions. More, PU impacts organizational identification, and shows a positive effect on the intention to apply, without the mediation of the organizational attractiveness.

Limitations and Implications
The results suggest that organizations should design their websites in a way that they are perceived as useful and easy to use, thus stimulating candidates’ identification and attraction towards the company. Future studies may involve more heterogeneous sample and should take into account even companies’ social media profiles.

References
Abstract

Media reports and scientific research suggest that managers increasingly struggle with burnout as they face both high demands and high pressure in their jobs. However, these managers are typically overlooked in burnout research as it is limited to samples of managers who normally just show very weak, subclinical symptoms of burnout. Thus, our understanding of the job demands that really affect clinical symptoms of burnout is fairly limited. Furthermore, an overview of relevant job demands is missing because present research is limited to statements about the concept of job demands in general, or about the effects of specific, yet isolated job demands. To encounter these weaknesses, we conducted semi-structured interviews with thirteen burned-out managers who were inpatients of a psychosomatic clinic, interviewing them on the job demands they struggled with in their former organizations. Using the GOIA methodology, we developed a categorical system of all the demands the managers struggled with, showing that they encountered a lot of demands stemming from the organizational system, their job position and their social environment, as well as their own vulnerabilities. Finally, we derive practical recommendations for organizations regarding what demands they should take into consideration when trying to prevent their managers from clinical burnout.
1400 - INFORMAL LEARNING IN ORGANIZATIONS: A STUDY ON PORTUGUESE MANAGERS’ PERCEPTIONS AND ATTITUDES

Eduardo Simões (1) - Catarina Delgado (1)

ISCTE. UNIVERSITY INSTITUTE OF LISBON, Human Resources and Organizational Behavior, Lisbon, Portugal (1)

Purpose
The purpose of this study is to contribute to an understanding of the way managers view informal learning’s role in the organizational learning system.

Methodology
Content analysis of semi-structured interviews with eleven managers from Portuguese companies of diverse industries points to four streams of analysis: informal learning concept, antecedents, organizational supporting methods, and outcomes.

Results
The findings indicate that, more than a modality of training, informal learning is a process which shapes individual and group knowledge, through a combination of diversified tools and experiences. Results highlight that managers are aware of its importance and are giving way to disruptive pedagogical events in organizations to ensure that employees reflect on their own learning needs, access key organizational knowledge resources and rely on peer-to-peer interaction to expand their knowledge. The findings also suggest that informal learning boosts communication and enhances individual motivation and engagement, positively contributing to organizational performance.

Limitations
Data are obtained from a relatively small sample and from an exploratory study.

Research/Practical Implications
Results highlight the role of informal learning in reshaping and complementing traditional formal training programs, as well as practical implications in fostering creativity and innovation in organizations.

Originality/Value
Regardless of recent advances in training technology and instructional design, there is very scarce research on the ways informal learning is perceived and used in organizations.

(*) ISCTE- University Institute of Lisbon, Portugal
**Purpose**

The aim of this study was to investigate whether trust in supervisors and psychological safety had an indirect effect on the relationship between authentic leadership and work engagement. An additional objective was to determine if authentic leadership indirectly influenced psychological safety through trust in supervisors.

**Methodology**

A sample of 244 employees (86.9% male; 54.5% African; 50.4% Grade 12 qualification) within the South African mining industry completed the Authentic Leadership Inventory, Utrecht Work Engagement Scale, Workplace Trust Survey, and Psychological Safety Questionnaire. Structural equation modelling was employed to establish the model fit as well as the structural paths between the constructs.

**Results**

The results indicated that authentic leadership had a statistically significant indirect effect on work engagement through trust in supervisor. Authentic leadership did not have a statistically significant indirect effect on work engagement through psychological safety.

**Limitations**

The cross-sectional study design does not allow conclusions to be drawn regarding temporal relationships between variables.

**Practical Implications**

Results of the study provide support for the development and implementation of interventions that promote authentic leadership in organisations. Moreover, the study provided evidence as to the importance of supervisory trust in facilitating this relationship towards harnessing a more engaged workforce.

**Originality/Value:**

Authentic leadership plays an important role in creating a positive work environment. This work environment may result in employees trusting their supervisors, which could lead to an engaged workforce.
Main Abstract Content/Purpose. Over the last decades the growth of the service sector has increased the number of jobs that involve interactions with clients. The quality of these service interactions is partly determined by the emotional responses of the service employees involved. However, in order to meet job demands, service employees are also expected to help clients. To achieve this, service employees need to perform well on concurrent cognitive tasks. We investigated the hypothesis that emotional and cognitive tasks are difficult to combine because they use the same resources. We present two studies that focussed on the relationship between emotional regulation and cognitive performance.

Design/Methodology. The first study was a systematic review in which we synthesised the adverse effects of different types of display rules on cognitive performance. The second study was a field research, in which we investigated the relationship between emotional labour and work related cognitive failure of service staff in restaurants and terraces.

Results. We uncovered that emotion regulation can cause different types of cognitive mistakes, such as clumsiness, forgetting things and missing information. These problems both occur in service and non-service contexts. Additionally, we found out that both parallel and subsequent cognitive tasks are adversely affected by emotion regulation.

Limitations. The systematic review pointed out that this field of research is still in its infancy, especially with respect to evidence from service contexts.

Research/Practical Implications. Our work shows that service providers should carefully consider to which tasks they give priority.

Originality/Value. Our work draws attention to the tension between the importance of emotion regulation in professional occupations and the seriousness of cognitive failure ranging from general service failure to life and death matters surrounding healthcare delivery.
Main Abstract Content/Purpose. Interactions with pupils contribute to the complex part of teachers work. Reasoning from Wood’s definition of complexity (1986), this is mainly because these interactions are dynamic, generate multiple concurrent demands and require the contribution of both teachers and pupils. Our work is based on the assumption that emotional demands contribute to all these types of complexity. Consequently, putting much effort in emotional labour is leaving fewer resources for cognitive performance.

Design/Methodology. We present two field studies among higher education and primary school teachers in which we investigated the relationships between different strategies of emotional labour on the one hand, and different types of cognitive failure on the other. Participants completed emotional labour strategy scales on deep acting, surface acting and hiding emotions. Additionally they filled in a general and a work-related cognitive failure scale.

Results

All emotional labour strategies were positively related to both work related and general cognitive failure. The study amongst primary teachers pointed out that in this context deep acting explained work related and general cognitive failure better than did other variables such as surface acting, hiding emotions and age. This means that deep acting cannot always be considered as the most beneficial emotional labour strategy. In higher education contexts, hiding emotions predicted cognitive failure best.

Limitations. Our research data are based on self-evaluations of longer periods. It would have been more precise to evaluate a number of separate working days.

Research/Practical Implications. Our findings point out that is important to prioritize between emotional and cognitive performance.

Originality/Value. Until now the relationship between emotion regulation and cognitive failure has never been studied in real working contexts.
Competences are a set of personal traits, which consists of elements characteristic for an individual, such as motivation, personality traits, skills, self-esteem related to group functioning and knowledge that this person has absorbed and uses (Boyatzis, 1982). All these elements are dependent on each other (Oleksyn) and convert into tangible results (Armstrong, 1996). In the literature it can be observed that there is a combination of perceived areas of competence, motives, and values relating to professional work choices (Schein, 2013). If you want to motivate an employee properly, you should satisfy his needs.

The aim of the study was to examine if the level of competence influence on the motives to work and to conclude based on the knowledge of competences which factors motivate employees to work. It has been assumed that the level of individual competences affects motives to work. The study group consisted of 307 people. 203 women and 104 men completed the survey. The average age of the respondents is 33.10 (SD = 8.8).

Two own questionnaires were used to verify the hypothesis. The first questionnaire referred to 16 competences required on the contemporary labour market and was constructed basing on reports. The reliability coefficient is at the level of 0.88. To measure motives to work, a questionnaire of types of motives was constructed. Basing on a review of the literature on motivation to work (Jonge and Schauffeli, 1998; Sousa-Poza and Sousa-Poza, 2000) and a pilot study, a list of 21 work motives was prepared. On the basis of exploratory factor analysis and confirmatory factor analysis, 4 factors were distinguished: personal and professional development at work, comfort and money at work, good relations and safety at work, and social support at work.

The results of the regression analysis show that competences (i.e. work under pressure, flexibility, self-improvement, initiative taking) explain the motives to work related to personal and professional development in 30% and competences (i.e. time management and cooperation) explain the motives to work related to good relations and security at work in 14%.
Purpose: Despite promising findings of meditation for individual outcomes (e.g., stress relief), there is limited research on applications of meditation at work. This study examines Virtual Reality (VR) to facilitate meditation practice for leadership development. We predicted meditation would improve leader behaviors (e.g., sustained attention, increased empathy, improved emotion regulation) resulting in improved perceptions of leadership skill and leadership style.

Design: A sample of 44 undergraduate and graduate students participated in an 8 week experiment. Students in the meditation condition were assigned weekly meditation and reflection time including meditation sessions in a VR environment. The control group received a VR experience and only responded to the baseline and outcome measures with no exposure to the meditation or VR intervention.

Results: Results demonstrated the impact of meditation practice on leadership outcomes (e.g., perceived effectiveness, performance, leadership styles) and individual experience (e.g., perceived stress, mindfulness). Full results and future implications will be discussed.

Limitations: A small student sample with no random sampling. This quasi-experimental design may create systematic differences between conditions. Only a portion of the meditation sessions were in the VR.

Research/Practical Implications: Findings establish the need for further research regarding the use of VR technology for development in the workplace. Meditation interventions have meaningful value in a workplace context and with leadership development.

Value: To our knowledge only one other study has used VR meditation as an intervention, this being the only study to use VR meditation for leadership development.
Values define the directions of human activities and they are related to the motivation to undertake specific activities and roles (see Schwartz, 1994, Brown, 2002). Researchers and employers notice differences in motivation to work among representatives of different generations and genders (see Twenge, Campbell and Freeman, 2012, Gursoy and Karadag, 2013). In the research project, there were asked some questions, what motivates contemporary employees, whether the intensity of these motives is different in different generations, what are the relationships between the dominant work motives and its dominant values, and whether there are differences between women and men regarding work motives. To verify the hypotheses, a study was conducted among 307 professionally active people. The types of motive questionnaire designed for the study and the Valued Living Questionnaire (VLQ) were used (Wilson and Murrell, 2004). The obtained results indicate that younger employees decide to work ensuring comfort and adequate pay. However, regardless of age, social support is the most important for all groups of respondents. In turn, for women, security and social support are important at work. Moreover, it shows that there is a relationship between work values and work motives. For example people who appreciate values such as friendship and stability are motivated to work by good relationships and security, those who value free time and stability are motivated by comfort and salary, those for whom respect and learning are most crucial, are motivated by the possibility of development, while people for whom professional success, parenting, learning and respect are the most important, are motivated to work by social support.
Purpose
This paper presents six metaphors representative of top management practices in knowledge organizations that develop healthy working environments characterized by organizational fairness, trust and cooperation.

Methods
This was a qualitative case study from 2015 to 2018 including six Norwegian knowledge organizations, yielding more than 30 interviews with both top managers and other managers in the top management teams, and extensive observational notes.

Results
The findings indicate that focusing on healthy work environments is an integral part of value creation in knowledge organizations, with high employee autonomy and individual professional identity, and of the organization’s continuous strategic development. Top managers that succeed with this focus on being credible, respectful and involving, and can be characterized as 1) marathon runners; 2) professional strategists; 3) empathic captains; 4) charismatic actionists; 5) visionary change agents; and 6) creative innovators.

Limitations
The sample consists of six managers, and more research is needed to further validate the findings. The metaphors need to be refined both to communicate a clearer message and to be consolidated.

Research/practical implications and originality value
The results show that top managers’ practices and behaviours affect the quality of work environments. Most leadership studies are on how middle managers affect individual workplace phenomena, while this study shows the relevance of top management for healthy work environments and value creation combined. This has clear implications for top management in practice as well.
The aim of the present pilot study is to explore work-related stress and burnout in parents with typically developing children and parents with special needs children, a comparison that has not yet been investigated. More specifically, the aim of the study is to assess how parents evaluate work-related stress, its sources and consequences as well as components of burnout in emotional, behavioral and cognitive perspective. The sample consisted of 30 parents of children of nursery and school aged typical developing children and 30 parents of children with disabilities who attend special schools or inclusive classrooms. Parents’ demographic information (e.g. gender, age), their experiences regarding work related stress and burnout were assessed by a structured questionnaire. The first part entailed demographic data and the second part the Stress Risk Assessment Tool (Johnson & Cooper, 2003) and the Maslach Burnout Inventory (Maslach & Jackson, 1986). The findings of the study suggest that parents of children with special educational needs experience higher levels of work related stress and occupational burnout. The findings will be discussed in relation of the need to design and implement intervention programs, which aim at improving the quality of life for parents of children with and without special educational needs.
My social identity right or wrong: A study on social identity fusion and loyalty

Torbjörn Engelkes

Purpose

Loyalty is an ambiguous and complex phenomenon that may set the individual in dilemmatic situations. One assumption is that the individual’s level of fusion with his or her social identities also indicates where the individual’s strongest loyalty lies. Another assumption is that social identity fusion and hence the object of prioritized loyalty is influenced by the present context.

Design/Methodology

The study is based on longitudinal questionnaire data collected among staff of a Swedish military unit, two months prior to an international deployment in Mali (May 2018) and during the mission (September 2018), while the follow-up wave will be collected two months after the end of the mission (December 2018).

Results

The analysis and data collection is ongoing. Preliminary results from an initial pilot test with 160 military officers attending a course at the Swedish Defence University indicates satisfactory measurement properties and that social identity fusion is associated with loyalty towards certain in-groups.

Limitations

The study needs replication with larger samples from various settings before any conclusions regarding the generalizability of the association between identity fusion and loyalty can be drawn.

Implications

This study contributes to a better understanding of the loyalty concept within organizations that operate in extreme contexts.

Originality

This is one of the first studies to investigate how social identity relates to loyalty towards different groups, and whether these associations differ in extreme contexts such as an international military mission.
The restructuration of a Non Profit Organization (NPO) after Hurricane María: The case of the Ricky Martin Foundation (RMF)

NPOs provide services that the government and private sector are not delivering, especially to sectors in economic and social disadvantage. Even though their contributions are significant, they face continuous challenges to accomplish their mission.

One significant challenge is the economic precariousness that Puerto Rico has been confronting for the past decade. The availability of funds for NPOs have been reduced and the demand for services increases. The call to action for adjusting services is something that many organizations are facing. After Hurricane María, the NPOs were the most appreciated by the society for their prompt and sensible response, in spite of their lack of resources. This presentation intends to present how the RMF went through a complex process to align its programs to the new reality. The focus was to provide the best services in Loíza, one of the poorest municipalities and the home base of the FRM TAU Center, mainly dedicated to prevent Human Trafficking through an education program. The changes included the transformation of being partially an alternative “school” to become a community development center.

With the Board approval, RMF went through significant processes, including building new alliances, redesign staff’s roles, hire new personnel, move its operations to TAU Center and develop a new evaluation system. They also asked for the support of a IO Psychologist to walk with them through the restructuration. Dialogic consultation was the route to support their voyage, with the challenges that this type of intervention brings to the working scenario of NPOs.
Purpose

In many organizations, loyalty towards the organization and the organizational goals is a highly desired virtue. The vague and sometimes romanticized definitions of loyalty makes the phenomenon difficult both to define and to measure. The present study evaluates a measure of loyalty developed for the military context.

Design/Methodology

Four preliminary dimensions of loyalty were derived from a thematic analysis of interviews with 10 top military managers within the Swedish armed forces. A questionnaire developed on basis of these dimensions was developed, and then pilot-tested using exploratory factor analysis. The resulting measure will be tested using confirmatory factor analysis in a military unit preparing for an international peacekeeping mission in Mali.

Results

The analyses are ongoing. After the initial pilot test with 160 military officers attending a course at the Swedish Defence University the four main latent variables were defined as: Loyalty and Self-sacrificial attitude (6 items); Loyalty and Extended actions (6 items); Loyalty and Whistleblowing (6 items); Loyalty and Duty (10 items).

Limitations

The sample sizes so far are limited (150-200 participators). Further studies using larger sample sizes are necessary to validate the generalizability of the scale.

Implications

This study contributes to a better understanding of the conception of loyalty within organizations that operate in extreme contexts.

Originality

While there exist many measures of loyalty to organizations, this one of few studies developing a scale for the conception of loyalty in military settings.
Abstract

Purpose:
This is a multidisciplinary and cross-national comparative study that examines the relationship between job insecurity (JI) and general health among employees from 32 countries. Specifically, the aim is to test the contextual role of country-level income inequality, based on the assumption that an individual’s reaction to JI can be influenced by the interaction of multiple contextual systems operating at different levels of analysis. Researchers within the fields of economics and political science have conceived the income gap between the richest and poorest individuals as an environmental stressor harmful to health. In particular, income inequality is a societal indicator of distributive injustice, a variable that has been found to negatively affect the impact of JI on various outcomes. Drawing from Conservation of Resources theory and Justice theory, this paper examines the moderating/exacerbating effect of country-level income inequality on the relationship between JI and health at the individual level.

Design/methodology:
Two different data sources were combined for this study. Individual perceptions of JI and general health (physical and mental) come from the International Social Survey Program (ISSP), the 2015 module on work orientations completed by 32 countries. At the higher-level, the Gini index derived from the Standardized World Income Inequality Database provides the data on income inequality. The assumption that individual perceptions are explained by macro-level factors required the use of hierarchical linear modeling, therefore a two-level regression model with cross-level interaction was applied.

Results:
The findings indicate that employees in countries with differing levels of income inequality react differently to the perception that their job may be at risk. In particular, in countries with greater income inequality the negative relationship between individual JI and health is more strong (exacerbating effect).

Originality/value:
Our results contribute to the literature on psychosocial health disparities by examining the contextual role of income inequality as a predictor of JI reactions. Very few studies within the domain of organizational psychology have investigated social consequences of income inequality, which has increased dramatically in most countries in recent years. However, the importance of this research is based on the assumptions that the societal acceptability of economic inequality affects organizational strategic and management decisions.
THE IMPACT OF JOB INSECURITY ON HOUSEHOLD SACRIFICES: THE MODERATING ROLE OF
EMPLOYMENT PROTECTION LEGISLATION IN EUROPE

Beatrice Piccoli (1) - Hans De Witte (2)

University of Essex, Essex Business School, Colchester, United Kingdom (1) - University of Leuven (KU Leuven), Research Group Work, Organisational & Personnel Psychology, Leuven, Belgium (2)

Abstract

Purpose:
The purpose of this study is to investigate job insecurity (JI) from a multilevel perspective, by moving from an exclusively individual level view to an examination of interactions between individuals and contextual factors. We broaden the focus on extra-organizational consequences of JI by studying the spill-over effect on household sacrifices in times of crisis in Europe. Drawing on Conservation of Resources theory, the effects of JI on household sacrifices at the individual level were first analysed. Second, we examined whether this relationship varies across European countries. Lastly, we tested whether this variation was explained by a country level factor, i.e. employment protection legislation: this variable may serve as a societal resource to cope with JI because it provides employment protection.

Design/methodology:
European countries during the economic crisis are the context of the study. Three different data sources of 2010 were combined: ESS for individual level variables, Eurostat and OECD for country level factors, including control variables such as GDP and unemployment rate. To take into account the impact of the crisis, household sacrifices are measured with retroactive questions on precautionary saving behaviours in the past three years. A two-level regression model with cross-level interaction was applied by using a step wise procedure of analysis.

Results:
Results confirm that JI is positively related to household sacrifices. This relationship varies across European countries. Employment protection legislation is a factor explaining this variation: in countries with more strict legislation the relationship is less strong (buffer effect).

Implications:
JI is a threat to a highly valued resource (employment), therefore insecure employees may withdraw from other activities that demand further resources, by adopting precautionary saving behaviours. Employment protection legislation is the indicator of the strictness of regulation on dismissal, so it provides a protective and resourceful context for employees.

Originality/value:
A multilevel perspective with a cross-country approach can take into account all factors involved in the experience of JI, providing suggestions for national policies on employment protection. By testing the generalizability of JI and its consequences in European countries, it is possible to identify common strategies to deal with it at the institutional level.
1447 - THE CONTEXT OF EMPLOYEES' IT INNOVATION ADOPTION: THE JOINT ROLES OF TRANSFORMATIONAL AND SHARED LEADERSHIP

Aldijana Bunjak (1) - Heike Bruch (1) - Matej Černe (2)

University of St. Gallen, Institute for Leadership and HR Management, St Gallen, Switzerland (1) - University of Ljubljana, Management and Organization, Ljubljana, Slovenia (2)

Abstract

Purpose

This study investigates how transformational leadership, through shared leadership, predicts the employees' information technology innovation adoption at work. We further examine how management innovation acts as an organizational-level enabler on the effect of leadership on employees' IT innovation adoption.

Design/Methodology/Approach/Interventions

A two-source multi-level field study of 2873 employees and their 63 managers in German small and medium-sized companies was conducted. Data were analyzed using hierarchical linear modeling and moderated mediation analysis.

Results

The study findings revealed that shared leadership mediated the relationship between transformational leadership and employees' information technology innovation adoption at the individual level. Furthermore, organizational-level management innovation moderated the relationship between transformational leadership and new technology information adoption, mediated by shared leadership.

Limitations

Cross-sectional design limiting our ability to infer causation.

Research/Practical Implications

Our results have important research and practical implications for the leadership and management innovation field, as well as micro-innovation and IT adoption research and practice. The study implies that transformational leadership and management innovation represent important boundary conditions for employees' IT innovation adoption.

Originality/Value

A multi-level approach examining the context of IT innovation adoption. Combining leadership research with the management innovation stream in proposing and testing cross-level interactions of leadership styles and managers’ role modeling in fostering employees’ perception of new technology adoption. Bridging the leadership, management innovation, and micro-innovation/IT innovation adoption research streams.
Agile, as a new software development/project management approach, has been popularized in recent years with the aim of effectively responding to the ever-changing environmental factors in the field of technology. Agile methodology defines individuals and interactions over processes and tools as one of its main values and self-organizing teams as building blocks to achieve higher flexibility and continuous improvement within the organization.

Our research assumption was that the perceived autonomy of the team within the company, along with the individual’s level of preference for equality and interdependence (horizontal collectivistic orientation) can predict the perceived team resilience (the team’s ability to deal with adversities).

A total of 252 members of agile software development teams were in our sample. Team autonomy was measured by a five-item scale adapted from Pekkanen’s study (2010), The Individualism and Collectivism Scale (Triandis, Gelfland, 1998) was used to measure 'Horizontal Collectivism’, while Ng’s (2013) Organizational Resilience Scale was adapted to measure 'Team Resilience’. Multiple linear regression analysis with dependent variable of the 'Team Resilience’ score shows that $R^2 = 0.276, F(2, 249) = 47.574, p = 0.000$. It is found that 'Horizontal Collectivism’ ($\beta = 0.154, p = 0.007$) and 'Team Autonomy’ ($\beta = 0.460, p < 0.001$) can positively predict higher values of 'Team Resilience’.

These research results may be used to support the development of training methods to increase teams’ ability to respond to change and also to aid the selection practice of potential candidates in an agile environment.

Purpose
This research arose from the need to deepen the knowledge about female labor particularities, especially in the stressful educational scenario, as the construction of an identity is considered a perceptual construction. The aim of this work is to study the relation between female coping strategies and general individual work performance in educational context considering that performance is perceived differently between pink-collar workers and the other categories.

Methodology:
3532 female employees of the Secretary of Education in the Federal District (Brazil) answered a Portuguese-version of brief-cope (Pais-Ribeiro & Rodrigues, 2004) and General Individual Work Performance (Andrade, Queiroga, & Valentini, 2016) scales.

Results:
Results partially support what was found in the literature about coping and performance. As expected, active problem-solving strategies (active coping and planning) are positively related with performance. But in contrast of what is found in the literature, the ‘palliative reaction’ (seeking emotional support) is negatively related with individual work performance.

Limitations:
All scales were self-reported in a transversal study. Social support needs to be further studied to allow better understanding of the phenomenon.

Practical implications:
Social support usually ameliorates performance and here we see the opposite, probably due to the emotional nature of this coping strategy. This kind of coping could be used in different stages of stress (e.g. on account of double burden), as an excuse, as a form to develop social relationship or other. Probably, these mechanisms allow them to evaluate their own performance worst.

Originality:
This essay deepens the discussion about the relation between coping and performance in a female pink-collar work.
We extend conservation of resources theory by examining childcare satisfaction (CCS) as a valuable resource for working parents. Childcare satisfaction affects absenteeism, turnover, and well-being through family-work conflict (FWF) (Payne, Cook, & Diaz, 2012; Buffardi & Erdwins, 1997). However, they did not examine family-work facilitation (FWF) or family outcomes. Our present research surveyed 361 mothers and 324 fathers from the U.S. to examine FWC and FWF as a mediator between CCS and family satisfaction with gender as a moderator. We predicted that the four CCS sub-scales would positively relate to FWF and negatively relate to FWC with stronger relationships for females.

Childcare communication (B=.19, p=.003; B=.23, p<.001), attention (B=.30, p=.003; B=.30, p<.001), dependability (B=.35, p<.001), and cost (B=.31, p=.021) were significant predictors of FWC and FWF, respectively. Childcare communication (B=.24, p<.001), attention (B=.36, p<.001), dependability (B=.35, p<.001), cost (B=.30), FWC (B=.11), and FWF (B=.35) were significant predictors of family satisfaction. The indirect coefficients were significant for all mediational analyses, except for FWC mediating childcare dependability and family satisfaction (CI=-.0005, .0478); and FWF mediating childcare cost and family satisfaction (CI=.0089, .1980).

The results supported our hypotheses: FWC and FWF partially mediated the CCS and family satisfaction; and gender moderated CCS and FWC/FWF. The research adds to the conservation of resources theory by finding CCS impacts family satisfaction through FWC and FWF; and CCS impacts family outcomes. In terms of practical value, organizations can use the results to evaluate their childcare policies (e.g. on-site, subsidized).

6 **Bolded** text indicates statistics for FWF.
1462 - WORKAHOLISM AND WORK–FAMILY CONFLICT: EXPLORING DYADIC PATTERNS IN SPILLOVER–CROSSOVER EFFECTS FOR COUPLES

Purpose: To examine the dyadic patterns of workaholism and work–family conflict (WFC) among dual-earner couples. It was expected that due to cultural gender norms present in the United States, husbands and wives would have different patterns of influence between workaholism and WFC.

Design/Methodology: 252 dual-earner couple dyads were recruited from a research panel in the United States. All couples were married, cohabitating, and working full-time. Husbands and wives were mostly White (80.6% and 83.3%, respectively) and in their 40s (M = 45.42 and 42.32, respectively). The measurement of workaholism and WFC were time-separated. Dyadic data were analyzed using the actor-partner interdependence model (APIM; Kashy & Kenny, 2000) in a structural equation modeling framework. Dyadic patterns were detected and tested using latent phantom variables (Kenny & Ledermann, 2010).

Results: Husbands WFC was affected equally by their own and their wife’s workaholism (i.e., the couple pattern). However, Wives WFC was only affected by their husband’s workaholism (i.e., the partner-only pattern). These findings provide support for our expectations.

Limitations: While this study used time-separated measures, it was still cross-sectional in nature. Additionally, both workaholism and WFC have multiple dimensions, but only the overall levels of each were examined.

Research/Practical Implications: This study shows that research exploring the effects of workaholism on the spouse without considering gender may be masking differential outcomes.

Originality/Value: This is the first known study to examine the disparate dyadic patterns of workaholism and WFC among dual-earner couples in the United States.
Over the last decade, interest in well-being at work has increased due to positive impacts such as absenteeism decline and engagement increase (Soane, Shantz, Alfé, Truss, Rees, & Gatenby, 2013). Compassion, as a relational process (Gilbert, 2005), could alleviate employees’ distress and reduce the resulting costs. In fact, some studies (i.e. Moon, Hur, Ko, Kim, & Yoo, 2016) provide empirical support for the existence of a correlation between compassion process in an organizational setting and variables profitable to the well-being of organizations. However, few studies have addressed the outcomes of compassion process for employees. This study examines the mediating role of compassion process (social safeness and compassion) between two relational resources (cooperative climate and recognition) and two outcomes for employees’ well-being (job satisfaction and flourishing). Using a cross-sectional study design, 198 francophone employees from Quebec (Canada) and France were recruited. Respondents answered a self-reported online questionnaire (SimpleSurvey) based on six measuring instruments ($0.78 \leq \alpha \leq 0.95$). Correlation analyzes confirm that both relational resources and outcomes are significant ($p < 0.01$) and positively linked to compassion process. Indirect effect analysis indicates that social safeness ($0.131 \leq \delta \leq 0.203$) is the predominant mediator between the relational resources and the outcomes (compassion: $0.003 \leq \delta \leq 0.017$). This study has some limitations: all results come from self-reported questionnaires and the French sample is too small to allow comparison with the Quebec data. Overall, these results identify recognition and cooperative climate as a mean to enhance employees’ well-being through compassion process.
Purpose

Done correctly, technology enablement improves the quality of work-life. We developed and tested a conditional, indirect process model in which effective technology enablement enhances employee work-life balance, which then boosts employee emotional well-being. We also proposed that the level of servant leadership of the first-line supervisor influences (i.e., moderates) the strength of the relationships in the model.

Design

Employees of a small corporation (N = 520) responded to four items measuring technology enablement, three items measuring work-life balance, four items measuring emotional well-being, four items measuring supervisory servant leadership, and two items assessing demographics.

Results

Results of regression analyses indicated partial mediation. Technology enablement was related to both work-life balance (Path a) and emotional well-being (Path c'), and work-life balance was related to emotional well-being (Path b). However, servant leadership moderated the direct effect of technology enablement on emotional well-being (Path c'). The relationship between technology enablement and emotional well-being was stronger among workers reporting that their supervisors were higher than lower in servant leadership.

Limitations

We emphasize that the results might reflect method variance and that the cross-sectional design precluded us from establishing causality.

Implications

Technology enablement has a positive effect – both directly and indirectly through work-life balance – on employee emotional well-being. However, the direct effect is likely a function of supervisory servant leadership.

Value

Integrating the work-life balance, occupational health, leadership, and technology literatures, we identified a psychological process linking technology enablement and emotional well-being.
Purpose. How does the behavioral suppression of one’s identity in terms of race/ethnicity, age, sexual orientation, religion, and/or disability influence employee psychological well-being? We investigated the joint effects of identity suppression, withdrawal deviance, and individual differences in conscientiousness on emotional exhaustion. Applying an emotion-focused coping framework, we proposed and tested a three-way interaction between identity suppression, withdrawal deviance, and conscientiousness.

Design. We collected data from 169 government employees. We measured emotional exhaustion using four items, identity suppression with three items, withdrawal deviance with four items, conscientiousness with six items, and emotional stability with six items.

Results. We found that identity suppression was positively related to emotional exhaustion. However, this relationship was jointly moderated by withdrawal deviance and conscientiousness. Specifically, low-conscientiousness employees who engaged in high levels of both identity suppression and withdrawal deviance experienced the least emotional exhaustion. Slope difference tests provided further evidence for these joint effects on emotional exhaustion.

Limitations. The cross-sectional design of the study prevents us from inferring causality.

Implications. The results suggest that the relationship between identity suppression and emotional exhaustion may operate within a stressor-strain framework. Employees may attempt to cope via withdrawal deviance; however, individual differences in conscientiousness may also influence those who are most successful in coping.

Value. We explored the stressor-strain relationship between identity suppression and emotional exhaustion as well as the personality and withdrawal behavior mechanisms that may help employees cope with emotional exhaustion when suppressing an identity.
Purpose
How do perceptions of organizational diversity climate (i.e., promotion of equal opportunity and inclusion) influence employee engagement? We proposed a conditional, indirect process model to examine a psychological process in which a favorable organizational diversity climate enhances unit cohesion, which then promotes employee engagement—a process influenced by the task leadership effectiveness of the first-line supervisor.

Design
Retail bank employees (N = 1,232; 73% women) responded to six items measuring diversity climate, four items measuring unit cohesion, three items measuring engagement, and three items measuring task leadership. They also indicated their gender, age, and organizational tenure.

Results
Regression results revealed that diversity climate was related to both unit cohesion and engagement and that unit cohesion was related to engagement, indicating partial mediation. However, task leadership moderated the relationships of diversity climate with both unit cohesion and engagement but not the relationship between cohesion and engagement. Among employees reporting (in)effective supervisory task leadership, diversity climate was more strongly (weakly) related to both unit cohesion and engagement.

Limitations
As we did not have the opportunity to measure the predictor and criterion variables at different times, we accentuate the point that our study was cross-sectional. Hence, we cannot establish causality.

Implications
The results suggest that the effect of diversity climate on engagement is likely a function of organizational, peer, as well as supervisory dynamics.

Value
We incorporated the leadership, diversity, and group cohesion literatures to define a psychological process underlying employee engagement.
Purpose. Why do workers engage in production deviance (i.e., reduce their work effort)? We tested a conditional, indirect process model to examine a psychological process in which abusive supervision reduces employee resilience, which then yields employee production deviance, albeit influenced by individual differences in emotional stability.

Design. Collecting survey data from 236 government workers, we measured abusive leadership with five items, resilience with five items, production deviance with six items, and conscientiousness and emotional stability each with nine items.

Results. We found that: (a) abusive leadership was related to resilience but not production deviance, and (b) resilience was related to production deviance. This suggests full mediation; that is, the effect of abusive leadership on production deviance was indirect through resilience. We also found that emotional stability moderated the relationships of abusive leadership with both resilience and production deviance but not the resilience-production deviance relationship. Graphing the interactions revealed that abusive leadership was most strongly related to: (a) resilience among workers low in emotional stability and (b) production deviance among workers high in emotional stability.

Limitations. As we were unable to collect the data longitudinally, we emphasize that we cannot demonstrate causality.

Implications. The results suggest that the effect of abusive supervision on production deviance may more likely reflect a stress process than a social exchange (i.e., retaliation) response.

Value. This study integrated the leadership, stress, personality, and counterproductive work behavior literatures to describe a psychological process underlying production deviance.
Researches suggest that showing compassion at work has many outcomes on the workers’ mental and physical health (1) (2). A better understanding of what can sustain compassion at work is thus important but remains mostly understudied. The social exchange theory suggests that if a leader use servant leadership or recognition, workers will be more likely to reciprocate by showing compassion towards their colleagues (3). This study postulates that the adoption of a leadership style x and the expression of recognition promote the adoption of gestures of compassion by workers towards their colleagues. On an exploratory basis, this study will also test the moderating role of recognition on the relationship between servant leadership and compassion. A sample of 195 French-speaking participants were recruited through organizations from Canada and France to answer three self-completed psychometric scales about compassion, servant leadership and recognition (0,80 < α < 0,84). The calculation of multiple regressions confirms the role of servant leadership in predicting compassion ($R^2 = 0,13$, $p < 0,001$). A moderation analysis revealed a non-significant interaction effect of the recognition on the relationship between servant leadership and compassion at work ($p < 0,10$). These results suggest the importance of servant leadership in the promotion of compassion at work. It also supports the social exchange theory and accentuate the importance of formation programs about servant leadership for leaders in organizations. One of the limits comes from the sampling of this study. Futures studies should replicate this study with non-French workers and consider other antecedents of compassion at work.

(2) Hur, W. M., Moon, T., & Rhee, S. Y (2016). Exploring the relationships between compassion at work, the evaluative perspective of positive work-related identity, service employee creativity, and job performance. *Journal of Services Marketing*, 30, 103-114.

A STUDY OF THE RELATIONSHIP BETWEEN ORGANIZATIONAL IDENTIFICATION AND OUTCOME BEHAVIORS OF EXIT-VOICE-LOYAL-NEGLECT MODEL FOR THE PUBLIC SERVANTS IN TAIWAN

Chia-Hui Lee (1) - Chiung-Yi Huang (2) - Min-Ping Huang (3)

Purpose:
Organizational identity refers to the members' awareness of organizational characteristics in the organization, which will affect the members' sense of organizational identification to the organization. The study following Hinkin's (1995) method to develop organizational identity scale for Public agency, and used this scale to test the relationship between organizational identification and employees' four pattern outcomes of exit, voice, loyal, and neglect behaviors.

Design/Methodology/Approach/Intervention
With grounded theory, this study concluded 28 organizational identity contents and 23 Public Agency Organizational Identity Scale (PAOIS) into empirical research. The data collection has 112 valid samples from public servants. Beside the organizational identify scale, all other scale were adapted from past valid scale.

Results
The study results that organizational identification and organizational dis-identification all revealed significantly positive related to loyalty ($\beta = .35, .47; p<.06, .04$, respectively), and schizo-identification revealed significantly negative related to loyalty ($\beta = -.66, p<.001$). Further, schizo-identification showed significantly positive related to neglect behavior ($\beta = .57, p<.001$), and exit behavior ($\beta = .83, p<.001$). Finally, it is pitiful that no any significantly pattern in the relationship between organization identification and voice behavior.

Limitations
The study have some limitations. First, the study used a cross-sectional design with self-reported data to assess our hypotheses. This design element limits our ability to make causal assertions about links between organizational identification and outcome behaviors. Second, common method variance is a potential problem.

Research/Practical Implications
The results of this study have two practical implications. First, a well-developed PAOIS could be a useful tool for testing employees’ organizational identification survey of human resource management in public agencies. Second, to develop higher organization identification, public agencies need to understand deeply about what kinds of identification to link different outcome behaviours for employees.

Originality/Value
Development specific organizational identity contents for public agency in Taiwan, and collect more data to test the validity.
Purpose
Voluntary turnover tends to be high in retail stores. We proposed and tested a conditional, indirect process model to investigate a psychological process in which the servant leadership of the first-line supervisor enhances employee empowerment, which then reduces employee intentions to leave – a process influenced by coworker support in the form of citizenship behavior.

Design
Employees (N = 986) in 37 stores of a small retail firm responded to four items measuring servant leadership, four items measuring empowerment, one item assessing intentions to leave, and five items measuring coworker citizenship behavior.

Results
Regression analyses indicated that servant leadership was related to both empowerment (path $a$) and intentions to leave (path $c'$) and that empowerment was related to intentions to leave (path $b$); that is, the effects of servant leadership were both direct and indirect through empowerment. However, coworker citizenship behavior moderated the link between servant leadership and empowerment (path $a$). Servant leadership was more strongly (weakly) related to empowerment among employees reporting high (low) levels of coworker citizenship behavior.

Limitations
Given the cross-sectional design of the study, we cannot infer causality.

Implications
The results suggest that the effect of servant leadership on intentions to leave are both direct and indirect through empowerment. However, coworker support in the form of citizenship behavior enhances the effect of servant leadership on empowerment.

Value
Applying the servant leadership, empowerment, and coworker support/citizenship literatures, we described a psychological process underlying employee intentions to leave.
The objective of this research was to design an Organizational Culture Scale (ECO) with psychometric properties to measure this construct in organizations. The importance of measuring and evaluating the organizational culture lies in the role it plays for the competitiveness of organizations.

Method. An exploratory, descriptive, non-experimental research was carried out. The stages that were followed for the construction of the scale were: a) systematic review of the literature (definition of the construct, theoretical models and scales of measurement), b) identification and analysis of organizational values of 60 public organizations and 62 Mexican private organizations, c) application of natural semantic networks to identify the psychological meanings of the construct, d) design of the items bank, e) validity interjueces, f) design of the scale, and g) application of the scale to determine its psychometric properties.

Results The statistical analyzes carried out were the analysis of items discrimination, factorial validity and reliability. Results. A validated and reliable scale was obtained to measure the organizational culture conformed by 12 factors (12 types of organizational culture) of this construct integrated in 4 groups, and a group of 3 organizational values.
Purpose: The aim of this research was to identify how managers and staff used the services they delivered and the environment to create an enabling environment for older people in residential care homes.

Methodology: A qualitative research approach was adopted using semi-structured narrative-pointed interviews in two residential care homes in North West England with ten participants (two managers, four staff and four residents without dementia) to investigate how enabling environment was created. Data was collected from a social constructionism stance and a phenomenology of practice perspective. By triangulating this perspective, manual thematic analysis and contextual constructionism stance, themes were identified from data.

Results: By engaging and utilising environmental influences, interpersonal relationships and continuity of care; enabling environment was created.

Limitation: This research was limited to residential care homes and utilised a small sample size.

Research Implication: Enabling environment can be created for older people in residential care homes using the services they deliver and the environment.

Originality: This research introduced the concept of the creation of enabling environment within residential care homes which has not been previously researched. This research also introduced a research methodology for data collection and themes identification termed phenomenological thematic analysis.
Purpose
With the increased use of digital communication in working life, dysfunctional behaviour such as cyber-harassment has emerged. The purpose of the presented study is to explore cyber-harassment within Swedish working life. This include analysing prevalence rates, sources of cyber-harassment, and risk groups with regard to gender, organisational position and types of work.

2.2. Methods
Data was collected as part of a validation and development project for the use of COPSOQ at workplaces and includes responses to a workplace survey from 4463 employees. Cyber-harassment and self-assessed stress level was based on COPSOQ III. Uni- and bivariate distributional analyses were conducted and differences between groups were tested by t-test, Chi²-test and Fischers’ exact test.

2.3. Results
The overall prevalence of exposure to cyber-harassment was 2.2%. More men than women and more leaders compared to non-leaders reported exposure to cyber-harassment the last 12 months. No significant difference in prevalence was found in relation to types of work. Different patterns regarding whether harassment was experienced from colleagues, superiors, subordinates or from clients, patients etc. were seen dependent on managerial position, gender and types of work. 98% of those experiencing cyber-harassment from clients or patients also reported cyber-harassment from people within the work-organisation. Those who had been cyber-harassed reported a significant higher level of stress-symptoms than those who did not.

2.4. Limitations
The cross-sectional study design does not allow for causal inferences.

2.5. Implications
2.6. Employees reporting cyber-harassment constitutes a high-risk group in relation to occupational stress.

2.8. Value
Cyber-harassment in working life is so far relatively unexplored.
Purpose: Technology and artificial intelligence (AI) may increasingly lead to job disruption. Emerging literature suggests that jobs are replaced by technology at the level of tasks. When one task is disrupted, it affects many jobs in related sectors. Workers then have to transition to either new tasks or new jobs based on other tasks that have not been disrupted. There exists a knowledge gap in how to enable workers to firstly identify and transition to new tasks and secondly to discover new jobs based on similar tasks.

Approach: This present study, funded by the Social Science Research Council (SSRC) of Singapore, presents a task-based approach to job re-design based on a newly developed Task Transition Framework (TTF) and a task database modelled after the American Occupational Information Network (O*Net). A mixed-methods study is being carried out using quantitative surveys, interviews, observations and focus groups to understand the experiences of Singaporean workers and employers who use the database and framework to identify and transition to new tasks.

Results: Findings from the study will be presented highlighting the strengths and areas of improvement to the task-based approach.

Limitations: As the task database is still in development, not all tasks and vocations may be comprehensively covered.

Practical Implications: This study can illuminate how to transition to new jobs via modular tasks.

Originality: To the researchers’ best knowledge, this is the first study to investigate the perspectives and psychology of workers and employers considering job transitions at the level of tasks.
Purposen: To investigate the association between working conditions and global exit from work before statutory retirement age.

Methodology: In a cohort of 2,429 employees aged 30 to 59 years in Germany based on a random sample subject to social contributions in a nationwide register, personal interviews were conducted in 2011/12 (AAPOR participation 36%) and 2017 (AAPOR follow-up participation 69%) on global exit from paid employment (Including unemployment, pension; ILO), age, gender, occupational grade (4 grades; ISCO), physical work load and psychosocial working conditions (COPSOQ). Excluded were 69 employees entering education/maternity leave or having missing information. Of the remaining 2,360 employees, 186 exited work (8%). Through multiple logistic regressions, associations of baseline working conditions with follow-up exit were estimated - controlled for baseline age, gender and occupational grade.

Results: Controlled for occupational grade, baseline high physical work load (OR 1.92; 95% CI 1.15-3.18), high amount of work (1.93; 1.14-3.28) and low quality of leadership (1.73; 1.09-2.75) were significantly associated with global exit from work 5 years later; high job insecurity was insignificantly associated (1.56; 0.94-2.61); whereas work pace, influence at work, opportunities for development were not.

Limitations: Information on exit from work was self-reported, although employment status had high agreement with register information.

Research/Practical Implications: Reduction in both physical and overall work load, as well as improvement in quality of leadership, may help to decrease global exit from work before statutory retirement age.

Originality/Value: This study of employees with a broad age range is the first of its kind in Germany.
THE ACADEMIC SOCIALIZATION QUESTIONNAIRE: FACTORIAL STRUCTURE AND MEASUREMENT INVARiance

Paola Spagnoli (1) - Maria Luisa Farnese (2) - Stefano Livi (3)

Università della Campania, Department of Psychology, Caserta, Italy (1) - Sapienza University of Rome, Department of Psychology, Rome, Italy (2) - Sapienza University of Rome, Department of Social and Developmental Psychology, Rome, Italy (3)

Purpose. In the last decades, a considerable body of literature on organizational socialization and several measures were created to capture the socialization process in the workplace context. Nevertheless, the adaptation of this construct in the academic context is still missing. In fact, freshman students—like all newcomers in organizations—need to successfully adapt to their university context. Hence, the current study aims to create a socialization measure specific for this context, borrowing Haueter al’s (2003) three-level (organization-group- and task-socialization) conceptualization and adapting their Newcomer Socialization Questionnaire.

Design/Methodology/Approach/Intervention. The factorial structure and measurement invariance of the Academic Socialization Questionnaire (ASQ) was examined on a sample of 758 university students, taking into account two stages of socialization: the early stage (311 freshmen onboarding students at the first year) and a “senior” stage (447 students attending their second and third year). Confirmatory Factorial Analysis was conducted using structural equation modelling on each subsample.

Results. Evidence of the superiority of the three-dimensions hypothesised factorial structural was found. Moreover, measurement invariance was supported, indicating that the ASQ is stable on students at different stage of socialization.

Limitations. Self-report data, cross-sectional design and specificity of the Italian cultural context are the main limitations of the study.

Research/Practical implication. The ASQ could be a useful tool for university managers, interested in fostering the students’ success and preventing the dropout, to capture the effectiveness of their university inclusion process.

Originality/Value. To the best of our knowledge, this is one of the first attempts to adapt a measure of organizational socialization to the academic context.

Key words: socialization, university context, questionnaire, measurement invariance
Purpose

Building on the circumplex model (Warr and Inceoglu, 2012), we explore the relative contribution of job satisfaction and work engagement on job performance in two different samples (police and service employees). We use problem solving as a performance dimension for both samples (citizen’s vs. customer’s problem’s solving).

Design

Police officers (n= 169) and hotel staff (T1, n=443; 6 months later, T2, n=143) completed a questionnaire on job satisfaction, engagement, and problem solving.

Results

Multiple regression analyses showed that job satisfaction has a positive impact on problem solving after controlling the effect of engagement. On the other hand, vigor is the only dimension of engagement with a positive influence on problem solving after controlling for job satisfaction. Therefore, the energy / activation is the main difference between job satisfaction and engagement. Engagement and job satisfaction complement each other in predicting job performance.

Limitations

The results are limited to two occupations, and additional indicators of job performance should be used (i.e. number of sales or supervisor evaluation).

Research/Practical Implications

Wellbeing should be measured considering job satisfaction, as an indicator of hedonic (passive) pleasure, as well as, engagement as an indicator of energy and activity at work. Managers should aim to create a satisfied and engaged workforce to improve their performance.

Originality

Our study helps to better understand the differentiation between job satisfaction and engagement and their effects on job performance.
Purpose. Although values and transformational leadership (TFL) have influence on work quality and employee health, still little is known about nurses’ perceptions of values their organizations promote and about their supervisors’ behaviors across countries. The study’s objectives are to analyze nurses’ perceptions of Schwartz’ values in their organization and of their supervisors’ transformational behavior, and to explore the relationship between both in two culturally different countries.

Methodology. In Germany and U.S., 275 nurses answered the Schwartz Value Scale (SVS) and the Multifactor Leadership Questionnaire’s (MLQ-TFL) transformational items. We tested both, the perception of SVS and MLQ-TFL, for differences between countries using U Mann-Whitney and the relationship using Spearman correlation.

Results. We found that achievement, benevolence and conformity are the top values nurses perceive in their organizations with some cross-cultural differences in SVS and MLQ-TFL. Positive correlations between SVS and MLQ-TFL with the exception of power and tradition were found in both countries.

Limitations. Results cannot be generalized as a small sample and only two not representative organizations were used. Another limitation is the use of only employees’ perceptions. Future research should include diverse institutions and countries and use multi-rater assessments.

Value & practical implications. This study offers information for human resources policies. The promotion of values related to TFL, value-based leader recruiting, training and management further facilitates positive consequences. To our knowledge, this is one of the first studies that analyzes nurses’ perception of values their organization promote, their supervisors’ TFL and the relationship of both across two countries.
Globalization and team work orientation in IT sector organizations pose unique work challenges for employees that contribute to organizational commitment. Culturally diverse and geographically dispersed teams operate in specific conditions using computer-mediated communication. Although innovative organizational forms are becoming more frequent in IT organizations and have the impact on employees, they are still scarcely researched. Literature provides limited data about the specific work challenges that global IT team members experience.

The purpose of this study is to investigate what are the most frequent challenges in global IT teams and evaluate their perceived organizational commitment considering the case of Lithuanian organization.

Methodology: The exploratory pilot study was conducted in international IT company operating in Lithuania. Five global teams (N=19) filled up TMC Employee Commitment Survey (Meyer, Allen&Smith, 1993) and rated perceived work challenges. This pilot survey is an initial stage of the larger project.

Results: IT team members pointed out the following work challenges as the mostly prevalent: time zone differences, lack of clear purpose and lack of information when working on a project. The least prevalent work challenges were difficulties speaking in a foreign language and failures to work virtually. Those IT teams that faced work challenges more frequently reported lower levels of organizational commitment.

Limitations: Small sample size and self-reported data are the major limitations of the study. Further research is needed to confirm the pilot study assumptions.

Implications: Study discovers guidelines for future studies. Organizations should consider the prevalence of work challenges and the benefits of organizational commitment.
A Systems Perspective on Risk Taking Behaviour and Safety Culture in the Ports Sector

Understanding why employees take health and safety risks and how this can be reduced or prevented is a longstanding cornerstone of modern health and safety management. This research focuses on volitional risk behaviour in situations where employees have awareness and knowledge of the consequences of failure. Dispositional, situational and contextual influences have all been shown to influence employee risk behaviour with situational influences moderating individual dispositional behaviours. Large scale major accidents have shown the importance of safety culture leading to a wide range of generic safety climate measures which may give misleading information on contextual issues and relationships.

A key aim of the research is the development of a sector specific safety climate tool for UK ports as a method for supporting culture change through identification of what, where and who needs to change. A focus on how change is effected can be further determined by understanding and monitoring the process of change. A mixed methods approach is envisioned concentrating initially on qualitative methods (interviews and focus groups) to garner insights from employee participants at all levels in organizations and through a range of differing port environments. The insights will be used to construct a climate survey tool for use with a sample of managers and employees and a selection of case studies to review culture change interventions.
1540 - BUILD UPON THE IDEAS OF OTHERS: THE RELATIONSHIP OF TEAM-MEMBER EXCHANGE (TMX) AND CREATIVITY IN DESIGN THINKING GROUPS – A MULTI-LEVEL ANALYSIS

Oliver Kohnke (1) - Marie Boos (2)

SAP Deutschland SE & Co. KG, Business Transformation Services, Hallbergmoos, Germany (1) - viasto GmbH, Berlin, Germany (2)

Purpose
The study examines the relationship of Team-Member-Exchange (TMX) and creativity in a Design Thinking (DT) context.

Design/ Methodology/ Approach / Intervention
It is hypothesized that TMX effects creativity both directly and indirectly (partially mediated by work engagement). The relationships are assumed as well on individual as on team level. In addition, on individual level it is postulated that the variable perspective taking moderates the direct relationship between TMX and creativity. To test these assumptions, responses of 220 participants assigned to 41 DT teams were collected. As an independent data source, team creativity was rated on team level by DT coaches.

Results
On individual level, the analysis showed significant relationships between TMX and creativity as hypothesized. Perspective taking did not moderate the direct relationship. On team level, the relationships were not significant. However, post-hoc analysis revealed first indications that TMX is related with specific facets of the creative group outcome (e.g. novelty of prototype).

Limitations
Causal assumptions could not be tested due to the cross-sectional design of the study. Future research should plan for more measurement points during the DT process.

Research/ Practical Implications
This study provides support that the TMX quality cognitively stimulates idea generation by activating concepts and knowledge based on challenge-related cues (e.g. teammates’ ideas). This encourages the practical importance of the DT principle ‘build upon the ideas of others’.

Originality / Value
This study contributes to a better understanding of the underlying psychological processes in DT and highlights the importance of cooperation for the DT outcome.
Purpose: Current literature states that Horizontal and Vertical Individualism and Collectivism (HVIC) are key constructs in cross-cultural research for their practical use and power to orient Human Resources practices. The present study aims to empirically support the stability of the HVIC structure.

Design: Study 1 used a sample comprised of 774 Brazilian workers, testing different models of the scale. Study 2 compares models and invariances between similar samples in Brazil and the USA (N=200 to each group). Study 3 conducted a national Brazilian sample of homogeneous blue-collar workers and compared models and invariances (total N=6,972) and contributes to convergent validity testing of the personal-environment fit.

Results: Study 1 indicated that the four-factor structure is well adjusted demonstrating adequate psychometric properties through EFA and reliability analysis. Study 2 indicated that the Study 1 structure fits well in both countries and varies slightly in its metric invariance. Finally, Study 3 supported Study 1 and 2, it showed regional differences among different Brazilian states and confirmed the convergent validity through the personal-environment fit hypothesis.

Limitation: H/V dimensions show room for improvement in the scale as a whole. The vertical collectivism dimension includes only items related to family and there are other power manifestations that could be included.

Practical implication: The scale is a valid tool to be used and to facilitate further cultural comparison between countries.

Originality: Despite the importance of the instrument to compare countries’ values, it was the first time that this measure has received attention in Brazil.
Purpose. Based on the theoretical approach of psychology of sustainability and sustainable development and on the theoretical model of Job Demands-Resources, this contribution aims to explore 1) the mediating effect of job crafting on the relationship between workload and contextual performance, 2) the moderating effects of individual adaptability on the workload-increasing challenging job demands relationship, and 3) the moderating effects of career growth on the increasing of challenging job demands-contextual performance.

Methodology. The study involved a convenience sample from the North-Centre-South of Italy (N= 177), average age = 40,56 (SD = 12,59), 62,7% female, from different occupational sectors. Data were collected with a self-report questionnaire administered at T1 and T2 (six months later).

Results. Challenging job demands (T1) fully mediated the relationship between workload (T1) and contextual performance (T2); furthermore, individual adaptability (T1) moderated the relationship between workload (T1) and challenging job demands (T1), as well as organizational career growth (T2) moderated the relationship between challenging job demands (T1) and contextual performance (T2). Results imply that job crafting, as a mediator variable, can represent an effective approach to promote sustainable development through an improvement of the performance at work maintaining its sustainability over time.

Limitations. The study suffers the common method bias due to self-report method.

Originality/value. The present study is innovative because links workload, job crafting, career growth and performance in a two-waves study, it has not only theoretical implications but also operative and practical spillovers for organizations.
1553 - THE RISE OF THE ‘E-RESISTOR’: TOWARDS A NEW PERSPECTIVE ON WORK-BASED NCT NON-USE

Deepali D'mello (1)

Kingston University, Management, London, United Kingdom (1)

Purpose: The purpose of the review was to highlight how work-based New Communication Technologies (NCT) influences work and well-being outcomes, and whether this might be influencing intentional choices to reduce or balance work-based NCT use at different life stages.

Methodology: A narrative literature review was conducted, using a scoping design to synthesise literature. Inclusion and exclusion criteria were determined. Thematic analysis was used to extract key themes to discuss and evaluate.

Results: The findings highlight that while individuals have generally embraced work-based NCT use, the costs of constant connectivity differentially deplete individuals’ resources, depending, in part, on their life stage. This appears to then, nudge certain groups (e.g. new parents) to potentially resist or reduce work-based NCT use.

Limitations: The review focuses on few micro-level and important factors that may potentially explain why people resist work-based NCT. It does not consider macro-level factors, such as technology interface or societal pressures.

Practical Implications: Understanding the consequences of work-based NCT use at different life stages may potentially support a movement towards a balanced used of work-based NCTs aligned with individuals’ current goals and overall well-being. It can enable leaders to be proactive in empowering their employees to make appropriate choices about work-based NCT use.

Originality: Most research in the field of resistance to NCTs is within the realms of social media and smartphones. This study will offer a unique contribution towards the understudied research area of work-based NCT resistance.
Purpose. To investigate the relationship between parents-children relationship and children’s career development in production organizations. The research was based on the theories that explain the role of childhood relationships in individuals’ career and life: A. Roe’s occupational choice theory, L. Vygotsky’s social development situation concept, J. Teutsch and Ch. Teutsch’s psychogenetic theory, and E. Berne’s concept of basic ego-states.

Design. The investigation was conducted in 2017-2018 on a sample of 108 production organization workers in Kyiv using a structured interview and a specially designed Career and Work Conditions Satisfaction questionnaire.

Results. The respondents’ career satisfaction and the level of burnout were related to their mother-to-child relationship: mother’s autonomy positively correlated with their children's career satisfaction (p≤0.05); mother's dominance negatively affected their children’s career development (p≤0.05) and life and professional space formation (p≤0.05) and positively affected children’s work stability (p≤0.01), which implied low professional self-fulfillment, general career dissatisfaction and emotional exhaustion at work (p ≤ 0.05); inconsistent maternal behavior positively correlated with the respondents' low professional achievements (poor work motivation and disinterest in work, p≤0.01). Father's positiveness negatively correlated with the respondents' attitudes towards entrepreneurship (p≤0.05); father's hostility negatively related to the respondents' professional achievement motivation (p≤0.05); father’s inconsistent behavior negatively affected the respondents’ professional self-realization (p≤0.05).

Limitations. The investigation was limited to the workers of production organizations.

Practical implications. The obtained results can be used in career counseling.

Originality. This was the first study in Ukraine to explore the effects of parents-children relationship on children's career development.
The aim of the study is to explain how young adults select positive and negative role models and perceive their prominent personality characteristics. The cognitive structures (e.g., general/specific, up/down, close/distant) and perceived similarities or differences between modeler’s and model's personalities were investigated.

The study consisted of two sessions with 50 undergraduate students. In the first session, questionnaire about negative role model was applied and followed by semi-structured individual interview. In the second session, same procedure was applied for positive role model.

Data was analyzed by two rater, content analysis, close coding. Cohen's Kappa analysis results showed that interrater level of agreement varies between .87 and .98. The most prominent personality characteristics are conscientiousness and agreeableness for both positive and negative role models. The negative models are attributed a few liked features (specific), hierarchically down and medium, familiar people (close). The positive role models are attributed as a few liked features (specific), hierarchically in the upper position, familiar (close). There is similarity between modelers’ disliked characteristics between negative role models’ characteristics. Modelers preferred positive models who perceived as a similar to their characteristics.

Positive role model is a source of motivation to work. A negative role model is motivator by illustrating an avoided failure. Negative role models are more effective motivator for prevention regulatory focus individual. Positive role models are more effective promotion regulatory focus individual. This research can be guide to develop vocational self-concept in early career stages by using effective type of role models for work motivation.
Purpose:
The purpose of this research was to investigate the impact of transformational leadership on the psychological bonding that individual employees develop with their employing organizations through the perception of positive organizational cultures. The conceptual framework of positive organizational cultures relies on a functional approach to culture and climate, and identifies goal, innovation, and support culture orientations as central thematic dimensions of the organizational culture concept.

Design/methodology:
The hypothesized effects were tested in three separate studies implementing measurement of mediation and experimental-causal-chain research designs.

Findings:
In the measurement of mediation research design transformational leadership was found to lead subordinates to perceive the culture of their employing organization as goal oriented, while innovation and support culture orientations had also positive effects on goal orientation. In turn, a goal culture orientation was found to be related to higher levels of organizational identification. In the two experimental studies a transformational leadership style led participants to perceive the culture as more supportive, innovative, and goal-oriented compared to transactional leadership, and support, innovation, and goal culture orientation led to high levels of organizational identification.

Implications:
The findings show that transformational leaders are in a position to cultivate the identification of their followers with the employing organization by influencing employee perceptions regarding the content of organizational culture, and more specifically the promotion of support, innovation, and goal culture orientations.

Originality/Value:
The originality of this research concerns the studying of organizational identification in a culture framework at the individual-level of analysis demonstrating that employee perceptions of their organization’s culture have an effect on the strength of the bonding between members and organizations.
LEADERS IN THE ARTS - SIMILAR OR DIFFERENT?

Christian Winther Farstad

Norwegian Business School, Department of Communication and Culture, Oslo, Norway

3. Purpose
Previous studies from the sector of artistry (such as actors, musicians, dancers) have found members to score different – or even opposite to typical leadership traits. This might restrict leadership emergence as a natural process in this sector. Differences might also provoke assumptions that leadership in the arts are different from other sectors. If so, individual characteristics should be different in leaders in this sector compared with others.

4. Design
In total approx. 150 artistic school leaders (previously artistic performers), 100, commercial leaders and 70 employees (without leadership positions) answered a five factor questionnaire, a scale of trait emotional intelligence as well as a scale for motivation to lead.

5. Results
The data is yet to be analyzed. The general assumption is that leadership as a construct perform similar in the sector of arts compared with others. Thereby, the construct of leadership performs more similar the different on the individual level in this sector.

6. Limitations
The “same time – same source” discussion challenge the design. Still, it is argued that personality is determined before the test was given. The two measures of personality (five factor model and trait emotional intelligence) were even given at different time (1 day interval). The main interest is the external between-group differences – not the internal in-between-group differences.

7. Practical Implications
If the groups of leader are similar in their characteristics, the argument imply how the sector of artistry should approach leadership in terms of structure, selection, and most important in development.

8. Originality
The sector of artistry lack research on individual differences and leadership. Based on traditional views on leadership, this study present unique thoughts for how leadership emerge in this sector. Based on the construct of motivation to lead the study present value to the field of leadership emergence.
Purpose

“Money does not make you happy”, except that research shows that it actually does. But correlations are low and heterogeneous. Our study aims to shed light on the conditions that attune the relation between salary and career satisfaction by investigating the moderating effect of work-nonwork conflict and enrichment in combination with high and low nonwork orientations. Additionally, we investigated if gender differences occur.

Design/Methodology

We conducted a longitudinal study among N = 534 employees, with three measurement time points, six months apart.

Results

Overall work-nonwork conflict weakens the relation between salary and career satisfaction, when nonwork orientations are low. When nonwork orientations and interference are high, the relationship between salary and job satisfaction into a negative relationship. Especially women suffer from work-nonwork conflict, when nonwork orientations are high. Conversely, men profit from work-nonwork enhancement and nonwork orientations when one of each is strong but not when both are perceived as high.

Limitations

All data are self-report and the age range is restricted to a young sample.

Research/Practical Implications

The relation of money and happiness is complex and more moderators should be evaluated. Besides rewarding employees with money, organizations could include opportunities to experience a positive work-nonwork interface and thus boost the positive relation of salary with satisfaction.

Originality/Value

We explored one condition under which money can make people satisfied with their careers. The focus on the work-nonwork interactions combines traditionally used aspects of success (salary and satisfaction) with a more whole-life perspective on career success.
The present study proposes to investigate the role of Psychological Contract Fulfillment (PCF) as a predictor of Flow and the mediating role of Job Satisfaction (JS). We are hypothesizing not only a direct link between PCF and Flow, but also that given the fact that JS represents an emotional evaluation (Macey & Schneider, 2008) and Flow presents a motivational component (Bakker, 2008), a mediation effect of JS.

A homogeneous sample of 1549 employees from a French company took part to the study. PCF items were derived from existing scales, EFA and CFA confirmed an unifactorial structure. Flow was assessed with the WOLF scale (Bakker, 2008), and JS with a visual analogue scale; sociodemographic variables served as controls.

SEM analysis confirmed the mediating effect of JS between PCF and Flow. Our results are in line with COR theory positioning PCF as a positive stock of resources, and furthermore highlighting a possible position as Job Resource of PCF in context of the JD-R model.

The present research carries one main limitation, the measure of PCF although reliable (α = .937) and validated via CFA does not use the typical response scales used in PCF measurement.

Results are in line with previous research, but also put through the hypothesis that Flow as measured by the WOLF scale (Bakker, 2008) and Work Engagement (WE) as measured by the UWES (Schaufeli, Bakker, & Salanova, 2006) are very close concepts.

If the studies on the links between PCF, JS and commitment are numerous, little information is found in the literature on the links between PC, JS and the ability of reaching states of Flow.

Purpose

The purpose of this study is to assess the link between authenticity and subjective wellbeing within the rarely explored context of faith-driven organizations.

Design

The study uses a quantitative design. Self-reported data were collected. Specifically, this study links authenticity with subjective wellbeing among the distinct groups that shape a large international Catholic organization (the total sample is 1942 employees). This study uses Partial Least Squares (PLS) to test our research model.

Results

Model 1 describes the significant direct effect (path coefficient: 0.582***; t-value: 20.106) of authenticity on subjective wellbeing for the entire sample (religious members, lay managers, and lay employees). Subsequently, in Model 2, we explore how each of the three dimensions of authenticity (external influence acceptance, authentic life and self-alienation) impact subjective wellbeing, and we assess these effects for the total sample – Model 2A – and for the three different subsamples that compose each of the categorized groups: Models 2B (religious members), 2C (lay employees), and 2D (lay managers). There are substantial differences with regard to the sign and significance of the three direct links represented within Models 2A–D.

Limitations

The study is based on self-reports and the cross-sectional study design limits the possibility of making causal inferences

Research/Practical Implications

From a practical point of view, the results of this study could serve to identify those members within religious organizations who exhibit poor levels of authenticity, in which case preventive policies should be designed to increase individual wellbeing, both in its hedonic and eudemonic forms.
CORRELATES AND PREDICTORS OF TIME BANDITRY

The objective of this study was to improve our understanding of time banditry (TB) behaviors and its work, organization, and health related correlates and predictors of young Estonian employees. Online survey was used for data collection; participants were recruited via social media (n=105, average age 26 years). Results revealed that respondents engaged significantly more in technological TB (checking non-work-related e-mail and/or any kind of messages at work, spending time on the Internet for reasons not related to work) compared to other TB dimensions. Employee health indicators (level of stress, burnout and general health) and satisfaction with immediate supervisor were negatively related to classic TB behaviors but not to other two TB dimensions. Main predictors of technological TB are slower work pace, lower organizational commitment and worktime flexibility. The latter together with slower work pace are the most important factors predicting social TB (talking to co-workers about their families or life during work hours, taking long coffee/smoke breaks). Classic TB (putting less effort into my work than I know I can; if I do not feel like going to work, I would call in sick) is most strongly predicted by feeling that one’s job is not very important or meaningful, lower job satisfaction and worktime flexibility. Due to sample limitations results of this study can be considered preliminary. However, our findings affirm that technological TB is number one way of stealing worktime in organizations among younger employees, and engaging in classic TB behaviors has different reasons compared to technological and social TB.
Purpose

Given the demanding nature of project work, and the increased phenomenon of projectification in public and private organizations as a mean to implement their strategic objectives, the purpose of this paper is twofold: first, to explore how this new work environment impacts the perception of justice of the main stakeholders (project managers, project team members) and second, to examine how it relates to individual outcomes, both positive and negative, project outcomes and organizational outcomes. Since there is a dearth of knowledge in project studies surrounding systemic justice, this paper propose an integrative view of the main determinants leading to perception of justice and its underlying effects on multiple outcomes.

Design/methodology/approach

Using a systematic review approach, the paper considers organizational studies and human resource management studies published in high ranked journals and then narrow with manual searches in project management journals. It identifies main determinants and links between systemic justice and its effects in project context and proposes a conceptual model as a foundation to investigate its links within project management in public funded initiatives.

Findings

This paper contributes to an effort of knowledge systematization in the context of project based organization. It tends to show that processes underlying the establishment has been understudied, as the majority of studies has looked on organizational justice and its effects on traditional project outcomes in terms of time, budget, and schedule.

Practical implications

Many individual outcomes, such as organizational citizenship behaviors, work satisfaction, psychological well-being, knowledge sharing behaviors, can be enhanced through a systemic justice climate. This can help improve human resources policies and
practices in their efforts to increase capacities and performance of their project workforce.

Originality/value

This paper improves our understanding of project managers and project team members workplace context mobilizing organizational justice research. It extends our understanding of how and why organizational climate and human resource function should be aligned and adapted to work conditions under project management specific constraints.
**Purpose:** Industry 4.0, the current trend of automation, data exchange in manufacturing technologies and modernising of production processes has been given a lot of attention in both media and the research field of technology management. However, the organizational implications followed by Industry 4.0 should be investigated further. Manufacturers emphasize a modernizing of production processes, accelerating automation and consequent increase the complexity of tasks, though not accompanied by the necessary support for the human operator. Today, human operators are required to demonstrate good adaptive capabilities and be highly flexible in a demanding working environment. To be a smart operator and fulfill the potential for increased value creations in Industry 4.0, usefulness of information, tools and coordination is needed. The purpose of this study is to investigate if workers on the floor level find the information and communication technology (ICT) given useful and available in comparison with their managers.

**Design:** A survey were conducted in ten Norwegian manufacturing companies covering all organizational levels and roles (N=1183).

**Results:** Preliminary results indicate several mean differences in access to technological tools, perceived usefulness of information, and coordination among workers and management.

**Limitations:** Generalizability of the results.

**Practical Implications:** Findings indicate that ICT systems and Industry 4.0 are designed by and for management.

**Originality/Value:** The revolution of Industry 4.0 should in the future ensure more involvement of workers. If the ICT systems are not implemented at the floor level it can result in inefficiency and non-optimal use of workers’ capabilities and potential.
Purpose: Ideal point measures of personality (i.e., include moderately-worded items) have gained attention from researchers and practitioners due to their potential to more accurately assess personality relative to traditional dominance measures (i.e., containing only extreme-worded items). However, no research has investigated applicants’ reactions to this new measure type. The present study examines test-taker reactions (perceived accuracy, perceived difficulty, and affective reaction) to ideal point compared to dominance measures.

Methodology: In an experimental design, we manipulated two factors: Measure Type (Dominance vs. Ideal Point); and the Instruction Set (Respond Honestly vs. Respond Like an Applicant). We evaluated a parallel moderated mediation model in which perceived accuracy and difficulty mediated the relationship between measure type and affective reaction, with instruction set moderating the relationship between measure type and the mediators.

Results: Results support a moderated mediation model. Ideal point test-takers perceived greater difficulty and lower accuracy relative to dominance test-takers but only in the applicant condition. Participants in the applicant/ideal-point condition who perceived lower accuracy and greater difficulty reported less favorable affective reactions.

Limitations: The current study used simulated rather than real job application conditions, which may have exacerbated faking effects. Moreover, the current design cannot disentangle causal effects, and other explanations for the present findings may exist.

Implications and Value: Findings suggest test-takers are likely to respond less favorably to ideal point measures of personality relative to dominance measures. However, they also point to potential opportunities for improving reactions, such as providing explanations that mitigate effects on perceived accuracy and difficulty.
**Purpose:** Virtual work is an increasingly popular phenomenon, but little is known about mechanisms by which virtual work affects psychological outcomes. To this end, this study draws on the theory of purposeful work behavior (Barrick, Mount, & Li, 2013) by investigating (a) job characteristics as mediators of the relationship between virtual work and psychological outcomes, and (b) how values moderate the relationship between job characteristics and psychological outcomes.

**Methodology:** Data were collected as part of the International Social Survey Programme (ISSP) Work Orientation module (N = 902). We evaluated two parallel mediation models in which job characteristics mediated the relationship between virtual work frequency and psychological outcomes (stress at work and job satisfaction). We then estimated moderated mediation models in which values moderated the effect of job characteristics on psychological outcomes.

**Results:** Job characteristics partially mediated the relationship between virtual work and stress and fully mediated the relationship between virtual work and satisfaction. Thus, results suggest virtual work influences some psychological outcomes via related job characteristics. However, there was little to no evidence of moderated mediation.

**Limitations:** The ISSP operationalizes values as the extent to which individuals value specific job characteristics. An alternative operationalization of values may show stronger effects. We will present results that also consider the moderating influence of cultural values (e.g., Project Globe indices) in a multinational sample.

**Implications and Value:** Results may help inform a framework for how virtual work affects psychological outcomes (i.e., via job characteristics) and how to build interventions.
Purpose
The main purpose of the “FCA Learning CITY” is to test the possibility to change the approach to training, from compulsory training programs to voluntary self-directed learning.

Design/Methodology/Approach/Intervention
In October 2017, we launched a digital learning platform called “FCA Learning City” with the “Sustainability Boulevard” as the pilot environment. Sustainability is a fundamental value of the culture of the company, it is relevant across countries and professional families, and the platform itself is sustainability oriented: it focuses on real business needs, personal interest with no waste of time and resources.

It is an interactive interface, accessible 24/7, where you can play to test your knowledge. If you complete the learning game successfully, you become a “Member” of the Boulevard. If you lose, you get instructions on where to find learning resources (games, videos, documents, mini-courses), to fill in your knowledge gap.

This learning model lies on the “learning agility” concept: when knowledge rapidly becomes obsolete, rather than teaching new skills, we need to foster the ability to learn from experience, apply learning to new situations, strengthen personal accountability, develop meta-competencies, and exploit social networks.

Results
The Boulevard was made accessible to around 50,000 employees in 12 languages. In 2 months more than 10,000 users had access, 1,000 became members.

We are now analyzing the data to look for patterns in learning behaviors, and possible correlation between game results and other individual assessments (e.g. performance and leadership evaluation).

Limitations
Data are limited to FCA employees, predominantly Italians and Brazilians.

Attendance is high (20% vs. 10% expected), but the program novelty could be a bias.

Data analysis is at an early stage.

Research/Practical Implications
The company considered this project worth scaling-up. After Sustainability, the Leadership Boulevard was launched in February 2018 and the Intercultural and Languages Boulevard followed in May 2018. Further programs are planned for 2019.
Originality/Value
Both the literature and the practice on digital learning environments and learning agility seem to be at an early stage, yet promising.
Introduction: Technological and economic developments have a significant impact on the workplace, and notably on the fit between the workplace and the individual. Research has shown that there is a huge misfit between people and work resulting in the exclusion of particular vulnerable groups (i.e., handicapped persons, low-skilled youngsters, older workers) challenging the notion of the “inclusive” society. In this paper we use the “strength-based” approach, High Performance Work Systems (HPWS) literature, and Sen’s Capability approach to formulate hypotheses about the impact of HR interventions and social innovations that may facilitate the person-work needs or abilities fit. We claim that a shift is needed from a work oriented perspective towards a people-centred perspective in which redesign of the job or workplace is needed to improve the person-work fit.

Purpose: The aim of this project is to examine results from earlier empirical survey research as well as earlier intervention applied research focusing on improving person-work fit.

Method: A systematic review will be conducted in medical, psychological, and management databases. Additionally, a focus group will be organized both with researchers and practitioners.

Findings and research implications*: The results will be used to address directions for future research.

Originality of the paper: To date, work-design theories have mainly adopted a work-centred perspective. This study turns the paradigm into a more people-centred view on (re)designing jobs, thereby allowing a better fit between the talents of the person and the job. Ultimately, this contributes to the participation of vulnerable groups on the labour market, and a higher level of (sustainable) employability, performance and well-being of employees.

Key words: Person-job fit, job (re)design, capability approach, strength-based approach, job crafting, job carving, HPWS

*NOTE: The study started as of September 1st 2018 and will be finished early next year, so that the full paper will be available at the EAWOP.

SAFETY CULTURE AT WORK: A STUDY ON ANCHORAGE POINTS IN ORGANIZATIONAL CULTURE IN A HIGH-COMPLEX HOSPITAL

Magda Macedo Madalozzo, Silvana Regina Ampessan Marcon

Universidade de Caxias do Sul, Psicologia, CAXIAS DO SUL, Brasil

The main objective of this research will be to identify anchoring points of the organizational culture for the strengthening of safety culture in the workplace in a hospital of high complexity. With a quantitative and qualitative character, the research will be developed through the application of an instrument called “Continuum of factors and sub-factors-core of safety culture at work” developed by Madalozzo and Zanelli (2016), observations in the organizational context and of semi-structured interviews. It will theoretically be based on the organizational culture analysis model proposed by Schein (1984, 2004, 2009) and also on the safety culture core factors and subfactors identified in Pidgeon and O’Leary (2000) and Frazier, Ludwig and Whitaker & Roberts (2013). It is considered that the study will provide insights to understand how the assumptions of the organizational culture can facilitate or hinder the occurrence of safe behaviors on the part of the organization's workers. It is understood that the research will make it possible to expand knowledge regarding the perception of risks in hospital contexts, from the incentive to recognize psychological factors that cover processes of incubation of errors, such as normalization of deviations and risk deniability, directly linked to values, beliefs and assumptions shared collectively. The results of this study may help to increase workers’ awareness of the influence of subjective factors, such as heuristics or shortcuts in risk perception processes, which may contribute to increase individual and organizational vulnerability to accidents and illness. It is understood that the research will make it possible to know more in detail the interfaces between worker safety phenomena and culture in a hospital of high complexity, in order to derive accident prevention and illness actions in health contexts. Strengthening care behaviors and prevention of illness and accidents tends to significantly reduce expenses with illness and disability. It is well known that public spending on diseases and aid amounts to billions of reais. Thus, studies that contribute to the development of public health policies focused on disease prevention become relevant. The expansion of knowledge about the psychosocial processes constituted by assumptions, beliefs and values, referring to health and safety practices at work, and consequent preventive interventions, should contribute to the strengthening of productive and healthier organizations.

Keywords: organizational culture, safety culture at work, values, beliefs and assumptions, risk denial, safety culture core factors.
Purpose
Policing involves stressful and potentially life-threatening work. Potential sources of strain are often divided into operational and organisational demands (Berg et al., 2005; Shane, 2010). Whereas the former (job-specific conditions) may include traumatic events and threats to physical and mental health, shift work, and overtime, the latter (organisation) affects all organisational members regardless of work tasks (police officer, civilian, police lawyer). This research project focuses on specific differences in working conditions that are of importance for mental and musculoskeletal health (MH), work engagement (WE), and mastery of work (MW) in the Norwegian Police Service (NPS).

Design
The present project includes all employees in NPS in a prospective cross-sectional questionnaire design and aims at 1) investigating operative and organisational job demands and organisational and individual resources among different groups, 2) investigating MH, WE, and MW across groups, and 3) examining how demands and resources are associated with MH, WE and MW.

Results
The theoretical framework of the job demand-resource model (JD-R-model) will be applied to explain the results. The results place focus on the specific working conditions in NPS that need to be improved and may be of significance to other agencies.

Limitations
Despite the results having implications for related operative professions, the results from the study may not apply to all organisations.

Originality
The role of the NPS is vital in society, and increasing knowledge of how working conditions may influence actual on-the-job practice is important. The study applies, the JD-R-model, which expands previous research (see e.g., Bakker, Demerouti & Sanz-Vergel, 2014).
Purpose: The purpose of this study is to investigate the dynamic interplay of moral capital, overstraining goals and unethical behavior within organizational social systems that can lead to ethical breakdowns in organizations. Thereby, this dynamic process will be unfolded both theoretically as empirically.

Design/methodology: I will apply an empirical agent-based model to explore tipping points and potential shocks leading to a wave of unethical behavior in the goal setting process in organizations. Agent-based simulations capture the heterogeneity of employees and their interactions within an organizational context. This helps to reveal and analyze the complex mechanisms of human behavior processes.

Results: Presenting first results from organizational agent-based simulations situated in an innovative theoretical approach.

Limitations: The empirical calibration of the agent-based model is not fully implemented.

Research/Practical Implications: Identification of conditions in the goal setting process causing ethical breakdowns in organizations.

Originality/Value: The contribution to the field of goal setting and unethical behavior consists of developing a theoretical model that regards a dynamic social process of overstraining goals and unethical behavior and its embeddedness into the organizational context of moral capital. In addition, the application of agent-based modeling serves as a computer-aided development of theories of human behavior in this realm.

Disclosure of Interest: None Declared

Keywords: Goal Setting, Unethical Behavior, Behavioral Ethics, Morality, Agent-Based Modeling
Genius loci – real and virtual environments for productive emotions in decision making
Ulrike Starker & Rüdiger von der Weth

Purpose: The term “Genius loci” describes the influence of a certain place or environment on decisions, negotiations and other political events. Additionally esoteric and religious theories postulate places, where special spiritual forces change human emotion and behaviour. The contribution proposes a scientific model of the interaction between the characteristics of the location, the kind of event and the emotional and cognitive state of mind of the participating people. It combines elements of environmental and architectural psychology, semiotics and our own model about the role of emotion in complex problem solving. Methodology: We assume the existence of explicit knowledge about the interaction between these aspects in the experience of professionals creating or managing real or virtual environments. The sample consists out of movie directors, computer game designers, managers of music events, priests and organizers of political ceremonies and negotiations. We conduct a retrospective analysis of existing interviews and professional guidelines for the design of events and related places. Results: The initial model of the authors is improved by the explicit knowledge of the experts, coming from their empirical experience in designing affordances of locations for their specific purposes. Limitations: This research is a starting point generating hypotheses for further research on this topic. Research/Practical implications/Value: The empirical evidence of theories and ideas about emotional and motivational effects of locations can be tested in further research. There are practical implications for the design of work environments. The results can be useful for designing critical events in change management and organization development.
Purpose

Research suggests university students, who must balance the demands of their personal life, studies, and often part-time work, experience symptoms of ill-being similar to what employees experience in the workplace. In their first year at university, in particular, students face multiple new stressors. Using the Demands-Resources Model of burnout, we examined fluctuations in perceived stressors, resources, and well-being in first year undergraduate students.

Methodology

As part of a larger study, we used online surveys to collect data at four points in time over one year from first year undergraduate students in a Canadian university. We used or adapted previously validated scales to capture study variables and analysed the data using latent growth curve modeling.

Results

Preliminary results suggest important stressors such as perceived role overload and work-life-school conflict decreased. Symptoms of ill-being such as emotional exhaustion and negative emotions also decreased. However, students with higher initial scores on stressors experienced less decline in ill-being. Some resources such as perceptions of social support decreased over time.

Limitations

Despite the study design, we cannot make firm causal claims.

Implications

Results suggest stressors in particular, including role overload and work-life-school conflict may be important drivers of student well-being, and levels of perceived stressors early on may have implications for fluctuations of well-being. Findings have implications for higher education institutions.

Originality/Value

This study is one of the first to adopt a dynamic perspective and thus provide a clearer picture of the evolution of well-being over the first year at university.
Purpose. Although some individuals with disabilities have normal intellectual abilities and high skill levels in specific areas, the unemployment rate of this population is alarming. This research aimed to create a form for the presentation of candidates with disabilities to match their needs and profile sought by recruiters. The form was articulated into: a) the description of personal and job-related skills, main personality traits, behavioural characteristics, reasonable workplace accommodations and supports; b) the assessment of candidate’s linguistic, mental and personal skills.

Methodology. 62 recruiters evaluated the form comparing it with a traditional CV. Employees’ perspective on barriers to employment of people with disabilities were analysed. Interviews were conducted to investigate more in-depth recruiters’ attitudes toward employment of people with disabilities and their perspectives on the presence of obstacles to their employment.

Results. The global format evaluation was positive. Results revealed that the main obstacle to work inclusion of people with disabilities was lack of knowledge and information.

Limitations. Although this study used both quantitative and qualitative data, the sample dimension was limited, and the design was cross-sectional.

Practical implications. Since this form provides a detailed skill profile of candidates suggesting possible practical solutions to overcome potential problems, it could be an effective tool to facilitate recruitment and work inclusion of people with disabilities.

Value. To date, this is one of the few studies to examine disabled people’ work inclusion by using both quantitative and qualitative data in order to provide a practical tool for the presentation of candidates with disabilities.

Keywords: people with disabilities; work inclusion; schedule for the presentation of candidates; well-being; recruitment
EXPLORING ORGANIZATIONAL AND SOCIAL SAFETY CLIMATE AMONG FIRST LINE MANAGERS IN MUNICIPAL ELDERLY AND DISABLE CARE IN SWEDEN

Cecilia Cervin

Malmö university, Urban studies, Malmö, Sweden

Purpose. The overall purpose of the upcoming study is to investigate the organizational and social safety climate for the first line managers in municipal elderly and disabled care in Sweden. The overall purpose is divided into four specific purposes. The first purpose investigates the first line managers experience of the organizational and social work environment, the second purpose - how the first line managers perceive risks and safety within their work environment, the third purpose – how the first line managers handle competing demands within the organization and finally what significance gender has towards the work environment and safety climate.

Method. The study will be conducted by qualitative and quantitative methods. The Job Demand Resources model will be used in the study for analyzing the first line managers work environment.

Results. A pilot study is conducted. Results from the pilot study will emerge winter 2018 and will be a foundation for further development of the study.

Limitations. The survey is conducted in a Swedish context.

Research/Practical implications. The results from the overall study can contribute with knowledge for how the organizational and social work environmental risks can be prevented or minimized.

Originality/value. Previous research upon occupational health among first line managers is limited. Current research indicates high turnover among the first line managers in municipal human service organizations, high retirement and difficulty of recruiting the younger generation to the profession. These difficulties plus high pressure and stress within the occupation will affect the public sector in Sweden in a near future.

Keywords: first line managers, organizational and social safety climate, work environment, elderly/disable care, risks, gender.
Artificial intelligence, especially deep learning, is making incredible strides and impacting many industries. Yet, its influence is only starting to be realized in the field of selection and assessment. We have channeled some of the latest advancements in artificial intelligence and implemented them within the field of high stakes assessment, specifically to score the text of open ended questions. We will showcase real scores, developed completely by an AI, used to assess open ended text content. Furthermore, we will outline how we developed this technology and integrated it with measurement sciences for legal defensibility and human interpretability. Lastly, we will discuss where this technology is headed in the short term and how it is poised to revolutionize employee assessment and measurement.
Abstract

Often working in unstable, dangerous context and witness to human suffering as well as atrocities, it is well known that the humanitarian workers work in difficult situations and are exposed to several stressors. This context is not without consequence on their mental health. The actual context of migratory crisis requires qualified and long-term committed workers. It is urgent to decrease the mental illness engendered by their work and increasing retention and re-engagement for future missions. What is the state of art on this subject? What kind of research and interventions programs can be developed to decrease the mental impacts of working in traumatic situations?

This study, conducted with an exhaustive literature review methodology, presents the state of art about Humanitarian workers' mental health (2010-2018). From this analysis, we will present: classification of core topics related to the research area of humanitarian workers’ mental health; up-to-date prevalences; methodology and most used psychometric tools. Also, new avenues of research and interventions concerning the post-intervention follow-up will be presented to guide the development of mental health support program for humanitarian workers back from a mission. These avenues aim to decrease mental impacts of working in traumatic situations, increase retention and re-engagement for future missions. These elements will be articulated around the precise concerns bound to the mental health in emergency and trauma for work disability prevention.
Purpose

Although several studies have concluded that work characteristics are important predictors of job satisfaction (i.e. Hsu & Liao, 2016), there is a lack of research on the role of age in this relationship. We study how work characteristics affect job satisfaction comparing three generations of workers. This study answers two research questions: Are there differences in job satisfaction between different age groups? Do the same work characteristics predict job satisfaction across age groups?

Design

593 employees from 42 Spanish companies participated in the study from three age groups (G1 < 35 years old, 27%; G2 between 35-50 years old, 62%; G3 >50 years old, 11 %). A self-administered questionnaire included measures on work characteristics (Bayona et al., 2015), general job satisfaction (Kunin, 1995), Job satisfaction facets (Pérez & Fidalgo, 1995), and socio-demographic data.

Results

One-way ANOVA analyses showed that G1 presented the highest levels of general job satisfaction. Multiple regression analyses showed that work characteristics predict general job satisfaction in all age groups. Specifically, feedback from the job (G1, G2 and G3); autonomy and work conditions (G1 and G2); skill variety (G2); social support (G3).

Limitations

Number of participants for each age group are unequal. Most companies belong to the service sector.

Practical implications

We encourage organizations to design or re-design jobs considering the relationship among work characteristics, job satisfaction, and age of employees.

Originality

We contribute to understanding generational differences and similarities in the workplace. We discuss common and different sources of job satisfaction among age groups.
Abstract

It is suggested that the ‘schema theory’ approach, to view occupational newcomers’ anticipatory psychological contract in the pre-socialisation phase of employment, might promote scholars understanding of the psychological contract development process. This knowledge could empower employers to effectively manage these employees. However, research regarding the anticipatory psychological contract is quite rare with no existing questionnaire for assessing the anticipatory psychological contract of occupational newcomers or theoretical model to understand first-time employees’ entitlements, anticipatory expectations and obligations. Therefore, we aimed at developing and validating an instrument to measure the anticipatory psychological contract of labour market entrees and use this data to develop and assess the theoretical model of the mental schema of prospective employees through a structural equation model (SEM). The developed anticipatory psychological contract questionnaire (APCQ) was used to gather data from 316 final-year students. Results indicated that the APCQ is reliable and valid to measure the anticipatory psychological contract of graduates. The descriptive statistics and correlation coefficient results clearly enhanced our understanding of how the anticipatory psychological contract works. The results further supported an excellent fit in the proposed model of the anticipatory psychological contract. This model indicated that entitlement is central to the anticipatory psychological contract, and that the norm of reciprocity was already present in the anticipatory psychological contract.
Purpose: The present study investigates the gain spiral hypothesis of interpersonal justice and trust in services for individuals with intellectual disability. The analysis focuses the attention on how professionals perceive the treatment they receive from family members.

Methodology: In a longitudinal spiral analysis over three time points, we examined the link from professionals’ perceptions of interpersonal justice (T1) to their trust in family members (T2), and the link between professionals’ trust in family members to professionals’ perceptions of interpersonal justice (T3). We used data from about 51 centers (N = 198). In each center, a group of professionals participated.

Results: The results revealed significant positive links from professionals’ perceived interpersonal justice treatments by family members (in T1) to their trust in family members (in T2) ($\alpha = .36, p< .01$). Perceived high levels of trust in T2 was positively linked to professionals’ perceived interpersonal justice treatment by family members in T3 ($\beta = .23, p< .01$). Further, employees’ interpersonal justice perceptions in T1 were positively related with employees’ interpersonal justice perceptions in T3 ($\tau = .60, p< .01$).

Limitations: Data were collected from the same source, so the relationships might have been inflated.

Implications: The study reinforces the importance of just social exchange relationship between professionals and family members. Their relationship goes beyond a mere exchange of services and integrates strong personal bonds between those two parties to pursue the common goal to better the life of people with intellectual disability.

Originality/Value: The dynamic spiral approach taken adds value to the field of organizational justice.

Alice Maniezki (1) - Vicente Martínez-Tur (1) - Yolanda Estreder (1) - Carolina Moliner (1) - Esther Gracia (1) - José Ramos (1)

IDOCAL, University of Valencia, Social Psychology, Valencia, Spain (1)
Purpose: We implemented a servant leadership\(^7\) development program within a healthcare system over five years, using the principles of action learning\(^8\). To our knowledge there is no research that has looked at this method for development of servant leadership capacity.

Intervention: Each organizational leader spent up to seven days over the course of a year learning about and reflecting on their own servant leadership capabilities, with three annual follow-up sessions designed to continue leader growth.

Results: The organizational culture changed significantly over the course of the program, as leaders learned to focus on serving others. Subordinate reports indicate that many leaders became markedly more effective servant leaders.

Limitations: Due to the length of this program, it is difficult to disentangle the effects of the leadership development program from the effects of other influences.

Research/Practical Implications: This organization had attempted to improve leadership capacity many times, with no lasting effect. The use of action learning made the difference, resulting in enduring improvements in individual leadership approaches, organizational culture, and organizational outcomes.

Originality/Value: While hinted at in the literature\(^9\), to our knowledge there has not been any research conducted on the applicability of action learning to servant leadership development. It took significant commitment by the organization to both servant leadership as a framework and to the action learning process itself.

---

To date, research failed to accurately conceptualize organizational resilience and empirically establish the influence of structural empowerment on resilience. This paper addresses this gap, by describing the results of an in-depth case study of a Dutch home care organization implementing a specific form of structural empowerment called Circular Management (CM). To this end, interview, observational and documental data has been collected and analyzed. Besides the structural means by which management empowers employees, we gained insights into the level of commitment employees experienced towards the organization, as well as certain dimensions of citizenship behavior and indications of the level of psychological empowerment of employees. This study has both practical and societal relevance as it enhances our understanding of how organizations can become more resilient by empowering their employees and therefore directly contributes to the scholarly literature on organizational resilience.
**Purpose**: Despite the importance of organizational identification for work-related attitudes, little research has examined the mechanisms that may link these constructs. The purpose of this contribution is to provide an understanding of how organizational identification relates to work engagement and to measure how social support influences this relationship in a longitudinal way. Particularly, we examined whether social support (both from the supervisor and from colleagues) moderates the relationship between organizational identification and work engagement.

**Design/Methodology**: A longitudinal quantitative design consisting of two waves (time lag: three months) was adopted, and it provided data of N=126 employees. Hypotheses was tested by means of moderation analyses, by using Hayes PROCESS add-on for SPSS.

**Results**: Supporting our hypothesis, social support moderates the relationship between organizational identification and work engagement after three months.

**Limitations**: The sample was not particularly large and the study was entirely based on self-report data. Moreover, future research should study the impact of multiple foci of identification.

**Research/Practical Implications**: The results imply that organizational identification could lead to a greater work engagement. Social support serves as an important buffer at the workplace for employees, because it can improve this relationship.

**Originality/Value**: By supporting previous studies that used cross-sectional data, this study offers new insights into the mechanism that link organizational identification to work engagement.
WHAT ARE THE FACTORS WHICH INCREASE EMPLOYEE PARTICIPATION AND CONTINUATION ON A CORPORATE WELLNESS PROGRAMME?

Amanda Roe (1) - Sarah-Jane Cullinane (1) - Amanda Nolan (1)

Trinity College Dublin, School of Business, Dublin, Ireland (1)

Purpose: This study aimed to better understand employee participation in corporate wellness programmes by analysing the internal and external factors which act as barriers to participate and explore design elements, and company efforts, to encourage participation. In addition, this study seeks to examine how the organisational environment can impact employee’s likelihood to participate in a wellness programme.

Design/Methodology/Approach: A number of internal and external barriers exist which discourage employees from participating in a wellness programme at work. From the perspective of the learning-theory principle, barriers can be seen as an adverse event prior to engaging. The link between the design elements and marketing of wellness programmes and employee participation was also considered. Finally, the role of organisational culture in promoting employee participation was addressed. Having perceived support from supervisors can encourage participation. Employing interview method, data was collected from 7 providers of wellness programmes for staff within the University context. The roles of the individuals included health promotion office, HR co-ordinator of wellness policies, physiotherapist mindfulness instructor, sports participation officer, learning and development and head of sports department. This data was categorised through the research questions and the emerging themes were analysed using the software called Nvivo 12 plus.

Results: The results indicate that internal barriers and external barriers exist, and both of these barriers can be overcome. The internal barriers are the concerns of the employees about the objectives of the programme, and the apprehension of attending the programme. Employee’s find it difficult to incorporate time to attend wellness programmes (external barrier). Employee involvement in the development of the programme is crucial to encourage participation, which in turn helps to market the programme. However, if there is a lack of management support, and the culture is primarily work driven, then employees will not feel they have the support and will not participate in the programmes.

Research limitations/ implications: The present study is limited in terms of sample size and single industry. Future research needs to examine the perspectives of employees and other elements of the wellness programmes.

Practical implications: Organisations been able to effectively adopt and implement these recommendations to reduce barriers to entry, can enhance the wellbeing of their employees and organisational performance.

Originality / Value: This is one of the few studies to analyse employee participation in wellness programmes and assess the factors which act as barriers to entry.
This study aims to compare the burnout diagnosis between clinical judgement collected by physicians during their consultations and t-scores (low, medium, high) of patients’ burnout derived from the self-reported Oldenburg Burnout Inventory (OLBI). Based on literature and focus group, we developed a screening tool to measure the clinical judgement of burnout. During 3 months, 43 physicians completed this screening tool for each patient experiencing work-related suffering. The same patients completed the OLBI. We were able to match 127 clinical judgements (burnout or not) with the OLBI (low, medium or high scores). These 127 cases were divided into 5 groups (medium OLBI - burnout diagnosis; high OLBI-burnout diagnosis; low OLBI - not burnout diagnosis; medium OLBI - not burnout diagnosis; high OLBI - not burnout diagnosis). Afterwards, we contrasted the characteristics reported in the different groups. The results show that two groups (low OLBI – not burnout diagnosis; medium OLBI – not burnout diagnosis) manifest in average less symptoms, less job demands and more job resources. Besides, two groups (high OLBI – burnout diagnosis; high OLBI – not burnout diagnosis) report in average more symptoms, more demands and fewer resources at work. The last group (medium OLBI – burnout diagnosis) obtain intermediary results. We identify some limits such as the small sample size and the exploratory characteristic of the study. This research highlights the ‘added-value’ for combined diagnosis tools, which can help health professionals in a more accurate diagnosis. This study is the first, in our knowledge, to compare burnout diagnosis between clinical judgement by physician and patient’s responses.
Purpose: Research on work performance and well-being has focused more extensively on workplace factors than on individual difference factors. This study examined the relative contribution of attachment styles to coworkers and perceptions of transformational leadership on work performance and emotional exhaustion.

Methodology: A survey was conducted (n = 613) to examine how employee attachment style towards colleagues and perceptions of manager transformational leadership relate to self-reported performance and emotional exhaustion at work via the satisfaction of basic psychological needs for autonomy, competence, and relatedness. Analyses were done through structural equation modeling.

Results: Anxious attachment was directly (and indirectly through need satisfaction) negatively related to proficiency and adaptivity, and was directly (and indirectly through autonomy satisfaction) positively related to emotional exhaustion. Avoidance attachment was directly (and indirectly through competence and relatedness satisfaction) negatively related to proficiency; was indirectly negatively related to adaptivity and proactivity through competence and autonomy satisfaction; and was indirectly positively related to emotional exhaustion through autonomy and relatedness satisfaction. In contrast, transformational leadership was directly (and indirectly through competence and autonomy satisfaction) positively related to proactivity and adaptivity; was indirectly positively related to proficiency through competence and relatedness satisfaction; and was indirectly positively related to emotional exhaustion through autonomy and relatedness satisfaction.

Limitations: The study used cross-sectional self-report methods.

Research/Practical implications: Finding from this study raises the possibility that transformational leadership may act as a possible protective factor against a negative attachment style.

Value: Results show the value of considering individual difference factors that influence work-related outcomes.
Purpose: Job insecurity (JI) has been defined as a stressor that negatively affects individuals and organizations. Appraisal of JI as a challenge or a hindrance may thus moderate the relationship between JI and its outcomes. Therefore, having a good instrument for assessing these appraisals has become critical. This study aims to validate the JI Appraisal Scale (JIAS-6), a 6-item scale measuring JI appraisal as a challenge or hindrance.

Methodology: Participants (N=288) were asked to complete a questionnaire that included an earlier version of the scale (JIAS-20; Bazzoli et al., 2017). From the pool of 20 items, authors ran several CFAs in order to identify the items that saturated the most on the challenge and hindrance dimensions. This process led to a 6-item scale.

Results: The best model, among those tested, turned out to be a correlated model with two dimensions (i.e., challenge and hindrance). Challenge and hindrance internal consistency reliability values were .89 and .80, respectively. Goodness of fit indices were good ($X^2_{(8)} = 15.423$, $p = .051$; RMSEA = .05; CFI = .992; TLI = .984).

Limitations: No criterion-related validity is tested at this point. The nomological net should also be tested.

Practical Implications: This study is a critical step of the validation process of a new instrument useful for both academics and practitioners, since the measurement of JI appraisals will add in our understanding of JI and its consequences.

Originality: Drawing from previous attempts to validate the JIAS, this study is a milestone in the standardization process.
Purpose: This research aimed to analyze the linear bivariate correlation and structural relations between self-regulation -as a central construct-, with flow, health, procrastination and academic performance, in an academic context.

Design/Methodology/Approach/Intervention: A total of 363 college students took part, 101 men (27.8%) and 262 women (72.2%). Participants had an average age of 22 years and were between the first and fifth year of studies. They were from five different programs and two universities in Bogotá city (Colombia). A validated ad hoc questionnaire of physical and psychological health was applied along with a battery of tests to measure self-regulation, procrastination, and flourishing.

Results: Regarding this linear association, it was established that (1) self-regulation has a significant positive association on flourishing and overall health, and a negative effect on procrastination. Regarding the structural relation, it confirmed that (2) self-regulation is a direct and positive predictor of flourishing and health; (3) self-regulation predicts procrastination directly and negatively, and academic performance indirectly and positively; and (4) age and gender have a prediction effect on the analyzed variables. Implications, limitations and future research scope are discussed.

Research/Practical Implications: According to the results, self-regulation is a personal and central construct in the prediction of the vital well-being (flourishing) and of health, as well as for the academic behavior of task delaying (procrastination) and the academic performance of college students.

Future Research Directions: In future research, the deepening on procrastination and health measures has to be considered, as well as an approach to the individuals’ reasons when procrastinating, in the context of the SR vs. ERL theory.
**Purpose:** The assessment of work-related stress by self-reports is common practice. However, self-reports are generally known to be affected by biases. In particular, research in other fields of psychology has shown that people often evaluate themselves relatively to others. This experiment investigated whether inducing an explicit comparison process changes the answers in stress self-reports.

**Design:** Participants (N = 207 employees of hospitals) were randomly divided into two groups: Whereas the first answered stress items that were tagged with “in comparison to your colleague”, the other group answered the items in a generic form (i.e., without an explicit comparison target). As a validity-criterion, we measured job satisfaction.

**Results:** The results showed lower means for the scales ‘development opportunities’ and stress in general. The manipulation did not affect the reliabilities (i.e., Cronbach alphas). For one scale, the criterion validity was greater in the group with social comparison.

**Limitations:** The sample consisted of hospital personnel only, which might question the generalizability of the findings.

**Research/Practical Implications:** The study suggests that social comparisons play a role for answers in self-reports about work stress. Since such comparison might be rather implicit, the standardization of comparison could provide more accurate results.

**Value:** This study contributes to the study of factors biasing stress self-reports.
Purpose. Social Cognitive Career Theory (Lent et al. 2000) illustrates the interplay of personal, environmental, and behavioral influences in career development and focuses on the processes by which individuals develop academic and career interests, create academic and vocational plans, and attain varying levels of performance and persistence in educational pursuits (Nauta et al. 1998). Recent studies suggest that the likelihood of success of students will be higher when the individual’s personal goal align with the organization’s goal (Van Horn et al., 2015). Our study aimed to examine the perceived organizational values and the social cognitive factors that contribute to students’ interest in engineering and psychological career fields. Previous studies suggested that the comparison of perceptions of “reputational pull” and “facilities pull” could contribute to the perceived “brand” of different institutions (Matzdorf et al., 2002). So, we also investigated these aspects and their influences on students’ university choice and performance.

Design/Methodology. A self-report questionnaire, in two waves, was administrated to undergraduates starting University Federico II of Naples in 2017 (N = 300).

Results. The results highlighted as self-efficacy, outcome expectations, values, perceived supports and barriers, and perceptions of employability contributed to the career choice of the students’ both in engineering that psychological courses. Facilities pull contribute to the university choice for engineering students.

Limitations: The sample was small and convenience-based, resulting in low statistical power.

Practical Implications. The authors highlight implications for educators, institutions and for those who are interested in orientation and placement of university students.
Objective: STEM fields are notorious for underrepresenting groups such as women and those with low-income backgrounds. Role congruity theory suggests underrepresentation is due to differences in expectations for those in STEM occupational roles compared to role expectations for those in marginalized demographic groups (e.g., Women should be nurturing, whereas scientists should be calculative). Indeed, research suggests individuals who perceive more incongruence between their social and occupational roles experience negative outcomes such as lower performance evaluations and wellbeing. We propose a model whereby mindfulness practices help individuals overcome automatic categorization processes that lead to perceptions of incongruity and associated consequences. Research has demonstrated that mindfulness buffers prejudice towards others by overcoming social categorization and other automatic processes. We posit that mindfulness weakens the effect of role incongruity on two mechanisms—the extent to which a person perceives themselves as knowledgeable in their field and the extent to which they feel they belong in it—thereby acting as a buffer against burnout. Method: Data were collected from 83 graduate students in STEM in a daily diary study across one week. Social categories were measured at baseline, mindfulness across several days, and perceived knowledge and burnout at the end of the week. Results: Preliminary mediational analyses support part of our model (perceived knowledge mediates the relationship between social categories and burnout, indirect effect = .12, 95%CI[.02, .49], but belongingness does not), indicating some support for the proposed relationships. To test the full moderated-mediation model simultaneously, we will use multilevel SEM.
 WHAT LEADS HIGH-SCHOOL GRADUATES TO CONSIDER VOCATIONAL EDUCATION AND TRAINING AS AN EDUCATIONAL OPTION?

Annalisa Schnitzler (1)
Federal Institute for Vocational Education and Training (BIBB), Bonn, Germany (1)

Purpose
As German employers use vocational education and training (VET) to recruit tomorrow’s skilled workers, the rising popularity of academic pathways amongst high-school graduates is detrimental for the skills supply in the labour market, but also for adolescents who profit more from practical learning. As expectancy-value theory suggests that the subjective value and the success expectancies of educational options influence educational choices, I investigate the corresponding psychological and social influences that differentiate between high-school pupils preferring VET and those planning to attend university.

Design/Methodology
Based on 2,500 pupils in their last school-year from the German NEPS, t-tests were conducted comparing pupils preferring VET and those preferring university with regard to personality, educational and occupational values and success expectancies and their social environment’s educational aspirations. A logistic regression displayed the combined influence of these variables on the likelihood of planning to enter VET.

Results
All categories of variables differentiate between the groups. A high subjective value of VET combined with low success expectancies concerning university and a more advanced vocational orientation process raise adolescents’ likelihood of planning to enter VET.

Limitations
Objective entrance chances for university and apprenticeship places were not accounted for.

Implications
The findings highlight the interplay of values, expectancies and the vocational orientation process in educational decision-making, which should be factored in by career-guidance professionals.

Value
This study enhances our knowledge on adolescents’ reasons for choosing VET over academic studies. It can thus enrich vocational guidance approaches and support employers in tailoring their recruiting strategies for potential apprentices.
Purpose: Coaching in organisations has been prevalent in Europe & North America for over 2 decades. However, in countries based in the Arabian Gulf, the concept of Coaching is fairly new, & organisations have a challenging time introducing it. The purpose of this paper is to share the challenges faced in the ‘Coaching Journey’ of an organisation based in the Arabian Gulf.

Approach: Over a span of 4 years, coaching was introduced in a telecommunication organisation, through various training programmes. Its workforce consist of approximately 1,600 employees, from 70 nationalities, & 31% are women. The use of coaching behaviours was encouraged for different groups of the business (N= 500), whether executive leaders, managers &/or supervisors, specifically when having conversations with teams, or addressing individual issues. The groups were exposed to the GROW model.

Results: Initially, there was skepticism when using coaching behaviours, Over a period of 1 year, the perception changed, & positive feedback was received (line manager & employees). The organisation trained internal employees (executives & managers) to be coaches, creating a coaching culture, & coaching effectiveness was gathered qualitatively & quantitatively.

Limitations: The project is ongoing, as a phased approach was implemented. It is expected internal trained coaches will be used for future interventions.

Practical Implications: Understanding challenges organisations face where coaching is concerned, particularly a culturally diverse population. This paper is unique, as limited research is available on the Coaching Journey in organizations based in the Arabian Gulf, specifically when dealing with a multi-cultural workforce.
Oral Presentation Abstract

**Purpose:** Teaching is a profession requiring emotional labour which relies upon both explicit and tacit knowledge of emotional display rules. Due to their implicit nature, emotional display rules are often unclear, unstable, and conflicting. This study aims to explore the complicated nature of emotional display rules of practicing secondary school teachers.

**Design/Methodology:** Modern online research methods incorporating traditional diary studies and a series of semi-structured interviews were conducted with secondary school teachers currently practising in Ireland.

**Results:** Preliminary analysis is currently being conducted with results expected to shed light on (a) the expected emotional displays of secondary school teachers; (b) the outcomes of adhering or not adhering to display rules; (c) unclear emotional display rules.

**Limitations:** Data were limited to teachers practicing in Ireland.

**Implications:** Findings will be beneficial for initial teacher education, for teachers and students, and will serve to draw a coherent frame for future research in the field. Furthermore, it is hoped that the importance of considering display rules when examining emotional labour in any occupation will be exposed.

**Values:** Explores the under-researched element of display rules as the core of emotional labour whilst answering calls for more focus on emotional labour in teaching.
Purpose
The objective of this study was to evaluate the influence of sport fan engagement on the personal, well-being related outcomes of meaning and life satisfaction amongst a sample of South African football fans. A secondary aim was to examine this relationship through the introduction of social interaction motive.

Methodology
A cross-sectional, exploratory design was implemented amongst 565 football fans attending matches at a stadium in the Gauteng province. The Fan Engagement Scale, Meaning in Life Questionnaire, Satisfaction with Life Scale and Motivation Scale for Sport Consumption were administered. Structural equation modelling analysis was conducted, specifying regression paths between variables.

Results
Results suggested a direct effect of sport fan engagement on meaning and life satisfaction. Results further revealed the existence of indirect paths to meaning and life satisfaction through social interaction motive.

Limitations
The cross-sectional study design doesn’t allow to account for the effects during various time periods within a season of a particular sport.

Implications
This study supports a renewed emphasis on the role that management of professional sport teams can potentially play in contributing value to society beyond the commercial growth.

Originality/Value
A research gap was addressed with regards to how the extent of a sport fan’s engrossment with his/her favourite team could lead to desired outcomes on a personal level.
1701 - WHERE WE STAND IS WHAT WE SEE - THE INFLUENCE OF HIEARCHICAL POSITION ON PERCEPTIONS OF CHANGE

Sonja Sackmann (1) - Verena Eichel (1) - Regina Palmer (1)

University Bw Munich, Department of Economics and Organizational Science, Munich, Germany (1)

Purpose

The ability to change is crucial for organizations operating in turbulent, volatile and uncertain environments. This implies that organizational members need to initiate change in time and implement it sustainably. Despite the large body of research addressing critical issues of change including change readiness (Armenakis & Mossholder, 1993), resistance to change and recommendations for change (Baily & Raelin, 2015; Ford & Ford, 2010; Ghitulescu, 2013), many change initiatives are not effective. Our research provides new explanations by addressing the (different) perspectives of hierarchical levels on change.

Design/Methodology

We collected data from three different organizational levels (top- and middle management plus employees) using an online questionnaire of change-fitness covering all phases of a change process.

Results

The results show several statistically significant different perceptions of change between the three different hierarchical levels along the process of change. These perceptual differences due to hierarchical levels are rather stable over four data collection points spread over eight years.

Limitations

Data were collected from several organizations instead of focusing on the hierarchical levels of a single organization.

Research/Practical Implications

The results shed new light on reasons for the high number of unsuccessful change efforts with implications for practice and future research.

Originality/Value

The hierarchical effect in change processes is highlighted leading to recommendations for more sustainable change.
Purpose: The purpose of this study was to explore coping resources of high school teachers in different career stages.

Design/Methodology/Approach/Intervention: A quantitative survey was conducted on a convenience sample (N = 193) of teachers from Gauteng province. The Coping Resource Inventory (CRI) and the Adult Career Concerns Inventory (ACCI) were used to measure coping resources and career stages.

Results: The results from this study indicate that similar coping resources were reported for high school teachers in Gauteng Province within different career stages. Career stages furthermore did not significantly predict coping resources for high teachers in Gauteng Province.

Limitations: This study was conducted within one province, Gauteng, and therefore cannot be generalised to the greater South African population. This however, created a need for further research opportunities to conduct similar studies in other provinces.

Research/Practical Implication: The findings of this study contribute valuable new knowledge on particular coping resources that Gauteng teachers are likely to deploy. This study furthermore allows for comparisons of coping resources for teachers, not only in a general or international context, but also between South African provinces. In addition, this study draws attention to the wellbeing of teachers specifically teaching in the Gauteng province of South Africa.

Originality/Value: These findings contribute valuable insight and knowledge to the field Career Psychology that can be applied in career guidance and counselling. The study provides insight into which coping resources are to be used by teachers at different stages of their careers.
ABSTRACT

Humility has received increasing attention in organizational studies in recent years. There is the growing realisation that humility within organisations is critical, affecting many organisational outcomes such as organisational learning (Vera & Rodriguez-Lopez, 2004), empowering climate (Ou et al., 2014), job satisfaction and work engagement (Owens, Johnson, & Mitchell, 2013). However, the influence of cultural differences on perceptions of humility has largely been neglected. Even studies conducted in the Eastern countries adopted the same definition and methodology as the Western studies did, which could have resulted in inaccurate conclusions. Thus, this study aimed to explore that there are clear cultural differences in perception of humility. To be specific, in the Eastern culture with an interdependent self-construal orientation (Markus & Kitayama, 1991), people view maintaining a low profile as humility and virtue, while the Eastern view of humility has been negatively perceived as a weakness and lack of confidence in Western culture (Exline & Geyer, 2004). To address this important yet under-researched topic, study 1 developed a scale incorporating the Eastern view into Western humility scale and then investigated cultural differences by collecting and analysing the data from full-time employees in South Korea and the United States. Further, study 2 used the scenario method to examine how humility is perceived differently according to cultures in more specific organisational contexts, which offer a richer explanation. The findings from the current study contribute to a deeper understanding of humility as well as shed lights on the importance of cultural difference in humility research.

1716 - HARDINESS AS A FACTOR OF EMPLOYEE INVOLVEMENT IN IMPLEMENTING THE ENVIRONMENTAL SECURITY POLICY IN AN OIL AND GAS ENTERPRISE

Svetlana Litvina (1) - Natalia Kozlova (1) - Sergey Bogomaz (1) - Emma Meshcheryakova (1) - Inna Atamanova (1) - Tatiana Levitskaya (1) - Anastasia Larionova (1) - Konstantin Yantsen (1) - Olga Balina (1)

National Research Tomsk State University, Tomsk, Russian Federation (1)

Purpose
Indicating factors of employee involvement in implementing the environmental security policy in environmentally hazardous industries is extremely important, including an understanding of what personal resources are involved in the personnel’s decision making to meet the environmental security rules in the workplace under extreme working conditions. The purpose of this empirical study was to analyze hardiness as a factor of employee involvement in implementing the environmental security policy in a specific organizational context.

Design/Methodology
The study used a psychodiagnostic technique developed for assessing the employee involvement in implementing the environmental security policy (a sample of 150 employees shift working at remote sites), based on evaluating their attitudes, behavior and hardiness. Analysis of variance, correlation and factor analyses were applied to treat the data collected.

Results
The study results showed that under extreme working conditions following the enterprise environmental security rules was mediated by the study participants’ level of hardiness. Statistic analysis revealed that a high level of hardiness can be viewed as a predictor of employees’ pronounced loyalty to the company’s rules and their active involvement in implementing the environmental security policy.

Limitations
One of the study limitations is its specific organizational context.

Research/Practical Implications
Nevertheless, this study results allow applying the psychodiagnostic model developed to assess employees’ personal resources as a factor of organizational safety, especially under extreme conditions and/or a shift working mode.

Originality/Value
The study conducted also contributes to a deeper understanding of the interaction between external and internal factors of environmental security under extreme working conditions.
Purpose
The implementation of co-production in healthcare provision is not only spreading rapidly but also being increasingly appraised as a more sustainable model for the future. Despite this widespread acceptance, minimal consensus exists, however, on the co-production’s definition and on the mechanisms for evaluating the actual impacts of the implementation of co-production in healthcare. This study aims to define the current state of art of the healthcare service co-production research field with a specific focus on evaluation issues.

Methodology
First of all, a quantitative bibliometric analysis, using Bibliometrix software (Aria and Cuccurullo, 2017), was carried. The reference database chosen is WoS and the inclusion criterion was “co-production AND health* OR coproduction AND health*” in topic. As second stage, a qualitative content analysis based on PRISMA protocol is developed, focusing on those papers targeting evaluation issues.

Results
The bibliometric analysis shows an annual percentage growth rate of about 26% with the biggest increase in the last 5 years in number of publications. The co-citation analysis highlights two main intellectual areas: a public administration and management cluster and a service management cluster. Nonetheless, only few studies focus on the evaluation of outcomes. Among them, the content analysis has revealed a predominantly mono-dimensional and mono-stakeholder approach. Specifically, clinical, economic or psychological-social - mainly in terms of patient satisfaction – impacts are assessed.

Practical implications
The study offers the base to develop a systematic analytical framework for the evaluation of co-production of healthcare.

Originality
The study represents the first bibliometric analysis on co-production in healthcare.
Purpose: Workplace civility promotes low job stress, improve employee morale and commitment, and helps mitigate employee dissatisfaction. Thus, evaluation of civil behavior seems crucial to promote healthy workplaces.

Methodology: This study explores the construct validity of a Civility Scale developed in Spanish using a secondary dataset of 302 workers (70% female; 28.1% male) from 8 organizations in Puerto Rico. Civility scores were correlated with relevant worker’s attitudes and well-being indicators. Dataset was randomly divided to perform factor analysis.

Results: Results from the EFA (n=140) with MLE yielded a multidimensional structure. An iterative process was conducted to retain items related to a unique factor with loadings > .30. Final solution suggested a three-dimension structure with 10 items (loadings ranging from .50 to .82). A CFA with a second sub-sample (n=162) confirmed this structure ($\chi^2 = 62.66$, $df= 32$, RMSEA = 0.07, SRMR=.05, CFI = 0.94, TLI= .91), with a better fit compared to a one-factor model ($\Delta\chi^2 (3)= 30.13$, $p<.01$). Dimensions were labeled as: Respect (4 items), Support (2 items) and Relate (4 items). Reliability estimates ranged from .70 to .84. Correlations with work engagement, job satisfaction, continuance, and normative commitment were positive and significant for each dimension.

Limitations: Factor analyses were conducted dividing the same sample and data collection of all constructs was at the same point in time in a unique country.

Implication and Value: This research provides Spanish-speaking organization with a valid and reliable measurement tool to assess and further developed positive initiatives to promote employees’ healthy behaviors.
Today, industrial environments are bringing workers the possibility to experience and deal with smart technologies, like highly automated and smart assembly line and collaborative robots. The relationship of workers with the “working tools” and the new industrial environment, the so called “cyber-physical systems”, has dramatically changed, involving to a higher extent cognitive abilities. Individuals do not merely issue commands to which machines respond passively. Indeed, the latter consider the operators current state to adapt their own functioning, improve safety conditions and industrial productivity. Monitoring cognitive workload and mental fatigue in the workplace, and while interacting with these robots, could be useful to prevent accidents or to avoid slowdowns in working performance. The present study aimed at analyzing different operator-related data working in an assembly line. Following this rationale, we collected several eye-tracking indices to verify the possibility of assessing cognitive load (e.g. pupil dilation, Nearest Neighbour Index) and mental fatigue levels (i.e. blink duration and frequency). Results showed that cognitive load metrics were generally reliable to assess the mental workload of operators. In addition, changes in blink duration and frequency were effective indices indicating fluctuations in the mental fatigue experienced by workers. Future developments will consider the implementation of systems that will adapt their functioning (e.g. the quality and amount of information presented to the specific operator) according to variations in cognitive workload and mental fatigue. Finally, we will contextualize the scientific results into design guidelines for highly automatized assembly line and collaborative industrial robots.
Many people report having a meaningful “calling” to a particular career. Calling has positive consequences for people’s careers and wellbeing, but little research has examined the psychological predictors of this feeling. We argue that conflicting definitions of calling have limited research on this topic. The current research aimed to establish the optimal way to measure the psychological nature of calling. A second aim was to clarify what traits predict calling. Across six studies, we measured calling in UK university students using diverse calling scales, and assessed several cognitive and personality factors that we predicted would be correlates of calling. Results revealed that calling should be treated as two separate dimensions – presence and search – that have different cognitive and personality predictors. The presence of calling was most strongly related to the presence of life meaning, dogmatism and future-perspective, followed by supernatural beliefs and right-wing political ideology. Conversely, the search for calling was most strongly related to the search for life meaning and openness to experience, followed by just-world beliefs for the self. The research was correlational, thus we could not establish the causal direction of the relationship between calling and the correlates. However, the findings have important practical implications. Counselling interventions aimed at enhancing a sense of calling to increase people’s wellbeing will benefit from considering that people who perceive and seek a calling have different personality traits. Overall, the findings suggest that it is essential to consider both presence and search to understand the complexities of how calling affects people.
Purpose
The modern world sets specific working conditions decreasing employees’ psychological safety (high emotional tension, unpredictable situations, increased responsibility). This makes it urgent to maintain a high level of employees’ psychological safety in their organization and their commitment as well. The study focus was the relationship between employees’ psychological safety and their commitment in the organizational context.

Design/Methodology
The study involved a number of scales to evaluate the study participants’ basic assumptions, their level of organizational commitment and their level of life quality. The study sample included 110 employees (education and IT-technology spheres). Descriptive statistics, correlation, factor and cluster analyses, analysis of variance were applied to process the data collected.

Results
The results showed that the respondents with a high level of psychological safety were more loyal to their organizations. Statistical analysis revealed that the higher was the study participants’ level of affective commitment to their organizations, the higher was their level of psychological safety. On the contrary, a higher level of continuance commitment was related to a lower level of psychological safety.

Limitations
One of the study limitations can be its specific organizational context connected with employees working in the field of education and IT-technologies only.

Research/Practical Implications
The study results allow practical application of the psychodiagnostic model developed to evaluate employees’ level of psychological safety and commitment to their organization and its types.

Originality/Value
The study conducted contributes to a better understanding of the relationship between employees’ psychological safety and their commitment in the context of organizational behaviour.
1733 - CO-ADAPT: DESIGNING AN ADAPTIVE AND ACCESSIBLE 4.0 WORKING ENVIRONMENT FOR THE OLDER EMPLOYEES’ NEEDS

Luciano Gamberini (1) - Patrik Pluchino (1) - Anna Spagnolli (1) - Valeria Orso (1) - Giulio Jacucci (2)

University of Padova, Human Inspired Technology (HIT) Research Centre, Padova, Italy (1) - University of Helsinki, Dep. of Information and Computer Science, Helsinki Institute for Information Technology (HIIT), Helsinki, Finland (2)

Nowadays, the increase in life expectancy carries a prolongation of working life. Efforts must be targeted on supporting older employees, who are generally less inclined to computer technologies, in facing the changes that characterize the Industry 4.0, especially in updating their skills and taking into account their needs due to the normal ageing process. CO-ADAPT project combines expertise in technology, research and innovation in order to realize cutting-edge working environments that will reduce productivity loss usually related to the age of the operators and will give the opportunity to still exploit the superior experience of older employees.

The CO-ADAPT project aims at supporting the active ageing of citizens in two ways: firstly by designing accessible and adaptive work technologies, suitable workplaces and secondly by focusing on the human factor. Adaptations of the machines to the workers (i.e. personalization) will be based on static rules, real-time monitoring of physiological parameters, and machine learning techniques and will be implemented in relation to age thresholds, individual skills, and information provided concerning the working tasks. The goal is to ensuring universal accessibility and a pleasant experience of interaction with tools and machines. A conversational agent will support behavioral changes (e.g. health, wellbeing, social) and learning (e.g. competences, values) by following the operators during work activities (e.g. obtaining and processing data from the assembly-line and from the workers themselves) as well as in their free time, where suggestions and recommendations about healthy activities are balanced with the data obtained during the working time.
Purpose: Active listening is an essential access key to greater employees’ comprehension and enhancement, as well as a necessary tool for work-related stress prevention. It can be implemented through communication technologies, in order to improve individual and organizational health. Therefore, drawing on the humanistic approach and a model of organizational well-being/distress, we hypothesized that active listening facilitated by innovative technologies promotes well-being and prevents potential distress exacerbation.

Design/Methodology/Approach: As part of a qualitative research, independent researchers have analysed 150 narrative outputs through computerized content analysis. The texts derive from an active psychological listening service offered by several Italian organizations as a form of external and independent support.

Results: Findings suggest that the model of organizational well-being/distress used might be applicable to a wide range of companies. Moreover, they show both critic dimensions, such as high workload and a lack of personal contribution recognition, and positive resources, including resilience and self-efficacy.

Limitations: Given the sample heterogeneity, results could not highlight marked differences across different sectors.

Research/Practical Implications: Field-testing produced encouraging results and companies accessing the service are increasing. Evidence points out the utility of an impartial and anonymous service managed by a team of psychologists, perceived as means of protection. This kind of services safeguards companies from disputes and is part of Corporate Social Responsibility.

Originality/Value: Communication technology allows us to originate a virtuous circle among knowledge generation and change production at the individual level, with consequent positive organizational outcomes.

Keywords: Active listening, qualitative research, technology, work-related stress, well-being.
1735 - PURPOSE-IN-LIFE ORIENTATIONS IN THE FORMATION OF STRESS RESISTANCE AS A RESOURCE OF MENTAL HEALTH IN PRISON STAFF

Anastasia Larionova (1) - Emma Meshcheryakova (1) - Konstantin Yantsen (1) - Svetlana Litvina (1) - Inna Atamanova (1) - Natalia Kozlova (1) - Sergey Bogomaz (1) - Tatiana Levitskaya (1) - Olga Balina (1)

National Research Tomsk State University, Tomsk, Russian Federation (1)

Purpose
The study aimed at exploring the role of purpose-in-life orientations in the formation of stress resistance as a resource of mental health and developing a program of psychological support for prison staff. Preservation of their mental health is urgent from the public safety perspective and for increasing the efficiency of executing punishments and isolation of socially dangerous individuals.

Design/Methodology
To measure psychological characteristics in question, we apply a set of psychodiagnostic techniques to collect qualitative and quantitative empirical data. Descriptive statistics, correlation analysis and analysis of variance were applied to process the data collected and to evaluate the effectiveness of the program developed.

Results
The study results (the sample involved 219 prison employees) showed that purpose-in-life orientations determined personal and semantic levels of stress resistance as a resource of the participants’ mental health. The factors influencing stress resistance are goal setting and achieving purposes, life satisfaction, life effectiveness and controllability. The program of psychological support for prison staff as an integration of training sessions and audio-visual impact showed its effectiveness.

Limitations
One of the study limitations can be its specific organizational context connected with prison employees only.

Research/Practical Implications
The idea of purpose-in-life orientations as a resource component of stress resistance can be also applied to extreme jobs. The psychological support program can be used in psychological departments of penitentiaries.

Originality/Value
The study conducted contributes to a better understanding of the effect of prison employees’ life purposes on their stress resistance as well as their mental health in general.
PERCEIVING SHARED LEADERSHIP IN TEAMS: THE ROLE OF INDIVIDUAL DIFFERENCES AND COMMUNICATION NETWORKS

Alexandra (Sasha) Cook (1) - Alexander Zill (1) - Bertolt Meyer (1) - Christine Gockel (2)

Chemnitz University Of Technology, Chemnitz, Germany (1) - SRH Hochschule Berlin, Berlin, Germany (2)

Purpose

Although current research emphasizes the positive effect of shared leadership on team performance, there are only little insights into individual-level predictors which drive individual behavior and impact the perceptions of leadership structure. In this study, we analyze how Affective Motivation to Lead (A-MTL) and Leadership Structure Schemas (LSS) affect the individual communication network and, subsequently, the perception of leadership centralization in teams.

Design/Methodology

We assessed data among 105 students in 41 research teams over the course of 4 months. Baseline measurement (T0) was followed by 5 measurement points (T1-T5). We assessed individual level predictors at T0 and perceived leadership and frequency of communication via round-robin assessment at T1-T5 for the computation of leadership and communication centralization values. We fitted mixed models with latent growth curves.

Results

The effect of the interaction of A-MTL and LSS on communication centralization was significant. A shared LSS only leads to decentralized communication if M-MTL is also high. Centralization of communication was positively associated with perceived leadership centralization. Mediation analyses showed support for a moderated mediation. The effects of LSS on perceived leadership centralization is only mediated by communication centralization, when A-MTL is high.

Limitations

As we assessed our data among student teams, the generalizability of the results is questionable.

Research/Practical implications

Our research demonstrated the importance of attending of individual differences when assessing shared leadership through perceptions only. The insights into the effect of individual traits has implications for personnel selection.

Originality value

Our study is the first to include a perceiver-specific and time-sensitive approach to shared leadership.
1742 - HOW CAN ORGANIZATIONS SUPPORT CAREER PARENTS? – THE IMPACT OF PARTNERS’ SUPPORT ON THE EFFECTS OF PERCEIVED ORGANIZATIONAL SUPPORT

Patrick Müller (1) - Uta Bronner (1) - Jan Klenk (1) - Monika Stefan (1) - Jördis Hollnagel (2)

HFT University of Applied Sciences Stuttgart, Business Psychology, Stuttgart, Germany (1) - Initiative Karriere-Eltern, Stuttgart, Germany (2)

Authors:
Patrick Müller1, Uta Bronner1, Jan Klenk1, Monika Stefan1, & Jördis Hollnagel2
1HFT University of Applied Sciences Stuttgart
2Initiative Karriere-Eltern

Purpose
Previous studies have shown that the impact of organizational family support measures on employees’ affective reactions is partly mediated by the perceived organizational support (POS). In this study, the role of partners’ support on this relationship was examined.

Design
A large online study of career parents investigated to what extent the impact of the satisfaction with organizational support measures on both affective commitment (model 1) and general life satisfaction (model 2) was mediated by POS. In both models, a moderating effect of partnership support in childcare was considered.

Results
Employee commitment was positively related to organizational support measures. Irrespective of partners’ support, a mediating effect of POS was found. In the case of general life satisfaction, there was a moderating effect of partners’ support in the mediation model: For parents with low support from their partner, the extent of existing support measures, partly mediated via POS, influences their life satisfaction. POS loses its mediating function under high partnership support.

Limitations
The findings present initial evidence from a cross-sectional self-report study, which should be replicated by other methods.

Originality/Value
By expanding their support measures and their targeted communication, companies are in a good position to create stronger affective commitment among parents. At the same time, they can positively impact on the overall life satisfaction of their employees.
Doerte Behrendt (1) - Michele Wessa (2) - Leif Boß (1) - Dirk Lehr (1)

Leuphana University of Lueneburg, Department of Health Psychology and Applied Biological Psychology, Lueneburg, Germany (1) - Johannes Gutenberg-Universität Mainz, Department of Clinical Psychology and Neuropsychology, Mainz, Germany (2)

Purpose
Despite the growing number of resilience interventions, many lack a theoretical foundation. Therefore, a combined online and app-supported resilience training for employees, based on positive appraisal style theory of resilience (PASTOR) and on the foundation of Strength-based cognitive behavioral therapy (S-CBT), was developed. This study aims to assess the feasibility of conducting future definitive randomized controlled trial (RCT).

Design
The study is designed according to the extended guidelines of the consolidated Standards of Reporting Trials for randomized pilot and feasibility trials. The resilience training will be carried out in 2 phases among employed part-time students with increased stress. Phase 1, 5 participants receive access to the training. In-depth interviews, focusing on user-experiences and core-understanding of the interventions' concept, follow. Feedback is used to revise the training. Phase 2, 20 participants are randomized to either the training or control group. Data is assessed at baseline and 8-weeks post-randomization. Primary outcome is perceived stress. Secondary outcomes include work ability and work engagement.

Results
Results collected from November 2018 until February 2019 will be presented at the EAWOP conference.

Limitations
As only employed part-time students were included, the sample does not represent the entire working population.

Implications
This study will generate knowledge about the acceptance of a newly developed resilience training for stressed employees. Information on user-experience will be provided. Data is collected to estimate the sample size of a definitive RCT.

Originality
To the best of our knowledge a combined online and app-supported resilience training, based on S-CBT, has neither been developed nor investigated.
LOYALTY CONFLICTS AND BALANCING DIFFERENT LOYALTIES

Although questions of ethical behaviour and loyalty are timely in many organisations they get specific attention in public service organisations. Also, representatives of some professions and occupations find themselves more often in situations where they have to balance different and sometimes conflicting loyalties. This study focuses on loyalty conflicts trying to answer following questions: (1) how the essence of loyalty and loyalty conflicts is understood; (2) what are seen as main causes of loyalty conflicts, (3) whether and how the balance between different loyalties can be established. We use data from semi-structured interviews (n=7) with social workers to answer these questions. Main results of our study are: (1) ‘loyalty’ is mostly defined as particular duties to employer but sometimes questions arise whether employees in publicly funded organisations should further the interests of employing organisation or public interests; (2) loyalty is value-based which makes knowing the (personal and professional) values of employees very important; (3) there are several possible loyalty conflicts resulting from various roles (e.g. employee, professional, citizen); (4) loyalty conflicts are mostly related to professional and organisational role requirements; (5) trying to solve the conflict of interests from the standpoint of citizen’s in an organisation one works is incompatible with his/her work role; (6) different role requirements can be balanced on the basis of integrating basic legal norms, professional ethos, and public service or organisational code of conduct.
1757 - PSYCHOLOGICAL HEALTH AT WORK: DIRECT AND BUFFERING EFFECTS OF JOB DEMANDS AND JOB RESOURCES

Soufian Azouaghe (1) - Dongo Rémi Kouabenan (1) - Abdelkarim Belhaj (2)

Laboratoire InterUniversitaire de Psychologie (LIP/PC2S), University Grenoble Alpes, Grenoble, France (1) - Faculty of Arts and Human Sciences, Mohammed V University, Rabat, Morocco (2)

Purpose

Previous studies in various countries have shown that teaching is stressful and difficult (Kyriacou, 2001; Travers & Cooper, 1996; Van Droogenbroeck & Spruyt, 2015). However, it is important to note that not all teachers are anxious and stressed (Farber, 1984). In this vein and according to the “job demands-resources theory” (Bakker & Demerouti, 2014, 2017), this research examines for the first time the role of job demands (e.g., poor physical environment, students misbehaviour) and job resources (e.g., social support, pedagogical autonomy, recognition at work) on psychological health at work (PHT) among Moroccan teachers. Additionally, this study investigates if job resources buffer the relationship between job demands and PHT.

Methodology

Data are collected by self-administered questionnaires from 1107 Moroccan teachers in primary schools, middle schools and high schools.

Results

The results show a positive correlation between job demands and PHT. Also, a negative one between job resources and PHT. They also illustrate that the job resources moderate the effect of job demands in the prediction of PHT.

Limitations

Data are collected by self-report measures and the study follows a cross-sectional design.

Research/Practical Implications

Our research reveals the importance of taking into account organizational and relational variables in promotion of PHT among Moroccan teachers.

Originality/Value

To our knowledge, this is the first study to examine the direct and buffering effects of job demands and job resources on PHT in a Moroccan context.
Purpose
Depression is one of the most common mental disorders in the United States and is the leading cause of disability worldwide. In the U.S. workforce, the prevalence of depression is 7.6%. The total economic burden of depression is about $210.5 billion per year, representing a 21.5% increase from $173.2 billion per year in 2005. Nearly half (48%-50%) of these costs are attributed to the workplace, including absenteeism and presenteeism, whereas 45%-47% are due to direct medical costs which are shared by employees, employers and society.

Methodology
In this study, data from the 2014 administration of the Quality of Worklife (QWL) survey were analyzed (n=1249) to explore the relationship between depression and demographic and job- and workplace-related factors in a nationally representative sample of American workers.

Results
Preliminary data analyses suggest that consistent with previous findings, women were more likely to report experiencing depression than men. Traditional job factors such as workload were significant predictors of depression as was job burnout. Other job factors such as gender discrimination and harassment were also predictive of depression in the study sample.

Limitations
Given that the data utilized in this study are cross-sectional, it was not possible to explore causality in this study. Longitudinal studies are needed for this purpose.

Implications/Value
The results of the study suggest that specific improvements in the way jobs are designed, to workplace climate, and to workplace programs may reduce risk factors for depression. These improvements may also enable employers to achieve cost savings through increased productivity.
Abstract

State of the Art: this article aims to extract the crucial elements of an experimental intervention to develop the leadership behavioral competencies of managers. Method: we used a systematic literature review to explore and classify the main elements of an experimental intervention for developing leadership behavioral competencies. To find these elements, we searched in four online databases of Psycho Info, Science Direct, Pub Med and Google Scholar in 2017 and 2018, using the key words of leadership development, assessment centers and evaluating training outcomes. New perspective: we introduced leadership developmental assessment center (LDAC) as an experimental intervention to develop leadership behavioral competencies systematically. As such, the pre-requirements of developing leadership competencies, its implementation method and evaluation of its effectiveness are discussed. Limitation: Lack of sufficient empirical studies, its time consuming procedure and the high cost of conducting LDAC may limit its use. Practical implementation: LDAC would develop the indexes of leadership competencies through bringing leadership-role related dilemmas from a real world to the simulation exercises and bridging between theory and practice. Originality: LDAC can provide a solid foundation to foster competent modern-day leaders through applying principles of active/deep learning and skill development.

Keywords: leadership behavioral competencies, leadership developmental assessment center, experimental intervention
1771 - THE DYNAMIC SPILLOVER OF JOB SATISFACTION ONTO LIFE SATISFACTION: THE MODERATING ROLE OF EMOTIONAL INERTIA

Evelina De Longis (1) - Guido Alessandri (1)

Sapienza University of Rome, Department of Psychology, Rome, Italy (1)

Abstract

Purpose. In recent years, research about work-life interface has grown rapidly (Edwards & Rothbard, 2000). Whereas work and family experiences have proved to be deeply interconnected (Zedeck, 1992), the underlying mechanisms of this spillover process are yet to be cleared (Heller & Watson, 2005). The aim of this study is to investigate the role of temporal dependency of emotional states in the spillover of daily job satisfaction onto daily life satisfaction. While several studies have attested the mediating role of negative and positive affect in work-life interface, little is known about the role that specific emotion dynamics, such as emotional inertia (Kuppens et al., 2012), may play in this process.

Methodology. Following the Experience Sampling Method (ESM), 116 workers who work directly with the public (62.1% females, average age 43.29 years, DS = 12.78) filled six brief questionnaires per day, for five working days. A multilevel path analysis was conducted to test our hypothesis.

Results. Results from multilevel analysis supported the hypothesized model, indicating that resistance to change of emotional states significantly moderates the relationship between daily job satisfaction and daily life satisfaction: the higher the levels of emotional inertia, the stronger the relationship.

Limitations. This study entails some limitations, mostly linked to the use of self-reports and the short time span covered.

Practical Implications and originality. These results improve the current understanding of the spillover process between job and life satisfaction, and emphasize the role of emotion dynamics and emotional regulation in the work-life interface.

Word count: 246 words
This poster summarizes the results of a state-of-the-art review of organizational justice in a project management context. Several determinants attached or related to organizational justice theory and equity seem to influence, positively or negatively, team performance, satisfaction, well-being, individual and team performance, collaboration, team climate, and psychosocial relationships in organizations. Stakeholders (de)engagement, and conflicts between individuals are often about fairness and equity. The first wave of empirical studies looked more at the distributive dimension of justice, before integrating its procedural and relational facets. Empirical studies have unraveled many of its determinants and effects. The objective of this poster is threefold: first, to summarize, after more than two decades of research of organizational justice and its impacts in organizations, what are the main findings and the remaining gap in the literature. Second, we aim to identify relevant findings pertaining to a project work context. Project management is observed as an increased tendency among all economic sectors. Forecasts show that the number of projects will double in the coming years. Many reasons explain the phenomenon, and despite improvements in project management tools and methodologies, project performance is declining. We tackle this problematic with a soft side angle, to increase our understanding of multiple factors leading to project results. The research focuses on a particular organizational context: project-based organizations involving multiple stakeholders. From this point, we aim to select relevant concepts in a project management context to advance scientific knowledge specific to this field and to set a research agenda.
DO MATURE EMPLOYEES INFLUENCE THE IMPACT OF TRANSFORMATIONAL LEADERS ON ORGANIZATIONAL DEVELOPMENT?

Naghi Radi Afsouran (1) - Morteza Charkhabi (2) - Fatemeh Mohammadkhani (3)

University of Guilan, Rasht, Iran (Islamic Republic Of) (1) - University of Clermont Auvergne, Psychology, Clermont, Iran (Islamic Republic Of) (2) - University of Guilan, Educational Planning and Administration, Rasht, Iran (Islamic Republic Of) (3)

Abstract

Purpose of study: the first aim of this study is to investigate the association between transformational leadership and organizational development. The second aim is to test the extent to which employee’s maturation can mediate this association. Method: to test our hypotheses, a sample of 255 full time employees (% 58 men and % 42 women) from four Iranian public organizations were recruited by simple random sampling technique. Participants were asked to complete scales on transformational leadership, organizational development and employees’ maturation. Results: Pearson correlation analysis showed that there is a positive significant relationship between transformational leadership and organizational development. Moreover, path coefficients of structural equation modeling revealed that the direct effect of transformational leadership on organizational development is significant. Furthermore, it supported the mediating role of employee’s maturation in the association between transformational leadership and organizational development. Limitations: we used a cross-sectional research design that may limit the generalizability of our findings. Practical Implications: In case transformational leaders lead organizations, mature employees would be potentially good candidates to further develop their organizations. Specific training programs are needed to enhance employee’s maturation. Originality: this study suggests employees’ maturation as one of the key variables contributing transformational leaders to develop their organization.

Key words: transformational leadership, organizational development, maturations’ employees
Abstract

The disproportionate increase in the older population, as compared to other age groups, has made the study of the aging workforce and its health an important area of study. The main goals of this paper is to utilize the resource-based dynamic model to identify factors that ensure the health of the aging workforce is maintained. Specifically, we test whether financial strain, social support, and self-efficacy affect major diseases, cognitive functioning, depressive symptoms, and functional ability, after controlling for age and baseline health measures. We aim to analyze longitudinal data six most recent waves of the Health and Retirement Study. The findings may help identify factors that are detrimental to or help maintain health levels of the aging workforce thus having implications for practitioners and researchers alike.
Purpose
Employee engagement has been linked to important organisational outcomes such as job satisfaction, organisational commitment, performance and intention to turnover. 'Your Voice', the annual staff survey for Worcestershire County Council (UK), explores employee engagement and offers the opportunity for employees to voice their opinions on key issues affecting the whole organisation. This paper investigates levels of engagement (UWES-9) and other organisational measures including strategy, leadership, pride, employee voice, and involvement.

Design/Methodology
In 2018 we conducted a survey with the Council’s employees (n=1,510, response rate=52%). We completed quantitative (SPSS) and qualitative (thematic analysis, Text Analytics) analyses. We made comparisons with last year’s results and identified trends.

Results
Overall engagement of the Council’s staff is average; vigour and dedication are average, and absorption is high. The results indicated high levels of good working relationships with colleagues and persistent challenges related to the clarity of vision and innovative thinking. Flexible working and feeling that they can make a difference are very important to staff.

Limitations
Analysis is based on self-report measures. Data is collected from one County Council in England, which limits the generalisation of results.

Research/Practical implications
This study adds to our understanding of the behaviours and resources that facilitate staff engagement in the public sector, particularly for organisations going through a significant period of change. The paper presents some suggestions in supporting employees based on the findings.

Originality/Value
The study offers useful insights and practical implications into how public sector organisations can develop more effective interventions to support employee engagement.
1806 - (INTER-)NATIONAL STANDARDS AND GUIDELINES FOR ASSESSMENT CENTER OPERATIONS: GLOBAL OR SPECIFIC?

Stefan Höft (1)

University of Applied Labour Studies (HdBA), Mannheim, Germany (1)

Purpose
The “Guidelines and ethical considerations for Assessment Center operations” formed by an international taskforce had first been published in 1975 and revised five times in the sequencing years (6th edition 2015). In the meantime, a multitude of national AC standards (e.g. from South Africa; Germany, United Kingdom, Russia, Turkey, Indonesia) had been formulated highlighting different priorities and demands. Based on two of the national standards (Russia v2015 and Germany v2016) and the international guidelines (v2015) the study investigates the common elements concerning the design of ACs (‘must’ and ‘should’ criteria). At the same time aspects of national standards are identified that differ from the demands and recommendations of the international guideline.

Methodology
A qualitative content analysis approach utilizing the IT-Tool MaxQDA is used to identify requirement statements throughout the texts and to classify them as ‘must’ or ‘should’ criteria. After on, similarities and differences concerning covered topics and required levels of quality are derived.

Results
The analyses are still in progress (Oct 2018) but it is hypothesized that the German standards cover additional topics and the Russian standards formulate in some parts (e.g. assessor-participant-ration) a lower level of quality compared to the international guidelines.

Limitations
The qualitative content analysis only covers formulated requirements. Actual practical implementations and realizations in the AC field are not investigated.

Practical Implications, originality
The analysis approach utilizes qualitative methods to investigate a relevant science-practice-frontier. The results provide an indication of the usefulness and specificity of national quality criteria for ACs.
The present study builds on the Social Cognitive Career Theory (SCCT, Lent, Brown, & Hackett, 1994) in investigating labor force migration. By now, the most notable studies identified economic factors as the main cause for migration. In the present study, we investigate if individual differences in terms of personal values interact with the main factors in SCCT, as applied to career migration (migration self-efficacy and migration outcome expectations) in predicting the migration intention of highly skilled professionals.

A sample of $N = 358$ IT engineers were administered measures of migration self-efficacy, migration outcome expectations and the Short Schwartz Value Survey. They were also asked to assess their intention/plans to migrate over the next year.

Moderation analysis showed that the global value of Conservation is a moderator between migration outcome expectations and intention to migrate, but not between migration self-efficacy and intention to migrate. However, the effect of the interaction is rather small, adding an $r^2$ square of .03 to the effect of outcome expectations alone.

The cross sectional nature of the data and the fact that we did not follow-up on how much of the intention to migrate became action.

The results imply that personal values may play a part in the migration decision.

The study is the first, to our knowledge, to apply the SCCT theory to the labor force migration of the highly skilled professionals.
Content: Purpose: Scholars consider encouraging bystanders to intervene as a solution to workplace bullying. Recent research has shown that moral courage could facilitate this kind of prosocial behavior. The aim of this study is to identify and analyze the psychological components underlying moral courage and their dynamics leading to bystander intervention.

Design/Methodology: Drawing from Comer and Sekerka’s (2015) conceptualization, three components involved in moral courage are identified: moral identity, self-regulation process and moral metacognition. Ad hoc self-reported measures are used to assess these components, including measures for moral courage and bystander intervention behavior.

Results: Using structural equation modeling (SEM), moral identity resulted to be the primary component of moral courage by motivating the intention to act. Self-regulation process, through self-regulatory strategies, showed to facilitate the passage from intention to bystander intervention. Moral metacognition resulted to affect the relationships between these two components and with the final intervention behavior.

Limitations: The validity of the results could be reduced by the use of self-reported measures.

Research/Practical Implications: These results may help scholars deconstruct moral courage and identify which elements support courageous actions against workplace bullying. Results can help HR experts and practitioners to develop more effective workplace bullying prevention programs.

Originality/Value: The study tries to provide a deeper understanding of moral courage and the mechanisms lying behind its functioning. In fact, despite previous research, there is still little understanding of moral courage and its action in helping bystander intervention.
Purpose. The aim of my presentation is to try to add a further perspective on the so-called “data-driven” and “evaluation based” culture in schools (Scheerens, 2004). Data and evaluation are powerful “organizational” tools for school leaders, capable of intervening in shaping the organizational culture of the single educational institution and in promoting processes of professional development of teachers (Fullan, 2001). Starting from an organizational and psychosocial perspective on schools’ effectiveness this is the main research questions: Can data and evaluation be a tool for school staff management done by school leaders?

Design/methodology. I will show empirical data from two studies completed in the Province of Trento. The first one focuses on the supporting role of principals in guiding the transfer of learning of middle management in schools (Timperley et al., 2007). The second one is based on the process of self evaluation of schools, in which data collected at teachers and students level are used to help school leaders in designing teachers’ professional development.

Results. Results from these studies show that an effective use of data and evaluation can help school leaders in reshaping their management practices with middle managers and teachers, being constantly on their side (providing systematic feedback, cognitive coaching, …), functioning as models and mentors in applying what they have learnt during the training and mostly, preparing them for training before it happens.

Research/Practical implications. Results show how to apply in real settings the use of data for human resources management in schools.

Originality/value. Evaluation data considered as organizational tools.
PURPOSE. The purpose of this study was to examine incidents of workplace bullying and mistreatment in a nationally-representative sample of U.S. workers, the nature of the aggressor in the workplace, and any actions taken by the target, as well as the impact of mistreatment on the individual and organization. DESIGN/METHODOLOGY. Data from a bullying module on the 2012 General Social Survey (GSS) were used for this study (N=1178). Respondents were asked about their experiences of workplace bullying and mistreatment during the past 12 months. Survey items were developed around three key constructs: physical/verbal active mistreatment, active undermining, and passive undermining. Work organization and climate factors, and health and well-being outcomes were also assessed. RESULTS. Most respondents experienced workplace bullying or mistreatment. Incidents of passive undermining were more prevalent than active undermining or physical/verbal aggression. Respondents reported that the aggressor was most often a coworker (28%), rather than a customer/client or a supervisor, and that their typical response to an incident was that they did nothing (18%), followed by confronted the offender, talked to others at work, and reported the incident to management or higher-ups. Job stress was higher when the aggressor was a manager or supervisor, and also when the respondent filed a formal complaint/grievance or confronted the offender. CONCLUSION. Workplace bullying and mistreatment remains an issue for U.S. workers, and that there are a variety of responses to such incidents and their impact on health and well-being outcomes may need to be taken into account when developing interventions.
1821 - FROM REGIONAL NETWORKS TO PREVENTION ALLIANCES THROUGH THE IMPLEMENTATION OF WORKPLACE HEALTH MANAGEMENT INTERVENTIONS

Yanina Mallok (1) - Christine Busch (1) - Monique Janneck (2)

University of Hamburg, Work- and Organizational Psychology, Hamburg, Germany (1) - THL, Luebeck, Germany (2)

From regional Networks to Prevention Alliances through the Implementation of Workplace Health Management Interventions

Yanina Mallok¹, Christine Busch¹, & Monique Janneck²

¹Universität Hamburg, Germany
²Technische Hochschule Lübeck, Germany

Purpose: Based on authors’ previous research within the project that focuses on crafts small business, well-established regional networks were used to place in the workplace health interventions (WHI) in the micro and small enterprises, targeting team development and coaching in WLB. These enterprises experience the lack of resources that unable health interventions. The goal of this study was to investigate, weather the established networking structures being regularly used for business relations (e.g. initiating new projects) can be linked to successful Implementation of non-commercial topics such as WHI.

Design/methodology/: The sample included entrepreneurs, divided in three groups (team development intervention group, coaching intervention group and waiting control group) that completed 40 semi-structured Interviews including implementation process evaluation and value networking analysis(VNA) in retrospective comparison group design (Study 1; three-groups design) and pre-post group design (Study 2).

Results: The preliminary implementation process evaluation and VNA results will be presented including three group comparison design (Study 1) and pre-post group design (Study 2).

Limitations: The major limitation of this study is an unexpected dropout due to difficulties in reaching the full sample size that received the interventions within the project.
Research/Practical Implications: Based on our findings, the WHI for the micro and small enterprises can be successfully carried out despite limited resources when regional networks are involved.

Originality/Value: This study contributes to successful mechanisms for reaching difficult target groups via regional networks to enable WHI and develop prevention alliances. This, in turn, can promote availability and further development of suitable WHI.
Anne Turner

Coventry University, Occupational and Business Psychology, Coventry, United Kingdom

With a recent trend being for organisations to utilise dress codes or uniforms for employee and organisational image enhancement, the impact of this practise on employees’ emotions is not fully understood (Lightstone et al. 2011). A body of literature has demonstrated positive effects of wearing work-place clothing such as the business suit upon behaviours and emotions, including reduced anxiety and negative affect (King and Vickery 2013; Kwon 1994a; Moody et al. 2010). Literature had tended to focus on wearers perceptions of traits associated to wearing a business-suit, and enhanced negative mood, measured through self-report and retrospective surveys (Cardon and Okoro 2009; Kwon and Hilleary-Johnson 1998; Peluchette and Karl 2007). Although alternative literature suggested that wearing formal clothing was accompanied with negative outcomes such as feelings of physical discomfort and negative task performance (Bell, Cardello and Schutz 2005; Sleipan et al. 2015). Adopting an exploratory approach to understanding the effect of work-place clothing on emotions and incorporating a more direct measure of wearing a ubiquitous work-place garment, a business suit, the present study examined wearers’ emotions whilst wearing (or not) a business suit.

Participants (N = 83) took part in a between-subjects paradigm in which participants were randomly assigned to; seeing or wearing a business-suit (or a control group) in an anxiety inducing context – an employment interview simulation, negative mood and anxiety was measured to assess the ability of the business suit to alleviate negative emotions.

The results showed that wearing a business suit did not significantly reduce negative affect or anxiety levels, compared to seeing a business suit or the control group. However, a pattern was observed in the data, that when the business suit was worn, anxiety and negative mood mean levels were reduced. This was observed with caution but suggested that wearing a business-suit in a related context in which this style of clothing is commonplace can affect emotions.

The importance of beginning to investigate the direct effect of clothing on work-place behaviours and emotions will address what has previously been contrary or inconclusive evidence regarding the impact of imposing clothing styles on employees.
The purpose of our research is to better understand the role of Non Cognitive Skills (Heckman, Humphries and Kautz 2014; Kautz et al. 2014) in teacher’s work. The hypothesis is that a teacher with high NCS would work better, could be a model and better develop the personality, skills and knowledge of their students.

Our study is divided into two sections. In the first one, we want to analyze a potential correlation between two self-report questionnaires, PCQ-12 and TeiQUE, that evaluate respectively Psychological Capital (Luthans and Youssef-Morgan 2017) and Emotional Intelligence (Salovey & Mayer 1990), and a measurement of teaching effectiveness achieved through the MET. This instrument uses three sources of data: TRIPOD, INVALSI, and a readjusted version of the FFT. In fact we have created an interview based on the indicators of the FFT. What we expect to find is a positive relation between teaching effectiveness and the two measure of NCS.

In the second one, we want to do a qualitative survey to get information as rich as possible about which educational practices teachers use daily and believe are useful for developing the student’s NCS.

Some possible limitations could be the low number of teachers involved and the self reported data collected with the two questionnaire for measuring personal abilities.

If our hypotheses were confirmed, this would throw the empirical bases to demonstrate the importance of professional development, such as the action learning training which could provide teacher with practices for the development of students’s NCS.
Planned obsolescence have existed since the 1920s. Manufacturers deliberately began to shorten the life span of their products to increase demand. The profit went up as the products life span went down.

This paper will present three different types of planned obsolescence: Planned obsolescence as death dating, planned obsolescence as innovation and planned obsolescence of desire, and show how they constitute a hidden engine in consumer society. Planned obsolescence in a variety of forms is one of the greatest stimulus in the growth economy. This creates not only a surplus of goods, but also a surplus of waste.

Planned obsolescence combined with the “use and dispose of”- mentality, was part of a carefully thought out consumer manipulation, that facilitated the transition from a needs to a desire driven society. In this process it constituted the consumer as a substantial wastemaker.

The paper will show that planned obsolescence in a desires driven society is one of the most substantial barriers that stops us from achieving sustainable development goals connected to climate and environmental degradation.

The connection between planned obsolescence and the desires driven consumer as central sources of wastemaking and environmental degradation, has to my knowledge, not been attempted before.

The empirical material consists of historical records, advertising campaign’s, documentaries and scientific articles and books on the various topics.
1828 - DO MENTAL HEALTH PROFESSIONALS HAVE A RISK TYPE, AND IS THERE A LINK WITH RESILIENCE?

Sonia Shah (1)

University of East London, London, United Kingdom (1)

Purpose
A combination of a concentration of acutely unwell mental health patients, as well as old and unsuitable buildings, on top of staff shortages and a lack of basic training, makes it a lot more likely that both patients and staff are at risk of suffering harm. This study aimed to examine the risk personality of mental health professionals, and assess the relationship with resilience, which is seen as a protective factor against, for example, emotional exhaustion and depersonalisation.

Design
The researcher administered two surveys to 232 mental health professionals. Survey one assessed risk personality using the Risk Type Compass (Trickey, 2017). Survey two assessed resilience using the Connor-Davidson Resilience Scale 25 (Connor & Davidson, 2003).

Results
Analyses suggest this occupation can be differentiated from a sample of the general population by their risk profile. There are many statistically significant strong positive correlations between various aspects of risk personality and resilience. Specifically, a higher tolerance to risk predicted greater resilience.

Limitations
This study was cross-sectional in design. Further longitudinal research across a greater number of service providers would allow for a more comprehensive understanding.

Practical Implications
Targeted interventions could be developed to assist in promoting the resilience in this group, in turn reducing the risk of burnout and staff attrition, and promoting staff retention, occupational mental health, and potentially recruitment.

Originality/Value
Risk as an aspect of personality brings originality to this paper, as well as adding to the limited empirical evidence with regards to supporting those in caring professions.
Purpose

With increasing changes in the job market, the ability to manage his occupational competencies increase the usefulness of subjective competency assessment.

This article looks to present the development process of a computer-based competency assessment tool used for training plan design. As a sole input, a competency profile, Cross Skill® aims to provide accurate and satisfying assessments in a cost-effective manner.

Design

This article presents one data set encompassing 357 dyads (mechanics and their supervisor).

In order to design a training plan, mechanics took a competency self-assessment and an objective MCQ focusing on the same competencies. Mechanic’s supervisors assessed their subordinate’s competencies with a similar tool as used by the subordinates.

Findings

Thanks to frequency scales and the decomposition of Likert scales in several randomized questions, we consider that we manage to get interesting inter-rater correlations (r = .59). An interesting result was also the fact that the correlations between the objective MCQ (golden standard?) and the self-assessment were lower than the correlations between self and supervisor assessment.

Limitations

This first use case (a small sample size of employees, with a specific job) is a limitation of this study. Some people might also consider that inter-rater agreement is not a relevant effectiveness’ criteria.

Research/Practical Implications

If we manage to reproduce the same magnitudes of inter-rater correlations with other jobs and bigger samples, our computer-based assessment tool might be useful to increase the interest and use of subjective assessment practices.
The aging process is a multifaceted experience that results from the correlation of multiple development processes, being influenced by biological, social and psychological factors that interact in an uninterrupted way (Veloso, 2015). The national and international literature shows that nursing workers are exposed to a variety of workloads, due to the transformations inherent in the work process, coupled with constant contact with pain, suffering and death. Objective: to identify the capacity for work in nursing workers in the face of aging. Method: This is a cross-sectional epidemiological study, with a quantitative approach, performed at the University Hospital of São Paulo. The study population consisted of 272 workers of the nursing team, whose inclusion criteria were: workers who were active in the data collection period, were 45 years of age or older, were in active staff, and workers who had, at least six months of work in the Institution. The 45-year-old age criterion is anchored in the World Health Organization (WHO) framework that defines as an aging worker the age of 45 years old, recognizing changes in the various systems of the human body that lead to a gradual loss in the effectiveness of each of them (WHO, 2004). Thus, 211 workers participated in the study, corresponding to 79.9% of the university hospital workers. In order to collect data, the Work ability Index (ICT) (Ilmarinen et al., 1991) was used, with validity and reliability of the Brazilian version verified by Martinez, Latorre and Fisher (2009), in which properties were found satisfactory as regards construct validity, criterion and reliability. The variable was categorized as optimal, good, moderate and low, according to the criteria of the Finnish Institute of Occupational Health (FIOH) (TUOMI et al., 2005): Great (44.0 to 49.0 points); Good (37.0 to 43.9 points); Moderate (28.0 to 36.9 points) and Low (7.0 to 27.9 points). Results: There was a predominance of the female population (89.1%), aged between 45.0 and 54.9 years (65.5%), higher level education (50.7%), including 33.6% postgraduate studies. The application of ICT revealed that 58.3% were able to work adequately (good or good) and 41.7% of workers, the ability to work compromised (moderate or low). The mean of the ICT score was 37.8 points (dp = 6.6), with a median of 38.0 points and ranging from 9.0 to 49.0 points. Regarding the estimated loss of work due to injuries / illnesses, only 39.8% reported some type of limitation to perform work due to injury or illness. Conclusion: It was observed that the majority (58.3%) of nursing workers were able to work adequately (good or good) and in relation to the
estimated loss of work due to injuries / diseases, only 39.8% reported some kind of limitation to perform the job due to injury or illness. These data show a good prognosis, considering that the majority of workers are aging and maintain their capacity for work.

Aging, nursing, productivity
Innovation becomes increasingly crucial for organizations in today’s fast changing environments. Literature on innovation widely suggests that participative leadership is strongly associated with innovative behavior in teams. We argue that this relationship deserves a more nuanced examination in innovation-oriented and less innovation-oriented functional contexts. In particular, we hypothesize that leader’s change readiness – a leader’s characteristic that has received little attention in innovation literature yet - moderates the relationship between participative leadership and innovative team behavior. Further, we expect that this moderation effect will be stronger in less innovation-oriented departments than in innovation-oriented departments. To test our hypotheses, we collected survey-data from a German medical technology company (1300 participants, 139 teams) across five functional departments from team leaders and team members and apply structure equation modelling using SMART PLS. Since all of our study-participants were employees of the same organization, the results must be interpreted with caution in terms of specific influence of the particular organizational culture on the hypothesized relationships. Our study provides researchers and practitioners with a more nuanced understanding of the relationship between participative leadership and team innovation in the context of various functional departments and sheds light on the to date to the best of our knowledge unexplored role of leaders’ change readiness for this relationship. These insights contribute to further theory building on leadership and team-innovation and to the adjustment of leadership trainings to the needs of the particular functional departments.
Research has shown that new ways of working have both positive and negative consequences on employees’ well-being. The aim of this study was to investigate the relationship between work-related smartphone use and work recovery. Additionally, we wanted to get an insight in work tasks and reasons why employees used smartphones.

We collected a heterogeneous sample of 336 Croatian employees who participated in the first part of online study, which included several work- and well-being related measures. In the second part, 81 of them took part in the five-day diary study, which included repeated measures of work recovery strategies and questions on work-related smartphone use.

Results showed that using smartphones during leisure time was related to experiencing lower work recovery. The effect was most pronounced for psychological detachment, while smartphone use showed no correlation with recovery strategy of mastery experiences. The relationships varied between the days of the week. Participants reported they used smartphones primarily for checking e-mails, with motivation to be in touch with the job.

In generalization of the findings, we should note the convenient sample and participants’ dropout from the diary study.

Eventhough flexibility seems appealing to both employees and employers, practical implications include suggestion that using smartphones for the work purposes during leisure should be limited in order to persevere employees' well-being.

We believe this scarce diary study broadens the existing occupational health literature by examining the reasons why employees use smartphones in their leisure time, and how is that related to their recovery from work.
Positive orientation more than traits helps to predict job satisfaction and psychological well-being (Miciuk, Jankowski, Laskowska, Oleś, 2016) but the character of this pattern needs empirical verification. The aim of this research project was to check the connections between positive orientation and variables important for the functioning at work, and especially its affinity to the occupational personality traits. Positive orientation (or positivity) represents a general dimension that captures the stable categories of judgement used by individuals to interpret and give meaning to their existence (Caprara, Alessandri, Steca 2013). To be more specific, Caprara (2009) defined it also as a general tendency to receive life experience with a positive attitude and described as a stable personality disposition.

In this paper would be presented the validation data for Polish working-age group representatives (the age range: 20-59, N=254). Author will show the results of canonical correlation analysis (CCA) for positive correlation and occupational personality traits measure by Business Focused Inventory of Personality BIP (Hossiep, Paschen, 1998, 2013; Jaworowska, Brzezińska, 2014). Two main hypotheses tested are (1) there is a moderate canonical correlation between positive orientation and personality traits important form the perspective of job-related context, and (2) for business focused context this connection will be weaker than for general measures of personality based on Big Five Model.

Limitation of this research project are mainly in the sample construction which is incidental and relatively small; in the future it will be useful to control the professional status of participants and their attitudes towards work.
Purpose

According to Kahneman (1973), there are two types of decision making processes, thinking fast by utilizing heuristics with low cognitive involvement and thinking slow using deliberate, cognitively strenuous techniques. Cognitive processing styles vary by context and available heuristics and can be identified through the Cognitive Reflection Test (CRT). Purpose of this study was to understand how known sex differences in CRT can be explained better by Faith in Intuition (FaithInt) and testing de-biasing strategies (Priming on difficulty, Explanation of decision) to overcome faulty decisions based on heuristics.

Design/Methodology /Approach/Intervention

175 students (54% female) took part in the 2x2 experimental design manipulating Priming and Explanation. Participants responded online to a 5-item version of the CRT (Frederick, 2005) and FaithInt using the Rational-Experiential Inventory (Keller et al., 2000).

Results

Step-wise regression analysis revealed significant impact of FaithInt on number of correct answers in CRT ($b = -.32, p = .03, R^2 = .03$). Sex and education increase explained variance establishing a small effect of FaithInt, sex and education ($R^2 = .09, \Delta R^2 = .06$). Both priming and explanation had no significant impact on usage of heuristics as tested with an ANOVA.

Limitations

Priming manipulation was not operationalized salient enough to trigger deliberate thinking processes, which would need to be implemented differently within online surveys.

Research/Practical Implications

Simple priming and explanation as de-biasing strategies are not sufficient to overcome use of heuristics in decisions, but need to be made more cognitively activating to connect to deliberate thinking.

Originality/Value

This study combines a focus on additional drivers of cognitive thinking processes as well as simple de-biasing strategies as opposed to complex ones.
The aim is to disseminate, among EAWOP members, the idea of EAWOP-EFPA standard of competences in test use within the organizations, based on EFPA test use model. The process of building the Polish Level 2 Occupational Testing qualification form the beginning to the point in which it met the standards set by EFPA will be shown.

On the poster will be presented the set of best practices applied to the Polish WO test market due to launch the European benchmark standards for competence in test use. In Poland, there is no tradition to assess the test users’ competencies in standardized way, so The Polish Psychological Association (PPA) took the effort to build three stages procedure to ensure this.

The timeline of the project with breaking points that the EFPA EuroTest-WO Implementation Team of PPA consider the most crucial for introducing the new testing culture to business environment will be presented. (five legs of the process will be presented: How to make the idea of ethical testing popular? How to adapt European standard to the local testing culture? How to build national procedure of assessing test user competence in WO settings? How to convince the market to implement it? How to get accredited by EFPA?)

The main idea of EuroTest-WO certificate is to obtain assessment that involve the use of tests from a competent and qualified professional, and the system should ensure this objectively. But how to remain neutral towards tests which are clearly the market products?
Purpose of the study

The study investigated the psychometric properties of the Attitudes towards Mental Illness Questionnaire (AMIQ) and the Perceived Stigma Questionnaire (PSQ); as well as the influence of demographic variables (gender, race, education and age) on attitudes towards mental illness.

Design and Method

A quantitative, cross-sectional design was followed. Exploratory factor analysis was used to examine the factor structure of the AMIQ and PSQ. To measure differences in mean scores on stigmatised attitudes, t-tests and ANOVAs were performed.

Results

A one-factor structure was found for both questionnaires, and acceptable reliabilities. Gender and age significantly impacted attitudes towards alcoholism and schizophrenia; as did race towards heroin abuse, and education towards schizophrenia.

Limitations

The influence of other variables were not considered. Response bias may have influenced the results. The gender specified in the vignettes may also have influenced participants’ responses.

Research/Practical implications

The study presents two instruments measuring attitudes towards mental illness that demonstrates evidence of construct validity and reliability, thereby showing potential to be utilised in research and in the workplace.

The study also demonstrates that not all employee demographic segments hold the same views with regards to mental illness. Organisations should bear this in mind when designing intervention strategies.

Originality

As far as could be established no such study has been conducted in the South African workplace. The study offers a unique perspective on stigmatised attitudes by examining the differences, in terms of demographic variables, between stigma towards mental illness in general, and stigma towards particular mental illnesses.
PURPOSE: The goal of conducted study was to investigate whether sense of coherence could be the factor differentiating subjective stress, usage of coping strategies and mental health in professionally active parents.

DESIGN/METHODOLOGY/APPROACH/INTERVENTION: 340 subjects took part in the study. They filled in the following questionnaires: Sense of Stress Questionnaire by Plopa, General Health Questionnaire-short version by Goldberg, MINI-COPE, and Sense of Coherence Questionnaire SOC-29. 239 sets of answers of working parents were analyzed – they were provided by parents in a steady relationship (marriage or informal partnership) who had at least one child. One-factor ANOVA analyses were conducted.

RESULTS: The results indicated that parents with higher sense of coherence felt less stressed, had better mental health and used more constructive coping strategies when stressed. Working parents with higher sense of coherence when compared to those with lower sense of coherence scores used less frequently strategies such as: denying, stopping all the actions, self-incrimination or usage of psychoactive substances. Working mothers with higher sense of coherence more frequently used strategies: planning, seeking emotional support, positive reappraisal, doing something else.

RESEARCH/PRACTICAL IMPLICATIONS: It could be concluded that the sense of coherence promotes mental health and helps to cope with stress constructively. It is therefore important to take it into account while researching working parents.

ORIGINALITY/VALUE: In presented study different levels of sense of coherence among men and women allowed to draw more accurate conclusions. It is important to separately analyze results of working mothers and fathers.
PURPOSE. The goal of this study was to examine how employee age is related to the experience of bullying in a national sample of U.S. workers. Based on previous research, conducted primarily with convenience samples, we hypothesized that older workers (55+ years) would report less workplace bullying overall than younger age groups. We also examined age-related differences for source of bullying (co-worker, supervisor, customer), the type of bullying (verbal/physical, active undermining, passive undermining), and the association between workplace bullying and general health. DESIGN/METHODOLOGY. Data came from a workplace bullying module included in the 2012 General Social Survey (GSS), a representative, face-to-face survey of the U.S. population (N=1,178). Respondents were asked about their experiences with workplace bullying and mistreatment during the past 12 months. Factor analysis was used to identify three different types of bullying. RESULTS. As hypothesized, there was an age-related decline in all three types of bullying, with passive undermining showing the strongest negative association with age. The source of bullying did not vary significantly by age, with co-worker being most common. There was a significant negative association between workplace bullying and general health for younger and middle-aged workers, but not for older workers (55+ years). CONCLUSION. Our findings indicate that the prevalence of workplace bullying declines consistently with age. The failure to find a relationship between workplace bullying and general health for older workers suggests that these workers may have developed greater resilience or better coping strategies than younger workers. Implications for future research will be discussed.
Given the importance of promoting healthy working conditions within European policies, this study presents empirical findings on the associations between working conditions and workers’ health in the EU28. Analysing the European Working Condition Survey Data from 2015 (N = 26968) we show that workers in the EU28 enjoy good health and well-being, whereas men are healthier, have higher well-being, fewer health symptoms, and better sleep quality than women. Relying on various theoretical approaches (JDC, JDCS and ERI-model), we show that exception of physical risks and social demands all job demands (quantitative, emotional, social demands and work intensity) and resources (social, work, organizational resources and rewards) produce health outcomes indirectly through a health-impairment (exhaustion) or motivational (engagement) processes. The model was found equally relevant for men as for women. Analysing trend data over the past 15 years no dramatic change were found in job demands and resources: Support did not improve while rewards and job control have. In contrast work is getting more demanding, indicated by a slight increase in work intensity and higher emotional demands. Risk groups for poor health and well-being can be identified: unskilled jobs carry the highest risks; job insecurity and downsizing create special risk groups - more work intensity, more social demands and fewer resources. Even if we rely on cross-sectional data we are the first to test the JD-R model based on a representative European-wide sample showing that the proposed relations hold for EU28 employees.
